[*] The origin of the word has been the occaſion of a notable diſpute among criticks. The common opinion, ſupported by Scaliger, Heinſius and Voſſius, deduces it from the Greek Σατυροι, *Satyrs*, a ſort of Sylvan deities, by the Romans called *Fauni*, to whoſe petulancy and wantonneſs this ſort of compoſition is ſuppoſed to bear ſome reſemblance.—On which footing *ſatyr* is conſidered as a poem of a wanton, and licentious nature, which like the *Satyrs*, turns things upſide down to find occaſion for cenſure, and ridicule.—Caſaubon, on the contrary, followed by Spanheim and Dacier, derives the Roman *ſatyr* not from the Grecian divinities called *Satyrs*, to which they aſſert it bears no relation, but from the Latin *ſatur*, uſed for *plenum* full, a thing to which nothing is wanting.—Thus it is, *ſatur color*[a], denotes wool which has ſufficiently imbibed the colour, ſo that its dye cannot be further heightened: ſo *ſatur meſſis* denoted a plentiful harveſt[b]; and *ſatur geſtus*, a various one[c].—From this *ſatur* came *ſatura*, which was alſo written *ſatira* with an *i*, as *maximus* for *maxumus*; and *optimus* for *optumus.* But *ſatura*, it is to be obſerved, is an adjective, referring to a ſubſtantive underſtood, which here is *lanx*; *ſatura lanx* being the name of a baſon filled with all manner of fruits, which the Romans offered yearly to Ceres and Bacchus, as their firſt fruits. Thus the grammarian Diomedes: *Lanx referta variis multiſque primitiis, ſacris Cereris inferebatur, & a copia & ſaturitate rei, ſatura vocabatur.* Thence alſo the word *ſatura* was applied to other mixtures; particularly to a diſh conſiſting of ſeveral ſorts of meats: *Quoddam genus farciminis multis rebus refertum ſaturum dicit Varro vocitari*[d]. And the ſame term was alſo tranſlated to works of genius: thus, *leges ſaturæ* denoted laws conſiſting of many heads or titles, as in Feſtus: *ſatura eſt lex multis aliis legibus conferta.*—And the ancient Gloſſ. *ſatura* Νομος πολλα περιεχων. Such, *e. gr.* is this, *Vultiſne, jubetiſne cum Jugurtha bellum componatur, & fœdus feriatur: elephantos tradat, item omnes tranſfugas, &c.*—Hence alſo a thing was ſaid *per ſaturam fieri*, when it was done haſtily and confuſedly: thus *per ſaturam legem ferre*, was to paſs a law confuſedly and in the lump, without collecting the votes.—Laſtly, *ſatura* alſo became the title of ſeveral books, as of that of Peſcennius Feſtus, who wrote *hiſtorias ſaturas*, or *per ſaturam.*—From the whole it is inferred, that the *ſatyrical* pieces of the poets were ſo called, as being various, and miſcellaneous compoſitions; or as Porphyrion expreſſes it, *quod multis & variis rebus hoc carmen refertum eſt.*—On this principle it is urged, the word ſhould be written in Latin with an *u* or *i*, *ſatura* or *ſatira*, and in Engliſh only with an *i*. They who write it with a *y*, do it as ſuppoſing with Scaliger, and others, that the Sylvan *Satyri* gave name to this compoſition, and that from *Satyrus* came *ſatyra*, which Caſaubon labours hard to diſprove, by ſhowing, that from *ſatyrus* could never be formed *ſatyra*, but *ſatyrica*, and by explaining the great difference between the Greek *ſatyric* poems and the Roman *ſatire.*—Scaliger nevertheleſs defends the ancient etymon from the Greek Σατυρος, which he makes the origin of the Latin *ſatur*, *ſatura lanx*, &c. which according to him were appellations firſt uſed in the ſacrifices and ceremonies of Bacchus, where *ſatyrs* were rehearſed: *Non a ſatura vel lege vel lance dicta eſt, ut fruſtra ac temere ſatagum grammatici; quin has a ſatyris dictas puto: cum lancibus enim prodibant, & caniſtellis pomorum omni genere plenis, quibus nymphas allicerent*[e].—In effect, *ſatyrical* poetry, according to this critick, may be naturally enough deduced from the wantonneſs of the *Satyrs*: and what confirms it is, that Σατυριστης is rendered in ancient gloſſes by *ludio*; and *ſatyrical*, by *ludicrous*, *ſportive*, &c. Thus Seneca's *ſatyr* is called *ludus*, and Horace and Perſius uſe *ludere* for *ſcribere ſatyras*[f].—[a] V. Plin. *Hiſt. Nat.* l. 30. c. 10. [b] Sever. *in Ætna.* v. 12. [c] Manil. l. 5. v. 480. [d] Diomed. l. 3. [e] Scal. *Poet.* l. 1. c. 12. [f] V. Dan. Heinſ. *de Satyr. Horatian.* l. 2. Lugd. 1628, 12° Fab. *Theſ.* p. 2248.

Satyr is divided into *general*, which is levelled at common abuſes wherein numbers are equally intereſted: and *perſonal*, which points out and expoſes particular characters.—Which laſt, as it affects mens reputation, on which their intereſt greatly depends, is ſcarce diſtinguiſhable from deſamation, and ſcandal. See INFAMOUS and SCANDAL.

To this laſt claſs belong moſt of thoſe which bear the title of *Anti*: as the Anti-Baillet of Menage, with which M. Baillet was ſo ſtung, that he compoſed a treatiſe expreſs on *perſonal ſatyrs which bear the title Anti*; to ſhew the immorality, and unlawfulneſs of them, and their contrariety to the precepts of the goſpel. See ANTI.

It is further objected to this kind of *ſatyr*, that a publick detection, far from producing the effect it is deſigned for, reformation, is apt to drive men to deſperation, and harden them in their courſe. The excellent author of the treatiſe of the *Government of the Tongue*, ſpeaking of uncharitable truths, ſays, a diſcovery of this kind ſerves not to reclaim, but enrage the offender, and precipitate him into farther degrees of ill. Modeſty and fear of ſhame is one of thoſe natural reſtraints which the wiſdom of heaven has put on mankind: and he who once ſtumbles, may yet by a check of that bridle recover himſelf again. But when by a publick detection he is fallen under that infamy he feared, he will be then apt to diſcard all caution, and to think he owes himſelf the utmoſt pleaſures of vice at the price of his reputation.—Nay, perhaps he advances farther, and ſets up for a reverſed ſort of fame, by being eminently wicked: thus he who before was but a clandeſtine diſciple, becomes a doctor of impiety.—Doubtleſs it was this ſort of reaſoning that induced our wiſe legiſlators lately to repeal the law which put the brand of infamy in the face of felons.—In effect, where crimes are enormous, the delinquent deſerves little pity, yet the reporter may deſerve leſs.—*V. Tatl.* N°. 74. T. 2. p. 154. *ſeq.* See alſo N°. 76. p. 166. *ſeq.*

Greek SATYR.—Caſaubon makes a diſtinction between the *ſatyrical* poetry of the Greeks, and the *ſatyr* of the Romans, which he maintains was peculiar to themſelves; in which alſo he ſeems to be juſtified by Quintilian. *Satyra quidem tota noſtra eſt, in qua primus inſignem laudem adeptus Lucilius* [a]. Which ſame Lucilius is alſo expreſly ſaid by Horace to have been the firſt *ſatyrical* poet [b].

————————Eſt Lucilius auſus
Primus in hunc operis componere carmina morem.

For a like reaſon Horace calls *ſatyr*, *Græcis intactum carmen*, a ſort of poetry unknown to the Greeks. Spanheim in his fine preface to the Cæſars of the emperor Julian, has ſhown five or ſix eſſential differences between thoſe two poems. The Greeks chiefly reprehended vice, *&c.* [c] in their drama's; though they had alſo a ſort of narrative poems called *Silli*, like the Roman and our *ſatyrs*. Theſe *Silli* were cutting, or ſarcaſtick poems, as may be eaſily ſeen by the fragments of Timon's *Silli*; with this difference, that the Greek *Silli* were parodies from one end to the other, which cannot be ſaid of the Roman *ſatyr*. Or if we find ſometimes a parody, it is what the poet did not deſign, and conſequently the parody does not make the eſſence of *ſatyr*, as it does that of the *Silli* [d].—[a] V. Quint. *Inſt. Orat.* l. 10. c. 1. [b] Hor. *Sat.* 1. l. 2. v. 62. [c] I. Caſaub. *de Satyrica Græcor. Poeſi & Romanor. Satyra.* l. 2. Par. 1605.—[d] See Maſcov. *Exerc. Prior. in Horat. Satyr.* § 10. Langheinrich *Diſſ. de Timon. Sillograph. Lipſ.* 1720. & 1721. Stoll. *Introd. ad Hiſt Liter.* P. I. c. 5. § 38.

Scaliger, notwithſtanding all this, followed by ſome of the lateſt and beſt criticks, ſcruples not to derive the *ſatyrical* poetry of the Latins from that of the Greeks. According to theſe authors, *ſatyr* in its origin was a ſort of interlude in tragedy, wherein goat-footed *Satyrs* were introduced to alleviate the diſtreſs, and with their jeers and humour diverſify the ſolemnity of the tragick ſcene: much like the mimes in comedy, and the feſcennines in the Attellan ſports. See SATYRICAL.

At firſt it was only in the tragedies exhibited in the feaſts of Bacchus, that *Satyrs*, the ſuppoſed companions and prieſts of that god, were introduced: but afterwards they made a part in the ſolemnities of the other deities. So that *ſatyr*, in its firſt inſtitution, was wholly dramatick.—V. Scalig. *Poet.* l. 1. c. 11 & 12. See alſo the article SATYRICAL.

Roman SATYR.—Dacier, after Caſaubon, traces the inſtitution of the Roman *ſatyr* very minutely; and diſtinguiſhes three ſpecies or ſtates of it: the firſt *dramatick*, the ſecond *narrative*, the third that called the *Varronian* or *Menippean ſatyr*.

The ancient Romans had been without any ſcenical entertainments for almoſt four hundred years; till chance and merriment in one of their feſtivals gave riſe to the ſaturnine and feſcennine verſes, which for ſome years ſupplied the place of theatrical performances. Theſe verſes were rude, and without any meaſure, being extemporary, and the productions of a ſavage people, who had no other inſtructors than the fumes of wine. Accordingly they were ſtuffed with groſs railleries, and accompanied with geſticulations and dances. An idea of them may be formed by conceiving a knot of country fellows, dancing in a hobbling manner, toſſing about their home-ſpun jokes, and expoſing each other's failings. Thus Horace, *Epiſt.* 1. *lib.* 2.

Feſcennina per hunc inventa licentia morem
Verſibus alternis opprobria ruſtica fudit.

The ancient Roman *ſatyrs* then were a ſort of innocent farces, where ſpectators and actors were indifferently rallied.—And thus they continued till the time of Livius Andronicus, who firſt attempted to write plays in imitation of the Greeks. This new entertainment appearing more noble and perfect, drew crowds of ſpectators, which occaſioned the *ſatyrs* to be neglected for ſome time; but they were afterwards reſumed, and tacked to the ends of comedies, much like the modern farces. They were annexed more peculiarly to the Atellane pieces, and on this occaſion changed their name *Satyrs* for that of *Exodia*, which they ever after retained. See EXODIUM.

After Livius Andronicus, Ennius having obſerved the eagerneſs of the Romans for *ſatyr*, imagined that poems not accommodated to the theatre, but retaining the gall, raillery, and pleaſantry of the theatrical *ſatyr*, would not fail of ſucceſs. Accordingly, he wrote diſcourſes under the title of *Satyrs*, in which he took the liberty of mixing ſeveral ſorts of verſe together, as hexameters with iambick trimeters, and trochaic tetrameters. In theſe pieces were found the ſame variety, raillery, alluſions, fables, and even dialogue, in a word every thing that conſtituted the character and beauty of the firſt *ſatyrs*, except the dancing and muſick. Pacuvius ſucceeded, who alſo writ *ſatyrs* in imitation of his uncle, or according to others, his grandfather Ennius. When Pacuvius was in his prime, Lucilius was born, who alſo compoſed *ſatyrs*, ſomewhat of a new turn, endeavouring to imitate the character of the ancient Greek comedy, of which the Romans had but an imperfect image in their own *ſatyrs*. This ſeems to be what Horace meant when he ſaid, *Satyr.* 1. lib. 2.

————————Quid, cum eſt Lucilius auſus
Primus in hunc operis componere carmina morem.

He could not mean, that the Romans had no *ſatyrs* before Lucilius, ſince that poet was preceded by Ennius and Pacuvius, whom he imitated. Horace's deſign was only to hint that Lucilius's manner and turn was new, that he had embelliſhed this poem, inſomuch that he might be looked upon as its firſt author. But in fact, Lucilius only added to it a little more politeneſs and ſalt, without other alteration. And though like Ennius he did not mix together ſeveral ſorts of verſe in the ſame piece, yet he compoſed different poems, ſome of which were entirely hexameter, others iambic, and others trochaic, as appears from his fragments.

The third kind of *ſatyr* was the *Varronian* or *Menippean*, ſo called from its author *Varro*, the moſt learned of the Romans, and becauſe in this he imitated the manner of Menippus the Gadarenian, a cynic philoſopher.

This *ſatyr* was not only a miſcellany of different ſorts of verſe, but was alſo interlarded with proſe, and Greek, and Latin.—Seneca's poem on the death of Claudius, Petronius's Satyricon, Lucian's Dialogues, the Golden aſs of Apuleius, and the Cæſars of the emperor Julian, are ſo many *ſatyrs* in the *Varronian* taſte. [a]—To the ſame head may alſo be referred the Catholicon of Spain, the Moriæ Encomium of Eraſmus, the Don Quixot of Cervantes [b], the Advertiſements from Parnaſſus of Boccalini, the Tale of a Tub by Dr. S. *&c.*—[a] V. Dacier *Diſcours ſur la Satire, in Mem. de Liter. de l'Acad. R. des Inſcr.* T. 3. p. 246. *ſeqq.* And in the preface to his verſion of Horace's *Satyrs*. [b] V. Rapin *Reflex ſur la Poet. en Partic.* § 28. *Oeuv. Diverſ.* T. 2. p. 205. *ſeqq.*

SATYRICAL, ſomething relating to, or that partakes of the nature of *ſatyr*. See SATYR.

We have *ſatyrical* poets; *ſatyrical* preachers, as South; *ſatyrical* hiſtorians, as Burnet and Mezeray; *ſatyrical* philoſophers, as Apuleius and Montaign.—In the heathen theology, we find a *ſatyrical* god, *viz.* Momus: Homer in his Therſites gives the character of a *ſatyrical* courtier. The Dutch have been charged with *ſatyrical* prints, and medals; which have ſometimes coſt them dear.

Satyrical poetry had its origin at Athens; though its perfection be owing to the Romans. According to father Mourgues, and Bianchini [a], it was at firſt a ſort of tragedy acted at the feaſts of Bacchus, wherein ſatyrs were introduced converſing with heroes [b]. Burette rather takes it for a ſort of paſtoral farce tacked to the ends of tragedies [c]. One of the chief ornaments of it was a wild, groteſque ſort of dance performed by ſatyrs, and called *Sicinnis* [d]. See DANCING.—[a] Mourg. *Trait. de la Poeſ. Franc.* c. 4. *Mem. de Trev.* Nov. 1723. p. 2149. [b] Bianchin. *Della Satira Italiana,* P. I. p. 5. *ſeqq.* Giorn. *de Letter d' Ital.* T. 20. p. 203. [c] Buret. *Mem.* 2. *ſur la Danſe, in Mem. Acad. R. Inſcript.* T. 2. p. 163. [d] *Buret.* l. c. Averan. *Prælect.* ap. *Bibl. Choiſ.* T. 22. p. 34.

The *ſatyrical* ſhews of the Greeks were through maſquerades: the actors herein were diſguiſed variouſly, ſome in the habits of Satyrs, Sileni, Centaurs, Mænades, and other of Bacchus's crew; while others perſonated giants, cyclopes, monſters, and even beaſts: the whole making a medley more romantick and extravagant than any thing on the modern ſtage, unleſs perhaps ſome of our late groteſque pantomime entertainments [a]. The only piece of the kind now extant is the ΚΥΚΛΩΨ of Euripides [b].—[a] V. Boind. *ſur les Maſq. &* *Habits de Theatr. des Anc.* in Mem. Acad. R. Inſcr. T. 5. p. 176, & 188. [b] V. Fabric. *Bibl. Græc.* l. 2. c. 18. § 2. p. 645.

SATYRIC *Fountain.* See the article FOUNTAIN.

SATYRION, or SATYRIUM, a root called by this name, becauſe of its fancied promotion of luſt. Dioſcorides diſtinguiſheth this from the orchis, but Mr. Dale ranks it under that tribe. It paſſes for a great cordial and reſtorer; but its ſhape, reſembling the human teſticles, ſeems to be the chief foundation of its virtues.

SAVAGES *, or SALVAGES, wild, barbarous people, without any fixed habitation, religion, law or policy. See BARBARIAN.

* The word is formed from the Italian *ſalvagio*, of *ſalvaticus*, *ſelvaticus*, or *ſilvaticus*, which we find uſed in the barbarous Latin for *ſilveſtris*, belonging to the woods,

A great part of America is peopled with *ſavages:* many, ſome ſay moſt, of the *ſavages* are Anthropophagi. See ANTHROPOPHAGI.

SAVANT. See the article SCAVANT.

SAUCE—*white* SAUCE } See the articles { WHITE.
SAUCIDGE } { SAUSAGE.

SAUCISSE, SAUSAGE, in the military art, a long train of powder ſewed up in a roll of pitched cloth, about two inches in diameter; ſerving to ſet fire to mines, or caiſſons. See MINE, *&c.*

The length of the *ſauciſſe* is to extend from the chamber of the mine, to the place where the engineer ſtands to ſpring the mine. See CHAMBER.

There are uſually two *ſauciſſes* to every mine; that if the one ſhould fail, the other may take effect.

SAUCISSON *, in fortification, a kind of faggot made of thick branches of trees, or of the trunks of ſhrubs bound together: whoſe uſe is to cover the men, and to ſerve as epaulments. See EPAULMENT.

* The word is French, and ſignifies literally, a big ſauſage. See SAUSAGE.

The *ſauciſſon* differs from a *faſcine*, which is only made of the ſmall branches, and by its being bound at both ends, and in the middle. See FASCINE.

Anciently, they made the *ſauciſſon* 46 foot long, and 15 foot thick; ſince, it is uſually 23 foot long, and 12 thick; bound ſtrongly together with three bands ſtrengthened with iron.

SAVE *Appearances.* See the article APPEARANCE.

SAVER DE FAULT, in law, ſignifies to excuſe a fault: as when a man having made default in court, comes afterwards, and alledges good cauſe why he did it; as impriſonment at the time, or the like. See DEFAULT.

SAVIOUR.—*Order of St.* SAVIOUR, is the name of a religious order founded by St. Bridget, about the Year 1344; thus called from an opinion, that Chriſt himſelf, the *Saviour* of the world, preſcribed the rules and conſtitutions thereof. They are alſo called, from their foundreſs, *Bridgetins*, or *Brigittins.*

Their origin was thus: Wilpho prince of Nericia, to whom St. Bridget had been married, being dead at Arras, in his return from Galicia; the widow thought of nothing but devoting herſelf to a religious life; and accordingly ſoon after, built the monaſtery of Weſtern in the dioceſe of Lincopen in Sweden, where ſhe entered herſelf.

By the conſtitutions of this order, it is principally appointed for women, who are to pay a particular honour, and ſervice to the virgin.—The monks are only to afford them the ſpiritual aſſiſtances they may need, to adminiſter them the ſacraments, *&c.*

The number of nuns is fixed to ſixty in each monaſtery, and that of monks to thirteen, according to the number of apoſtles, whereof St. Paul makes the thirteenth. Four of them are to be deacons, to repreſent the four doctors of the church, and eight converts; the whole number making ſeventy-two, the number of the diſciples of our *Saviour.* Setting aſide theſe circumſtances, and the habit; this order is under the rule of St. Auguſtine.—It was approved of by Urban V. and ſeveral ſucceeding popes. In 1603, Clement VIII. made ſome alterations in it, on account of the double monaſteries which then began to be built in Flanders, *&c.*

SAULTS. See the article SALT.

SAUNDERS. See the article SANTALUM.

SAVOR, or SAVOUR, SAPOR. See the article TASTE.

SAUSAGE *, or SAUCIDGE, a term of ſome ſignificancy in commerce; denoting a popular food prepared of ſome crude meat, uſually either pork or veal ſhred ſmall, ſeaſoned and put up in a ſkin, in manner of a pudding.

* The word comes immediately from the French *ſauciſſe*, which ſignifies the ſame, formed of the Italian *ſalſiccia*, and that according to Salmaſius from the Latin *ſalſicium* wrote for *ſalſum*, ſalted.

The moſt eſteemed confection of this kind, is the Bologna *ſauſage*, which is much thicker than the common one, and is made with moſt ſucceſs in ſome cities in Italy, particularly Bologna, Venice, *&c.* whence great quantities are exported to other places. It is made of raw pork, well beaten in a mortar, with a quantity of garlick, pepper in the grain, and other ſpices: the Italians are furniſhed with a great part of the ſkins or guts for their *ſauſages* from England: the quantities of that commodity yearly exported, are greater than one would imagine.

SAUSAGE, in war. See the article SAUCISSE.

SAUT, in the menage. See the article SALTS.

SAW, SERRA, an inſtrument ſerving to divide into pieces, divers ſolid matters; as wood, ſtone, marble, ivory, *&c.* See SAWING.

The *ſaw* is one of the moſt uſeful machines, in the mechanick arts, ever invented: the fable, which is perhaps founded on ſome ſurer tradition, attributes the invention thereof to Icarus; who, vying with his father Dædalus, enriched the riſing arts with ſeveral diſcoveries.—It is added, he took the firſt hint from the ſpine or backbone of a flat fiſh, ſuch as the ſoal.

The *ſaw* is made of ſteel, with teeth, but thoſe differently filed, and turned, according to the uſe it is deſigned for.—

There are alſo a kind of *ſaws* without teeth, uſed in the ſawing of marbles and other ſtones.

The beſt *ſaws* are of tempered ſteel, ground bright and ſmooth; thoſe of iron are only hammer-hardned: hence, the firſt, beſides their being ſtiffer, are likewiſe found ſmoother than the laſt.—They are known to be well hammered by the ſtiff bending of the blade; and well or evenly ground, by bending equally into a bow.

The edge, wherein the teeth are, is always thicker than the back, in regard the back is to follow the edge.—The teeth are cut and ſharpened by a triangular file; firſt fixing the blade of the *ſaw* in a whetting-block.

When filed, the teeth are to be *ſet*, that is, to be turned a-ſkew, or out of the right line, to make the wider kerf or fiſſure, that the back may follow the better. This is done by putting an inſtrument, called a *ſaw-wriſt*, between every other two teeth, and giving it a little wrench, which turns one of the teeth a little towards you, and the other a little from you.—The teeth are always ſet ranker for coarſe cheap ſtuff, than for hard and fine; in regard the ranker the tooth is ſet, the more ſtuff is loſt in the kerf; and if the ſtuff be hard, the greater the labour of ſawing it.

The workmen, who make the greateſt uſe of the *ſaw*, are, the ſawyers, carpenters, joiners, eboniſts, ſtone-cutters, carvers, ſculptors, *&c.* The lapidaries too have their *ſaw*, as well as the workers in moſaick; but theſe bear little reſemblance to the common *ſaws.* See LAPIDARY and MOSAICK work.

But of all mechanicks, there are none have ſo many *ſaws* as the joiners, nor of ſo many different kinds.—The chief are as follow.

Pit-ſaw, a large two-handed *ſaw*, uſed to ſaw timber in pits.—It is ſet rank for coarſe ſtuff, ſo as to make a kerf or fiſſure of almoſt a quarter of an inch; but for finer ſtuff, finer.

Whip-ſaw, which is likewiſe two-handed, uſed to ſaw ſuch large pieces of ſtuff as the *hand-ſaw* will not eaſily reach.

Hand-ſaw, is made for a ſingle man's uſe: of which there are various kinds; as the

Bow or *frame-ſaw*, furniſhed with cheeks; by the twiſted cord and tongue in the middle thereof, the upper ends are occaſionally drawn cloſe together, and the lower ſet the further apart.

Tenon-ſaw, which being very thin, has a back to keep it from bending.

Compaſs-ſaw, which is very ſmall, and its teeth, uſually, not ſet; its uſe is to cut a round, or any other compaſs-kerf: hence, the edge is made broad, and the back thin, that it may have a compaſs to turn in.

The chirurgeons likewiſe uſe a SAW, to cut off bones.—It is to be very ſmall, and light, in order to be managed with the more eaſe and freedom: the blade exceedingly fine, and the teeth exquiſitely ſharpened; to make its way more gently, and yet with more expedition in amputations of legs, arms, *&c.*

The SAW is alſo a gardener's inſtrument, uſed in the pruning of trees, *&c.*—It is chiefly applied in the cutting of old, dry, and, conſequently, hard woods, whether roots or branches, which might ſpoil the pruning-knife; and big branches, *&c.* which the knife could not well take off at one ſtroke.

Except on theſe occaſions, Quintiney will have us always uſe the knife, rather than the *ſaw.* See PRUNING.

SAWING, the application of the ſaw, in the dividing of timber, *&c.* into boards, *&c.* See SAW.

There are wind-mills, and water-mills, which do the office of *ſawing* wood, with infinitely more expedition, and eaſe than is performed by the hand. See MILL.—They conſiſt of ſeveral parallel ſaws, which are made to riſe and fall perpendicularly, by means of one of the grand principles of motion.—A very few hands are here needed, *viz.* only to puſh forward the pieces of timber, which are laid on rollers, or ſuſpended by ropes; in proportion as the *ſawing* advances. Theſe mills are frequently found abroad; and were lately begun to be introduced in England; but the parliament, in conſideration of this, that they would ſpoil the ſawyers trade, and ruin great numbers of families, thought fit to ſuppreſs them.

M. Filibien mentions a kind of long ſaws, invented by one Miſſon, inſpector of the marble quarries in the Pyreneans; by means whereof ſtones are ſawed even in the rock itſelf whence they are taken.—He adds, that ſome of them are twenty-three foot long: but does not deſcribe either their form, or application: he only ſays, they are of iron, and without teeth.

SAXIFRAGE*, SAXIFRAGA *alba*, a medicinal plant, thus called from its ſuppoſed virtue in diſſolving the ſtone in the bladder. See LITHONTHRIPTIC.

* The word is compounded of the Latin *Saxum*, ſtone, and *frango*, I break.

Its leaves are almoſt round, indented, ſucculent and ſhining, like thoſe of ivy: in the middle of the leaves riſe ſtalks, about a foot high, which, at their extremities, bear little white flowers, conſiſting of five leaves, diſpoſed in form of a roſe. Its ſeed, which is very ſmall, is incloſed in the capſula of a roundiſh pod. Its root divides itſelf into ſeveral fibres, at the bottom whereof are found little reddiſh tubercles, like coriander-ſeed.

It is theſe grains are commonly called the ſeed of the *ſaxifrage*, and are the part uſed in medicine.—The beſt manner of adminiſtration, is to take them infuſed in white-wine, or in a decoction in common water.

Some uſe the decoction of the root itſelf: it is held a great diuretick; though Dr. Quincy obſerves, its lithonthriptic virtue is but little ſeen in practice. He adds, that the ſimple water thereof, ſold in the ſhops, is good for nothing; the virtue of the plant, if it have any, conſiſting in ſomething too groſs to riſe over the helm. See STONE.

SAXON, or the SAXON *Language*. See ENGLISH.

SAY, or SAYE, in commerce, a kind of ſerge; or a very light croſſed ſtuff, all wool; much uſed abroad for linings, and by the religious for ſhirts; and with us, by the quakers, for aprons, for which purpoſe it is uſually green.

There are very conſiderable manufactures hereof at Sudbury, near Colcheſter; alſo at Ypres, Houdſcot, &c. in Flanders, &c.—Thoſe made in England are chiefly exported to Portugal, and Leghorn.

SCABELLUM, in the antient architecture, a kind of pedeſtal, uſually ſquare, ſometimes polygonous, very high and ſlender, commonly terminating in a kind of ſheath or ſcabbard, or profiled in manner of a balluſter. Its uſe is to ſupport buſto's, or other relievo's, &c. See PEDESTAL, STATUE, &c.

SCABIES, in medicine. See the article ITCH.

SCABIOUS, SCABIOSA, a medicinal plant, very common in the fields, which has a great character among diſpenſatory writers, though it ſeems to grow much out of uſe.

It paſſes for a great pectoral, and to do great things in aſthma's and pleuriſies; and Etmuller gives it the pre-eminence in inward abſceſſes. It has a place alſo among alexipharmicks. But hardly any thing is in better eſteem for the itch, and other cutaneous foulneſſes; whence it has its name, *viz.* from *ſcabies*, itch; and upon which account it is often met with in decoctions, and ſometimes in a ſyrup, among ſuch as are called ſweetners.

SCAFFOLD*, a timber-work, raiſed in manner of an amphitheatre, to place ſpectators upon for the commodious viewing of ſome ſhew, or ceremony.

* Some derive the word from the German *ſchawhaus*, which ſignifies the ſame, compounded of *ſchawen*, to look, view, and *haus*, houſe. Guyet derives it from the Italian *catafalco*, which ſignifies the ſame thing. Du Cange, from *Eſchafaudus*, a word in the corrupt Latin, ſignifying a tribunal, or pulpit: he adds, that it might come originally from *cata*, a wooden machine uſed to carry earth to fill up ditches, and carry over the ſoldiers to the attack; whence the Italians formed their *catafalco*, the old French their *chafaut*, the Monks their *ſcaffaldus*, and the Engliſh their *ſcaffold*.

SCAFFOLD, is alſo uſed for a little ſtage, or theatre, raiſed in ſome publick place, to execute criminals upon, either by beheading or breaking upon the wheel.

SCAFFOLD, or SCAFFOLDING, is alſo uſed for an aſſemblage of planks and boards ſuſtained by treſſels, or by pieces of wood fixed in the wall; whereon maſons, ſculptors, painters, &c. ſtand to work in high places, wells, cielings, &c.

SCALA, in anatomy.—The cochlea, or inner cavity of the ear, is divided by a ſeptum into two canals, called *ſcalæ*: whereof the one, looking towards the tympanum, is called the *ſcala tympani*; the other, having a communication with the veſtibulum, is called the *ſcala veſtibuli*. See COCHLEA, EAR, TYMPANUM, and VESTIBULUM.

SCALA, in the ancient architecture, denotes what in the modern we call a *ſtair-caſe*. See STAIR-CASE.

SCALÆ *Gemoniæ*. See the article GEMONIÆ.

SCALADO, or SCALADE, a furious aſſault made on the wall or rampart of a city, by means of ladders wherewith to mount without carrying on works in form to ſecure the men. Cities are now no longer taken by *ſcalade*, ſince the walls have been flanked. See ESCALADE.

SCALE, a mathematical inſtrument, conſiſting of one or more lines drawn on wood, metal or other matter, divided into equal or unequal parts, of great uſe in laying down diſtances in proportion, or in meaſuring diſtances already laid down.

There are *ſcales* of ſeveral kinds, accommodated to the ſeveral uſes; the principal are, the *plain ſcale*, the *diagonal ſcale*, *Gunter's ſcale*, and the *plotting ſcale*.

Plain SCALE, or SCALE *of equal parts*, is made, by dividing a line, as A B (*Tab. Surveying fig.* 37.) into any number of equal parts, *e. gr.* 5 or 10, and then ſubdividing one of them, as *a b*, into 10 leſs parts.—This done, if one of the larger diviſions repreſent 10 of any meaſure: *e. gr.* 10 miles, 10 chains, 10 poles, 10 feet or 10 inches; each of the leſſer will repreſent one mile, or one chain, pole, foot or inch. See PLAIN and LINE.

The uſe of this *ſcale* is very obvious. *E. gr.* To lay down a diſtance by it of 32 miles, or 32 poles, &c. I take in my compaſſes the interval of three of the larger diviſions, which contain 30, and two of the ſmaller, for the two odd ones: this diſtance drawn on paper, will contain 32 by the *ſcale*.—Again, were I required to meaſure any line by a given *ſcale*: taking the length of the line in my compaſſes, I apply one foot in one of the great diviſions of the *ſcale*, ſo as the other may reach over among the leſſer; then the number of great and ſmall diviſions intercepted between the points, give the number of miles, &c.—See the uſe hereof further illuſtrated under the article PLOTTING *ſcale*.

Proportional SCALES, called alſo *logarithmical*, are the artificial numbers, or logarithms, placed on lines; for the eaſe and advantage of multiplying, dividing, &c. by means of compaſſes, or of ſliding-rules.—They are, in effect, only ſo many lines of numbers, as they are called by Gunter; but made ſingle, double, triple, or quadruple; beyond which they ſeldom go. See DECIMAL, GUNTER'S, PLOTTING, REDUCING *ſcale*.

Decimal SCALE,	See the articles	DECIMAL.
Gunter's SCALE,		GUNTER, and LINE.
Plotting SCALE,		PLOTTING *ſcale*.
Proportional SCALE,		PROPORTIONAL.
Reducing SCALE,		REDUCING.

SCALE, in geography and architecture, a line divided into equal parts, placed at the bottom of a map or draught, to ſerve as a common meaſure to all the parts of the building, or all the diſtances and places of the map. See MAP, &c.

In maps of large tracts, as kingdoms and provinces, &c. the *ſcale* uſually conſiſts of miles; whence it becomes denominated *A ſcale of miles*.

In more particular maps, as thoſe of manors, &c. the *ſcale* is uſually of chains ſub-divided into poles or links.

The *ſcales* uſed in draughts of buildings, uſually conſiſt of modules, feet, inches, palms, fathoms, or the like.

To find the diſtance between two towns, &c. in a map, the interval is taken in the compaſſes, and ſet off in the *ſcale*, and the number of diviſions it includes, gives the diſtance.—The ſame method ſerves to find the height of a ſtory in a deſign.

Front SCALE, in perſpective, is a right line in the draught, parallel to the horizontal line; divided into equal parts, repreſenting feet, inches, &c.

Flying SCALE, is a right line in the draught, tending to the point of view, and divided into unequal parts, repreſenting feet, inches, &c.

SCALE, SCALA, in muſick, is a denomination given to the arrangement of the ſix ſyllables invented by Guido Aretine, *ut re mi fa ſol la*; called alſo *Gammut*. See GAMMUT and NOTE.

It bears the name *ſcale* (*q. d.* ladder) by reaſon it repreſents a kind of ladder, by means whereof the voice riſes to acute, or deſcends to grave; each of the ſix ſyllables being as it were one ſtep of the ladder.

SCALE is alſo uſed for a ſeries of ſounds riſing or falling towards acuteneſs or gravity, from any given pitch of tune to the greateſt diſtance that is fit or practicable, through ſuch intermediate degrees as make the ſucceſſion moſt agreeable and perfect, and in which we have all the harmonical intervals moſt commodiouſly divided.

This *ſcale* is otherwiſe called an *univerſal ſyſtem*, as including all the particular ſyſtems belonging to muſick. See SYSTEM.

Origin and conſtruction of the SCALE *of muſick*.—Every concord or harmonical interval, is reſolvable into a certain number of degrees or parts; the octave, for inſtance, into three greater tones, two leſs tones, and two ſemi-tones; the greater ſixth, into two greater tones, one leſs tone, and two ſemi-tones; the leſs ſixth, into two greater tones, one leſs tone, and two ſemi-tones; the fifth, into two greater tones, one leſs tone, and one ſemi-tone; the fourth, into one greater tone, one leſs tone, and one ſemi-tone; the greater third, into one greater tone, and one leſs tone; and the leſs third, into one greater tone, and one leſs tone. It is true, there are variety of other intervals or degrees, beſides greater tones, leſs tones, and ſemi-tones, into which the concords may be divided; but theſe three are preferred to all the reſt, and theſe alone are in uſe.—For the reaſon whereof, ſee TONE. Further, it is not any order, or progreſſion, of theſe degrees, that will produce melody; a number, for inſtance, of greater tones will make no muſick, becauſe no number of them is equal to any concord, and the ſame is true of the other degrees: there is a neceſſity, therefore, of mixing the degrees to make muſick; and the mixture muſt be ſuch, as that no two of the ſame kind be ever next each other. A natural and agreeable order of theſe degrees Mr. Malcolm gives us in the following diviſion of the interval of an octave; wherein (as all the leſſer concords are contained in the greater) the diviſions of all the other ſimple concords are contained.—Under the ſeries are the degrees between each term, and the next.—In the firſt ſeries, the progreſſion is by the leſs third; in the latter by the greater third.

	great 2d	gr. 3d	4th	5th	6th	7th	8th
1 :	$\frac{8}{9}$:	$\frac{4}{5}$:	$\frac{3}{4}$:	$\frac{2}{3}$:	$\frac{3}{4}$:	$\frac{8}{15}$:	$\frac{5}{2}$
Key or fund.	great tone.	leſs tone.	ſemi-tone.	great tone.	leſs tone.	great tone.	ſemi-tone.

	great ſecond.						
1 :	$\frac{8}{9}$:	$\frac{5}{6}$:	$\frac{3}{4}$:	$\frac{2}{3}$:	$\frac{5}{8}$:	$\frac{5}{9}$:	$\frac{1}{2}$
Key or fund.	great tone.	ſemi-tone.	leſs tone.	great tone.	ſemi-tone.	great tone.	leſs tone.

Now, the ſyſtem of octave, containing all the original concords; and the compound concords being only the ſums of octave and ſome leſs concord; it is evident, that if we would have the ſeries of degrees continued beyond octave, they are to be continued in the ſame order through a ſecond as through the firſt octave, and ſo on through a third and fourth octave, &c. and ſuch a ſeries is what we call the *Scale of muſick.*

Of this, there are two different ſpecies; according as the leſs or greater 3d. or the leſs or greater 6th. are taken in; for both can never ſtand together in relation to the ſame key or fundamental, ſo as to make an harmonical *ſcale*. But if either of theſe ways, we aſcend from a fundamental or given ſound, to an octave, the ſucceſſion will be melodious; though the two make two different ſpecies of melody.—Indeed, every note is diſcord with regard to the next; but each of them is concord to the fundamental, except the 2d. and 7th.

In continuing the ſeries, there are two ways of compounding the names of the ſimple interval with the octave: thus, a greater or leſſer tone or ſemi-tone above an octave, or two octaves, &c. or to call them by the number of degrees from the fundamental, as 9th, 10th, &c.

In the two *ſcales* above, the ſeveral terms of the *ſcale* are expreſſed by the proportionable ſections of a line, repreſented by 1, the key or fundamental of the ſeries.—If we would have the ſeries expreſſed in the whole numbers, they will ſtand as follows; in each whereof the greateſt number expreſſes the longeſt chord, and the other numbers the reſt in order: ſo that if any number of chords be in theſe proportions of length, they will expreſs the true degrees and intervals of the *ſcale* of muſick, as contained in an octave concinnouſly divided in the two different ſpecies abovementioned.

great tone.	ſemi-tone.	leſs tone.	great tone.	ſemi-tone.	great tone.	leſs tone.	

This *ſcale* the ancients called the *diatonic ſcale*, becauſe proceeding by tones and ſemi-tones. See DIATONIC.

The moderns call it, ſimply, *The ſcale*, as being the only one now in uſe; and ſometimes, *The natural ſcale*, becauſe its degrees and their order are the moſt agreeable and concinnous, and preferable, by the conſent both of ſenſe and reaſon, to all other diviſions ever inſtituted.—Thoſe others, are the *chromatic* and *enharmonic ſcales*, which, with the *diatonic*, made the three *ſcales*, or *genera* of melody of the ancients. See GENERA: See alſo ENHARMONIC, and CHROMATIC.

The Deſign of the SCALE *of Muſick*, is to ſhew how a voice may riſe and fall leſs than any harmonical interval, and thereby move from the one extreme of any interval to the other, in the moſt agreeable ſucceſſion of ſounds.—The *ſcale*, therefore, is a ſyſtem, exhibiting the whole principles of muſick; which are either harmonical intervals (commonly called *concords*) or concinnous intervals: the firſt are the eſſential principles, the other ſubſervient to them, to make the greater variety. See CONCORD and INTERVALS.

Accordingly, in the *ſcale*, we have all the concords, with their concinnous degrees, ſo placed, as to make the moſt perfect ſucceſſion of ſounds from any given fundamental or key, which is ſuppoſed to be repreſented by 1. It is not to be ſuppoſed, that the voice is never to move up and down by any other more immediate diſtances than thoſe of the concinnous degrees: for though that be the moſt uſual movement, yet to move by harmonical diſtances, as concords, at once, is not excluded, but is even abſolutely neceſſary. In effect, the degrees were only invented for variety ſake, and that we might not always move up and down by harmonic intervals, though thoſe are the moſt perfect, the others deriving all their agreeableneſs from their ſubſerviency to them. See DEGREE.

Add that, beſides the harmonical and concinnous intervals, which are the immediate principles of muſick, and are directly applied in practice; there are other diſcord relations, which happen unavoidably in muſick, in a kind of accidental and indirect manner: for, in the ſucceſſion of the ſeveral notes of the *ſcale*, there are to be conſidered not only the relations of thoſe that ſucceed others immediately; but alſo of thoſe betwixt which other notes intervene. Now the immediate ſucceſſion may be conducted ſo, as to produce good melody; and yet among the diſtant notes there may be very groſs diſcords, that would not be allowed in immediate ſucceſſion, much leſs in conſonance:—Thus in the firſt ſeries, or *ſcale* above delivered, though the progreſſion be melodious, as the terms refer to one common fundamental; yet are there ſeveral diſcords among the mutual relations of the terms; *e. gr.* from 4th to 7th is 32 : 45, and from the greater 2d to the greater 6th is 27 : 40, and from the greater 2d to 4th is 27 : 32, which are all diſcords; and the ſame will happen in the ſecond ſeries. See DISCORD.

From what we have obſerved here, and under the article KEY, it appears, that the *ſcale* ſuppoſes no determinate pitch of tune; but that being aſſigned to any key, it marks out the tune of all the reſt, with relation to it; ſhews what notes can be naturally joined to any key, and thereby teaches the juſt and natural limitations of melody: and when the ſong is carried through ſeveral keys, yet it is ſtill the ſame natural *ſcale*, only applied to different fundamentals.—If a ſeries of ſounds be fixed to the relations of the *ſcale*, it will be found exceedingly defective; but this imperfection is not any defect in the *ſcale*, but follows accidentally from its being confined to this condition, which is foreign to the nature and office of the *ſcale* of muſick.

This is the caſe in muſical inſtruments; and in this conſiſts their great deficiency.—For, ſuppoſe a ſeries of ſounds, as thoſe of an organ or harpſicord, fixed in the order of this *ſcale*; and the loweſt taken at any pitch of tune; it is evident, 1°. that we can proceed from any note, only by one particular order of degrees: ſince from every note of the *ſcale* to its octave, is contained a different order of the tones and ſemi-tones. Hence, 2°. we cannot find any interval required from any note upwards or downwards; ſince the intervals from every note to every other, are alſo limited. And hence, 3°. a ſong may be ſo contrived, that, beginning at a particular note of the inſtrument, all the intervals, or other notes, ſhall be found exactly on the inſtrument or in the fixed ſeries; yet were the ſong, though perfectly diatonic, begun in any other note, it would not proceed.

In effect, it is demonſtrable, there can be no ſuch thing as a perfect *ſcale* fixed on inſtruments; *i. e.* no ſuch *ſcale* as from any note upwards or downwards, ſhall contain any harmonical or concinnous interval required.

The only remedy for this defect of inſtruments whoſe notes are fixed, muſt be by inſerting other notes and degrees betwixt thoſe of the diatonic ſeries.—Hence ſome authors ſpeak of dividing the octave into 16, 18, 20, 24, 26, 31, and other number of degrees; but it is eaſy to conceive, how hard it muſt be to perform on ſuch an inſtrument.

The beſt on it is, we have a remedy on eaſier terms: for a *ſcale* proceeding by twelve degrees, that is, thirteen notes, including the extremes, to an octave, renders our inſtruments ſo perfect, that we have little reaſon to complain.—This, then, is the preſent *ſcale* for inſtruments, *viz.* between the extremes of every tone of the natural *ſcale* is put a note, which divides it into two unequal parts, called *ſemi-tones*; whence the whole may be called the *ſemitonic ſcale*; as containing twelve ſemi-tones, betwixt thirteen notes, within the compaſs of an octave. See SEMITONE.

And to preſerve the diatonic ſeries diſtinct, theſe inſerted notes take either the name of the natural note next below, with the mark ♯ called a *ſharp*; or the name of the natural note next above, with this mark ♭ called a *flat*. See FLAT and SHARP.

For the SCALE of ſemi-tones,	See	SEMITONIC *Scale.*
For Guido's SCALE, commonly called the *Gammut*,		GAMMUT.
For the SCALE *of the ancients*, commonly called the *Diagram*,		DIAGRAM.

SCALENE *, SCALENUM, or SCALENOUS *triangle*, in geometry, a triangle, whoſe ſides and angles are all unequal. See TRIANGLE.

* The word is formed from the Greek σκαληνος, which ſignifies oblique, unequal, &c.

A cylinder or cone, whoſe axis is inclined to its baſe, is alſo ſaid to be *ſcalenous*. See CONE and CYLINDER.

SCALENUS, or SCALENUM, in anatomy, a name given to three pair of muſcles, from their form; all of them ſerving to draw the ribs upwards, in conjunction with the ſerratus ſuperior poſticus, &c.—See *Tab. Anat.* (Myol.) *fig.* 2. *n.* 5. *fig.* 1. *n.* 16.

SCALENUS *Primus*, ſprings, fleſhy, from the tranſverſe proceſſes of the ſecond, third, and fourth vertebræ of the neck, where deſcending laterally, it is inſerted into the firſt rib, which it helps to draw upwards.

SCALENUS *Secundus*, ariſes from the ſame proceſſes, as likewiſe from thoſe of the fifth vertebra of the neck; and is inſerted into the ſecond rib, and ſometimes into the third.

SCALENUS *Tertius*, ariſes from the ſame proceſſes with the former, and from thoſe of the ſixth vertebra of the neck; and is inſerted into the firſt rib.

SCALLOP *Tyles.* See the article TYLES.

SCALPEL, SCALPELLUM, in chirurgery, a kind of knife chiefly uſed in diſſections; but which may be occaſionally uſed in many other operations, as in amputations, and to cut off the fleſh and membranes that are between the two bones of an arm or leg, before the limb be ſawed off.

There are two kinds of *ſcalpels*: the firſt cuts on both ſides, and is fixed in an ebony or ivory handle, which being very flat and thin at the extremity, ſerves to part the membranous and fibrous parts in anatomical preparations.

The other has a back, that is, it only cuts on one ſide; it is crooked, and very commodious for ſtripping the fleſh off the bones in embalming, making ſkeletons, *&c.*

Scultetus, in his *Arſenal*, deſcribes ſeveral other kinds of *ſcalpels*; as, a deceitful *ſcalpel*, thus called, becauſe it deceives the patient by hiding its blade. It was much uſed by the ancients, in opening and dilating of ſinews; but as it is apt to deceive the chirurgeon itſelf, and is beſides very ſlow, it is better uſing a ſyringotomus.—A *ſcalpel*, ſharp on both ſides for ſetons.—A little crooked *ſcalpel* for ſeparating the coherence of the eyelids.—A ſharp, double-cutting *ſcalpel*, with a bone-handle, for the cutting off an ægilops.—*Scalpels* like ſcolopomachærions, *&c.* Even the ſcolopomachærion itſelf is a kind of *ſcalpel.* See SCHOLOPOMACHÆRION.

SCALPER, SCALPRUM, or SCALPING-*Iron*, a chirurgeon's inſtrument wherewith to raſp, and ſcrape foul, carious bones.

SCALPTOR *Ani*, in anatomy. See LATISSIMUS *Dorſi.*

SCAMILLI *Impares*, in the ancient architecture, a term much contended about among the criticks; though, in effect, it ſignify no more than certain zocco's or blocks, ſerving to raiſe the reſt of the members of an order, column, ſtatue or the like, and prevent their being loſt to the eye, which may chance to be placed below their level; or below the projecture of ſome of the ornaments thereof.

Theſe *Scamilli* are well enough repreſented by the pedeſtals of ſtatues. See PEDESTAL.

SCAMMONY, SCAMMONIUM, in pharmacy, an inſpiſſated juice, of the root of a plant of the ſame name, growing in the Levant, particularly about Aleppo and St. John de Acre.

The juice flows from an inciſion made in the root; and is afterwards thickened by the ſun, as it was pretended, but in reality by the fire. The tree is much like an ivy, its leaves in form of hearts, its flowers white, and it creeps on the ground or climbs on other trees, walls, *&c.*

The good and genuine *ſcammony* of Aleppo, is to be grey, tender, friable and reſinous; the taſte bitter, and the ſmell faintiſh, and diſagreeable.

The *ſcammony* of Smyrna, and that of the Eaſt-Indies, are leſs valued; the firſt as being more heavy, hard and black; the latter, though light, friable, *&c.* is in reality only a compoſition of common roſin with ſome other violent purgatives. Pomet aſſerts, that both kinds are rather poiſons than remedies.

The true *ſcammony* is one of the ſureſt purgatives; but, at the ſame time, one of the moſt violent they have: hence, it is ſeldom uſed without correcting it by ſome preparation with ſulphur, quince or the like. See DIAGRYDIUM.

From the juice is drawn a reſin of more virtue than the *ſcammony* itſelf. They alſo make a ſyrup of it, which is found a very gentle purgative.

The *ſcammony* now in uſe, muſt be very different from that of the ancients, at leaſt in the preparation; by reaſon the ancients gave it in much larger doſes: hence Fallopius conjectures, the modern *ſcammony* to be adulterated with ſpurge.

Some give the name of American *ſcammony* to Mechoacan. See MECHOACAN.

SCANDAL,* ΣΚΑΝΔΑΛΟΝ, in the ſcripture language, denotes any thing that may draw us aſide, or ſollicit us to ſin.

* The word is formed from the Greek σκανδαλον, or the Latin *ſcandalum*, which, according to Papias, was originally uſed for a ſudden, extemporary quarrel, *quæ ſubito inter aliquos* ſcandit *vel oritur*.

In which ſenſe, the word is uſed promiſcuouſly with *offence*, and *ſtumbling-block.*

Scandal is either *active* or *paſſive.*

Active *ſcandal* is a real induction to ſin; paſſive *ſcandal* is the impreſſion which an active *ſcandal* makes on the perſon induced to ſin.

SCANDAL, in the popular language, is ſome action, or opinion contrary to good manners, or to the general ſenſe of a people. See ABSURD.

SCANDAL alſo denotes a diſadvantageous rumour, or report; or an action whereby any one is affronted in publick.

Stone of SCANDAL, *Lapis Scandali*, or *Vituperii*, a ſtone raiſed in the great portal of the capitol in Rome; whereon was engraven the figure of a lion; upon which bankrupts or ceſſionaries being ſeated bare-breeched, cried with a loud voice, *Cedo bonis*, I ſurrender my effects; when, ſquatting their breech violently, three times on the ſtone, they were acquitted. See CESSION.

It was called the *Stone of Scandal*, becauſe thence-forward the ceſſionary became inteſtable, and incapable of giving any evidence.

Julius Cæſar introduced this form of ſurrender, after abrogating that article of the laws of the twelve tables, which allowed the creditors to cut their inſolvent debtors in pieces, and take each his member; or at leaſt to make a ſlave of him. See BANKRUPT.

SCANDALUM *Magnatum*, in law, denotes a ſcandal or wrong done to any high perſonage of the land, as peers, prelates, judges, or other great officers, by falſe or ſlanderous news or tales, whereby any debate or diſcord between them and the commons, or any ſcandal to their perſons, might ariſe.

This offence has alſo given name to a writ granted to recover damages thereupon.

SCANNING *, SCANSIO, in poetry, the meaſuring of a verſe, to ſee what number of feet and ſyllables it contains, and whether or no the quantities, that is, the long and ſhort ſyllables, be duly obſerved. See QUANTITY, MEASURE, FOOT, *&c.*

* The word is formed from the Latin, *ſcandere*, to climb.

The term is chiefly uſed with regard to Greek and Latin verſes; the quantities not being well ſettled and obſerved in the verſes of the modern languages. See VERSE.

Hexameters are *ſcanned* one way, iambicks another, ſapphicks another. See HEXAMETER, *&c.*

SCANTLING *, a meaſure, ſize, or ſtandard, whereby the dimenſions, *&c.* of things are to be determined.

* The word is formed from the French, *eſchantillon*, a pattern or ſpecimen. See STANDARD.

SCAPHISM *, SCAPHISMUS, in antiquity, a kind of torture or puniſhment formerly in uſe among the Perſians. It conſiſted in locking the criminal cloſe up within the trunk of a tree bored to the dimenſions of his body, only with five holes for his head, arms, and legs to come through. In this ſtate he was expoſed to the ſun, and the parts thus appearing anointed with honey and milk, to invite the waſps and flies.

* The word is Greek, Σκαφισμος; formed of σκαφος, digging, of σκαπτω, I dig, hollow.

To increaſe the torment, they forced the criminal to eat abundantly, till his excrements, cloſe pent up in the wood, rotted his body. Some authors obſerve, that perſons ordinarily lived forty days in this condition.

This invention is aſcribed to Pariſatis queen of Perſia, and mother of Artaxerxes Mnemon, and the young Cyrus. It is added, ſhe firſt ordered it to be practiſed on the perſon who brought the tidings of the death of Cyrus.

SCAPHOIDES *, ΣΚΑΦΟΕΙΔΗΣ, in anatomy, a bone of the foot; called alſo *Naviculare.* See NAVICULARE.

* The word is formed of the Greek, σκαφη, a boat, or bark; of σκαπτω, I hollow (becauſe boats were originally made of trunks of trees hollowed, as are ſtill the canoes of ſeveral ſavages) and ειδος, form.

SCAPULA, in anatomy, *omoplata*, or *ſhoulder-blade*; a large, broad bone, repreſenting a ſcalenous triangle, ſituate on each ſide of the upper and back part of the thorax.—*V. Tab. Anat.* (Oſteol.) *fig.* 7. *n.* 6, 6.

The ſubſtance of the *ſcapula* is thin, but ſolid and firm; its outſide is ſomewhat convex, and its inſide concave; its upper edge is called *coſta ſuperior*, and its lower, *coſta inferior*; its broad end is called its *baſis*, which, with the two edges, make the upper and lower angles. See OMOPLATE.

The *ſcapulæ* have each three proceſſes, of which the firſt runs all along the middle of their outſide, and is called their *ſpine.* —*Fig.* 3. *n.* 4, 4. & *fig.* 7. *n.* 7, 7. That end of the ſpine, which receives the extremity of the clavicula, is called *Acromium.*—The ſecond proceſs is a little lower than the acromium; it is ſhort and ſharp, like a crow's bill, therefore called *Coracoides*; theſe two proceſſes are tied to one another by a ſtrong ligament, which ſerves to keep the head of the humerus in the cavity of the third proceſs, which is called *Cervix.*

This proceſs is the extremity of the *ſcapula*, which is oppoſite to its baſis. It has a round ſinus, tipped about its brim with a cartilage, which receives the head of the humerus.

The uſe of the *ſcapula* is to receive the extremities of the clavicula and humerus, for the eaſier motion of the arm, and to give riſe to the muſcles, which move the arm.

SCAPULAR, SCAPULARIS, in anatomy, an epithet given to two arteries, and as many veins of the body.

The SCAPULARIS *interna & externa*, or inner and outer *ſcapular* arteries, ariſe out of the ſubclavian, and are ſpread over the *ſcapulæ.* See ARTERY.

The Inner and *Outer* SCAPULAR *Veins* diſcharge themſelves into the axillary, or vein of the arm-pits. See VEIN, and SUBSCAPULARIS.

SCAPULAR *, or SCAPULARY, alſo denotes part of the habit of ſeveral orders of religious, worn over the gown, as a badge of peculiar veneration for the virgin.

* The word is formed from the French, *ſcapulaire*, which ſignifies the ſame; and that from the Latin, *ſcapula*, the ſhoulder-blade.

The *ſcapular* conſiſts of two narrow breadths or ſlips of cloth, covering the back and the breaſts, and hanging down to the feet of the profeſſed religious, and to the knees of the lay-brothers, *&c.*

The common opinion concerning the introduction of the *ſcapular*, is, that it was firſt given by the virgin herſelf, in an apparition ſhe made to F. Stock, general of the Carmelites, in the thirteenth century.—Which account of its origin is aſſerted, or at leaſt ſuppoſed, in ſeveral bulls of the popes. See CARMELITE.

M. de Launoy, however, maintains, in an expreſs treatiſe on the ſubject, that the apparition was falſe, and the ſabbatine bull, which approves of the *ſcapulary*, a counterfeit. In effect, the Carmelites themſelves did not begin to wear the *ſcapulary* till ſeveral years after it is pretended the virgin gave it to father Stock.

There is alſo a *Friery*, or *Fraternity of the* SCAPULAR; conſiſting of lay-brothers, who profeſs a particular devotion to the virgin, and who, in honour of her, wear a little *ſcapular*, in manner of a bracelet, or otherwiſe, repreſenting the great one.—They are obliged to certain prayers, and to obſerve certain rules in their manner of life.

SCAPUS, in architecture, the fuſt or ſhaft of a column. See FUST.

SCAPUS, in botany, denotes the ſtrait ſtalk, or ſtem of a plant, ſtanding upright like a pillar, or column. See STEM.

SCAR. See the article ESCHAR.

SCARIFICATION *, SCARIFICATIO, in chirurgery, an operation whereby ſeveral inciſions are made in the ſkin, with a lancet or other inſtrument proper for that purpoſe. See SCARIFICATOR.

* Salmaſius will have us write *ſcariſatio*, not *ſcarificatio*, in regard the word is derived from the Greek, σκαμφος. See his notes on Solinus, p. 519. where he thus corrects the reading of *Plin.* lib. XVII. F. Hardouin lets the old reading *ſcarificatio* ſtand; though he owns the MSS have it *ſcariphatio*; but adds, that Theod. Priſcian writes *ſcarificatio*.

Scarificatio is chiefly practiſed in cupping. See CUPPING. It acts by ſtimulating and evacuating.

SCARIFICATOR, a chirurgical inſtrument uſed in *ſcarification*. See SCARIFICATION.

The *ſcarificator* is made in form of a box, wherein are fitted 10, 12, or 15 lancets, all perfectly in the ſame plane; which being, as it were, cocked, by means of a ſpring, are all diſcharged at the ſame time, by pulling a kind of trigger, and driven equally within the ſkin.—Till of late, they uſed little ſharp cutting wheels inſtead of lancets.

The uſe of the *ſcarificator* is to evacuate the blood, and other humours, ſpread under the ſkin, by making a great number of apertures, or outlets, therein; which being thus all ſtruck at once, gives much leſs pain than when ſtruck ſucceſſively.

SCARLET *, in dying, one of the ſeven kinds of good reds. See RED, COLOUR and DYING.

* Menage derives the word from the barbarous Latin, *ſcarleta*, or *ſcarletum*; which he deduces further from the German *ſcharlach*, or the Flemiſh *ſcarlaken*: whence the Engliſh have formed *ſcarlet*, the Italians *ſcarlato*, and the French their *eſcarlate*.—Others derive it from the Celtic, *ſquarlera*: Dalechampius will have it called *ſcarlatum*, by corruption, for *caſculiatum*, a barbarous word introduced into Spain; others fetch it from the Arabic *yxquerlate*.

There are two kinds of *ſcarlets*; the one given with *kermes*, or *ſcarlet-grain*; the other with *cochineel*. See COCHINEEL, KERMES, *&c.*

SCARLET-GRAIN, is a dyer's drug, uſed for giving a *ſcarlet* colour; and commonly taken for the grain of a plant.

This imaginary grain, called by the Arabs, *kermes*, is found on a kind of ilex, growing in great plenty in the uncultivated parts of Provence, Languedoc, Spain and Portugal.—That of Languedoc paſſes for the beſt, being big, and of a very bright red; that of Spain is the worſt, being very ſmall, and of a blackiſh red; it is to be gathered when ripe, and is only good while new, that is, within the compaſs of the year, after which time a kind of inſect is found in it, that eats out the heart thereof.

F. Plumier has made ſome particular diſcoveries on the ſubject of *ſcarlet-grain*: the Arabic term *kermes*, which ſignifies *little worms*, he obſerves, agrees perfectly with the nature of this drug; which is the work of a worm, and not the grain or ſeed of a tree, as is generally ſuppoſed.—The ſhrub it is found on, is the ilex aculeata cocci-glandifera; on the leaves, and little ſhoots whereof, appear, in the ſpring time, a kind of little veſiculæ, at firſt no bigger than grains of millet, occaſioned by the puncture of an inſect, which depoſits its eggs therein.—In proportion as theſe grow, they become covered with a kind of aſh-coloured down, which hides the red colour underneath: and when arrived at maturity, which thoſe who gather them know very well, they are taken from the tree, in form of little galls.

The huſk, or ſkin of theſe galls, is very light, and brittle, covered with a fine membranous pellicle all around, except at the place where it grows to the leaf: a ſecond ſkin, under the firſt, is full of a duſt, partly red, and partly white.

As ſoon as the galls are gathered, the juice, or pulp is expreſſed from them; and they are waſhed in vinegar, to deſtroy the little inſects within-ſide, which, without ſuch precaution, would grow, feed on the duſt, and, at laſt, be hatched, and leave only empty ſhells.

The *ſcarlet-grain* is alſo of conſiderable uſe in medicine, where it is better known under its Arabic name of *kermes*. See KERMES and CONFECTION.

SCARLETINA *Febris*, SCARLET-*Fever*, the ſame as purple-fever. See PURPLE and FEVER.

SCARP, in fortification, the interior ſlope of the ditch of a place; that is, the ſlope of that ſide of a ditch which is next to the place, and faces the campaign. See DITCH.

The *ſcarp* commences from the liziere or foot of the rampart. The *ſcarp* is oppoſite to the *counterſcarp*, which is the other ſide of the ditch. See COUNTERSCARP.

SCARP, is alſo a term in heraldry, probably derived from the French *eſcharpe*; ſignifying the ſcarf, which military commanders wear for ornament.

It is borne ſomething like a battoon ſiniſter, but is broader, and is continued out to the edges of the field; whereas the battoon is cut off at each end.—He beareth argent, a *ſcarp* azure.—*V. Tab. Herald. fig.* 44. See alſo BATTOON.

SCAVAGE, SCHEVAGE, SCHEWAGE, or SHEWAGE, in our ancient cuſtoms, a kind of toll or cuſtom, exacted by mayors, ſheriffs, *&c.* of merchants-ſtrangers, for wares ſhewed, or offered to ſale within their liberties. This cuſtom is prohibited by Stat. 19 Hen. VII. c. 7.. though the city of London ſtill retains the benefit of it. See OSTENSIO.

SCAVANT *, or SAVANT, a term purely French, ſignifying *learned*; little uſed in our language, except in the phraſe, *journal des ſçavans*, denoting, a journal of the works of the learned publiſhed monthly at Paris; being the firſt work of that kind; and that from which all the reſt were taken. See JOURNAL.

* Menage derives the word from the Latin *ſapere*, to be wiſe, and on that footing will have it wrote *ſavant*; others, from *ſcire*, to know, and for that reaſon write it *ſçavant*. —The latter etymology, and orthography, are followed by the academy; though all the ancient MSS. have it *ſavant*, *ſavoir*, &c.

SCAVENGERS *, two officers choſe yearly in each pariſh in London, and the ſuburbs, whoſe buſineſs it is to hire perſons, called *rakers*, and carts to cleanſe the ſtreets, and carry away the dirt and filth thereof.

* The word is derived from the Saxon *ſcaefda*, or Dutch *ſchaven*, to ſcrape or ſhave away.

The *ſcavengers* are much the ſame with what were anciently called *ſtreet-wards*.—The Germans call them *dreckſimons*, from one Simon a famed *ſcavenger* of Marpurg.

SCELOTYRBE *, ΣΚΕΛΟΤΥΡΒΗ, weakneſs and pains in the legs; generally attending ſcorbutick habits.

* The word is compounded of σκελος, leg, and τυρβη, tumult, or uproar.

Scelotyrbe is alſo uſed for the ſcurvy itſelf; and ſometimes applied to medicines contrived againſt ſuch diſorders. See SCORBUTUS.

SCENE *, SCENA, in its primary ſenſe, denoted a theatre, or place where dramatic pieces, and other publick ſhews, were repreſented. See THEATRE.

* The word is originally Greek, Σκηνη, ſignifying a tent, hut, booth, or the like, where dramatic pieces were anciently performed.

According to Roſinus, the *ſcene* in its proper, and original ſenſe, was a ſeries of trees diſpoſed againſt each other, ſo as to form a continued arch, and ſhade, σκια, to defend thoſe underneath it from the injuries of the weather: for in ſuch places it was, that, in ancient times, ere theatres were built, they acted their plays. Thus alſo Caſſiodorus derives the word *ſcene*, from the cloſe ſhade of the grove, where, in the ſpring-time, the ancient ſhepherds uſed to ſing and play.

SCENE, was more particularly uſed for the decorations of a ſtage, or theatre. See DECORATION.

The ancients, we are informed by Vitruvius, had three ſorts of *ſcenes*, or ſcenical decorations in their theatres.—That in common uſe was a ſpacious front or range of building adorned with columns and ſtatues; in which were three large openings, through which other buildings appeared in perſpective, *viz.* a palace for tragedies, houſes and ſtreets for comedies, and foreſts for paſtorals.

Theſe decorations were either *verſatile*, *i. e.* they turned on pivots, as deſcribed by Vitruvius; or *ductile*, *i. e.* ſlided along grooves, as thoſe in our theatres.—And, as this or that ſide, or repreſentation, was turned towards the ſpectators, the *ſcene* was called a *tragic*, a *comic*, or a *paſtoral ſcene*. See ſeveral curious remarks on the ancient *ſcene* in M. Perrault's notes on Vitruvius, lib. 5. cap. 6.

SCENE, is alſo uſed for the place repreſented, or that where the action is conceived to have paſſed. See ACTION.

One of the grand laws of the drama, is, to obſerve the unity of the *ſcene*, which we more uſually call the *unity of place*. See UNITY.

In effect, to keep cloſe to nature and probability, the *ſcene* ſhould never be ſhifted from place to place, in the courſe of the play. The ancients were pretty ſevere in this reſpect,

ſpect, particularly Terence: in ſome of his plays, the *ſcene* never ſhifts at all, but the whole is tranſacted before the door of an old man's houſe, whither, with inimitable art, he brings all his actors, occaſionally.

The French too are very ſtrict in this reſpect: but the Engliſh plead for a diſpenſation from the rule; which they think confines them to too narrow bounds, and precludes them from that variety of adventures and intrigues, which an Engliſh audience will never be ſatisfied without.

However, the more judicious and accurate of our writers are very moderate in the uſe of this licence; and take care not to deviate too far from probability, by ſhifting the *ſcene* between the acts, much farther than the perſons concerned may be ſuppoſed to have gone in the interval. Hence they ſeldom carry the *ſcene* out of the ſame town.—Though others, who own no ſubjection to the ancient rules, take otherguiſe liberties: with ſome of theſe it is nothing, when a fancied *ſcene*'s in view, to ſkip from Covent-Garden to Peru.—The great Shakeſpear is exceedingly faulty in this reſpect, in almoſt all his plays.

SCENE, is alſo a part, or diviſion, of a dramatic poem, determined by a new actor's entering.

Plays are divided into *acts*, and acts ſubdivided into *ſcenes*. See ACT.

In moſt of our printed plays, a new *ſcene* is never expreſſed to begin, but when the place is ſuppoſed to be changed by ſhifting, or drawing, the moveable *ſcene*; but this muſt be eſteemed an overſight, ſince on our ſtage, the *ſcene* is, properly, the perſons preſent at, or concerned in, the action on the ſtage at ſuch time. Whenever, therefore, a new actor appears, or an old one diſappears, the action is changed into other hands, and therefore a new *ſcene* then commences.

It is one of the laws of the ſtage, that the *ſcenes* be well connected: that is, that one ſucceed another, in ſuch manner, as that the ſtage is never quite empty till the end of the act. See CONNECTION.

The ancients did not allow of above three perſons on the ſtage at the ſame time, excepting in the chorus's, where the number was not limited: the moderns have but little regard to this reſtriction.

SCENIC *Games*, *Ludi* SCENICI, among the ancients, were entertainments exhibited on the *ſcena*, or theatre; including what we now call *plays* of all kinds, with dancing, and other theatrical performances. See THEATRE, GAME, *&c.*

The Romans were 400 years without any *ſcenic games* at all: Livy obſerves, that they were firſt inſtituted in the year of Rome 392, under the conſulate of C. Sulpitius Peticus, and C. Licinius Stolo. But the criticks have obſerved a trip here in Livy; the conſulate of thoſe perſons falling in the year 389, which, therefore, is held the æra of the introduction of *ſcenic games*. See SATYR.

At firſt, ſome actors were ſent for out of Hetruria; who, without reciting any thing, danced about to the ſound of inſtruments: ſo that thus far was no more than a ball, or rather what the French call a *ballet*.—At length they began to rehearſe verſe. See ATELLAN, FESCENNINE, *&c.*

Thus, by degrees, growing more and more perfect, their *ſcenical* ſhews were at laſt repreſented with a juſtneſs, and magnificence, beyond any thing the world ever ſaw.—The fathers, in their writings, cry out loudly againſt the *ſcenical games*.

SCENOGRAPHY *, in perſpective, a repreſentation of a body on a perſpective plane; or, a deſcription thereof in all its dimenſions, ſuch as it appears to the eye. See PERSPECTIVE.

* The word is formed from the Greek, σκηνη ſcene, and γραφη deſcription.

The ichnography of a building, *&c.* repreſents the plan, or ground-work of the building. See ICHNOGRAPHY. The orthography, the front, or one of the ſides. See ORTHOGRAPHY. And the *ſcenography*, the whole building, front, ſides, height and all, raiſed on the geometrical plan.

To exhibit the SCENOGRAPHY *of any body.*—1°. Lay down the baſis, ground-plot, or plan of the body, in the perſpective ichnography, according to the method laid down under the article PERSPECTIVE. 2°. Upon the ſeveral points of the plan raiſe the perſpective heights: thus will the *ſcenography* of the body be compleated; excepting that a proper ſhade is to be added. The method of raiſing the heights is as follows.

On any point given as C, *Tab. Perſpect. fig.* 1. N°. 2. to raiſe a perſpective altitude, anſwerable to an objective altitude P Q—On the terreſtrial line raiſe a perpendicular P Q, equal to the given objective altitude. From P and Q, to any point, as T, draw right lines P T and Q T. From the given point C draw a right line C K, parallel to the terreſtrial line D E, meeting the right line Q T in K. In the point K, upon the line K C, erect a perpendicular I K. This I K is the *ſcenographic* altitude required.

The application of this general method of drawing the *ſcenography* of a body, is not ſo obvious, in every caſe, but that it may be neceſſary to illuſtrate it a little by a few examples.

To exhibit the SCENOGRAPHY *of a cube, viewed by an angle.*—1°. As the baſis of a cube viewed by an angle, ſtanding on a geometrical plane, is a ſquare viewed by an angle; draw a ſquare, viewed angular-wiſe, on the perſpective table, or plane. 2°. Raiſe the ſide H I (*fig.* 2. N°. 2.) of the ſquare perpendicularly on each point of the terreſtrial line D E; and to any point, as V, of the horizontal line H R, draw the right line V I and V H. 3°. From the angles d, b and c, draw c 1, d 2, *&c.* parallel to the terreſtrial line D E. 4°. From the points 1 and 2, raiſe L 1, and M 2, perpendicular to the ſame. Laſtly, ſince H I is the height to be raiſed in a, L I in c and b, and M 2 in d; in a, raiſe the line f a perpendicular to a E; in b and c, raiſe b g and c e perpendicular to b c 1; and laſtly, raiſe d h, perpendicular to d 2: and make $af = HI$, $bg = ec = L1$, and $hd = M2$: if then the points g, h, e, f be connected by right lines, the *ſcenography* will be compleat.

To exhibit the SCENOGRAPHY *of a hollow quinquangular priſm.*—1°. Since the baſe of a hollow quinquangular priſm, ſtanding on a geometrical plane, is a pentagon, with a limb or breadth of a certain dimenſion; find the appearance of this pentagon on a table, or plane. See PERSPECTIVE. 2°. On any point, as H, of the terreſtrial line D E (*fig.* 3.) raiſe a perpendicular H I, equal to the objective altitude; and to any point, as V, of the horizontal line H R, draw the lines H V and I V. 3°. From the ſeveral angles a, b, d, e, c, of the perſpective ichnography, both the internal and external ones, draw right lines, as b 2, d 3, *&c.* parallel to the terreſtrial line; and from the points 1, 2, 3, raiſe perpendiculars to the ſame, as L 1, M 2 m 2, N 3 n 3. If theſe, then, be raiſed in the correſpondent points of the ichnography, as in the preceding article, the *ſcenography* will be compleat.

To exhibit the SCENOGRAPHY *of a cylinder.*—1°. Since the baſe of a cylinder, ſtanding on a geometrical plane, is a circle; ſeek the appearance of a circle. In the points, a, b, d, f, h, g, e, c, (*fig.* 8.) raiſe the apparent altitudes, as in the preceding articles. If now their upper lines be connected by curve lines, as in the baſe, a, b, d, f, g, h, e, c, the *ſcenography* of the circle will be compleat.

It is evident that thoſe lines are to be omitted, both in the plan and in the elevation, which are not expoſed to the eye; though they are not to be diſregarded, from the beginning, as being neceſſary for the finding of other lines.—*E. gr.* In the *ſcenography* of the cube, viewed angle-wiſe, the lines b d and d c, (*fig.* 2. N°. 2.) in the baſe, and d h in the elevation, are hid from the eye, and are therefore omitted in the deſcription. But ſince the upper point h is not to be found unleſs the point d be had in the ichnography; nor can the lines g h and d e be drawn without the height d h; the appearance of the point d is as neceſſary to be determined in the operation, as the height h d.

To exhibit the SCENOGRAPHY *of a pyramid, ſtanding on its baſe.*—Suppoſe, *e. gr.* it were required to delineate a quadrangular pyramid, viewed by an angle. 1°. Since the baſe of ſuch pyramid is a ſquare ſeen by an angle, draw ſuch a ſquare. 2°. To find the vertex of the pyramid, *i. e.* a perpendicular let fall from the vertex to the baſe, draw diagonals mutually interſecting each other in e (*fig.* 5. N°. 2.) 3°. On any point, as H, of the terreſtrial line D E, raiſe the altitude of the pyramid H I; and drawing the right lines H V, and I V to each point of the horizontal line H R; produce the diagonal a b, till it meet the line V H in h. Laſtly, from h draw h i parallel to H I. This being raiſed on the point e, will give the vertex of the pyramid K; conſequently, the lines d k, k a, and k b, will be determined at the ſame time.

After the like manner is the *ſcenography* of a cone delineated.

To exhibit the SCENOGRAPHY *of a truncated pyramid.*—Suppoſe the truncated pyramid quadrangular; 1°. then, If from the ſeveral angles of the upper baſe be conceived perpendiculars let fall to the lower baſe, we ſhall have a pentagon, with another inſcribed therein, whoſe ſides are parallel to thoſe of the former. This coincides with a pentagon, furniſhed with a rim or breadth, *&c.* and may therefore be delineated in the ſame manner.—2°. Raiſing the altitude of the truncated pyramid I H (*fig.* 6. N°. 2.) determine the *ſcenographic* altitudes, to be raiſed in the points a, b, c, d, e. If now the points higher f, g, h, i, k, be connected by right lines, and the lines l k, f m, g n, h o, be drawn, the *ſcenography* will be compleat.—By drawing two concentric circles in a geometrical plane, and doing every thing elſe, as in this problem, the *ſcenography* of a truncated cone will be drawn.

To exhibit the SCENOGRAPHY *of walls, columns,* &c. *or to raiſe them on the pavement.*—1°. Suppoſe a pavement AFHI (*fig.* 7. N°. 2.) repreſented in a plan, together with the baſes of the columns, *&c.* if there be any. 2°. Upon the terreſtrial line ſet off the thickneſs of the wall B A and 1 3. 3°. Upon A and B, as alſo upon 3 and 1, raiſe perpendiculars A D and B C, as alſo 3, 6, and 1, 7. 4°. Connect the points D and 6 with the principal point V, by the right lines D V and 6 V. 5°. Upon F and H raiſe perpendiculars H G and E F. Thus will all the walls be delineated.

Now to raiſe the pillars, *&c.* there needs nothing but, from their ſeveral baſes (whether ſquare, or circular) projected on the perſpective plan, to raiſe indefinite perpendiculars; and on the fundamental line, where interſected by the radius F A paſſing through the baſe, raiſe the true altitude A D: for D V being drawn as before, the *ſcenographical* altitudes will be determined.

To exhibit the SCENOGRAPHY *of a door in building.*—Suppoſe a door required to be delineated in a wall D E F A; 1°. Upon the fundamental line ſet off its diſtance A N from the angle A, together with the breadths of the poſts N I and L M, and the breadth of the gate itſelf L I. 2°. To the point of diſtance K, from the ſeveral points N, I, L, M, draw right lines K N, K I, K L, K M, which will determine the breadth of the door l i. and the breadths of the poſts i n and m l. 3°. From A to O, ſet off the height of the gate A O, and from A to P, the height of the poſts A P. 4°. Join O and P with the principal point, by the right lines P V and O V. 5°. Then, from n, i, l, m, raiſe perpendiculars, the middle ones whereof are cut by the right line O V in o, and the extremes, by the right line V P in p. Thus will the door be delineated, with its poſts. If the door were to have been exhibited in the wall E F G H, the method were nearly the ſame. For, 1°. Upon the terreſtrial line, ſet off the diſtance of the door from the angle, and thence alſo the breadth of the door R T. 2°. From R and T, draw right lines to the principal point V, which give the breadth r t in the perſpective plan. 3°. From r and t, raiſe indefinite perpendiculars to F H. 4°. From A to O, ſet off the true height A O. Laſtly, from O, to the principal point V, draw the right line O V, interſecting E F in Z, and make r r and t t equal to F Z.—Thus is the door r r, t t, drawn; and the poſts are eaſily added, as before.

To exhibit the SCENOGRAPHY *of windows in a wall.*—When you know how to repreſent doors, you will find no difficulty in adding windows; all that is here further required, being to ſet off the height of the window from the bottom of the ground. The whole operation is as follows. 1°. From 1 to 2, ſet off the thickneſs of the wall at the window; from 3 to 4, its diſtance from the angle 3; and from 4 to 5 its breadth. 2°. From 4 and 5, to the point of diſtance L, draw the right lines L 5 and L 4, which will give the perſpective breadth 10, 9 of the window. 3°. From 10 and 9 raiſe lines perpendicular to the pavement, *i. e.* draw indefinite parallels to 6, 3. 4°. From 3 to 11 ſet off the diſtance of the window from the pavement 3, 11; and, from 11 to 12, its height 11, 12. Laſtly, from 11 and 12, to the principal point V, draw lines V 11 and V 12; which inter ſecting the perpendiculars 10, 13, and 9, 14, in 13 and 14, as alſo in 15 and 16, will exhibit the appearance of the window.

From theſe examples, which are all no more than applications of the firſt grand general rule, it will be eaſily perceived what method to take to delineate any other thing, and at any height from the pavement.

For *a mechanical method of exhibiting the* SCENOGRAPHY *of any object*, ſee DESIGNING.

SCENOPEGIA*, ΣΚΗΝΟΠΗΓΙΑ, a feaſt among the Jews, more uſually called *feaſt of tabernacles*, inſtituted after the people of Iſrael were in poſſeſſion of the land of Canaan, in memory of their having dwelt under tents in the wilderneſs.

* The word is Greek, formed of σκηνη, ſcene, tabernacle, tent; and πηγνυμι, *figo*, I fix.

The *ſcenopegia* was held for eight days ſucceſſively, commencing on the fifteenth of Septemper. The laſt day was much the moſt ſolemn; both on account of the conflux of perſons, and of the extraordinary tokens they gave of their joy.—It is of this eighth day, St. John muſt be underſtood to ſpeak, when he tells us, our Saviour was at the feaſt of tabernacles, on the laſt and great day.

When the holy ſcripture ſays abſolutely, *the feaſt*, it is uſually to be underſtood of the *ſcenopegia.*

SCEPTER*, SCEPTRUM, a royal ſtaff, or battoon, borne, on ſolemn occaſions, by kings, as a badge of their command and authority. See KING, and REGALIA.

* Nicod derives the word from the Greek, σκηπτρον, which, he ſays, originally ſignified a javelin, which the ancient kings uſually bore as a badge of their authority, in regard that inſtrument was in very great veneration among the heathens. —But σκηπτρον does not properly ſignify a javelin, but a ſtaff to reſt upon, from σκηπτω, *innitor*, I lean upon.

The *ſcepter* is an enſign of royalty of greater antiquity than the crown. The Greek tragic, and other poets, put *ſcepters* in the hands of the moſt ancient kings they ever introduce.

Juſtin obſerves, that the *ſcepter*, in its original, was a *haſta*, or ſpear: he adds, that in the moſt remote antiquity, men adored the *haſtæ*, or *ſcepters*, as immortal gods; and, that it was upon this account, that even in his time, they ſtill furniſhed the gods with *ſcepters.*—Neptune's *ſcepter* is his trident. See TRIDENT.

Tarquin, the elder, was the firſt who aſſumed the *ſcepter* among the Romans.—Le Gendre tells us, that in the firſt race of the French kings, the *ſcepter* was a golden rod, almoſt always of the ſame height with the king who bore it, and crooked at one end like a crozier.—Frequently, inſtead of a *ſcepter*, kings are ſeen on medals with a palm in their hand.

SCEPTER, SCEPTRUM, in aſtronomy, one of the ſix new conſtellations of the ſouthern hemiſphere, conſiſting of 17 ſtars; one of the 4th magnitude, 8 of the 5th, and as many of the 6th. See STAR and CONSTELLATION.

SCEPTICISM, the doctrine and opinions of the ſcepticks; called alſo *Pyrrhoniſm*, from the name of its author. See SCEPTICKS and PYRRHONISM.

The ancient *ſcepticiſm* conſiſted in doubting of every thing, in affirming nothing at all, and in keeping the judgment in ſuſpenſe on every thing. Sextus Empiricus makes *ſcepticiſm* to conſiſt in a faculty of oppoſing all appearances, of making all, even contrary things, equally probable, and of proceeding firſt to an εποχη, ſuſpenſe of mind, and then to an intire undiſturbedneſs or tranquillity. See ACADEMY and ACADEMICKS.

Hence theſe great maxims of theirs: Ου μαλλον τȣτο η εκεινο, this no more than that: Παντι λογω λογος, *&c.* every reaſon has another againſt it; and Ουδεν οριζω, I determine nothing.

The proper character then of *ſcepticiſm*, is an ακαταληψια, neutrality, or ſuch a diſpoſition of mind as does not, upon any occaſion, incline to any thing more than the contrary thing. See ACATALEPSIA.

This heſitancy of the ſcepticks is well deſcribed by Ariſtocles in Euſeb. *de præpar. evan.* All things are equally indifferent, uncertain and undeterminate: neither our ſenſes, nor our opinions give us either truth or falſhood: therefore, neither the one, nor the other are to be credited; but all things to be left on a level, without admitting any opinion, inclination or motion of the mind at all.—It is added, that the ſcepticks carried this ſuſpenſe of theirs ſo far, as to deny, that any thing is either good or evil, juſt or unjuſt, true or falſe; or that any thing is this, more than that. See EVIL, GOOD, *&c.*

It is from this acatalepſia of the ſcepticks, that Des Cartes ſeems to have borrowed his great principle of doubting of all things; as is owned by many of his followers.—It muſt be owned, there is ſome difference between the doubting of the ſcepticks, and that of the Carteſians. In phyſical matters, it is true, there does not ſeem a great deal of difference; and Des Cartes, in that reſpect, may, without much injuſtice, be deemed a ſceptick: but this may be ſaid in his favour, that the great Socrates was ſo far a ſceptick himſelf; phyſical and ſenſible things, he held, were all dubious, and, at beſt, but probable. See CARTESIANISM.

The origin of *ſcepticiſm* is ſomewhat obſcure. Pyrrho, who lived under Alexander the Great, and made the tour of India in his retinue, is uſually reputed the author; whence Pyrrhonians and ſcepticks are ordinarily uſed indifferently. See PYRRHONIAN.

It muſt be owned, however, that the great dogma of the ſcepticks had been countenanced, and even cultivated before Pyrrho, by Democritus, Heraclitus, *&c.*—Sextus Empiricus ſays, expreſly, that all that Pyrrho did, was to improve, illuſtrate and inforce the dogma, and form the retainers thereto into a ſect.

Democritus's philoſophy was near akin to *ſcepticiſm*; for upon his obſerving, that honey ſeemed ſweet to ſome, and bitter to others, he concluded, that it was neither ſweet nor bitter; and thereupon, pronounced ȣ μαλλον, *non magis*, which is pure *ſcepticiſm.*—Yet the ſame Sextus adds, that Democritus was no ſceptick.

Though Plato argues very ſtrenuouſly againſt the acatalepſy of the ſcepticks; yet it is certain that dogma received a great part of its encouragement from Socrates's ſchool, and Plato's academy. Nay, it was a great controverſy among the ancients, whether Plato himſelf were a ſceptick or dogmatiſt? Indeed Plato's deciſive way of ſpeaking, in many caſes, ſeems to leave no great room for ſuch a doubt; but it is certain, his followers of the new academy founded by Arceſilas, gave much into this way; and *nihil ſcitu*, was held by them a principle. See ACADEMY, PLATONIC, *&c.*

Sextus Empiricus obſerves, that Socrates himſelf had a tincture of *ſcepticiſm*; ſome even make him the author of it, from that cuſtomary ſaying of his, *I know nothing but this, that I know nothing.* If this were the origin of *ſcepticiſm*, it muſt be owned, it was mightily improved afterwards, ere Metrodorus ſaid, *I know nothing, not even this, that I know nothing.* The ſame Sextus however adds, that Plato, introducing his maſter in his gymnaſtick dialogues, diſputing with the ſophiſts, makes him act the part of a ſceptic. See SOCRATIC.

Some have even charged Job, and Solomon, with *ſcepticiſm*; from their propoſing a great number of queſtions, without deciding any of them. The philoſopher of Kiel, who has publiſhed a diſſertation on *ſcepticiſm*, fetches its origin ſtill higher: he will have the devil the author thereof, who made our firſt parents doubt of the word of God himſelf; and drew them in, the firſt proſelytes to *ſcepticiſm.* See DOUBTING.

SCEPTICKS *, Sceptici, a ſect of ancient philoſophers, founded by Pyrrho, whoſe diſtinguiſhing tenet was, that all things are uncertain and incomprehenſible; contraries equally true; that the mind is never to aſſent to any thing; but to keep up an abſolute heſitancy or indifference. See Scepticism.

* The term *ſceptick*, in its original Greek, σκεπτικος, properly ſignifies *conſiderative*, and *inquiſitive*; or a man who is ever weighing the reaſons on one ſide and the other, without ever deciding between them: it is formed from the verb σκεπτομαι, I conſider, look about, deliberate.

Laertius notes, that the followers of Pyrrho had various denominations: from their maſter, they were called *Pyrrhonians:* from their dogma, *aporetici*, that is, doubters, of απορειν, to doubt.—From their ſuſpenſion and heſitation, *ephectici*, of επεχειν, to ſtay, to keep back.—And from their never getting beyond the ſearch of truth, *zetetici*, ſeekers.

Plato refutes the great principle of the *ſcepticks* thus: when you ſay, that all things are incomprehenſible, do you comprehend or conceive that they are thus incomprehenſible, or do you not? if you do, then ſomething is comprehenſible; if you do not, there is no reaſon we ſhould believe you, ſince you do not comprehend your own aſſertion. See Acatalepsy.

SCHAR-PENNY, Scarn-Penny, or Schorn-Penny.—It appears from our old books, that ſome cuſtomary tenants were obliged to pen up their cattle at night in the pound or yard of their lord, for the benefit of their dung, or *ſcearn*, as the Saxons called it.—In defect of this, they were to pay a ſmall compenſation; hence called *ſcharpenny*.

SCHEAT, or SEAT, in aſtronomy, a fixed ſtar of the ſecond magnitude in the juncture of the leg with the left ſhoulder of Pegaſus. See Pegasus.

Some call it *ſcheat alpheras*, and ſome *ſcheat Pegaſi*.—Its longitude, according to Mr. Flamſteed, is 25° 2′ 13″, its latitude 31° 8′ 6″ north.

SCHEDULE *, Schedula, a ſcroll of paper, or parchment, annexed to a will, leaſe, or other deed; containing an inventory of goods, or ſome other matter, omitted in the body of the deed. See Codicil.

* The word is a diminutive of the Latin *ſcheda*, or Greek σχηδη, a leaf or piece of paper.

SCHEITER', *fortification*. See Fortification.

SCHEMATISM, ΣΧΗΜΑΤΙΣΜΟΣ. See the articles Figure and Trope.

SCHEME *, a draught, or repreſentation of any geometrical, or aſtronomical figure, or problem, by lines ſenſible to the eye; or of the cœleſtial bodies in their proper places for any moment. See Figure and Diagram.

* The word is formed from the Greek, σχημα, *habitus*.

Scheme *arches*. See the article Arch.

SCHEVAGE. See the article Schewage.

SCHIPPER. See the article Shipper.

SCHIREMOTE, or Scyremot. See Scyremot.

SCHISM *, Schisma, in the general, ſignifies *diviſion*, or *ſeparation*; but it is chiefly uſed in ſpeaking of ſeparations happening through diverſity of opinions, among people of the ſame religion, and faith.

* The word is formed from the Greek, σχισμα, cleft, fiſſure.

Thus, we ſay, the *ſchiſm* of the ten tribes of Iſrael, from the two tribes of Juda and Benjamin; the *ſchiſm* of the Perſians, from the Turks and other Mahometans, &c.

Among eccleſiaſtical authors, the *great ſchiſm of the weſt*, is that which happened in the times of Clement VII. and Urban VI. which divided the church for forty or fifty years, and was at length ended by the election of Martin V. at the council of Conſtance.

The Romaniſts number thirty-four *ſchiſms* in their church.—They beſtow the name, *Engliſh ſchiſm* on the reformation of religion in this kingdom.—Thoſe of the church of England again apply the term *ſchiſm* to the ſeparation of the non-conformiſts, *viz.* the preſbyterians, independants, and anabaptiſts, who contend for a further reformation.

Some call the ſeparation of the proteſtants from the church of Rome, a *paſſive ſchiſm*, becauſe that church cut them off from her communion.

Negative Schism. See the article Negative.

SCHOENOBATES *, ΣΧΟΙΝΟΒΑΤΗΣ, a name which the Greeks gave to their rope-dancers: by the Romans called *funambuli*. See Rope-dancer and Funambulus.

* The word is formed from the Greek, σχοινος, a rope; and βαινω, I walk.

The *ſcœnobates* were ſlaves, whoſe maſters made money of them, by entertaining the people with their feats of activity.—Mercurialis *de arte gymnaſtica*, *lib.* III. gives us five figures of *ſchœnobates* engraven after ancient ſtones.

SCHOLARUM *domeſticus*. See Domesticus.

SCHOLASTIC, ΣΧΟΛΑΣΤΙΚΟΣ, ſomething belonging to the ſchools; or that is taught in the ſchools. See School.

Scholastic, Scholasticus, was a long time a title of honour; at firſt only given to ſuch as diſtinguiſhed themſelves by their eloquence, in declaiming, &c. See Orator, Sophist, Rhetor, &c.

After Nero, the appellation Scholasticus was alſo given to the advocates; and among others, to Socrates and Euſebius, the eccleſiaſtical hiſtorians, who were advocates at Conſtantinople. Conſtant. Harmenopulus alſo bore it in the twelfth century, with ſeveral others. See Advocate, Advouee, and Defender.

Afterwards, Scholasticus became reſtrained to ſuch as had the government of the eccleſiaſtical ſchools, eſtabliſhed under the firſt race of French kings, who inſtructed the clerks of each church, firſt in the humanities, then in the theology and the liturgy.—Theſe were alſo called *primiciers eſcolaſtres*, and *theologaux*; if the church were ſituated in a city, the *ſcholaſticus* was called the *chancellor*.

Among the Greeks, Scholasticus, Σχολαστικος, was alſo the name of an office, or dignity; anſwering to our *divine* or *theologue*.—Indeed, Genebrard obſerves, it was only properly applied to people of general learning, and fine parts, and who were well known to the world in that character.

Thus, St. Jerom mentions, that Serapion was ſurnamed *Scholaſticus*, by reaſon of the delicacy of his wit: Walafrid Strabo, calls the poet Prudentius, *ſcholaſticus:* Fortunatus was called *ſcholaſtiſiſſimus*.

Scholastic *divinity*, is that part or ſpecies of divinity which clears, and diſcuſſes queſtions, by reaſon, and arguments. See Theology.

In which ſenſe, it ſtands, in good meaſure, oppoſed to *poſitive* divinity, which is founded on the authority of fathers, councils, &c. See Positive.

The *ſchool divinity*, like Plato's ſchool, has had its three ſeveral ages, or periods: the *ancient*, the *middle*, and the *new*.

The *ancient* began under Lanfrank, archbiſhop of Canterbury, or, more properly, under Peter Lombard, the maſter of the ſentences; and held about 200 years; ending under Albertus Magnus.

This was ſucceeded by the *middle ſchool divinity*, which laſted about 100 years, to the time of Thomas Aquinas; during which time the peripatetic philoſophy was raiſed to its utmoſt reputation. See Peripatetic.

The third age began under Durandus, who ſet himſelf up againſt Thomas, the chief of the *middle* age. After his time people's wits became more and more ſubtile; and the ſchool began to be wholly taken up in frivolous queſtions. They diſputed, with great heat, about mere formalities; and even raiſed phantoms on purpoſe to combat withal.

The *ſchool divinity* is now fallen into the laſt contempt; and is ſcarce regarded any where, but in ſome of the univerſities, where they are ſtill obliged by their charters to teach it.

SCHOLIAST, ΣΧΟΛΙΑΣΤΗΣ, *commentator*; a grammarian, who writes *ſcholia*, that is, notes, gloſſes, &c. upon ancient Greek authors. See Scholium.

SCHOLIUM, ΣΚΟΛΙΟΝ, a note, annotation, or remark occaſionally made on ſome paſſage, propoſition, or the like. See Gloss, Commentary, Annotation, &c.

The term is much uſed in geometry, and other parts of mathematicks; where, after demonſtrating a propoſition, it is frequent to point out how it might be done ſome other way; give ſome advice, or precaution, in order to prevent miſtakes; or add ſome particular uſe or application thereof.

Wolfius has given us abundance of curious and uſeful arts, and methods, a good part of the modern philoſophy, the deſcription of mathematical inſtruments, &c. all by way of *ſcholia* to the reſpective propoſitions in his *Elementa Matheſeos*.

SCHOOL *, Schola, a publick place, wherein the languages, humanities, or other arts and ſciences are taught.

* The word is formed from the Latin, *ſchola*, which according to Du Cange ſignifies *diſcipline*, and *correction:* he adds, that it was anciently uſed, in the general, for all places, where ſeveral perſons met together, either to ſtudy, to converſe, or do any other matter. Accordingly, there were *ſcholæ palatinæ*, being the ſeveral poſts wherein the emperor's guards were placed; *ſchola ſcutariorum*, *ſchola gentilium*, &c. At length the term paſſed alſo to civil magiſtrates; and accordingly in the code, we meet with *ſchola chartulariorum*, *ſchola agentium*, &c. and even to eccleſiaſticks; as, *ſchola cantorum*, *ſchola ſacerdotum*, &c.

Thus we ſay, a grammar *ſchool*, a writing *ſchool*, a *ſchool* of natural philoſophy, &c.

School, is alſo uſed for a whole faculty, univerſity, or ſect: as Plato's *ſchool*, the *ſchool* of Epicurus, the *ſchool* of Paris, &c. The *ſchool* of Tiberias was famous among the ancient Jews; and it is to this we owe the maſſora, and maſſoretes. See Massoretes.

School, in painting, is uſed to diſtinguiſh the different manners of places, and perſons. See Manner, &c.

Thus we ſay, the Roman *ſchool*, the Venetian *ſchool*, the Flemiſh *ſchool*, &c. Raphael's *ſchool*, Titian's *ſchool*, da Vinci's *ſchool*, &c. meaning their diſciples, pupils, &c. See Painting.

School *of Athens*, is the name of a celebrated piece of Raphael, now in the Vatican.—It contains a great number of figures, repreſenting philoſophers, mathematicians, and other perſons engaged in the arts, and ſciences.

Several authors have wrote of this painting, and given different explications thereof: Vaſari will have it to be, the agreement of philoſophy, and aſtronomy, with theology.—The engravers, by the inſcription they add at the bottom of the print thereof, ſhew, that they take it for a painting of St. Paul preaching at Athens.—An Auguſtin of Venice takes the philoſopher who is writing, for St. Mark; and he at his knees, for the angel Gabriel.

M. de Piles rejects all theſe explications of the *ſchool of Athens*, and eſpecially the laſt: his opinion is, that it is nothing more than an image of philoſophy, which Raphael here repreſents under all the philoſophers he has painted.

In behalf of the Venetian engravers it may be ſaid, that they do not pretend to explain the painting, but have only copied ſuch of the figures as they thought proper to repreſent, St. Mark, St. Gabriel, *&c.*

SCHOOL *philoſophy*, *theology*, &c. the ſame with *ſcholaſtic*. See SCHOLASTIC and THEOLOGY.

Charity SCHOOLS. See the article CHARITY.

SCHOOUBIAH, a ſect among the muſſulmen, whoſe diſtinguiſhing tenet it is, that the Sunnites are not a whit preferable to the Shiites or Rafadhites, *i. e.* the orthodox to the heterodox; but that both the one and the other are equally true believers.

The *Schooubiah*, therefore, ſhould be properly, the Latitudinarians of Mahometaniſm: yet are not they regarded by either party, as much better than Gentiles, or Heathens, as their name imports. See DEISM, *&c.*

There are abundance among the muſſulmen, who give into this ſect, only ſecretly; Mahometaniſm, like all other falſe religions, being an avowed enemy to toleration. See MAHOMETANISM, TOLERATION, LIBERTY *of conſcience*, &c.

SCHORN-PENNY. See the article SCHAR-PENNY.

SCIAGRAPHY, or SCIOGRAPHY, the profile, or ſection of a building, to ſhew the inſide thereof. See SECTION and PROFILE.

SCIAGRAPHY, in aſtronomy, *&c.* is a term ſome authors uſe for the art of finding the hour of the day or night, by the ſhadow of the ſun, moon, ſtars, *&c.* See DIAL.

SCIAMANTIA *, SCIAMANCY, or SCIOMANCY, a kind of diviNation, otherwiſe called *pſychomancy*.—*Sciamancy* among the ancients, was the art of raiſing and calling up the manes or ſouls of deceaſed perſons, to give intelligence of things to come. The witch who conjured up the ſoul of Samuel, to foretel Saul the event of the battle he was about to give, did it by *ſciamancy*.

* The word is formed from the Greek, σκια, ſhadow, uſed metaphorically for the ſoul, and μαντεια, divination. See DIVINATION.

SCIATICA, in medicine, the gout in the hip. See GOUT.

SCIE.—*Feuille de* SCIE. See FEUILLE *de ſcie*.

SCIENCE *, in philoſophy, a clear and certain knowledge of any thing, founded on ſelf-evident principles, or demonſtration. See KNOWLEDGE.

* The word is formed from the Latin, *ſcientia*, of *ſcire*, to know.

In this ſenſe, *doubting* is oppoſed to *ſcience*; and *opinion* is the middle between the two. See DOUBTING and OPINION.

The ſcepticks profeſs to deny, that we have any ſuch thing as *ſcience*; that is, any clear, certain notices of any thing, capable of producing abſolute conviction. See SCEPTICISM.

Divines ſuppoſe three kinds of *ſcience* in God: the firſt, *ſcience of mere knowledge*, whereby God knows himſelf, and all things poſſible.—The ſecond, *ſcience of viſion*, whereby he knows all things he has reſolved to do, or to permit, in the ſame order wherein he has reſolved to do, and to permit them.—The third, a *mediate* or *intermediate ſcience*, whereby he knows what angels and men will do, in certain caſes and certain circumſtances, if he reſolve to bring them about.

It is greatly diſputed among ſchool divines, whether or no there be ſuch a mediate *ſcience* in God? the reaſon why ſome call it in queſtion is, becauſe it does not conſiſt well with their particular ſchemes of preſcience, *&c.* See LIBERTY, NECESSITY, *&c.*

SCIENCE *of conditionals*. See CONDITIONAL.

SCIENCE, is more particularly uſed for a formed ſyſtem of any branch of knowledge; comprehending the doctrine, reaſon and theory of the thing, without any immediate application thereof to any uſes or offices of life.

In which ſenſe, the word is uſed in oppoſition to *art*. See ART.

Indeed, the preciſe notion of an art, and *ſcience*, and their juſt, adequate diſtinction, do not ſeem to be yet well fixed. See the PREFACE to this work.

As to the number, and diviſion of the *ſciences*, Mr. Locke limits them thus: all that can fall within the compaſs of human underſtanding, is, firſt, either the nature of things, their relations, and their manner of operation: or, ſecondly, that which man himſelf ought to do as a voluntary and rational agent, for the attainment of any end, eſpecially happineſs: or, thirdly, the ways and means, whereby the knowledge of both of theſe is attained and communicated: whereupon, *ſcience* may be properly divided into theſe three ſorts.

Firſt, the knowledge of things, their conſtitutions, properties and operations, whether material or immaterial.—This, in a little more inlarged ſenſe of the word, may be called, φυσικη, or *natural philoſophy*.—The end of this is bare ſpeculative truth, and whatſoever can afford the mind of man any ſuch, falls under this branch; whether it be God himſelf, angels, ſpirits, bodies, or any of their affections; as number, figure, *&c.* See PHYSICKS and PHILOSOPHY.

Secondly, πρακτικη, the ſkill of right applying our own powers, and actions for the attainment of things good and uſeful.—The moſt conſiderable under this head, is *ethicks*, which is the ſeeking out thoſe rules and meaſures of human actions, which lead to happineſs, and the means to practiſe them. The end of this is not bare ſpeculation; but right, and a conduct ſuitable thereto. See ETHICKS and MORALITY.

Thirdly, σημειωτικη, or the doctrine of ſigns.—The moſt uſual being words, it is aptly enough termed *logick*; the buſineſs whereof is to conſider the nature of ſigns which the mind makes uſe of for the underſtanding of things, or conveying its knowledge to others. Things are repreſented to the mind by ideas; and mens ideas are communicated to one another by articulate ſounds or words. The conſideration then of ideas and words, as the great inſtruments of knowledge, makes no deſpicable part of their contemplation who would take a view of human knowledge in the whole extent of it. See WORD, LANGUAGE, *&c.*

This ſeems the firſt, and moſt general, as well as natural diviſion of the objects of our underſtanding: for a man can employ his thoughts about nothing, but either the contemplation of things themſelves for the diſcovery of truth; or about the things in his own power, which are his actions, for the attainment of his own ends; or the ſigns the mind makes uſe of, both in the one and the other, and the right ordering of them, for its clearer information.—All which three, *viz.* things as they are in themſelves knowable; actions, as they depend on us in order to happineſs; and the right uſe of ſigns in order to knowledge, being *toto cælo*, different, they ſeem to be the three great provinces of the intellectual world, wholly ſeparate and diſtinct one from another. See KNOWLEDGE.

Academy of SCIENCES. See the article ACADEMY.

SCIENTIFIC, or SCIENTIFICAL, ſomething relating to the pure, ſublimer ſciences; or, that abounds in ſcience, or knowledge. See SCIENCE, KNOWLEDGE and FAITH.

A work, a method, *&c.* is ſaid to be *ſcientifical*, when it is ſounded on the pure reaſon of things, or conducted wholly on principles thereof. See METHOD.

In which ſenſe, the word ſtands oppoſed to narrative, arbitrary, opinionative, poſitive, tantative, *&c.*

SCILLA, or SQUILLA, *ſquill*, the *ſea-onion*; a medicinal plant, of the onion-kind, but very large; chiefly brought from Spain: uſed only in infuſion, and that generally in vinegar, which it renders emetic.

There are two kinds of *ſquills*, *male* and *female*: the *male* are whitiſh, and the *female* reddiſh; whence they are alſo diſtinguiſhed by the appellations of *white ſquills*, *ſcillæ albæ*, and *red ſquills*, *ſcillæ rubræ*.

Their infuſion, when boiled to the conſiſtence of a ſyrup, with honey, is called *oxymel ſcylliticum*, in the ſhops, and retains the ſame properties.

Squills powerfully deterge, and ſcour off the viſcid adheſions in the bowels, and gently irritate the ſtomach to ejection. They are alſo, as all of the onion-kind are, very diuretick, and therefore in great eſteem, with ſome, in dropſies: if their infuſion be mixed with cinnamon-water, they will ſeldom vomit, but work downwards, and very forcibly, by urine: in aſthmas, and all obſtructions, or infractions of the lungs, which are to be removed by deterſive; and expectoration, there is ſcarce any thing more effectual. They are alſo eſteemed alexipharmick, and upon that account have a place in the theriaca Andromachi.

SCILLITICUM *vinum*. See the article VINUM.

SCIOPTICK, a ſphere or globe of wood, with a circular hole or perforation wherein a lens is placed.—It is ſo fitted, that, like the eye of an animal, it may be turned round every way; to be uſed in making experiments of the darkened room. See CAMERA OBSCURA.

SCIRE-FACIAS, a judicial writ, moſt commonly uſed to call a man to ſhew cauſe to the court whence it iſſues, why execution of a judgment paſſed, ſhould not be made out?

This writ is not granted, till a year and a day be elapſed after a judgment given.

Scire-facias, upon a fine, lies only after a year and a day after the fine levied.—Otherwiſe, it is the ſame with the writ of *habere facias ſeiſinam*. See HABERE *facias*, &c.

SCIRRHUS *, ΣΚΙΡ'ΡΟΣ, in medicine, a hard, indolent tumor, formed gradually, in the ſoft, glandulous parts of the body; ſometimes internal, and ſometimes external.

* The word is Greek, formed of σκιρος, a piece of marble.

There are two kinds of *ſcirrhus's*; the one only beginning, and frequently painful when preſſed by the fingers; the other, confirmed and ſenſeleſs.

The *ſcirrhus* ariſes from a thick, viſcid, probably gritty matter, detained and indurated in the pores and other minute paſſages of the parts affected.

There are ſome *ſcirrhus*'s as hard as ſtones; ſome are even painful in their confirmed ſtate, and partake of the nature of a cancer.

SCITE. See the article SITE.

SCLAVONIC, the language of the Sclavi, an ancient people of Scythia Europæa; who, about the year 518, quitting their native country, ravaged Greece and eſtabliſhed the kingdoms of Poland and Moravia, and at laſt ſettled in Illyria: which thence took the name of *Sclavonia*. See LANGUAGE.

The *Sclavonic* is held, after the Arabic, the moſt extenſive language in the world: it is ſpoke from the Adriatic to the north ſea, and from the Caſpian to Saxony, by a great variety of people, all, the deſcendants of the ancient Sclavi, *viz.* the Poles, Muſcovites, Bulgarians, Carinthians, Bohemians, Hungarians, Pruſſians, Suabians, *&c.* each of whom, however, have their particular dialect; only the *Sclavonic* is the common mother of their ſeveral languages, *viz.* the Poliſh, Ruſſian, Hungarian, *&c.*

By a Latin chronicle of the Sclavi, compoſed by Helmold, a prieſt of Boſow, and Arnold abbot of Lubec, and corrected by M. Leibnitz, it appears, that the Sclavi anciently inhabited the coaſts of the Baltic ſea, and were divided into eaſtern and weſtern: in the latter whereof, were the Ruſſians, Poles, Bohemians, *&c.* And in the former, the Vandals.

Dom. Maur. Orbini Rauſer, abbot of the order of Malta, in an Italian hiſtory of the Sclavi, intitled, *Il regno de gli Slavi*, printed in 1601, will have them to be originally of Finland in Scandinavia. Laur. Pribevo, a Dalmatian, in an expreſs diſcourſe on the origin of the Sclavi, maintains them to be originally of Thrace, and the ſame with the Thracians, the poſterity of Thiras, ſeventh ſon of Japhet. Theod. Polycarpowitz, in a Greek, Latin and *Sclavonic* dictionary, printed at Moſcow in 1704, obſerves, that the word *Sclava*, whence *Sclavonic* is formed, ſignifies in their language, *glory*.

SCLEROPHTHALMIA, ΣΚΛΗΡΟΦΘΑΛΜΙΑ, a kind of ophthalmia, wherein the eye is dry, hard, red and painful; and the eyebrows likewiſe; ſo as not to be opened after ſleep, without great pain. See OPHTHALMIA.

SCLEROTICA *, in anatomy, one of the common membranes of the eye, ſituate between the adnata and the uvea; it is very firm and opaque behind; but tranſparent before.—Though in ſtrictneſs, it is only the hind-part is called *ſclerotica*; the fore-part being properly called the *cornea*. See CORNEA.

* The word is formed from the Greek, σκληρος, hard, whence alſo *ſclerotick*. See SCLEROTICKS.

The *ſclerotica* is a ſegment of a larger ſphæroid than the cornea. See EYE.

SCLEROTICKS, medicines, proper to harden and conſolidate the fleſh, *&c.* of parts they are applied to.

Such are purſlain, houſe-leek, flea-wort, garden night-ſhade, *&c.*

SCOLDING.—The puniſhment allotted by our laws for *ſcolds* or *ſcolding* women, is, to be ſet in a trebuchet, commonly called a *cucking-ſtool*, placed over ſome deep water, into which they are to be let down, and plunged thrice, under water, to cool their heat and choler. See CUCKING-STOOL.

SCOLOPOMACHÆRION, ΣΚΟΛΟΠΟΜΑΧΑΙΡΙΩΝ, in chirurgery, a kind of ſcalpel, thus called, by the Greeks, from its reſembling a woodcock's bill. See SCALPEL.

Its uſe is to open, and dilate narrow wounds of the breaſt, abſceſſes, *&c.*—Aquapendente recommends it for tapping in dropſies.

It is uſually furniſhed with a little button at the point, that it may be uſed to open wounds of the breaſt without danger of wounding the lungs.

SCONCES, ſmall forts, built for defence of ſome paſs, river, or other place. See FORT.

Some *ſconces* are made regular, of four, five, or ſix baſtions; others are of ſmaller dimenſions, fit for paſſes, or rivers; and others for the field.—Such are

1. Triangles with half baſtions; which may be all of equal ſides, or they may be ſomething unequal. However it be, divide the ſides of the triangle into three equal parts, one of theſe three parts will ſet off the capitals and the gorges; and the flanks, being at right angles with the ſides, make half of the gorge.—2. Square, with half baſtions; whoſe ſides may be betwixt 100 and 200 feet, and let one third of the ſide ſet off the capital and the gorges, but the flank (which raiſe at right angles to the ſide) muſt be but one half of the gorge or capital, that is, on the ſixth part of the ſide of the ſquare. —3. Square with half baſtions and long.—4. Long ſquares. —5. Star redoubt of four points.—6. Star redoubt of five or ſix points.—7. Plain redoubts, which are either ſmall, or great. The ſmall are fit for court of guards in the trenches, and may be ſquares of 20 feet to 30. The middle ſorts of redoubts may have their ſides from 30 to 50 feet; the great ones from 60 to 80 feet ſquare.

The profiles (that is, the thickneſs and height of the breaſt-works) to be ſet on theſe ſeveral works, and the ditches, are to be accommodated to the occaſion. See REDOUBT, FORTIFICATION, FORTIFIED *place*, &c.

SCOPER-HOLES, or SCUPER-HOLES, in a ſhip, are holes made through the ſides cloſe to the deck, to carry off the water that comes from the pump, or any other way. Theſe holes in the lower or covert deck, have round leathers nailed over them, to keep the ſea-water from coming up into the ſhip, which are called *ſcoper-leathers*.

And the ſhort nails, with broad heads, which faſten theſe leathers down, are called *ſcoper-nails*, or *ſcuper-nails*.

SCORBUTUS, or SCORBUTUM, the *ſcurvy*; a diſeaſe very frequent in the northern countries, particularly in fenny, wet, humid places, expoſed to the north, *&c.*

It is accompanied with a great variety of ſymptoms, attacking the ſeveral parts of the body all at once: hence Willis ſays, it is not any particular diſeaſe, but a legion of diſeaſes. —The moſt uſual ſymptoms are bleeding, coughing, vomiting, difficulty of breathing, looſeneſs, a relaxation of the parts, ſweating, a fœtid ſmell of the gums, a falling of the teeth, ſtinking breath, reddiſh or yellow livid ſpots, pains of the arms and legs, wearineſs, faintings, head-ach, *&c.*

Some diſtinguiſh the *ſcurvy* into *hot* and *cold*; but there is little foundation for ſuch a diſtinction, as the cauſe is the ſame in all, *viz.* according to Barbette and Decker, a too thick pituitous lymph; whence various ſymptoms in various temperaments.

Charleton obſerves, that it ariſes chiefly from ſharp, ſaline particles, taken in by inſpiration, from ſalt and corrupted meats eaten, from bad waters drank, from naſtineſs, deep chagrins, *&c.* He adds, that it is contagious.

Dr. Quincy will have the *ſcurvy* to conſiſt in ſuch a conſtitution, wherein the blood is unequally fluid: and hence he obſerves, it is beſt remedied by ſtimuli, exerciſe, and ſuch means as promote ſanguification.

The cure is very difficult; and when the diſeaſe is rooted, next to impoſſible. It ſometimes goes off in a flux by ſtool, ſometimes by the hæmorrhoids, and ſometimes by urine; but more often degenerates into a dropſy, atrophy, apoplexy, epilepſy, or convulſions.

A very exact diet is held of more effect than the beſt medicines; without this, it becomes incurable. Bleeding does not avail; ſtrong purgatives are hurtful: ſo is ſugar, and all ſugared things: mercurius dulcis uſed internally, ſo as not to ſalivate, but only raiſe a ſweating, is found excellent. Dolæus undertakes to cure any *ſcorbutus* in twelve days time, by the uſe of this alone; only the patient to drink nothing all that time, but a proper decoction, and to abſtain from acids, and hog's fleſh. Charleton recommends a continued uſe of milk, particularly milk emulſions of ſweet almonds, decoctions of china, broths and other anti-acids and analepticks. Etmuller makes the baſis of the cure of the *ſcorbutus* and hypochondriacal diſeaſe the ſame, *viz.* copious vomiting. Strong catharticks, he obſerves, are prejudicial; but gentle ones good; for the body is to be ſtill kept open. He adds, that vinegar is hurtful, and yet the acid juices of fruits and vegetables, wholſome. Accordingly the uſe of lemon-juice is much recommended by Liſter. Milk, and all milky things, while the ſtomach is yet able to digeſt, are excellent. So are martials. Etmuller, inſtead of mercurials, recommends antimonials.

Thus much in the general: for the particular ſymptoms, particular medicines adapted thereto, are to be uſed; only mixing antiſcorbuticks with them all.

The chief ſimple antiſcorbuticks are, horſe-radiſh, ſorrel, butter-bur, ſcorzonera, ſow-thiſtle, zedoary, polypody, elecampane, guaiacum, ſaſſafras, muſtard-ſeed, naſturtium aquaticum, trifolium paludoſum, oranges, lemons, juniper-berries, cream of tartar, tartarum vitriolatum, *&c.*

SCORDIUM, } See the articles { DIASCORDIUM.
SCORDIUM *water*, } See the articles { WATER.

SCORE, in muſick, denotes *partition*, or the original draught of the whole compoſition, wherein the ſeveral parts, *viz.* treble, ſecond treble, baſs, *&c.* are diſtinctly *ſcored*, and marked. See PARTITION and MUSICK.

SCORPIO, SCORPION, in aſtronomy, the eighth ſign of the zodiac; denoted by the character, ♏. See SIGN.

The ſtars in *ſcorpio*, in Ptolemy's catalogue, are 20; in that of Tycho 10; in that of M. Flamſteed 49: the longitudes, latitudes, magnitudes, *&c.* whereof, are as follow;

Names and ſituations of the ſtars.	Signs.	Longitude			Latitude.				Magn.
		°	′	″	°	′	″		
In the firſt ſouth foot	♏	26	48	50	5	26	33	A	6

SCORPION, Scorpio, is alſo the name of an ancient, military engine, uſed chiefly in the defence of walls, &c.

Marcellinus deſcribes the *ſcorpio*, as conſiſting of two beams bound together by ropes. From the middle of the two, roſe a third beam, ſo diſpoſed, as to be pulled up and let down at pleaſure; and on the top of this, were faſtened iron hooks, where was hung a ſling, either of iron or hemp. Under the third beam lay a piece of hair-cloth full of chaff, tied with cords.

To uſe the engine, a round ſtone was put into the ſling, and four perſons on each ſide, looſening the beams bound by the ropes, drew back the erect beam to the hook: when, the engineer ſtanding on an eminence, giving a ſtroke with a hammer on the cord to which the beam was faſtned with its hook, ſet it at liberty; ſo that hitting againſt the ſoft hair-cloth, it ſtruck out the ſtone with a vaſt force.

It had its name *ſcorpio*, becauſe when the long beam or tillar was erected, it had a ſharp top, in manner of a ſting.—More modern times have given it the name *onager*, wild aſs, becauſe that animal, when hunted, flings back ſtones.

SCORIA, ΣΚΩΡΙΑ, the recrement, or droſs of any metal, remaining after melting, or refining the ſame. See Metal, Refining, &c.

The *ſcoria* of iron, is the ſcum taken from that metal in forges where it is melted. See Scum.

The *ſcoria* of iron, is the ſulphurous part of the iron; which uniting with the ſulphurous part of the charcoal, makes together, thoſe porous maſſes, reſembling ſpunges, frequently ſeen in the ſmiths forges. See Iron.

SCORTUM. See the article Scrotum.

SCOT, Scotta, or Scottus, a cuſtomary contribution laid upon all ſubjects, according to their ability.

Whoever are aſſeſſed to any contribution, though not by equal portions, are ſaid to pay *ſcot and lot*. See Tax.

Church Scot. See the article Church *ſcot*.

SCOTIA *, in architecture, a ſemi-circular cavity or channel between the tores, in the baſes of columns.—See *Tab. Archit. fig.* 4. See alſo Base.

* The *ſcotia* is a concave, dark moulding; whence its name, *viz.* from σκοτος, obſcurity, darkneſs,

The *ſcotia* has an effect juſt oppoſite to that of the quarter-round.—Our workmen frequently call it the *caſement*.

It is alſo called *trochilus*, partly from its form. See Trochilus.

In the Ionic and Corinthian baſe, there are two *ſcotias*, the upper whereof is the ſmaller.—*V. Tab. Archit. fig.* 32. *lit. b, c*, and *fig.* 26. *lit. i, k*.

According to Felibien, the cavetto is a fourth part of the *ſcotia*. See Cavetto.

SCOTISH *terms*. See the article Terms.

SCOTISTS, a ſect of ſchool divines and philoſophers; thus called from their founder, J. Duns Scotus, a Scotiſh, or as others ſay, Iriſh cordelier; who maintained the immaculate conception of the virgin, or that ſhe was born without original ſin; in oppoſition to Thomas Aquinas and the Thomiſts. See Thomist.

As to philoſophy, the *Scotiſts* were, like the Thomiſts, peripateticks; only diſtinguiſhed by this, that in each being, as many different qualities as it had, ſo many different formalities did they diſtinguiſh; all diſtinct from the body itſelf; and making, as it were, ſo many different entities: only thoſe metaphyſical, and, as it were, ſuperadded to the being. See Formality, &c.

SCOTOMIA, or Scotoma, in medicine, a dizzineſs, or ſwimming in the head, wherein the animal ſpirits are ſo whirled about, that external objects ſeem to turn round. See Vertigo.

SCOTTA, or Scottus. See the article Scot.

SCRATCHES, among farriers, a diſtemper incident to horſes, conſiſting of dry ſcabs, chops or rifts, that breed between the heel and the paſtern joint.

There are various kinds of *ſcratches*, diſtinguiſhed by various names, as crepances, rats-tails, mules, kibes, pains, &c. which are all ſo many ſpecies of the ſame malady; engendered from ſome dry humour falling on the legs, or from the fumes of the beaſt's own dung lying under his heels, or near them; or for want of rubbing his heels, eſpecially after a journey, from over-hard riding, &c.

The diſorder begins firſt, with dry ſcabs in the paſtern joint, in ſeveral forms. It is known by the ſtaring, dividing and curling of the hair on the ſpot.

SCRATCH-WORK, *ſgraffiata*, a way of painting in freſco, by preparing a black ground, on which is laid a white plaiſter; which white being taken off with an iron bodkin, the black appears through the holes, and ſerves for ſhadows See Sgraffiata.

This kind of work is laſting; but being very rough, is unpleaſant to the ſight.

SCREW, or Scrue, *cochlea*, in mechanicks, one of the five mechanical powers; chiefly uſed in preſſing or ſqueezing bodies cloſe, though ſometimes alſo in raiſing weights. See Mechanical *power*, Machine, &c.

The *ſcrew* is a right cylinder, as A B, (*Tab. Mechanicks, fig.* 11.) furrowed ſpiral-wiſe: it is generated by the equable motion of a right line F G, around the ſurface of a cylinder; while, at the ſame time, the point I, deſcends equably from F towards G.

If the furrowed ſurface be convex, the *ſcrew* is ſaid to be *male*; if concave, it is *female*.

Where motion is to be generated, the male and female *ſcrew* are always joined; that is, whenever the *ſcrew* is to be uſed as a ſimple engine, or mechanical power.—When joined with an axis in peritrochio, there is no occaſion for a female; but in that caſe, it becomes part of a compound engine. See Axis.

Doctrine of the Screw.—1°. If, as the compaſs deſcribed by the power in one turn of the *ſcrew*, is to the interval or diſtance between any two immediate threads or ſpiral windings, as B I (meaſured according to the length of the *ſcrew*) ſo is the weight or reſiſtance, to the power; then the power and the reſiſtance will be equivalent one to the other: and, conſequently, the power being a little increaſed, will overcome the reſiſtance.

For it is evident, that in one turn of the *ſcrew*, the weight is ſo much lifted up, or the reſiſtance ſo much removed, or the thing to be preſſed, is ſqueezed ſo much cloſer together, as is the diſtance between two immediate ſpirals; and in the ſame time, the power to be moved is ſo much, as is the compaſs deſcribed by the ſaid power in one turn of the *ſcrew*. Wherefore the velocity of the weight (or whatſoever anſwers thereto) will be to the velocity of the power, as is the ſaid diſtance between the ſpirals to the compaſs deſcribed by the power, in one revolution or turning round of the *ſcrew*: ſo that the gaining in power, is here recompenſed by the loſs in time.

2°. As the diſtance between two threads, B I, is leſs; the power required to overcome the ſaid reſiſtance is leſs; therefore the finer the thread, the eaſier the motion.

3°. If the male *ſcrew* be turned in the female, at reſt, a leſs power will be required to overcome the reſiſtance, as the lever or ſcytala, B D (*fig.* 12.) is the longer.

4°. The diſtance of the power from the centre of the *ſcrew*, C D, the diſtance of two threads I K, and the power to be applied in D, being given, to determine the reſiſtance it will overcome: or, the reſiſtance being given, to find the power neceſſary to overcome it:

Find the periphery of a circle deſcribed by the radius C D: then to the diſtance between the two threads, the periphery juſt found, and the given power: or, to the periphery found, the diſtance of the two threads, and the given reſiſtance, find a fourth proportional. This in the former caſe will be the reſiſtance that will be overcome by the given power; and in the latter, the power neceſſary to overcome the given reſiſtance.

E. gr. Suppoſe the diſtance between the two threads, 3, the diſtance of the power from the centre of the *ſcrew* C D, 25, and the power 30 pounds; the periphery of the circle to be deſcribed by the power, will be found 157. Therefore, as 3, 157 : 30, 1570, the weight to which the reſiſtance is equal.

5°. The reſiſtance to be overcome by a given power, being given; to determine the diameter of the *ſcrew*, the diſtance of two threads I K, and the length of the ſcytala or handle: the diſtance of the threads, and the diameter of the *ſcrew* may be aſſumed at pleaſure, if the male be to be turned in the female by a handle. Then, as the given power is to the reſiſtance it is to overcome, ſo is the diſtance of the threads to a fourth number, which will be the periphery to be deſcribed by the handle C D, in a turn of the *ſcrew*. The ſemi-diameter of this periphery, therefore, being ſought, we have the length of the handle C D. But if the female *ſcrew* be to be turned about the male, without any handle; then the periphery and ſemi-diameter found, will be very nearly thoſe of the *ſcrew* required.

E. gr. Suppoſe the weight 6000, the power 100, and the diſtance of the threads 2 lines; for the periphery to be paſſed over by the power, ſay, as 100, 6000 : 2, 120; the ſemi-diameter of which periphery being $\frac{1}{3}$ of 120=40 lines will be the length of the handle, if any be uſed; otherwiſe the ſide of the female *ſcrew* muſt be 40 lines.

Endleſs SCREW. If a *ſcrew* be ſo fitted as to turn a dented wheel DF (*fig.* 13.) it is called an *endleſs*, or *perpetual ſcrew*; in regard it may be turned for ever, without coming at an end. From the ſcheme, it is evident enough, that while the *ſcrew* turns once round, the wheel only advances the diſtance of one tooth.

Doctrine of the endleſs SCREW.—1°. If the power applied to the lever, or handle of an *endleſs ſcrew* A B, be to the weight, in a ratio compounded of the periphery of the axis of the wheel E H, to the periphery deſcribed by the power, in turning the handle, and of the revolutions of the wheel D F, to the revolutions of the *ſcrew* C B; the power will be equivalent to the weight.

Hence, 1°. as the motion of the wheel is exceedingly ſlow; a ſmall power may raiſe a vaſt weight, by means of an *endleſs ſcrew:* for this reaſon, the great uſe of the *endleſs ſcrew*, is either where a great weight is to be raiſed through a little ſpace; or, where a very ſlow, gentle motion is required. On which account it is very uſeful in clocks and watches.

2°. The number of teeth, the diſtance of the power from the centre of the *ſcrew* A B, the radius of the axis H F, and the power, being given; to find the weight it will raiſe:

Multiply the diſtance of the power from the centre of the *ſcrew* A B, into the number of teeth: the product is the ſpace of the power paſſed through, in the time the weight paſſes through a ſpace equal to the periphery of the axis. Find a fourth proportional to the radius of the axis, the ſpace of the power now found, and the power. This will be the weight the power is able to ſuſtain. Thus, if A B =3, the radius of the axis H F=1; the power 100 pounds; number of teeth of the wheel D F 48; the weight will be found 14400: whence it appears, that the *endleſs ſcrew* exceeds all others, in increaſing the force of a power.

Archimedes's SCREW, or the *ſpiral pump*, is a machine for the raiſing of water, invented by Archimedes. See PUMP and SPIRAL.

Its ſtructure is as follows: a leaden tube is wound round a cylinder A B (*Tab. Hydraulicks*, *fig.* 1.) after the ſame manner as the ſpiral thread is drawn in the common *ſcrew* above deſcribed. This cylinder is inclined to the horizon, in an angle of about 45 degrees, and the orifice of the tube B immerged under water.—If then, the *ſcrew* be turned about by the handle I, againſt the water; the water will riſe up the ſpiral, and at length be diſcharged in A.

This machine, with a very little ſtrength, is able to raiſe a great quantity of water: whence it is found of good uſe, in the emptying of lakes, *&c.*

If the water be to be raiſed to any conſiderable height, one *ſcrew* will not ſuffice; but the water drawn up by one, is to be taken by another, and ſo ſucceſſively.

SCRIBE, Scriba, a principal officer in the Jewiſh law, whoſe buſineſs was to write, and interpret ſcripture.

We find no mention of *ſcribes*, in the Old Teſtament, before Eſdras; whence ſome learned men have concluded, that the office was brought from Chaldæa, and Aſſyria, and firſt eſtabliſhed by the Jews after their return from the Babyloniſh captivity.

The *ſcribes* were in great credit and eſteem among the Jews, and had even the precedency of the prieſts and ſacrificers.—Indeed, there were three kinds of *ſcribes*, whereof thoſe juſt mentioned, properly called *ſcribes of the law*, were the firſt, and moſt conſiderable: the deciſions of theſe were received with the ſame reſpect as the law of God itſelf.

The ſecond kind, properly called *ſcribes of the people*, were a ſort of magiſtrates, among the Greeks, as well as among the Jews. See the following article.

The third kind were publick notaries, or ſecretaries of the council: theſe were the leaſt conſiderable.

Scribe, Scriba, was alſo the title of an officer, among the Romans, who wrote decrees, or acts, and made out authentic copies thereof. See CLERK, ACTS, *&c.*

Every magiſtrate had his *ſcriba*, or ſecretary, ſo that there were *ſcribæ ædilitii*, *prætorii*, *quæſtorii*, &c.

The *ſcribæ* were not admitted to the management of the principal offices of the republick, unleſs they relinquiſhed their profeſſion.

In the time of the emperors, they were alſo called *notarii*, becauſe they made uſe of abbreviations, and ſhort notes in writing. See NOTARY.

SCRIBING, in joinery, *&c.* a term uſed, when one ſide of a piece of ſtuff being to be fitted to the ſide of ſome other piece, which laſt is not regular; to make the two join cloſe together all the way, they *ſcribe* it.

That is, they lay the piece of ſtuff to be *ſcribed* cloſe to the other piece they intend to *ſcribe* to, and open their compaſſes to the greateſt diſtance the two pieces any where ſtand from each other; then, bearing one of the legs againſt the ſide to be *ſcribed* to, with the other point they draw a line on the ſtuff to be *ſcribed.*—Thus have they a line on the irregular piece parallel to the edge of the regular one; and if the ſtuff be wrought away exactly to the line, when the two pieces are put together, they will ſeem a joint.

SCRIPTORIUS *calamus.* See the article CALAMUS.

SCRIPTURARY, among the Jews. See CARAITES.

SCRIPTURE, or SCRIPTURES. See BIBLE.

SCROBICULUS *cordis*, the ſame as *anticardium.* See ANTICARDIUM.

SCROLL. See the article ESCROLL.

SCROPHULÆ*, in medicine, ſcirrhous tumours, ariſing uſually about the neck, and ſometimes on other glandulous parts; called alſo *ſtrumæ*, and popularly, the *king's evil*, or ſimply, the *evil.* See EVIL.

* The word is Latin, formed by diminution, from *ſcropha*, ſow.

SCROTUM, or SCORTUM, in anatomy, the common capſula or membrane wherein the teſticles are contained; thus called from its reſembling a pouch or purſe of leather, called by the ancients *ſcortea.* See TESTICLE.

The *ſcrotum* conſiſts of two membranes; the exterior whereof is only a production of the cuticula or cutis, which is here very thin, and without any fat underneath it.

The inner, called *dartos*, is only an expanſion of the panniculus carnoſus, which, together with the cutis, is drawn into the figure of a purſe externally: it is divided longitudinally into two parts, right and left, by a line, called the *ſeam of the ſcrotum*; anſwering to which inwardly is a membrane, called the *ſeptum*, which divides the cavity into two parts; being only the production of the dartos.

It is diviſible into lamellæ, and the teſticles are on each ſide looſely connected to it by means of their outer proper tunic.—Its uſe is to ſuſtain them, prevent their colliſion, as alſo their falling too low, and to promote the corrugation of the *ſcrotum.* See DARTOS.

SCROTUM *cordis*, the ſame as *pericardium.* See PERICARDIUM.

SCROWLS, or SCROLLS, in architecture. See VOLUTES.

SCRUE. See the article SCREW.

SCRUPLE, SCRUPULUS, SCRUPULUM, or SCRIPULUM, the leaſt of the weights uſed by the ancients; which amongſt the Romans was the twenty-fourth part of an ounce, or third part of a dram. See OUNCE and DRACHM.

SCRUPLE is ſtill a weight among us, containing the third part of a dram, or 20 grains. See GRAIN.

Among goldſmiths, the *ſcruple* is 24 grains. See WEIGHT.

SCRUPLE, in chronology.—The Chaldee SCRUPLE is $\frac{1}{1080}$ part of an hour, called, by the Hebrews, *helakim.* Theſe *ſcruples* are much uſed by the Jews, Arabs, and other eaſtern people in computations of time.

SCRUPLES, in aſtronomy.—SCRUPLES *eclipſed*, that part of the moon's diameter which enters the ſhadow, expreſſed in the ſame meaſure wherein the apparent diameter of the moon is expreſſed. See DIGIT.

SCRUPLES *of half duration*, an arch of the moon's orbit, which the moon's centre deſcribes from the beginning of the eclipſe to its middle. See ECLIPSE.

SCRUPLES *of immerſion*, or *incidence*, an arch of the moon's orbit, which her centre deſcribes from the beginning of the eclipſe, to the time when its centre falls into the ſhadow. See IMMERSION.

SCRUPLES *of emerſion*, an arch of the moon's orbit, which her centre deſcribes in the time from the firſt emerſion of the moon's limb, to the end of the eclipſe. See EMERSION.

SCRUTINY, SCRUTINIUM, in antiquity, an examination, or probation, practiſed in the laſt week of lent, on the catechumens, who were to receive baptiſm on Eaſter-day. See CATECHUMEN and BAPTISM.

The *ſcrutiny* was performed with a great many ceremonies: exorciſms and prayers were made over the heads of the catechumens.—On palm-ſunday, the Lord's prayer and creed were given them; which they were afterwards made to rehearſe.

The proceſs was called *ſcrutinium*, *ſcrutiny*; becauſe hereby the hearts of the catechumens were ſcrutinized, or ſearched, that the prieſts might underſtand who were fit to be admitted to baptiſm.

This cuſtom was more in uſe in the church of Rome, than any where elſe: though it appears, by ſome miſſals, to have been likewiſe uſed, though much later, in the Gallican church. It is ſuppoſed to have ceaſed about the year 860.

SCRUTINY is alſo uſed, in the canon law, for a ticket, or little paper billet, wherein, at elections, the electors write their votes privately, ſo as it may not be known for whom they vote.

Among us, SCRUTINY is chiefly uſed for a ſtrict peruſal, and examination of the ſeveral votes haſtily taken at an election; in order to find out any irregularities committed therein, by unqualified voters, *&c.*

SCRUTORE, or SCRUTOIR (from the French *eſcritore*) a kind of cabinet, with a door or lid opening downwards, for conveniency of writing on, *&c.*

SCULK, amongſt hunters, denotes a company; as, a *ſculk* of foxes.

SCULPTURE, SCULPTURA, the art of cutting or carving wood, ſtone, or other matter, and forming various figures or repreſentations therein; as alſo, of faſhioning wax, earth, plaiſter, *&c.* to ſerve as models, or moulds, for the caſting of metalline figures.

Sculpture, in its latitude, includes both the art of working in creux, properly called *engraving*; and of working in relievo, which is what we ſtrictly call *ſculpture*. See ENGRAVING.

The antiquity of this art is paſt doubt; as the ſacred writings, the moſt ancient and authentic monuments we have of the earlieſt ages, mention it in ſeveral places: witneſs Laban's idols ſtolen away by Rachel, and the golden calf which the Iſraelites ſet up in the deſart, *&c.* But it is very difficult to fix the original of the art, and the firſt artiſts, from prophane authors; what we read thereof, being intermixed with fables, after the manner and taſte of thoſe ages.

Some make a potter of Sicyon, named Dibutades, the firſt ſculptor: others ſay, the art had its origin in the iſle of Samos, where one Ideocus, and Theodorus, performed works of this kind, long before Dibutades's time. It is added, that Demaratus, father of Tarquin the elder, firſt brought it into Italy upon his retiring thither; and that by means of Eucirapus and Eutygrammus, two excellent workmen herein, who communicated it chiefly to the Tuſcans; among whom it was afterwards cultivated with great ſucceſs. They add, that Tarquin ſent for Taurianus, one of the moſt eminent among them, to Rome, to make a ſtatue of Jupiter, *&c.* of baked earth; for the frontiſpiece of the temple of that deity.

About this time, there were many ſculptors, both in Greece and Italy, who wrought altogether in earth: ſome of the moſt noted, are, Chalcoſthenes, an Athenian, who made himſelf and his houſe famous, by the great number of earthen figures he adorned it withal; and Demophilus and Gorſanus, two painters, who inriched the temple of Ceres with great variety of painting and earthen images. In effect, all the firſt ſtatues of the heathen deities, were either of earth, or wood; and it was not ſo much any frailty of the matter, or unfitneſs for the purpoſe, as the riches and luxury of the people, that firſt induced them to make images of marble, and other more precious ſtones.

Indeed, how rich ſoever the matter were, whereon they wrought, yet they ſtill uſed earth, to form models thereof: and to this day, whether they be for cutting marble ſtatues with the chiſſel, or for caſting them in metal, they never undertake the one or the other, without firſt making a perfect model thereof in earth. Whence, doubtleſs, aroſe the obſervation of Praxiteles, that the art of moulding earthen figures, was the natural mother of that of making marble and metalline figures; which laſt never appeared in perfection, till about 300 years after the building of Rome; though the firſt was at its height long before.

Phidias of Athens, who came next, ſurpaſſed all his predeceſſors, both in marble, in ivory and metals: and about the ſame time, appeared ſeveral others, who carried *ſculpture* to the higheſt perfection it ever arrived at; particularly, Polycletus at Sicyon; then Myron; Lyſippus, who alone was allowed the honour of caſting Alexander's image in braſs: Praxiteles and Scopas, who made thoſe excellent figures, now before the pope's palace at Montecavallo: Briaxis, Timotheus and Leochares, who, with Scopas, wrought at the famous tomb of Mauſolus king of Caria; Cephiſſodotus, Canachus, Dædalus, Buthieus, Niceratus, Euphranor, Theodorus, Xenocrates, Pyromachus, Stratonicus, Antigonus, who wrote on the ſubject of his art; the famous authors of the Laocoon, *viz.* Ageſander, Polydore, and Athenodorus, and infinite others, the names of ſome whereof have paſſed to poſterity; thoſe of others have periſhed with their works: for though the number of ſtatues in Aſia, Greece, and Italy, was ſo immenſe, that in Rome alone, as we are informed, there were more than there were living perſons, yet we have but few now left, at leaſt very few of the fineſt.

When Marcus Scaurus was ædile, his office obliging him to provide what was requiſite towards the publick rejoicings, he adorned the ſtately theatre which he erected, with 3000 brazen ſtatues; and though L. Mummius, and Lucullus, brought away a great number out of Aſia and Greece, yet, there were ſtill above 3000 remaining in Rhodes, as many at Athens, and more at Delphos.

But what is moſt extraordinary, was the bigneſs of the figures, which thoſe ancient artiſts had the courage to undertake: amongſt thoſe Lucullus brought to Rome, there was one of Apollo, 30 cubits high; the Coloſſus of Rhodes, made by Cares of Lyndos, the diſciple of Lyſippus, far exceeded it; Nero's ſtatue, made by Xenodorus, after that of Mercury, was alſo of an extraordinary ſize, being 110 feet high. See COLOSSUS and STATUE.

Sculpture, however, did not continue above 150 years, after Phidias's time, till it began inſenſibly to decline; not but that there were ſtill ſome fine pieces of workmanſhip both in Greece and Italy, though not performed with ſo good a fancy, and ſuch exquiſite beauty as ſome of the former works. Beſides that the Greek ſtatues are moſt eſteemed for the workmanſhip; there is a ſpecial difference between them, and thoſe of the Romans, in that the greateſt part of the firſt are naked, like thoſe who wreſtle or perform ſome other bodily exerciſe, wherein the youth of thoſe times placed all their glory; whereas, the others are clad or armed, and particularly have the toga on, which was the greateſt mark of honour amongſt the Romans. See STATUE.

To perform any thing in the way of SCULPTURE, they begin with making a model of earth, or wax.—For earthern models, they uſe but few inſtruments: their hands and fingers do almoſt the whole.—For waxen models, to a pound of wax they put half a pound of colophony; ſome add turpentine, melting the whole with oil of olive; ſome add a little vermillion, or other matter, to give it a colour. It is wrought and molded with the fingers, like earthern models.

For SCULPTURE *in wood*, which we properly call *carving*, the firſt thing required, is, to chuſe a wood proper for the particular kind of work.—If it be any thing large, and require a deal of ſtrength and ſolidity; the hardeſt and moſt durable wood is to be choſen, as oak, or cheſnut: for ſmaller works they uſe pear-tree, and ſervice-tree. But as theſe woods are very hard, for little delicate works, they uſe ſofter woods, only cloſe, and of a fine grain: ſuch is the linden-tree, which the chiſſel is found to cut more eaſily, and cleanlily, than any other wood.

As to ſtatues, we find the ancients have made them of almoſt all kinds of wood: at Sicyon was an image of Apollo in box; at Epheſus, that of Diana was in cedar. As theſe two kinds of wood are very hard, and even held incorruptible, eſpecially cedar; Pliny obſerves, they were judged particularly ſuitable for repreſentations of the deities. In a temple, on mount Cyllenius, dedicated to Mercury, was an image of that god formed of the wood of the lemon-tree: others there were of the palm-tree, olive-tree, ebony, and even of the vine.

For large works, if it be only ſingle figures, it is better they conſiſt of ſeveral pieces, than of a ſingle one, by reaſon of the liableneſs of the latter to wrap; for every large piece may probably not be dried to the heart, however it may appear without ſide.—Obſerve, that the wood will not be fit for working, till after it have been cut at leaſt ten years.

SCULPTURE *in marble and ſtone*.—The firſt thing they do, is out of a great block of marble to ſaw another of the ſize required, which is performed with a ſmooth ſteel ſaw without teeth, caſting water and ſand thereon, from time to time: then they faſhion it, by taking off what is ſuperfluous with a ſtubbed point, and a heavy mallet; after this, bringing it near the meaſures required, they reduce it ſtill nearer with another finer point.—They now uſe a flat cutting inſtrument, having two notches in its edge, or three teeth; then a chiſſel to take off the ſcratches the former has left.—This laſt inſtrument they uſe with a deal of delicacy, giving thereby a ſoftneſs, and tenderneſs to their figure; till, at length, taking raſps of different degrees of fineneſs, by degrees they bring their work into a condition for poliſhing.—To poliſh, or make the parts ſmooth and ſleek, they uſe pumice-ſtone, and ſmalt; then tripoli, and when a ſtill greater luſtre is required, a ſkin and burnt ſtraw.

When any conſiderable work is undertaken, as a ſtatue, baſſo relievo, or the like, they always make a model, before-hand, of clay; but as this ſhrinks in drying, and eaſily cracks and breaks, they only uſe it to make a mould of plaiſter, or ſtucco, wherein they make a figure of the ſame matter, which ſerves them thenceforth for a model, and by which they adjuſt all their meaſures and proportions.

To proceed the more regularly; on the head of the model, they place an immoveable circle, divided into degrees, with a moveable ruler, or index faſtened in the centre of the circle, and divided likewiſe into equal parts. From the end of the ruler hangs a thread with a plummet, which ſerves to take all the points to be transferred thence to the block of marble, from whoſe top hangs another plummet like that of the model.—See *Tab. Miſcell. fig.* 2.

Indeed there are ſome excellent ſculptors who diſapprove of this method; urging, that the ſmalleſt motion of the model changes their meaſures, for which reaſon they rather chuſe to take all their meaſures with the compaſſes.

For the caſting of ſtatues, or figures of metal; and the moulding of ſtatues, &c. *of ſtucco, plaiſter*, &c. See STATUE, STUC, PLAISTER, *&c.*

SCUM, or SPUME, SPUMA, a light excrement, ariſing from liquors when briſkly ſtirred; called alſo *foam*, or *froth*. See FROTH.

SCUM is alſo uſed for the impurities which a liquor by boiling caſts up to the ſurface; and alſo, for thoſe taken from off metals when in fuſion; called alſo *ſcoria*. See SCORIA.

SCUM *of lead*, is a kind of ſmalt, of various colours, produced from the fumes of lead. See LEAD.

SCUM *of ſilver*, is what we commonly call *litharge* of ſilver. See LITHARGE.

SCUM *of nitre*,	See the articles	SALT-PETRE.
SCUM *of ſalt*,		SALT.
Sugar of the SCUM,		SUGAR.

SCUPER *holes*,	See the articles	SCOPER.
SCUPER *nails*,		NAILS.

SCURVY, in medicine, a diſeaſe called by phyſicians *ſcorbutus*. See SCORBUTUS.

M. Poupart, in the memoirs of the French academy, gives us a very accurate hiſtory of a particular kind of *ſcurvy*, very frequent in Paris in the year 1699. The ſymptoms, and conſequences of this new *ſcurvy* were very extraordinary; and ſoon determined M. Poupart to conclude it ſomewhat of that cruel plague wherewith the Athenians were ſo long and ſo dreadfully harraſſed; yet was it a true *ſcurvy*, and the perſons attacked with it had all the uſual ſcorbutic ſymptoms.

SCUTAGE, SCUTAGIUM, in ancient cuſtoms.—All tenants who held of the king by military ſervice, were either bound to attend perſonally in wars and expeditions; or, for default of ſuch ſervice, to pay *ſcutage*, that is, a compoſition in money, which was levied on every *ſcutum militare*, or knight's fee, and the proportional parts thereof for the king's uſe. See KNIGHT'S *ſervice* and KNIGHT'S *fee*.

The barons, and knights, who paid *ſcutage* to the king, had a power to levy the ſame tax on thoſe tenants who held from them in military ſervice.

The *ſcutage* was at one, two, or three marks for each knight's fee. See ESCUAGE.

SCUTCHEON. See the article ESCUTCHEON.

SCUTCHEON *grafting*. See ENGRAFTING.

SCUTIFORM *os*, in anatomy, the chief bone of the knee, called alſo *patella*, *mola*, &c. See PATELLA.

SCUTIFORMIS *cartilago*, in anatomy, one of the cartilages of the larynx, the broadeſt, and biggeſt of them all: thus called by the Latins, becauſe in form of a ſhield, or ſquare buckler; by the Greeks *thyroides*. See THYROIDES.

It is alſo by ſome called the *anterior cartilage*, becauſe ſituate in the fore-part. See CARTILAGE.

It is gibbous without ſide, and hollow within: ſometimes double, chiefly in women, in whom it does not advance ſo far forward as in men. See LARYNX.

SCUTTLES, in a ſhip, are ſquare holes cut in the deck, big enough to let in the body of a man; ſerving to let people down into any room below, upon occaſion, or from deck to deck.

They are generally before the main-maſt, before the knight in the fore-caſtle; in the gun-room, to go down to the ſtern-ſheets; in the round-houſe, to go down into the captain's cabbin, when forced by the enemy in a fight aloft.

There are alſo ſome ſmaller *ſcuttles*, which have grattings over them; and all of them have covers to them, that men may not tumble in, in the night.

SCUTTLE is alſo a denomination given to thoſe little windows, and long holes, which are cut out in cabbins to let in light.

SCYREGEMOT, or SCYREMOT, in ancient cuſtoms, a country court held twice every year by the biſhop of the dioceſe, and the ealdorman, or ſheriff; wherein both the eccleſiaſtical and temporal laws were given in charge to the county.

In the time of Canutus the *ſcyregemot* was held thrice every year.—Edward the confeſſor appointed it to be held twelve times in the year. See CONSISTORY, COUNTY, and COURT.

SCYTALA, in mechanicks, a term which ſome writers uſe for a kind of radius, or ſpoke, ſtanding out from the axis of a machine, as a handle or lever, to turn it round and work it by. See AXIS *in peritrochio.*

SCYTALA *Laconica*, in antiquity, a ſtratagem, or device of the Lacedæmonians, for the ſecret writing of letters to their correſpondents, ſo that if they ſhould chance to be intercepted, no body might be able to read them.

To this end they had two wooden rollers, or cylinders, perfectly alike, and equal; one whereof was kept in the city, the other by the perſon to whom the letter was directed.—For the letter, a ſkin of very thin parchment was wrapped round the roller, and thereon was the matter wrote; which done, it was taken off, and ſent away to the party, who, upon putting it in the ſame manner upon his roller, found the lines and words in the very ſame diſpoſition, as when they were firſt wrote.

This expedient they ſet a very high value on; though, in truth, artleſs, and groſs enough: the moderns have improved vaſtly on this method of writing. See CIPHER.

SE.—*Felo de* SE,	See the articles	FELO.
Per SE,		PER *ſe.*

SEA, *mare*, in geography, is frequently uſed for that vaſt tract of water incompaſſing the whole earth; more properly called *ocean*. See OCEAN.

For the cauſe of the ſaltneſs of the SEA, ſee SALTNESS.

SEA is more properly uſed for a particular part, or diviſion of the ocean; denominated from the countries it waſhes, or from other circumſtances.

Thus we ſay, the *Iriſh ſea*, the *Mediterranean ſea*, the *Baltic ſea*, the *Red ſea*, &c.

Till the time of the emperor Juſtinian, the *ſea* was common, and open, to all men: whence it is, that the Roman laws grant an action againſt a perſon who ſhall prevent, or moleſt another in the free navigation, or fiſhing therein.—The emperor Leo, in his 56th novel, firſt allowed ſuch as were in poſſeſſion of the land the ſole privilege of fiſhing before their reſpective territories, excluſive of all others: he even gave a particular commiſſion to certain perſons, to divide the Thracian Boſphorus among them.

From that time, the ſovereign princes have been endeavouring to appropriate the *ſea*, and to withdraw it from the publick uſe. The republick of Venice pretends to be ſo far miſtreſs in her gulf, that there is a formal marriage, every year, between that ſeignory and the Adriatic.

In theſe laſt ages, the Engliſh have particularly claimed the empire of the *ſea* in the channel; and even that of all the *ſeas* incompaſſing the three kingdoms of England, Scotland, and Ireland; and that as far as the ſhores of the neighbouring ſtates. In conſequence of which pretenſion it is, that children born on theſe *ſeas* are declared natural Engliſhmen, as much as if born on Engliſh ground.—The juſtice of this pretenſion is ſtrenuouſly argued between Grotius, and Selden, in the *mare liberum*, and *mare clauſum*.

SEA *army*,	See the articles	ARMY.
SEA *aſtrolabe*,		ASTROLABE.
SEA *biſquet*,		BISQUET.
SEA *chart*,		CHART.
SEA *compaſs*,		COMPASS.

SEA *drags*, among mariners, are ſuch things as hang over the ſhip, in the ſea; as ſhirts, coats, and even the boat, *&c.* when towed.

SEA *fight*,	See the articles	SIGNAL.
SEA *laws*,		USES *and cuſtoms.*
SEA *officer*,		OFFICER.
SEA *quadrant*,		BACK-STAFF.
SEA *ſalt*,		SALT.

SEA *water*, that briny bitteriſh fluid, which conſtitutes the ſea. See WATER.

To make SEA-WATER *ſweet*, or *freſh*, is a thing long and much wanted, for the advantage of navigation and commerce: a method of doing which has been invented by Mr. Hauton, and the ſecret publiſhed in the *Philoſophical Tranſactions*.—It is performed by precipitating the water with oil of tartar, and then diſtilling it.

The oil of tartar he can draw very cheap, and the diſtillation he performs very compendiouſly, ſo as to gain 24 French quarts of freſh water in a day; for the cooling of which, inſtead of making the worm paſs through a veſſel of water, as uſual, he makes it paſs through a hole in the ſhip into the ſea, and enter in again through another.

To the precipitation, and diſtillation, he adds a third operation, *viz.* filtration, to correct intirely the malignity of the water. The filtration is performed by a peculiar earth, mixed and ſtirred with the diſtilled water, and at length ſuffered to ſettle at the bottom.

The water thus managed, is found perfectly wholſome both to man and beaſt.

Dr. Liſter obſerves, that the *ſea-water* is made freſh by the breath of plants growing in it. This he found by putting a quantity of ſea-weed in a veſſel of *ſea-water*; and fitting the hole with a head, beak and receiver, he diſtilled daily, from the plants, a ſmall quantity of freſh, ſweet, potable water: this he takes to be the moſt natural, ſafe, and ſpeedy way of having freſh water from the ſea. See WATER.

Mr. Boyle relates, from ſome experiments he procured to be made of the gravity of *ſea-water*, in different climates, that ſtill, as you approach nearer the equator, the *ſea-water* is heavier and heavier, as far as within 30 degrees thereof, after which it continues much at one.

SEA *wreck*. See the article WRECK.

SEA *yoke*.—When the ſea is ſo rough, that the helm cannot be governed by the hands, the ſeaman make a *yoke* to ſteer by: that is, they fix two blocks to the end of the helm, and reeving too ſmall ropes through them, which they call *falls*, by having ſome men at each tackle, they govern the helm by direction.

They have another way of making a *ſea-yoke*, by taking a double turn about the end of the helm with a ſingle rope; the ends being laid to the ſhip-ſides, by means whereof they guide the helm. See HELM.

Head SEA,	See the articles	HEAD *ſea.*
High SEA,		HIGH.
Lie under the SEA,		LIE.
Pacific SEA,		PACIFIC.
Reflux of the SEA,		REFLUX.
Trough of the SEA,		TROUGH.
Under the SEA,		UNDER.

SEAL, *ſigillum*, a puncheon, or piece of metal, or other matter, uſually either round or oval; whereon is engraven the arms, device, *&c.* of ſome prince, ſtate, community, magiſtrate, or private perſon, with a legend or inſcription: the impreſſion whereof in wax ſerves to make acts, inſtruments, *&c.* authentick. See SIGNATURE.

The king's *great-ſeal* is that whereby all patents, commiſſions, warrants, *&c.* coming from the king, are ſealed. The keeping hereof is in the hands of the lord high chancellor, who is hence alſo denominated *lord-keeper.*—Indeed, there is ſome difference between the lord chancellor and lord keeper; not in office, but in the manner of creation, the latter being made by the delivery of the *great-ſeal* to him by the king; but the former having likewiſe a patent. See CHANCELLOR and KEEPER.

The king's *privy-ſeal*, is a *ſeal* uſually firſt ſet to grants that are to paſs the *great-ſeal.* See PRIVY-SEAL, CLERK, and HALF-SEAL.

The uſe of *ſeals* is very ancient: in Daniel, chap. xiii. we read that Cyrus ſet his *ſeal* on the temple of Bel: but *ſeals* are ſtill older; for Jezebel, in 1 Kings, chap. xxi. *ſeals* the orders ſhe ſent for Naboth's death with the king's ring.—In effect, as the ancient *ſeals* were all engraven on the collets, ſtones, *&c.* of rings, and as the original uſe of rings, it is aſſerted, was only to be in a readineſs for the ſealing of acts, inſtruments, *&c. ſeals* ſhould be as ancient as rings themſelves. See RING.

Theſe *ſealing-rings*, called *annuli ſignatorii*, *ſigillares*, *cirographi* or *cerographi*, it is ſaid in ancient authors, were firſt invented by the Lacedæmonians, who, not content to ſhut their cheſts, armories, *&c.* with keys, added *ſeals* to them: and to this end, at firſt, made uſe of worm-eaten wood, the impreſſions whereof they took on wax, or ſoft earth: but they at length found the art of engraving figures, or rings, the impreſſions of which they took in the ſame manner.—This, however, muſt be granted, that even in Moſes's time, the art was known of engraving, not only on metals, but alſo on precious ſtones. See ENGRAVING.

Indeed, it does not appear that the ring had any other uſe among the primitive Jews beſides ornament: but at length it was uſed to *ſeal* inſtruments, contracts, diplomas, letters, *&c.* inſtances whereof we have in the third book of Kings, xxi. 8. Eſther viii. 10. Xenophon. Hellen. lib. I. Quint. Curt. lib. vi. Juſt. lib. xliii. cap. iii. where we learn, the keeping of the emperor's *ſeal* was become a particular office.—Lucian adds, that Alexander gave his to Perdiccas, thereby appointing him his ſucceſſor.

Pliny obſerves, that in his time there were no *ſeals* uſed any where but in the Roman empire: at Rome, he tells us, they were become of abſolute neceſſity, inſomuch that a teſtament was null without the teſtator's *ſeal*, and the *ſeals* of ſeven witneſſes: but it does not appear that the Romans had any ſuch things as public *ſeals*; nor that their edicts, and contracts, were *ſealed*, not even in the times of the emperors.

In France the cuſtom anciently was, inſtead of ſigning their inſtruments, *&c.* only to *ſeal* them; as appears from an infinity of ancient charters, which are not ſigned at all: the reaſon whereof was, that in thoſe days very few people were then able to write; no body could read and write but clerks. In England, the firſt *ſealed* charter we find extant, is that of Edward the confeſſor, upon his founding of Weſtminſter-Abbey: yet, we read of *ſeals* in the MS. hiſtory of king Offa.

Before the time of William the conqueror, the Engliſh did not *ſeal* with wax, but only made a golden croſs on the parchment, and ſometimes an impreſſion on a piece of lead, which hung to the grant with a ſilken ſtring, and was deemed an abundant authorizing of the grant itſelf, without either ſigning or witneſſes.—The colour of the wax wherewith the king's grants were *ſealed*, was uſually green, to ſignify that the act continued for ever freſh, and of force.

The uſual impreſſion on all laymens *ſeals*, till the year 1218, was a man on horſeback, with a ſword in his hand; afterwards, they began to engrave their coats of arms on their *ſeals*: only the archbiſhops, and biſhops, by a decree of cardinal Otto, who was legate here in 1237, were to bear in their *ſeals*, their title, office, dignity, and even their proper names.

Du Cheſne obſerves, that none below the dignity of a knight had any right to a pendent *ſeal*, called *authenticum.*

The emperors long *ſealed* all their acts of importance with a golden *ſeal*; and the golden bull of Charles IV. for the election of an emperor, takes its name from the gold *ſeal* hanging to it, which is called *bull.* See BULL.

The pope has two kinds of *ſeals*: the firſt uſed in apoſtolical briefs, and private letters, *&c.* called, the *fiſherman's ring.*—This is a very large ring, wherein is repreſented St. Peter, drawing his net full of fiſhes. See BRIEF.

The other is uſed in bulls, repreſenting St. Peter's head on the right, that of St. Paul on the left, with a croſs between the two: on the reverſe is ſometimes the pope's name, and arms. See BULL.

The impreſſions of the firſt *ſeal* are taken in red wax, thoſe of the ſecond, in lead.

Theod. Hopingk, a German lawyer, has furniſhed the world with a learned and curious work on the ſubject of *ſeals*: it conſiſts of ſixteen chapters, the 1st. whereof treats of the name *ſeal*, *ſigillum.* 2d. Of the antiquity of the *ſealing-rings*, mentioned in Geneſis, their inventors, the reaſons of bearing them, their kinds, and differences, forms, ornaments, hieroglyphicks, ends, uſes, effects, and abuſes. 3°. Of bulls, in the ſame method, and under the ſame circumſtances. 4°. Of different kinds of *ſeals*; which he divides into *publick* and *private*, *proper* and *foreign*, *formed* and *unformed*, *ordinary* and *extraordinary*, *known* and *unknown*, *true* and *falſe*; and laſtly, *ratificative* and *confirmative*, of *authority*, *ſolemnity*, *teſtimony* and *conſent.* 5°. Of ſuch as have a right to bear *ſeals.* 6°. Of the keeping of *ſeals.* 7°. Of things *ſeals* are put to. 8°. Of the images, figures, arms, characters, inſcriptions, *&c.* the places where *ſeals* are to be put, and the order to be obſerved therein. 9°. Of the number and multitude of *ſeals*, and the advantage they bring. 10°. Of their uſe, end, effects, force, *&c.* 11°. Of the proof of *ſeals* in general, and particular, publick and private. 12°. Of the verifying of *ſeals.* 13°. Of the manner of cenſuring and diſputing *ſeals.* 14°. Of ſubſcriptions that have a regard to *ſeals.* 15°. Of other particulars that have a regard thereto; as the ſignatures of emperors, kings, chancellors, ſecretaries, and notaries, all in the ſame order and method.

The book was printed in 1642, at Nurembergh, in quarto, under the title, *De ſigillorum priſco & novo jure, tractatus practicus*, &c.—We have another work of the like kind, by Heineccius, in folio, printed at Francfort, and Leipſic, in 1709, under the title, *De veteribus Germanorum aliorumq; nationum ſigillis, eorumque uſu & præſtantia, ſyntagma hiſtoricum.*

Hermetical SEAL. See the article HERMETICAL.

SEAL is alſo uſed for the wax or lead, and the impreſſion thereon, affixed to the thing *ſealed.*

The manufacturers *ſeal* frequently applied to their ſtuffs, *&c.* is to be of lead. That of knights by the French law is to be of hard wax; that of agents, of ſoft wax.

Some *ſeals* are ſtamped on the paper or parchment itſelf; others hung by ſilken ſtrings.

The French *ſeal* their edicts with green wax, arrets with yellow wax; expeditions for Dauphine with red wax. The letters of the French academy are *ſealed* with blue wax. See WAX.

SEALER, an officer in chancery, appointed by the lord chancellor, or keeper of the great-ſeal, to ſeal the writs and inſtruments there made in his preſence.

SEALING, in architecture, the fixing a piece of wood or iron in a wall, with plaiſter, mortar, cement, lead, or other ſolid binding.

For ſtaples, hinges, and joints, plaiſter is very proper.

SEALING *wax.* See the article WAX.

SEAM or SEME *of corn*, is a meaſure of eight buſhels.

SEAM *of glaſs*, is the quantity of 120 pounds, or 24 ſtone, each five pound weight.—Of wood, an horſe-load.

Monks SEAM. See the article MONK.

SEARCE. See the article SIEVE.

SEARCHER. See the article ALNAGER.

SEAR-CLOTH*, or CERE-CLOTH, in chirurgery, denotes a form of external remedy, ſomewhat harder than an unguent, yet ſofter than an emplaſter; though it is frequently uſed, both for the one, and the other. See CERATE and SPARADRAP.

* The word *ſear-cloth* is ſuppoſed to be a corruption of *cere-cloth*, and to be derived originally from the Greek κηρος, wax.

The *ſear-cloth* is ſuppoſed to have wax in its compoſition, which diſtinguiſhes, and even denominates it. In effect, when a liniment or unguent has wax in it, it does not differ from a *ſear-cloth.* See UNGUENT, *&c.*

Sear-cloths are a kind of ſubſtitutes to friction, and are ſometimes uſed for raiſing a ſalivation: they are uſually compounded of reſolvent drugs, as ſaffron, myrrh and aloes, incorporated with wax and gums, as galbanum, gum ammoniac, and ſagapenum: the whole tempered with wine.

SESE. See the article SEIZE.

SEASONING *of timber.* See TIMBER.

SEASONINGS, in the Weſt-Indies, a kind of aguiſh diſtemper, which foreigners are much ſubject to at their firſt coming.

SEASONS*, in coſmography, certain portions or quarters of the year, diſtinguiſhed by the ſigns which the ſun then enters, or by the meridian altitudes of the ſun; conſequent on which, are different temperatures of the air, different works in tillage, &c. See YEAR, SUN, ECLIPTIC, OBLIQUITY, &c.

* The word is formed from the French, *ſaiſon*, which Menage derives from the Latin, *ſtatio*, whence the Italians have formed *ſtagione:* Nicod derives it from *ſatio*; *tempus ſationis*, ſowing time.

The year is divided into four *ſeaſons*, ſpring, ſummer, autumn, and winter. The beginnings and endings of each whereof, ſee under its proper article, SPRING, &c.

It is to be obſerved, the *ſeaſons* anciently began differently from what they now do: witneſs the old verſes,

Dat Glemens hyemem; dat Petrus ver cathedratus;
Æſtuat Urbanus; autumnat Bartholomæus.

SEAT, in aſtronomy. See the article SCHEAT.

SEAT, in medicine. See the article ANUS.

SEAZE. See the article SEIZE.

SEBACEÆ *glandulæ*. See the article GLANDULÆ.

SEBESTEN, SEBESTENA, *myxa*, in pharmacy, &c. a fruit reſembling a little plumb or prune; which when ripe, is of a deep red colour, bordering on black; very ſweet, and the fleſh, or pulp, glutinous, or ſticky. See DIASEBESTEN.

The Syrians make a kind of glue or birdlime, of the *ſebeſtens*, called *birdlime of Alexandria*. The fruit is eſteemed pectoral, cooling, and emollient; though not much uſed in medicine. The ſtone within it is triangular.—It brought its name from Arabia, whence Pliny obſerves it came in his time into Italy.

SEBUÆI, a ſect among the ancient Samaritans; whom St. Epiphanius accuſes of changing the time expreſſed in the law, for the celebration of the great annual feaſts of the Jews. See FEAST and SAMARITAN.

Serrarius conjectures, that they were thus called, from their celebrating the feaſt of the paſſover on the ſeventh month, called by the Hebrews *ſeba*, ſeventh.—Druſius rather takes them to have been denominated from *Sebaia*, the leader of a ſect among the Samaritans; as the followers of Doſitheus, were denominated *Doſithei*; which two ſects, ſome Jewiſh doctors ſuppoſe to have ſubſiſted at the ſame time.—Scaliger derives the name from the Hebrew, *ſebua*, week; as who ſhould ſay, *Hebdomadites*, becauſe of their celebrating every ſecond day of the ſeven weeks, between Eaſter and Whitſuntide. Yet the ſame Scaliger, in his anſwer to Serrarius, gives a different explication.—In effect, all that has hitherto been advanced on the point, is mere conjecture.

SEBURAI *, SEBURÆI, a name which the Jews give to ſuch of their rabbins or doctors, as lived and taught ſome time after the finiſhing of the talmud.

* The word is derived from סבר, *ſebar*, I think, whence סברא, *ſebura*, opinion, ſentiment; and thence סבראי, *ſeburi*, or *ſeburai*, opinionative.

The reaſon of this appellation, ſay the rabbins, is, that the Talmud being finiſhed, publiſhed, and received in all the ſchools and ſynagogues, theſe doctors had nothing to do, but diſpute for, and againſt, the Talmud and its deciſions. Others ſay, it was becauſe their ſentiments were not received as laws, or deciſions; as thoſe of the Miſchnic and Gemaric doctors were; but were held as mere opinions. Others, as the author of *Scalſcheleth Hakkabala*, or chain of tradition, tells us, that the perſecution, the Jews underwent in thoſe times, not allowing them to teach quietly in their academies, they only propoſed their opinions on the compoſition of the Miſchna.

The firſt and chief of the *Seburai*, was R. Joſi, who began to teach in the year 787 of the æra of contracts; which, according to R. David Gautz, falls on the year of the world 4236; and who, according to R. Abraham, was 38 years preſident of the Jewiſh academy.

This æra of contracts is the ſame with that of the *Seleucidæ*, the 787th year whereof, falls on the year of Chriſt 476, which of conſequence, is the æra of the origin of the *Seburai*; whoſe reign did not hold long: Buxtorf ſays, not above 60 years; but R. Abraham and others, not 50. The laſt of them was R. Simona.—They were ſucceeded by the Gaons or Geonim.

SECANT, in geometry, a line that cuts another, or divides it into two parts. See LINE, &c.

Thus the line A M (*Tab. Geometry, fig.* 12.) is a *ſecant* of the circle A E D, &c. as it cuts the circle in B.

It is demonſtrated by geometers; 1°. That if ſeveral *ſecants* M A, M N, M E, &c. be drawn from the ſame point M, that paſſing through the centre M A, is the greateſt, and the reſt are all ſo much the leſs, as they are more remote from the centre. On the contrary, the portions thereof without the circle M D, M O, M B, are ſo much the greater, as they are further from the centre. The leaſt, is that of M A, which paſſes through the centre.

2°. That if two *ſecants* M A and M E, be drawn from the ſame point M; the *ſecant* M A, will be to M E, as M D to M B. See TANGENT.

SECANT, in trigonometry, denotes a right line, drawn from the centre of a circle, which cutting the circumference, proceeds, till it meets with a tangent, to the ſame circle. See CIRCLE and TANGENT.

Thus the line F C (*Tab. Trigonometry, fig.* 1.) drawn from the centre C, till it meet the tangent E F, is called, a *ſecant*; and particularly, the *ſecant of the arch* A E, to which E F is a tangent.

The *ſecant* of the arch A H, which is the complement of the former arch to a quadrant, is called the *co-ſecant*, or *ſecant of the complement*. See CO-SECANT.

The ſine of an arch, A D, being given; to find the *ſecant* thereof F C, the rule is, as the co-ſine A D C is to the ſine A D, ſo is the whole ſine E C, to the *ſecant* C F.

To find the logarithm of the *ſecant* of any arch, the ſine of the complement of the arch being given; multiply the whole ſine of the logarithm by two, and from the product ſubtract the logarithm of the ſine complement; the remainder is the logarithm of the *ſecant*. See LOGARITHM.

Line of SECANTS. See the article SECTOR.

SECK.—*Rent* SECK. See the article RENT *ſeck*.

SECOND, in anatomy. See SECUNDI *generis*.

SECOND, in geometry, aſtronomy, &c. the ſixtieth part of a prime, or minute; either in the diviſion of circles, or in the meaſure of time. See PRIME and MINUTE.

A degree, or an hour, are each divided into 60 minutes, marked thus ′: a minute is ſub-divided into 60 *ſeconds*, marked thus ″; a *ſecond* into 60 thirds, marked thus ‴, &c. See DEGREE.

We ſometimes ſay a *ſecond minute*, a *third minute*, &c. but more uſually, ſimply, *ſecond*, *third*, &c. See MINUTE.

A pendulum three feet three inches, and two tenths of an inch long, vibrates *ſeconds*, according to Sir Jonas Moor's reduction of Huygens's three feet eight lines and a half of Paris meaſure, to Engliſh meaſure. See PENDULUM.

SECOND, in muſick, denotes one of the muſical intervals; being only the diſtance between any ſound, and the next ſound, whether higher or lower. See INTERVAL.

As in the compaſs of a tone, there are reckoned nine ſenſibly different ſounds, which form thoſe little intervals, called *commas*; one might, in ſtrictneſs, ſay, there are eight kinds of *ſeconds*. But as theſe minute intervals, though ſenſible, are not yet ſo far ſo, as to contribute much to the harmony, they uſually only diſtinguiſh four ſorts.

The firſt, called *the diminiſhed ſecond*, containing four commas; being the difference, for inſtance, of a natural *ut*, and an *ut* raiſed four commas higher.

The ſecond, called *leſſer ſecond*, contains five commas, and is made either naturally, as from *mi* to *fa*, or from *ſi* to *ut*; or accidentally, by means of *b*, as from *la* to *ſi*, *b flat*; or from *fa dieſis* to *ſol*; otherwiſe called a *major ſemitone*, or *imperfect ſound*, by the Italians, *ſemitono*. See SEMITONE.

The third is the *greater ſecond*, containing the nine commas, which compoſe the tone. This the Italians call *tono* or *perfect ſound*.

The fourth is the *redundant ſecond*, compoſed of a whole tone and a minor ſemi-tone. See TONE, SEMI-TONE, &c.

SECOND *captain*, is a reformed captain, who acts as lieutenant of another, into whoſe company he is incorporated. See CAPTAIN.

SECOND *cauſe*. See the articles CAUSE and EFFICIENT.

SECOND *flank*,	See the articles	FLANK.
SECOND *notion*,		NOTION.
SECOND *order of curves*,		CURVE.
SECOND *rate*,		RATE.

SECOND *ſight*, an odd qualification, which many of the inhabitants of the weſtern iſlands of *Scotland* are ſaid to be poſſeſſed of.—The thing is atteſted by ſo many credible authors (the lateſt of whom is Mr. Martin, author of the natural hiſtory of theſe iſlands, and a member of the royal ſociety) that, notwithſtanding the quaintneſs of it, there ſcarce ſeems room to call it in queſtion.

The *ſecond ſight*, then, is a faculty of ſeeing things to come, or things doing at a great diſtance, repreſented to the imagination as if actually viſible, and preſent.

Thus if a man be dying, or about to die, his image ſhall appear diſtinctly in its natural ſhape, in a ſhroud, and with other funeral apparatus, to a *ſecond-ſighted* perſon, who, perhaps, never ſaw his face before: immediately after which, the perſon ſo ſeen, certainly dies.

This quality of *ſecond-ſightedneſs*, is not hereditary: the perſon who has it, cannot exert it at pleaſure: nor can he prevent it, or communicate it to another; but it comes on him involuntarily, and exerciſes itſelf on him arbitrarily: And often, eſpecially in the younger *ſecond* ſeers, to their great trouble and terror.

There are a great number of circumſtances attend theſe viſions; by obſervation whereof, the particular circumſtances as to time, place, &c. of the death of the perſon, are learnt.—The method of judging of them, or interpreting them, grows into a kind of art; which is very different in different perſons. *Second-ſightedneſs* is held a diſcredit in the country; ſo that none will counterfeit it; many conceal and diſſemble it.

SECOND *terms*, in algebra, thoſe where the unknown quantity has a degree of power leſs than it has in the term where it is raiſed to the higheſt. See TERM.

The art of throwing theſe *ſecond terms* out of an equation; that is, of forming a new equation, where they have no place, is one of the moſt ingenious and uſeful inventions in all algebra. See REDUCTION *of equations*.

SECOND *tithe*. See the article TITHE.

SECONDARY, or SECUNDARY, an officer who acts as ſecond, or next to the chief officer. See OFFICER and PRINCIPAL.

Such are the *ſecondaries* of the fine-office.—The *ſecondaries* of the compters, who are next the ſheriffs of London in each of the two compters.—*Secondary* of the office of the privy ſeal.—Two *ſecondaries* of the pipe.—*Secondary* to the remembrancers, &c. See REMEMBRANCER, &c.

SECONDARY, is more frequently uſed in an adjective ſenſe, by way of oppoſition to primary or principal. See PRIMARY, and PRINCIPAL.

SECONDARY *actors*, } See the articles { ACTOR.
SECONDARY *affections*, } See the articles { AFFECTION.

SECONDARY *circles*, of the ecliptick, are circles of longitude of the ſtars; or circles which paſſing through the poles of the ecliptick, are at right angles to the ecliptick. See CIRCLE and SPHERE.

By the help of theſe, all points in the heavens are referred to the ecliptick; that is, any ſtar, planet or other phænomenon, is underſtood to be in that point of the ecliptick, which is cut by the *ſecondary* ſemi-circle, which paſſes through ſuch ſtar or phænomenon. See ECLIPTICK, LONGITUDE, &c.

If two ſtars be thus referred to the ſame point of the ecliptick, they are ſaid to be in conjunction; if in oppoſite points, they are ſaid to be in oppoſition: if they be referred to two points at a quadrant's diſtance, they are ſaid to be in quartile aſpect; if the points differ a ſixth part of the ecliptick, they are ſaid to be in ſextile aſpect. See ASPECT, &c.

In the general, all circles which interſect one of the ſix greater circles of the ſphere at right angles, may be called *ſecondary circles*.—As, the azimuth or vertical circles in reſpect of the horizon, &c. the meridian in reſpect of the equator, &c. See AZIMUTH, VERTICAL, &c.

SECONDARY *collateral points*, } See { COLLATERAL.
SECONDARY *dials*, } See { DIAL.

SECONDARY *fever*, is that which ariſes after a criſis, or the diſcharge of ſome morbid matter: as, after the declenſion of the ſmall-pox, or meaſles. See FEVER, *Small*-POX, &c.

SECONDARY *motion*, } See the articles { MOTION.
SECONDARY *place*, } See the articles { PLACE.

SECONDARY *planets*, thoſe moving round other planets, as the centres of their motion, and along with them round the ſun. See PLANET.

Saturn, Jupiter, and the Earth, are each attended with *ſecondary planets*: Jupiter with four, and Saturn with five, called the *ſatellites* of thoſe two planets. See SATELLITES. The earth has one *ſecondary planet*, called the *moon*. See MOON.

The motion of the primary planets, is very ſimple and uniform, as being compounded only of a projectile motion, forward in a right line, which is a tangent to the orbit; and a gravitation towards the ſun at the centre. Add, that being at ſuch vaſt diſtances from each other, the effects of their mutual gravitation towards one another are inſenſible.—But the matter is far otherwiſe, in reſpect of the *ſecondary planets*; for every one of theſe, though it chiefly gravitate towards its reſpective primary one, as towards its centre, yet at equal diſtances from the ſun, is attracted towards him with equally accelerated gravity, as the primary one is towards him; but at a greater diſtance with leſs, and at a nearer diſtance with greater: from which double tendency towards the ſun, and towards their own primary planets, the motion of the ſatellites, or *ſecondary planets*, comes to be mightily compounded, and affected with many inequalities: as for inſtance,

1. The ſatellite ſhall be continually accelerated in its motion, from the time of its quadrature with the ſun, to the next following conjunction or oppoſition; but contrary-wiſe from the ſyzygies to the quadratures, it ſhall be retarded; and therefore will not always move ſwifter in or near the ſyzygies, and ſlower near the quadratures. From whence will follow that,

2. The orbits of theſe *ſecondary planets* will be of a figure more circular in the quadratures than in the ſyzygies, where the ſwiftneſs of the motion will make the figure of the orbit more rectilinear, and therefore the ſatellite will run farther from its primary planet at the quadratures, than at the ſyzygies: ſo that the orbit will be a little elliptical, having the primary planet for its centre, and the longer diameter will coincide with the line of the quadratures, and the ſhorter with that of the ſyzygies.—Which irregularities will ariſe, if the ſun's power of diſturbing the motion of the ſatellite be excluded, and the orbit be concentrick with that of the primary planets: for if the orbit be excentrical, it may happen that the ſatellite ſhall be farther off from the primary one in the ſyzygies, and ſo move ſlower than it does at the quadratures: and when this is the caſe, that the ſatellite's orbit is not a circle concentrick to the primary orbit, but an ellipſis, in one of whoſe focus's the primary planet is placed, then, the motion of the ſatellite will be ſo diſturbed by the ſun, that as it proceeds in its orbit, the apſes of the orbit ſhall be moved ſometimes *in conſequentia*, and ſometimes *in antecedentia* (whereas the nodes and apſes of the primary planets are at reſt.) See APSES and NODES.

3. When the plane of the ſatellite's orbit is inclined to the plane of the primary orbit, the line of the nodes of the *ſecondary* orbit will be moved *in antecedentia*, with an angular motion, and an unequal velocity; for it will recede moſt ſwiftly, when the nodes are in quadrature to the ſun; after which, it will move ſlower; and at the time of the nodes being in the ſyzygies, will be perfectly at reſt.

4. The inclination alſo of the plane of the *ſecondary* orbit, to the primary one, will be continually varying, and will be greateſt, when the nodes are in the ſyzygies with the ſun, and leſs, *cæteris paribus*, when they are in the quadratures; and from the time of the nodes being in the ſyzygies, to the quadratures, it will be always decreaſing, and from the time of their being in the quadratures to the ſyzygies, it will be always increaſing: and all thoſe irregularites, whether in any excentrick or concentrick orbit, will always be ſomething greater, when the ſatellite is in conjunction with the ſun, than when he is in oppoſition to him. See PLANET, QUADRATURE, SYZYGY, GRAVITY, &c.

SECONDARY *qualities*, } See the articles { QUALITY.
SECONDARY *rainbow*, } See the articles { RAINBOW.

SECONDINE. See the article SECUNDINE.

SECRETARY, an officer, who, by order of his maſter, writes letters, diſpatches, and other inſtruments, which he renders authentick by his ſignature. See CLERK.

Of theſe there are ſeveral kinds, as *ſecretary of ſtate*, *ſecretary of war*, *ſecretary of the treaſury*, *ſecretary of the admiralty*, *ſecretary of the lord chancellor*, &c.

SECRETARIES *of ſtate*, are officers attending the king, for the receipt and diſpatch of letters, grants, petitions, and many of the moſt important affairs of the kingdom, both foreign and domeſtick. See OFFICER.

The king's *ſecretaries* were anciently called the *king's clerks*, and *notaries*, *regi a commentariis*.—For the name *ſecretary*, it was at firſt applied to ſuch as being always near the king's perſon, received his commands, and were called *clerks of the ſecret*; whence was afterwards formed, the word *ſecretary*, *regi a ſecretis*: and as the great lords began to give their clerks the quality of *ſecretaries*, thoſe who attended the king, were called, by way of diſtinction, *ſecretaries of the commands*, *regi a mandatis*. This continued till the reign of our Henry VIII. 1559; when, at a treaty of peace between the French and Spaniards, the former obſerved, that the Spaniſh miniſters, who treated for Philip II. called themſeves *ſecretaries of ſtate*. Upon which the French *ſecretaries des commandements*, out of emulation, aſſumed the ſame title; which thence paſſed into England.

'Till the reign of king Henry VIII. there was only one *ſecretary of ſtate*: but then buſineſs increaſing, that prince appointed a ſecond *ſecretary*; both of equal power and authority, and both ſtiled *principal ſecretaries of ſtate*.—Before queen Elizabeth's time, the *ſecretaries* did not ſit at the council-board; but that princeſs admitted them to the place of privy-counſellors; which honour they have held ever ſince, and a council is never, or at leaſt very ſeldom, held without one of them.—On the union of England and Scotland, queen Anne added a third *ſecretary*, on account of the great increaſe of buſineſs, which, as to Britain, is equally and diſtinctly managed by all the three, although the laſt is frequently ſtiled *ſecretary of ſtate for North Britain*.

They have under their management and direction, the moſt conſiderable affairs of the nation, and are obliged to a conſtant attendance on the king: they receive and diſpatch whatever comes to their hands, be it for the crown, the church, the militia, private grants, pardons, diſpenſations, &c. as likewiſe petitions to the ſovereign, which, when read, are returned to the *ſecretaries* for anſwer; all which they diſpatch according to the king's command and direction.

As to foreign affairs, they are divided into two provinces, or departments, comprehending all the kingdoms and nations which have any intercourſe or buſineſs with Great Britain; each *ſecretary* receiving all letters and addreſſes from, and making all diſpatches to, the ſeveral princes and ſtates comprehended in his province: which diviſion ſtill ſubſiſts, notwithſtanding the addition of a third *ſecretary*.—Ireland and the plantations are under the direction of the elder *ſecretary*, who has the ſouthern province.

Of theſe three principal *ſecretaries*, the two for South Britain, have each two *under ſecretaries*, and one chief clerk; and the other for North Britain one *under ſecretary*, and one chief clerk, with an uncertain number of other clerks and tranſlators, all wholly depending on them.

The *ſecretaries of ſtate* have the cuſtody of that ſeal, properly called the *ſignet*, and the direction of the ſignet-office; wherein are four clerks employed, who prepare ſuch things as are to paſs the ſignet, in order to the privy, or great ſeal. All grants ſigned by the king are returned hither, which, tranſcribed, are carried to one of the principal *ſecretaries of ſtate*, and ſealed, and then called *ſignets*, which being directed to the lord privy-ſeal, are his warrant. See SIGNET, &c.

On the *ſecretaries of ſtate*, is likewiſe dependant another office, called *the paper-office*, wherein all publick writings, papers, matters of ſtate, &c. are preſerved. See PAPER-OFFICE.

All the *under ſecretaries* and clerks are in the choice of the *ſecretary*

ſecretary of ſtate, without reſerve to any perſon: the *under ſecretaries* receive orders and directions from them, for writing diſpatches, foreign and domeſtick, which they give to the chief clerk, who diſtributes them to the under-clerks.

SECRETARY *of an embaſſy*, is a perſon attending an embaſſador, for the writing of diſpatches relating to the negotiation.

There is a deal of difference between the *ſecretary of the embaſſy*, and the embaſſador's *ſecretary*; the laſt is a domeſtick or menial of the embaſſador's; the firſt a ſervant or miniſter of the prince. See EMBASSADOR.

SECRETION, SECRETIO, in medicine, the act whereby the ſeveral juices, or humours in the animal body, are ſeparated from the blood, by means of the glands. See HUMOUR, BLOOD, ANIMAL, *&c.*

In the bodies of animals, we obſerve a great number of juices of different natures, *viz.* the blood, lympha, ſaliva, ſtomach-liquor, inteſtinal juices, pancreatic juice, bile, urine, *&c.*—Now, the blood is the general ſource of all; and from it they are all ſecerned by particular organs, called *glands*. See GLAND.

The manner wherein this *ſecretion* is effected, has been greatly enquired into in theſe laſt ages; though not with the greateſt ſucceſs. The ancient phyſicians, indeed, contented themſelves to aſſert certain particular virtues, or faculties inherent in the ſeveral viſcera; whereby they were determined to ſeparate one liquor rather than another; without troubling themſelves much about the manner wherein it was done. But the moderns, according to the genius of their philoſophy, muſt have this point cleared, and the modus of *ſecretion* rendered intelligible.—Hence, as the exceeding ſmallneſs of theſe organs prevented any regular ſearch, they have imagined various manners of explaining them.

Some, full of the effects they have obſerved from fermentations, maintain, that there are ferments in the ſeveral parts; by aid whereof, certain kinds of particles mixed in the blood, are ſeparated therefrom; after the ſame manner as we ſee in muſt, or new wine, from which, while fermenting, certain parts are detached in form of froth.—But this opinion has ſo many inconveniencies to grapple withal, that it is almoſt univerſally abandoned. See FERMENT.

Others conſider the glands as kinds of ſieves, whoſe holes having different figures, will only let paſs certain particles or molecules, whoſe figures reſemble thoſe of the holes.—But the falſity of this hypotheſis was ſoon found out; and it was thought ſufficient to fix ſome proportion between the diameters of the pores and of the molecules that were to paſs through them, to account why very ſubtile parts ſhould paſs through the glands, through which the coarſer could not paſs.—Yet this opinion was not found perfectly ſatisfactory: for on this ſuppoſition, the moſt ſubtile parts of the blood muſt paſs in ſuch quantity through the largeſt pores, that there would not be enough left to furniſh the little ones with what they needed: and for the ſame reaſon, thoſe parts whoſe pores are biggeſt, ought to furniſh liquors much fuller of ſubtile parts, than thoſe whoſe pores are ſmaller; which yet is contrary to experience. For the ſeroſity ſeparated in the kidneys, under the name of *urine*, conſiſts of parts much ſubtiler and ſmaller than the bile ſeparated in the liver: why then does not this ſeroſity eſcape in the liver? the pores whereof muſt be much greater than thoſe of the kidneys. See BILE.

This inconvenience, many naturaliſts being aware of, has made them have recourſe to *imbibition* (if the word may be allowed us for want of a better.) They maintain, then, that beſides the different diameters of the pores, it is required that the ſeveral parts be already imbued or moiſtened with a liquor like to that they are to filter.—This opinion is rather the reſult of reaſon than of experiment, and the maintainers hereof, well pleaſed they had ſomething to ſatisfy their reaſon withal, never troubled themſelves whether it were true: till M. Winſlow fell into it.

Dr. Keil, whoſe theory prevails moſt in England, accounts for *ſecretion*, from the joint conſideration of the different diameters of the veſſels, the different velocity of the blood, the different angles the ducts make with the arteries, and the different attraction of the different parts under all theſe different circumſtances.—His theory ſee at length, under the article ANIMAL *ſecretion*.—But even in this, there is ſomething arbitrary and conjectural: beſides, the reaſoning is carried ſuch a length, that, in a thing, the principles wherof are ſo obſcure, the parts or organs ſo imperfectly known, and the whole proceſs carried on out of ſight, the mind can ſcarce ſafely acquieſce in it.

M. Winſlow, of the royal academy of ſciences at Paris, ſeems to have taken a better courſe for the diſcovery of this important action of *ſecretion*. He does not take up with conjectural principles, nor draw a plauſible ſcheme of reaſoning therefrom through the dark; but applies himſelf to experiment, and inveſtigates, in nature herſelf, and the ſtructure of the parts, the manner *ſecretion* is performed in. From a ſtrict examination of the ſeveral kinds of glands, both in men and other animals, he finds, with ſome other anatomiſts, that the glands are only bundles or plexus's of veſſels: but the veſſels peculiar to the gland, and which conſtitute the principal part thereof, M. Winſlow firſt diſcovered to be tubes, furniſhed, on the inſide, with a kind of down or lanugo, or rather a very fine, ſpongeous tiſſue, which fills the whole cavity of thoſe veſſels like a pith or marrow. This he finds in all glands, of all animals: in different glands, it appears of different colours, and this different colour is even found in the different glands of fœtus's themſelves.

The gland, then, is, at leaſt its main part, a compound of thoſe downy or ſpongeous veſſels, which, from their office, we will call *ſecretory veſſels*, or *ducts*, and which frequently do, almoſt of themſelves, form what we call a *gland*, or *glandulous body:* though beſide theſe veſſels, we uſually remark four other kinds, *viz.* arteries, veins, excretory ducts and nerves. The *ſecretory* ducts we diſtinguiſh from the excretory ones; in that the former, by the peculiar texture of their down, ſerve to ſeparate a particular liquor; and that the latter only ſerve to receive the liquor thus *ſecreted*, and to carry it to the place it is deſtined for. For a more particular account of the ſtructure and organization of the glands, ſee GLAND.

For the manner wherein the glands act, in ſeparating the ſeveral liquors from the body, M. Winſlow lays it down thus: it is a thing well known by phyſicians and chymiſts, that a piece of brown paper, which is only an aſſemblage of ſmall fibres impacted cloſe to each other, having once imbibed oil or water, will never let any other liquor paſs through it, but of the ſame kind with what it is impregnated withal. All others it ſtops. And the like is obſerved of a wick of cotton or other matter, which having firſt imbibed its fill of oil or water, and being then dipped at one end, in a veſſel full of oil and water together; the wick that had imbibed the oil, will only raiſe and diſtil oil, and that with water, only water. Now, in the *ſecretory* ducts of the glands, we find a parallel ſtructure; an aſſemblage or plexus of fine threads or filaments bound cloſe together, much as in brown paper, or a cotton-wick; only differently diſpoſed. This plexus, then, having once imbibed a certain juice, will not let paſs any of the liquors which arrive at the orifices of theſe ducts, but that it had firſt imbibed.—The cauſe of this phænomenon is, doubtleſs, to be referred to the great principle of attraction, which is found ſtronger between the homogeneous than the heterogeneous parts of the ſame fluid. But this is an enquiry that belongs to another place. See ATTRACTION and REPULSION.

As the blood, now, is not a homogeneous liquor; but a compound of an infinity of different parts or molecules, ſome oily, others mucilaginous, aqueous, ſaline, ſubtile, groſs, *&c.* in its motion along the arteries of the gland, it becomes divided into all the little ramifications thereof; by which means its velocity is exceedingly abated, and its molecules obliged to go off one by one, through the narrow paſſage of the artery into the vein, and of conſequence to paſs over the orifices of the *ſecretory* ducts of the glands, whoſe down is already tinged with a juice of a certain nature. Such of the molecules therefore, as are found of the ſame nature with the juice they meet withal at the entrance of the *ſecretory* duct, join themſelves to them, and enter the ducts, driven on by others that follow them. Thus they paſs, ſucceſſively, through the whole veſſel, and at length go out of it into the excretory duct; while the reſt, which are of a different kind, run over the orifice of the *ſecretory* veſſel, without ever mixing with the juice thereof, and thus arriving in the vein, are carried back to the heart.

All that remains, is, to explain how theſe parts ſhould have firſt imbibed the particular juices neceſſary for their reſpective *ſecretions:* how, for inſtance, the bile ſhould come to be ſeparated in the liver, for the firſt time, preferable to any other liquor? To this M. Winſlow anſwers, that having obſerved the glands of the ſmalleſt fœtus's to be coloured much as in adults; it appears highly probable they had been imbued with the juices they were to filtrate, at the firſt formation of the animal; or at the ſame time when the ſolid parts of the fabric themſelves were framed.

SECT, SECTA, a collective term, comprehending all ſuch as follow the doctrines or opinions of ſome famous divine, or philoſopher, *&c.* See HERESY and SCHISM.

The *ſects* of philoſophers among the ancients, particularly in Greece, were numerous; as Pyrrhonians, Platoniſts, Epicureans, Stoicks, Peripateticks, Academicks, *&c.* See each under its proper article, PERRHONIAN, PLATONIST, ACADEMICK, *&c.*

At preſent the *ſects* of philoſopy are chiefly reduceable to three, *viz.* the Carteſians, Peripateticks, and Newtonians. See CARTESIAN, *&c.*

In theology, the *ſects* are much more numerous; yet the ancients had legions now extinct; as, Manichees, Gnoſticks, Montaniſts, *&c.* See MANICHEE, GNOSTICK, *&c.* The principal now on foot, are the Lutherans, Calviniſts, Anabaptiſts, Arians, Socinians, Arminians, *&c.* The riſe, progreſs, and fate, with the diſtinguiſhing characters and opinions of each, ſee under its reſpective head, LUTHERAN, CALVINIST, *&c.*

Ionic SECT, } See the articles { IONIC.
Italic SECT, } { ITALIC.

SECTA, in law. See the article SUIT.

Hundred SECTA. See the article HUNDRED.

SECTIO *Cæſarea*. See the article CÆSAREAN *ſection*.

SECTION *, SECTIO, a part of a thing divided; or the diviſion itſelf. See DIVISION and DISSECTION.

* The word is formed from the Latin *ſeco*, I cut.

Such, particularly, are the ſub-diviſions of chapters, by others called *paragraphs*, and ſometimes *articles*.—The mark of a *ſection* is §. See PARAGRAPH.

The ancients neglected to divide their books into chapters, and *ſections*; that was a taſk left for future editors, and criticks. See CHAPTER.

SECTION, in geometry, denotes a ſide or ſurface appearing of a body, or figure cut by another; or the place wherein lines, planes, &c. cut each other. See BISSECTION, INTERSECTION, and TRISSECTION.

The common *ſection* of two planes is always a right line, being the line ſuppoſed to be drawn by the one plane in its cutting or entering the other. See PLANE.

If a ſphere be cut in any manner, the plane of the *ſection* will be a circle, whoſe centre is in the diameter of the ſphere. See SPHERE.

The *ſections* of the cone are four, *viz.* a circle, parabola, hyperbola and ellipſis. See each under its proper article. See alſo CONE.

Conic SECTIONS. See the article CONIC *ſection*.

Axis of a conic SECTION, } See { AXIS.
Center of a conic SECTION, } { CENTER.
Diameter of a conic SECTION, } { DIAMETER.
Tangent of a conic SECTION, } { TANGENT.

Following SECTIONS, *ſectiones ſequentes*, in conics, may be thus conceived: ſuppoſe two right lines, as A B, C D (*Tab. Conics, fig.* 5.) mutually interſecting one another in E, which point E is ſuppoſed to be the common centre of the oppoſite hyperbolic *ſections* F G, H I, and whoſe common aſymptotes, the propoſed lines A B, C D alſo are.—In this caſe, the *ſections* G F and H I, are called *ſectiones ſequentes*, becauſe they are placed following one another in the contiguous angles of two interſecting right lines.

If the determinate diameter H G, of one of the *ſectiones ſequentes* (which is coincident with the ſuppoſed indeterminate diameter of its oppoſite) be equal to the vertical tangent KL, applied between the aſymptotes in the point G, of the diameter GF, then, Apollonius calls ſuch *ſections*, *conjugate ſections*.

Oppoſite SECTIONS, } See the articles { OPPOSITE.
Similar SECTIONS, } { SIMILAR.

SECTION *of a building*, denotes its *profile*; or a delineation of its heights and depths raiſed on the plan; as if the fabrick was cut aſunder, to diſcover the inſide. See PROFILE and ORTHOGRAPHY.

Horizontal SECTION. See the article ICHNOGRAPHY.

SECTOR, in geometry, a part of a circle comprehended between two radii, and the arch. See CIRCLE and ARCH.

Thus the mixt triangle ACD (*Tab. Geometry*, *fig.* 13.) comprehended between the radii A C and C D and the arch A D, is a *ſector of the circle*.

It is demonſtrated by geometricians, that the *ſector* of a circle, as A C D, is equal to a triangle, whoſe baſe is the arch A D, and its altitude the radius A C.

If from the common centre of two concentric circles, be drawn two radii, to the periphery of the outer, the two arches included between the radii, will have the ſame ratio to their peripheries; and the two *ſectors*, the ſame ratio to the areas of their circles.

To find the area of a *ſector* D C E; the radius of the circle C D, and the arch D E being given. To 100, 314 and the radius A C, find a fourth proportional number; this will be the ſemi-periphery. Then to 180°, the given arch DE, and the ſemi-periphery juſt found, find another fourth proportional; this will give the arch DE in the ſame meaſure in which the radius A C is given. Laſtly, multiply the arch D E into the ſemi-radius, the product is the area of the *ſector*.

SECTOR alſo denotes a mathematical inſtrument, of great uſe in finding the proportion between quantities of the ſame kind, as between lines and lines, ſurfaces and ſurfaces, &c. whence the French call it the *compaſs of proportion*.

The great advantage of the *ſector* above the common ſcales, &c. is, that it is made ſo as to fit all radius's, and ſcales.—By the lines of chords, ſines, &c. on the *ſector*, we have lines of chords, ſines, &c. to any radius betwixt the length and breadth of the *ſector* when opened. See SCALE and LINE.

The *ſector* is founded on the fourth propoſition of the 6th book of Euclid, where it is demonſtrated, that ſimilar triangles have their homologous ſides proportional: an idea of its foundation may be conceived thus.—Let the lines A B, A C (*fig.* 14.) repreſent the legs of the *ſector*, and A D, A E two equal ſections from the centre. If now the points C B and D E be connected, the lines C B and D E will be parallel; therefore the triangles A D E, A C B ſimilar; and conſequently the ſides A D, D E, A B and B C proportional: that is, as A D : D E : A B : BC; whence if A D be the half, third or fourth part of A B; D E will be a half, third or fourth paart of C B: and the ſame holds of all the reſt. If, therefore, A D be the chord, ſine, or tangent of any number of degrees to the radius A B; D E will be the ſame to the radius B C. See CHORD, SINE, &c.

Deſcription of the SECTOR.—The inſtrument conſiſts of two equal rules, or legs of braſs or other matter, rivetted together; but ſo as to move eaſy on the rivet. See its figure, *Tab. Geometry*, *fig.* 15. On the faces of the inſtrument are placed ſeveral lines; the principal are the line of equal parts, line of chords, line of ſines, line of tangents, line of ſecants, and line of polygons.

The *line of equal parts*, called alſo *line of lines*, marked L, is a line divided into 100 equal parts; and, where the length of the leg will allow it, each is ſub-divided into halves and quarters. It is found on each leg, on the ſame ſide; and the diviſions numbered 1, 2, 3, 4, &c. to 10, which is near the extremity of each leg. Note, in practice, 1 is taken for 10, or 100, or 1000, or 10000, &c. as occaſion requires; in which caſes 2 repreſents 20, or 200, or 2000, &c. and ſo of the reſt. The line of chords, marked C on each leg, is divided after the uſual manner, and numbered 10, 20, 30, &c. to 60. See CHORD. The line of ſines, denoted on each leg by the letter S, is a line of natural ſines, numbered 10, 20, 30, &c. to 90. See SINES. Line of tangents, denoted on each leg by the letter T, is a line of natural tangents, numbered 10, 20, 30, &c. to 45: beſides which, is another little line of tangents on each leg, commencing at 45°, and extending to 75°, denoted by the letter t. See TANGENT. Line of ſecants, denoted on each leg by the letter S, is a line of natural ſecants, numbered 10, 20, 30, &c. to 75, and commencing, not from the centre of the inſtrument, but at two inches diſtance therefrom. See SECANT. Line of polygons, denoted by the letter P on each leg, is numbered 4, 5, 6, &c. to 12, which falls 3 inches ſhort of the centre of the inſtrument. See POLYGON.

Beſide theſe lines, which are eſſential to the *ſector*, there are others placed near the outward edges on both faces, and parallel thereto, which are in all reſpects, the ſame as in Gunter's ſcale, and uſed after the ſame manner. Such are the line of artificial ſines marked S; the line of artificial tangents; a line of 12 inches, marked in; and Gunter's line of numbers, marked N. For the uſes of all which, ſee *Gunter's* SCALE. There are ſometimes, other lines placed, to fill the vacant ſpaces, as the lines of hours, latitudes, and inclinations of meridians, which are uſed the ſame as on the common ſcales. See SCALE.

The lines found by the *ſector* are of two kinds, lateral and parallel. The firſt are ſuch as are found by the ſides of the *ſector*, as A B, A C, *fig.* 14. The latter, ſuch as go acroſs from one leg to the other, as D E, C B. Note, the order of the lines in the newer *ſectors*, is different from what it is in the old ones; for the ſame line is not now put at the ſame diſtance from the edge on both legs; but the line of chords, *e. gr.* is innermoſt upon the one, and the line of tangents on the other. The advantage hereof is, that when the inſtrument is ſet to a radius for the chords, it ſerves alſo for the ſines and tangents without ſtirring it; for the parallel betwixt 60 and 60 of the chords, 90 and 90 of the ſines, and 45 and 45 of the tangents, are all equal.

Uſe of the line of equal parts on the SECTOR.—1°. To divide a given line into any number of equal parts, *e. gr.* ſeven. Take the given line in your compaſſes, and ſetting one foot in a diviſion of the line of equal parts, that may eaſily be divided by 7, *e. gr.* 70, whoſe ſeventh part is 10; open the *ſector* till the other point fall exactly on 70 in the ſame line, in the other leg. In this diſpoſition, applying one point of the compaſſes to 10 in the ſame line; ſhut them till the other fall in 10 in the ſame line of the other leg. This aperture will be the 7th part of the given line. Note, if the line to be divided be too long to be applied to the legs of the *ſector*, only divide one half, or one fourth by 7, and the double or quadruple thereof will be the 7th part of the whole.

2°. To meaſure the lines of the perimeter of a polygon, one of which contains a given number of equal parts. Take the given line in your compaſſes, and ſet it over, upon the line of equal parts, to the number of parts on each ſide expreſſing its length. The *ſector* remaining thus, ſet off the length of each of the other lines parallel to the former; and the numbers each of them falls on will expreſs their lengths.

3°. A right line being given, and the number of parts it contains, *e. gr.* 120, to take from it a leſs line, containing any number of the ſame parts, *e. gr.* 25. Taking the given line in your compaſſes, open the *ſector* till the two feet fall on 120 on each leg; then, the diſtance from 25 to 25 gives the line required.

4°. To find a third proportional to two given lines, and a fourth to three. For the firſt, take the length of the firſt given line in your compaſſes, and lay it off on the line of equal parts from the centre, to find the number where it terminates: then open the *ſector*, till the length of the ſecond line be included in the aperture of the extreme of the firſt: the *ſector* remaining thus, lay off the length of the ſecond line on one of the legs, from the centre; and note the number where it terminates; the diſtance between that number on the two legs, gives the third proportional.—For the ſecond, take the ſecond line in your compaſſes, and opening the *ſector*, apply this extent to the ends of the firſt, laid off from the centre on both legs. The *ſector* thus opened, lay off the third line from the centre, and the extent between the number whereon it terminates on both legs, is the fourth proportional.

5°. To divide a line in any given proportion, *e. gr.* into two parts, which ſhall be to each other as 40 to 70. And the two numbers together, their ſum is 110. Then, between your compaſſes take the line propoſed, which ſuppoſe 165, and open the *ſector* till this diſtance reach from 110 to 110 on both legs. The *ſector* thus opened, take the extent from 40 to 40, as alſo from 70 to 70; the firſt will give 60, the laſt 105, which will be the parts propoſed, for 40 : 70 : 60 : 105.

6°. To open the *ſector*, ſo as the two lines of equal parts may make a right angle: find three numbers that may expreſs the ſides of a right-angled triangle, as 3, 4 and 5, or their equimultiples, as 60, 80 and 100. Take then, in your compaſſes, the diſtance from the centre to 100; and open the *ſector*, till one point ſet upon 80, the other fall upon 60 in the other leg; then do the two lines of equal parts include a right angle.

7°. To find a right line equal to the circumference of a circle. The diameter of a circle being to the circumference, nearly as 50 to 157, take the diameter in your compaſſes, and ſet it over on the legs of the *ſector*, from 50 to 50. The *ſector* thus opened, take the diſtance from 157 to 157 in your compaſſes. This will be your circumference required.

Uſe of the line of chords on the SECTOR.—1°. To open the *ſector*, ſo as the two lines of chords may make an angle of any number of degrees, *e. gr.* 40. Take the diſtance from the joint to 40, the number of degrees propoſed, on the line of chords; open the *ſector*, till the diſtance from 60 to 60, on each leg, be equal to the foreſaid diſtance of 40; then does the line of chords make the angle required.

2°. The *ſector* being opened, to find the degrees of its aperture. Take the extent from 60 to 60, and lay it off on the line of chords from the centre: the number, whereon it terminates, ſhews the degrees of its opening.—By applying ſights on the line of chords, the *ſector* may be uſed to take angles, as a ſurveying inſtrument.

3°. To make an angle of any given number of degrees, with a given line. On the given line deſcribe a circular arch, the centre whereof is the point whereon the angle is to be made. Set off the radius from 60 to 60; and the *ſector* remaining thus, take the diſtance of the two numbers on each leg, expreſſing the propoſed degrees, and lay it from the line upon the arch deſcribed. Laſtly, drawing a line from the centre, through the end of the arch, it will make the angle propoſed.

4°. To find the degrees a given angle contains. About the vertex deſcribe an arch, and open the *ſector*, till the diſtance from 60 to 60 on each leg, be equal to the radius of the circle: then taking the chord of the arch between the compaſſes, and carrying it on the legs of the *ſector*, ſee what equal number, on each leg, the points of the compaſſes fall on: this is the quantity of degrees, the given angle contains.

5°. To take an arch, of any quantity, from off the circumference of a circle. Open the *ſector*, till the diſtance from 60 to 60 be equal to the radius of the given circle: then take the extent of the chord of the number of degrees, on each leg of the *ſector*, and lay it off, on the circumference of the given circle. By this uſe may any regular polygon be inſcribed in a given circle, as well as by the line of polygons.

Uſe of the line of polygons on the SECTOR.—1°. To inſcribe a regular polygon in a given circle. Take the ſemi-diameter of the given circle, in the compaſſes, and adjuſt it to the number 6, on the line of polygons, on each leg of the *ſector*: then the *ſector* remaining thus opened, take the diſtance of the two equal numbers, expreſſing the number of ſides the polygon is to have. *E. gr.* The diſtance from 5 to 5 for a pentagon, from 7 to 7 for a heptagon, &c. Theſe diſtances carried about the circumference of the circle, will divide it into ſo many equal parts.

2°. To deſcribe a regular polygon, *e. gr.* a pentagon, on a given right line. Take the length of the line in the compaſſes, and apply it to the extent of the number 5, 5, on the lines of polygons. The *ſector* thus opened, upon the ſame lines take the extent, from 6 to 6, this will be the ſemi-diameter of the circle the polygon is to be inſcribed in. If, then, with this diſtance, from the ends of the given line, you deſcribe two arches of a circle, their interſection will be the centre of the circle.

3°. On a right line, to deſcribe an iſoſceles triangle, having the angles at the baſe, double that at the vertex. Open the *ſector*, till the ends of the given line fall on 10 and 10 on each leg; then take the diſtance from 6 to 6. This will be the length of the two equal ſides of the triangle.

Uſe of the lines of ſines, tangents, and ſecants, on the SECTOR.—By the ſeveral lines diſpoſed on the *ſector*, we have ſcales to ſeveral radius's; ſo that having a length, or radius, given, not exceeding the length of the *ſector* when opened, we find the chord, ſine, &c. thereto. *E. gr.* Suppoſe the chord, ſine, or tangent, of 10 degrees, to a radius of 3 inches, required: make 3 inches the aperture, between 60 and 60, on the lines of chords of the two legs; then will the ſame extent reach from 45 to 45 on the line of tangents, and from 90 to 90 on the line of ſines on the other ſide; ſo that to whatever radius the line of chords is ſet, to the ſame are all the others ſet. In this diſpoſition, therefore, if the aperture between 10 and 10, on the lines of chords, be taken with the compaſſes, it will give the chord of 10 degrees. If the aperture of 10 and 10 be in like manner taken on the lines of ſines, it will be the ſine of 10 degrees. Laſtly, if the aperture of 10 and 10 be in like manner taken on the lines of tangents, it gives the tangent of 10 degrees.

If the chord, or tangent, of 70 degrees were required; for the chord, the aperture of half the arch, *viz.* 35, muſt be taken, as before; which diſtance, repeated twice, gives the chord of 70°. To find the tangent of 70° to the ſame radius, the ſmall line of tangents muſt be uſed, the other only reaching to 45: making, therefore, 3 inches the aperture between 45 and 45 on the ſmall line; the extent between 70 and 70 degrees, on the ſame, will be the tangent of 70° to 3 inches radius.

To find the ſecant of an arch, make the given radius the aperture between 0 and 0 on the line of ſecants: then will the aperture of 10 and 10, or 70 and 70, on the ſaid lines, give the tangent of 10°, or 70°.

If the converſe of any of theſe things were required; that is, if the radius be required, to which a given line is the ſine, tangent, or ſecant, it is but making the given line, if a chord, the aperture on the line of chords, between 10 and 10, and then the *ſector* will ſtand at the radius required; that is, the aperture between 60 and 60, on the ſaid line, is the radius. If the given line were a ſine, tangent or ſecant, it is but making it the aperture of the given number of degrees; then will the diſtance of 90 and 90 on the ſines, of 45 and 45 on the tangents, of 0 and 0 on the ſecants, be the radius.

Uſe of the SECTOR *in trigonometry.*—1°. The baſe and perpendicular of a rectangled triangle being given, to find the hypotenuſe. Suppoſe the baſe A C (*Tab. Trigonom. fig*, 2.) 40 miles and the perpendicular A B 30; open the *ſector* till the two lines of lines make a right angle: then for the baſe, take 40 parts on the line of lines on one leg; and for the perpendicular 30 on the ſame line on the other leg: then the extent from 40 on the one, to 30 on the other, taken in the compaſſes, will be the length of the hypotenuſe, which line will be found 50 miles.

2°. The perpendicular A B of a right-angled triangle A B C, being given, 30, and the angle B C A, 37°, to find the hypotenuſe B C. Take the given ſide A B, and ſet it over, on each ſide, upon the ſine of the given angle A C B; then the parallel diſtance of radius, or of 90 and 90, will be the hypotenuſe B C; which will meaſure 50 on the line of ſines.

3°. The hypotenuſe and baſe being given, to find the perpendicular. Open the *ſector*, till the two lines of lines be at right angles; then lay off the given baſe on one of thoſe lines from the centre. Take the hypotenuſe in your compaſſes, and ſetting one foot in the point of the given baſe, let the other fall on the line of lines, on the other leg: the diſtance from the centre to the point where the compaſſes fall, will be the length of the perpendicular.

4°. The hypotenuſe being given, and the angle A C B, to find the perpendicular. Make the given hypothenuſe a parallel radius, *i. e.* make it the extent from 90 to 90 on the lines of ſines; then will the parallel ſine of the angle A C B be the length of the ſide A B.

5°. The baſe and perpendicular A B given, to find the angle B C A. Lay off the baſe A C on both ſides the *ſector*, from the centre, and note its extent: then take the given perpendicular, and to it open the *ſector*, in the terms of the baſe; the parallel radius will be the tangent of B C A.

6°. In any right-lined triangle, two ſides being given, with the included angle, to find the third ſide. Suppoſe the ſide A C 20, the ſide B C 30, and the included angle A C B 110°; open the *ſector*, till the two lines of lines make an angle equal to the given angle, *viz.* 110°. Lay off the given ſides of the triangle from the centre of the *ſector*, on each of the lines of lines; the extent between their extremes is the length of the ſide A B ſought.

7°. The angles C A B and A C B given, and the ſide C B, to find the baſe A B. Take the given ſide C B, and turn it into the parallel ſine of its oppoſite angle C A B; and the parallel ſine of the angle A C B will be the length of the baſe A B.

8°. The three angles of a triangle being given, to find the proportion of the ſides. Take the lateral ſines of the ſeveral angles, and meaſure them in the line of lines; the numbers anſwering thereto, give the proportion of the ſides.

9°. The three ſides being given, to find the angle A C B. Lay the ſides A C, C B, along the line of lines, from the centre; and ſet over the ſide A B in their terms: ſo is the *ſector* opened, in theſe lines, to the quantity of the angle A C B.

10°. The hypotenuſe A C (*fig.* 3.) of a right-angled ſpherical triangle A B C given, *e. gr* 43°, and the angle C A B 20°; to find the ſide C B. The rule is: As radius is to the ſine of the given hypotenuſe 43°, ſo is the ſine of the given angle 20° to the ſine of the perpendicular C B. Take, then, 20° from the centre, along the line of ſines, in your compaſſes, and ſet the extent, from 90 to 90, on the two legs; and the parallel ſine of 43°, the given hypotenuſe, will, when meaſured from the centre on the line of ſines, give 13° 30′, the ſide required.

11°. The perpendicular B C, and the hypotenuſe A C given, to find the baſe A B. As the ſine complement of the perpendicular B C is to radius, ſo is the ſine complement of the hypotenuſe to the ſine complement of the baſe.—Therefore, make the radius a parallel ſine of the given perpendicular, *e. gr.* 76° 30′; then the parallel ſine of the complement of the hypotenuſe, *e. gr.* 47° meaſured along the line of ſines, will be found 49° 25′, the complement of the baſe required: conſequently the baſe itſelf will be 40° 35′.

Particular uſes of the SECTOR *in geometry*, &c.—1°. To make a regular polygon, whoſe area ſhall be of any given magnitude. Let the figure required be a pentagon whoſe ſuperficial area is 125 feet: extract the ſquare root of $\frac{4}{5}$ of 125, it will be found 5. Make a ſquare, whoſe ſide is 5 feet; and, by the line of polygons, as already directed, make the iſoſceles triangle C G D (*Tab. Geom. fig.* 14. N°. 2.) ſo as that C G being the ſemi-diameter of a circle, C D may be the ſide of a regular pentagon inſcribed therein, and let fall the perpendicular G E. Then continuing the lines E G and E C, make E F equal to the ſide of the ſquare before made: and from the point F, draw the right line F H parallel to G C; then a mean proportional between G E and E F will be equal to half the ſide of the polygon ſought, which doubled, will give the whole ſide. The ſide of the pentagon thus had, the pentagon itſelf may be deſcribed, as above directed.

2°. A circle being given, to find a ſquare equal thereto. Divide the diameter into 14 equal parts, by the line of lines, as above directed: then will 12. 4 of thoſe parts found by the ſame line, be the ſide of the ſquare ſought.

3° A ſquare being given, to find the diameter of a circle equal thereto. Divide the ſide of the ſquare into 11 equal parts, by means of the line of lines; and continue that ſide to 12. 4 parts; this will be the diameter of the circle required.

4°. To find the ſide of a ſquare, equal to an ellipſis whoſe tranſverſe and conjugate diameters are given. Find a mean proportional between the tranſverſe and conjugate diameters; which, being divided into 14 equal parts; 12$\frac{4}{10}$ thereof, will be the ſide of the ſquare required.

5°. To deſcribe an ellipſis in any given ratio of its diameter; the area whereof ſhall be equal to a given ſquare. Suppoſe the proportion of the tranverſe and conjugate diameters be required, as 2 to 1; divide the ſide of the given ſquare into 11 equal parts: then, as 2 is to 1, ſo is $11 \times 14 = 154$ to a 4th number; the ſquare whereof is the conjugate diameter ſought. Then, as 1 to 2, ſo is the conjugate diameter to the tranſverſe. Now,

6°. To deſcribe an ellipſis, by having the tranſverſe and conjugate diameters given. Suppoſe A B and E D (*Tab. Con. fig.* 21.) to be the given diameters; take A C in your compaſſes, and to the extent thereof open the *ſector*, till the diſtance from 90 to 90, on the lines of ſines, be equal thereto. Then may the line A C be divided into a line of ſines, by taking the parallel extents of the ſine of each degree on the legs of the *ſector*, in your compaſſes, and laying them off from the centre C. The line thus divided into ſines (in the figure it is only done into every 10th ſine) from each raiſe perpendiculars both ways; then, find points in thoſe perpendiculars through which the ellipſis muſt paſs, thus: take the extent of the ſemi-conjugate diameter C E between your compaſſes, and open the *ſector*, till the aperture of 90 and 90 on the lines of ſines be equal thereto: then take the parallel ſines of each degree of the lines of ſines of the *ſector*, and lay them off on thoſe perpendiculars drawn through their complements in the lines of ſines A C; thus will you have two points in each perpendicular, through which the ellipſis muſt paſs. *E. gr.* The *ſector* ſtill remaining the ſame, take the diſtance from 80 to 80 on the lines of ſines, in your compaſſes, and ſetting one foot in the point 10, on the line A C, with the other, make the points *a* and *m* in the perpendiculars paſſing through that point: then will *a* and *m* be the two points in the perpendicular, through which the ellipſis muſt paſs. All the other points, found after the ſame manner, being connected, will give the ſemi-ellipſis D A E; and the other half will be drawn after the ſame manner.

Uſe of the SECTOR *in ſurveying*.—The bearings of three places, as A, B, C, (*Tab. Surveying*, *fig.* 4. N°. 2.) to each other, *i. e.* the angles A B C, B C A and C A B, being given; and the diſtance of each, from a fourth ſtanding among them, as, D, *i. e.* B D, D C, and A D being given; to find the diſtances of the ſeveral places A, B, C, from each other, *i. e.* the lengths of the ſides A B, B C, A C. Having drawn the triangle E F G (*fig.* 4. N°. 3.) ſimilar to A B C, divide the ſide E G in H, ſo as that E H may be to H G, as A D to D C, after the manner already directed: and, after the like manner muſt E F be divided in I, ſo as E I may be to I F, as AD to BD. Then continuing the ſides EG, EF, ſay, as EH—HG is to H G, ſo is E H+H G to G H; and as E I—I F is to IF, ſo let EI+IF be to FM; which proportions are eaſily wrought by the line of lines on the *ſector*. This done, biſſect HK and IM, in the points L, N; and about the ſaid points as centres, with the diſtances LH and IN, deſcribe two circles interſecting each other, in the point O; to which, from the angles E, F, G, draw the right lines EO, FO, and OG, which will have the ſame proportion to each other, as the lines AD, BD, DC: now, if the lines EO, FO, and GO, be equal to the given lines AD, BD, DC, the diſtances EF, F G, and E G, will be the diſtances of the places required. But if E O, O F, O G, be leſs than A D, D B, D C, continue them, till P O, O R, and O Q be equal to them: then the points P, Q, R, being joined, the diſtances P R, R Q and P Q, will be the diſtances of the places ſought. Laſtly, if the lines EO, OF, OG, be greater than AD, DB, DC, cut off from them lines equal to A D, B D, D C, and join the points of ſection by three right lines; the lengths of the ſaid three right lines will be the diſtances of the three places ſought. Note, if E H be equal to H G, or E I to I F, the centres L and N, will be infinitely diſtant from H and I; that is, in the points H and I, there muſt be perpendiculars raiſed to the ſides E F, E G, inſtead of circles, till they interſect each other; but if E H be leſs than H G, the centre L will fall on the other ſide of the baſe continued; and the ſame is to be underſtood of E I, I F.

The *ſector* is of eſpecial uſe for facilitating the projection of the ſphere, both orthographic and ſtereographic. See PROJECTION and STEREOGRAPHIC.

SECULAR, ſomething that is *temporal*: in which ſenſe, the word ſtands oppoſed to *eccleſiaſtical*. See TEMPORAL and ECCLESIASTICAL.

Thus we ſay, *ſecular power*, *ſecular arm*, *ſecular juriſdiction*. See POWER, ARM, JURISDICTION, &c.

SECULAR, is more peculiarly uſed for a perſon who lives at liberty in the world; not ſhut up in a monaſtery, nor bound by vows, or ſubjected to the particular rules of any religious community. See VOW, RULE, MONASTIC, MONK and ORDER.

In which ſenſe the word ſtands oppoſed to *regular*. See REGULAR.

The Romiſh clergy is divided into *regular* and *ſecular*. See CLERGY.

The *regulars* pretend their ſtate is much more perfect than that of the *ſeculars*. *Secular* prieſts may hold abbies and priories both ſimple and conventual, though not regularly, but only *in commendam*. See ABBOT and COMMENDAM.

It is a maxim, in their canon law, *ſecularia ſecularibus*, i. e. *ſecular* benefices are only to be given to *ſecular* perſons; regular to regular. See BENEFICE.

SECULAR *corporation*. See the article CORPORATION.

SECULAR *games*, *ludi* SECULARES, in antiquity, ſolemn games, held among the Romans, once in an age; or, in a period deemed the extent of the longeſt life of man, called by the Greeks, αιων, and the Latins, *ſeculum*. See AGE and GAME.

The *ſecular games* were alſo called *Terentine games*, *ludi Terentini*, either by reaſon Manius Valerius Terentinus gave occaſion to their inſtitution; for that having been warned, in a dream, to dig in the ground in a place near the Campus Martius, called *Terentum*, he there found an altar inſcribed to Dis, or Pluto and Proſerpine: upon which, as had been foretold him in his dream, three of his children born blind, recovered their ſight; and he, in gratitude, performed ſacrifices, on the ſame altar, for three days and three nights ſucceſſively.—Or by reaſon here was an altar of Pluto buried deep under ground, becauſe the water of the Tyber *terram tereret*, eat into the ground in this place.

The *ſecular games* laſted three days, and as many nights; during which, ſacrifices were performed, theatrical ſhews exhibited, with combats, ſports, &c. in the circus.

Their origin, and inſtitution, is delivered at length by Val. Maximus: the occaſion thereof, according to this writer, was, to ſtop the progreſs of a plague.—The firſt who had them celebrated at Rome, was Valerius Publicola, the firſt conſul created after the expulſion of the kings, in the year of Rome 245.—The ceremonies to be obſerved therein were found preſcribed in one of the books of the Sibyls.

At the time of the celebration of the *ſecular games*, heralds were ſent to invite all the world to a ſolemnity no body had ever yet ſeen, nor was ever to ſee again.

Authors are not agreed as to the number of years wherein theſe games returned; partly, becauſe the quantity of an age or *ſeculum* among the ancients is not known; and partly on other accounts: ſome will have it, that they were held once every hundred years, and that the *ſeculum*, or age, was our century.—This Varro and Livy ſeem to expreſs in very plain terms; yet others will have it, that *ſeculum* comprehended 110 years, and that the *ſecular games* only returned in that period, that is, at the beginning of every 111th year; which opinion is countenanced by Horace, in his *ſecular poem*, v. 21.

Be this as it will, it is certain they ſometimes did not ſtay for the 111th, nor even for the 100th year, for the celebration of theſe games. Auguſtus, for inſtance, held them in the year of Rome 736; and Caligula again in the year of Rome 800, and of Chriſt 38, *viz.* 64 years after the former; and Domitian, again, in ſtill leſs time, *viz.* in the year of Chriſt 87, at which Tacitus aſſiſted in quality of quindecimvir, as he himſelf tells us, *Annal. lib.* xi. c. 11. This was the ſeventh time that Rome had ſeen them from their firſt inſtitution.

The emperor Severus exhibited them the eighth time 110 years after thoſe of Domitian: Zoſimus ſays, theſe were the laſt; but he is miſtaken, for in the year of Rome 1000, fifty years after thoſe of Severus, the emperor Philip had them celebrated with greater magnificence than had ever been known.—We find them repreſented on medals.

SECULAR *poem.* See the article SECULARE *carmen.*

SECULAR *year*, the ſame with *jubilee.* See JUBILEE.

SECULARE *carmen*, SECULAR *poem*, a poem ſung, or rehearſed, at the *ſecular* games. See SECULAR *games.*

Of this kind we have a very fine piece among the works of Horace: it is a Sapphic ode, which uſually comes at the end of his epodes.—In ſome editions, the twenty-firſt ode of the firſt book, is called *carmen ſeculare.*

SECULARIZATION, the action of *ſecularizing*, or of converting a regular perſon, place, or benefice, into a ſecular one. See REGULAR and SECULAR.

Almoſt all the cathedral churches were anciently regular, *i. e.* the canons were to be religious; but they have been moſt of them *ſecularized.* See CATHEDRAL and CANON.

For the *ſecularization* of a regular church there is required the authority of the pope, that of the prince, the biſhop of the place, the patron, and even the conſent of the people.—In France all this muſt be confirmed by parliament.

Religious, that want to be releaſed from their vows, obtain briefs of *ſecularization* from the pope.

SECUNDA *aqua*, among chymiſts, &c. denotes aqua-fortis which has been already uſed to diſſolve ſome metal, &c. See AQUA-FORTIS and DEPART.

SECUNDARY, or SECONDARY. See SECONDARY.

SECUNDI *generis*, in anatomy, a diſtinction among the lacteal veſſels.—There are two kinds of lacteals, *viz. primary*, or thoſe of the firſt kind, *primi generis:* and *ſecundi generis*, *ſecondary*, or of the ſecond kind.

The firſt carry the chyle from the inteſtines into glands diſperſed in great numbers throughout the meſentery.—The ſecond carry it from theſe glands, after its being diluted there with lympha, into the common receptacle. See LACTEAL.

SECUNDI *internodii pollicis extenſor.* See EXTENSOR.

SECUNDINE, or SECUNDINES, SECUNDINÆ, in medicine, the ſeveral coats or membranes wherein the fœtus is wrapped up, in the mother's womb; as the chorion and amnios, with the placenta, &c.—See *Tab. Anat.* (Splanch.) *fig.* 16. *lit. b b.* See alſo the articles FOETUS, CHORION, AMNIOS, &c.

They are thus called, becauſe they come out in the ſecond place, *i. e.* after the child, in delivery.—The matrons and midwives call them the *after-birth*, as being eſteemed a ſecond burthen, whereof the mother is freed. Others call them, the *delivery*, becauſe when theſe are out, the woman is reckoned to be perfectly delivered.

The *ſecundine* muſt never be left in the matrix; it is a foreign body, which would deſtroy the mother: it is dangerous even to have a piece of it left behind.

Hippocrates obſerves, that twins have always the ſame *ſecundine.* See TWINS.

Dr. Grew, in his anatomy of plants, applies the term *ſecundine* to the fourth and laſt coat or cover of ſeeds; by reaſon this performs nearly the ſame office in plants, that the membranes inveſting the fœtus do in animals. Indeed Pliny, Columella, Apuleius, &c. have uſed *ſecundine* in the ſame ſenſe.

SECUNDO.—*Propoſitio de* SECUNDO *adjacente.* See the article PROPOSITION.

SECUNDUS *peronæus*, } See the articles { PERONÆUS.
SECUNDUS *ſcalenus*, } { SCALENUS.

SECURITATE *pacis*, a writ, which lies for one who is threatened with death, or danger; againſt the perſon who ſo threatens him.—It is taken out of chancery, directed to the ſheriff. See SURETY and PEACE.

SECUTORES *, in antiquity, a kind of gladiators among the Romans, who fought againſt the retiarii. See GLADIATOR.

* The word is formed from the verb *ſequi*, to follow; becauſe the *ſecutores* uſed to purſue the retiarii. See RETIARII.

The *ſecutores* were armed with a ſword, and a buckler, to keep off the net, or nooſe, of their antagoniſt, and wore a caſk on their head.—Some confound the *ſecutores* with the mirmillones, becauſe both had nearly the ſame weapons.

SECUTORES was alſo a name given to ſuch gladiators, as took the place of thoſe killed in the combat; or, who fought the conqueror. This poſt was taken by lot.

In ancient inſcriptions we alſo meet with *ſecutor tribuni*, *ſecutor ducis*, *ſecutor Cæſaris*, &c. who were officers attending the tribunes, and generals; perhaps like our aids de camp.

SE-DEFENDENDO, a plea for him who is charged with the death of another; alledging, that he was forced to do what he did, in his own defence, the other ſo aſſaulting him, that had he not done as he did, he muſt have been in danger of his own life. See MANSLAUGHTER.

To have this plea admitted, the danger muſt appear inevitable.—Though the party juſtify its being done *ſe-defendendo*, yet he is driven to procure his pardon of courſe from the lord-chancellor, and forfeits his goods to the king.

SEDER OLAM, in philology, a Hebrew term, literally ſignifying, *order of the world*; being the title of two chronicles in that language.

They are both very ſhort, though the one more ſo than the other; for which reaſon the one is called *ſeder olam rabba*, that is, the *great ſeder olam*; and the other, *ſeder olam zuta*, i. e. *little ſeder olam.*

The *great* SEDER OLAM commences at the creation of the world, and comes down as low as the war of the pſeudo-meſſiah Barchochabas, under Adrian, 52 years after the deſtruction of the temple of Jeruſalem, and, of conſequence, to the 122d year of Chriſt.—It is almoſt all taken from the ſcripture, excepting the end. It is the work of R. Joſa, ſon of Hhelpeta of Tſippora, who lived in the ſecond century, about the year 130, and was maſter of the famous R. Juda Hakkadoſch, the compiler of the Miſchna.

The *leſſer* SEDER OLAM is an abridgment of the former, brought down as far as Mar Sutra, who lived 450 years after the deſtruction of the temple, or 522 years after Chriſt.—F. Morin, continually bent upon diminiſhing the antiquity of the principal books of the Jews, endeavours to prove it to have been wrote about the year of Chriſt 1124, as indeed it is expreſſed at the beginning: but R. Dav. Gantz. has overthrown this opinion in his Tſemahh David, and ſhewn, that the date, in the beginning, is an interpolation.

The two chronologies were firſt printed at Mantua in 1514, quarto; again, at Baſil, by Frobenius in 1580, octavo: at Venice in 1545, quarto: at Paris, with a Latin verſion of Genebrard, in 12°.—They have been ſince re-printed at Amſterdam, in 1711.

SEDIMENT *, the ſettlement, or dregs, of any thing; or that groſs, heavy part of a fluid body, which, upon reſting, ſinks to the bottom of the veſſel. See HYPOSTASIS.

* The word is formed from the Latin, *ſedimentum*, which Matthias Sylvaticus derives *à diuturna ſede.*

Some phyſicians pretend to diſcover much of the nature of the diſeaſe, from the *ſediment* of the urine. See URINE.

Dr. Woodward maintains, that at the deluge, the whole terreſtrial globe was diſſolved into one uniform maſs, and that the new world ariſing thence was perfectly ſpherical, and without any inequalities, conſiſting of ſeveral ſtrata, which the earthy *ſediment* gradually produced, as it drained. See DELUGE, STRATA, &c.

SEDR, or SEDRE, the high prieſt of the ſect of Ali, among the Perſians. See MAHOMETANISM.

The *ſedr* is appointed by the emperor of Perſia, who uſually confers the dignity on his neareſt relation.

The juriſdiction of the *ſedr* extends over all effects deſtined for pious purpoſes, over all moſques, hoſpitals, colleges, ſepulchres, and monaſteries. He diſpoſes of all eccleſiaſtical employments, and nominates all the ſuperiors of religious houſes.—His deciſions, in matters of religion, are received as ſo many infallible oracles: he judges of all criminal matters, in his own houſe, without appeal, and is, without contradiction, the ſecond perſon in the empire.

The *ſedr*, however, has not any indelible character, but frequently quits his poſt, for another purely ſecular one.—His authority is balanced by that of the mudſitehid, or firſt theologue of the empire.

SEED, SEMEN, a matter prepared by nature, for the reproduction, and conſervation of the ſpecies, both in men, animals, and plants. See GENERATION, ANIMAL, PLANT, &c.

Some naturaliſts add, that even ſtones, minerals, and metals themſelves have each their proper *ſeed* in their mines, and are produced and perpetuated thereby. See MINERAL, STONE, &c.

SEED, SEMEN, in the animal œconomy, is a white, liquid matter, or humour, the thickeſt of any in the body, ſeparated from the blood in the teſticles, and reſerved in proper veſſels, to be the means of generation.—By chymical analyſis it is found to conſiſt almoſt intirely of oil, and volatile ſalts blended together by the mediation of a little phlegm. Its activity Dr. Drake takes to be derived from the ſalts, wherewith it abounds, far more than any other animal liquor. See HUMOUR.

The parts concerned in the preparation of the *ſeed* are the ſpermatic arteries, which bring the blood to be ſecreted into the teſticles; the teſticles, and paraſtatæ, where the ſecretion itſelf is chiefly effected; the vaſa deferentia, which convey the ſecreted matter out of the teſticles; and the veſiculæ ſeminales, which receive and preſerve it to be emitted in coition. See each of theſe parts deſcribed under its proper article TESTICLE, &c.

The blood received, in ſmall quantities, into the ſpermatic arteries, and there, by the particular ſtructure of the parts, much diminiſhed of its velocity, is yet farther retarded about the corpus pyramidale, or varicoſum, and its redder, and thicker parts, carried off by canals opening into the veins. Thus rendered paler, and ſlower, it is received into the winding receſſes of the teſticles, where, almoſt ſtagnating, it aſſumes an aſh-colour, and is further prepared, thickened, &c. in the ductus Highmorianus, whence, ſlowly driven into the epididymidæ, or paraſtatæ, it is further prepared and elaborated in the folds and complications thereof, and, at length, creeps ſlowly into the vaſa deferentia, or ejaculatoria. Theſe conſiſt, at firſt, of a thick fungous matter, and are very narrow, but growing ſenſibly wider, and then again narrower, in the winding meanders hereof the humour is collected, its motion abated, further elaborated, and concocted, and at laſt driven into the veſiculæ ſeminales, in the various cells and meatus's whereof it is received, laid up, fixed, thickened, whitened, and raiſed to its laſt perfection; in which ſtate it is called *ſeed.*

It is obſervable, that no humour in the body is generated ſo ſlowly, meets with ſo many means to retard it, or to elaborate, and concoct it, when at reſt, as the *ſeed.* Some imagine that, in its whole retarded progreſs, beſides what is apparent, there is ſomething ſtill added to it from the minute nervous veſicles; and ſomething taken away, by the various lymphatics, and diſcharged thereby into the venous veſicles of the corpus pyramidale, and the little veins of the veſiculæ ſeminales, and thence into the humours of the whole body: Boerhaave takes both the one and the other to be very probable.

The *ſeed*, or humour, thus formed in the teſticles, paraſtatæ, vaſa deferentia, and veſiculæ ſeminales, being, when new, diluted with a little warm water, and viewed with a good microſcope, ſeems to conſiſt of innumerable, little, oblong, living, eel-like animalcula floating in the other part of this humour.—This is ſaid to be always obſerved in the ſeed of all men, quadrupedes, birds, fiſhes, amphibeous animals, and inſects. See Animalcule.

Upon comparing this with the bulk, figure, place, change, &c. of the carina of the chick deſcribed by Malpighi, and with the known law of nature obſerved in the generation of frogs; it appears highly probable, that the animalcula of the male *ſeed*, contain the rudiments, or ſtamina, of the future human body; and the more ſo, ſince, whenever the teſticles, or this humour is wanting, there is always ſterility on the ſide of the male.

M. Leewenhoeck, the firſt diſcoverer of theſe animalcula, and many after him, make no ſcruple to call them true *fœtus's*, little men; and ſome have even pretended to diſcover ſomewhat of the human figure therein.—But Verheyen, and others after him, deny the exiſtence of any ſuch animalcula; maintaining, that it is only the inteſtine motion of the parts of the *ſeed* kept on foot by the warmth thereof, that exhibits this appearance, which fanciful perſons have improved into friſking animalcula; and urging, in confirmation hereof, that no ſooner is the warmth gone, than all appearance of animals ceaſes.—But this notwithſtanding, the doctrine of the animalcula in ſemine, ſeems now pretty generally received. See Generation.

Some admit of four ſeveral kinds of *ſeed:* the *ſeed* of the teſticles, that of the veſiculæ ſeminales, that of the proſtates, and that of the glands of the penis.—The two firſt, which we have deſcribed as one and the ſame humour, only in different ſtages, thoſe authors take to be different, as not being able to find any ſtrict communication between the deferentia and the veſiculæ; but that communication is fully ſhewn by Dr. Drake, ſo that nothing needs further, to ſhew the *ſeeds* the ſame.—The liquor of the proſtates, and that of the glands of the penis, are generally allowed not to be any true *ſeed*, no more than that emitted by women: nor is there any good reaſon why either of them ſhould be called ſo, as their appearance is very different, and as other ſufficient uſes are aſſigned for them, *viz.* to line and lubricate the parts, that the *ſeed*, urine, &c. may paſs more freely, and without adhering. See Prostates.

The ſeminal liquor, however, ſuch as emitted for uſe, is a mixture of ſeveral fluids, poured at the ſame time into the common canal of the urethra, either from the glands that have ſecreted them, of the reſervoirs that have kept them.—M. du Verney obſerves, that in different ſpecies, the number and ſtructure of theſe organs is different. In man, the principal are the veſiculæ ſeminales, and the proſtates, beſides what was diſcovered by Mr. Cowper, *viz.* a number of new glandulous bodies on each ſide the urethra, whoſe excretory ducts open into the urethra, towards the root of the yard. See Mucous *glands.* M. du Verney has found, that the ſame are likewiſe in moſt other animals, and placed in the ſame manner.

It is controverted, whether or no the liquor filtrated hereby, be neceſſary to generation? M. du Verney thinks it is; and his chief reaſon is, that in animals that have been caſtrated, theſe glands, as well as all the other ſources of generation, are found dried up, and decayed.—M. Littre objects to this, that the veſiculæ ſeminales, and proſtates, having little cells, where their filtrated liquor is depoſited, it is eaſily conceived that their humours may wait ſome time, for an occaſion of being emitted; but that theſe new proſtates, or glands, of Mr. Cowper, having no ſuch reſervoirs, their liquor muſt ooze out into the cavity of the urethra, in proportion, as it is ſeparated, and be deſtined for ſome continual, not a momentary, or occaſional uſe. He adds, that as the excretory ducts of theſe glands traverſe the ſpongeous body of the urethra, for two inches, ere they penetrate into its cavity, and that in the ſole moments when the liquor ſhould be diſcharged, to aſſiſt in generation, that ſpongeous body is extremely dilated, and its ſides in a ſtate of compreſſion, the liquor muſt be then leſs diſpoſed to a diſcharge than ever. See Erection.

For the fate of the *ſeed* when lodged in the uterus: ſee Conception, Generation, &c.

Seed, in botany, is the laſt product of a plant, whereby the ſpecies is propagated. See Plant.

The *ſeed* is frequently the fruit of the plant, as is the caſe in moſt herbs. See Fruit.

Sometimes it is only a part incloſed in the fruit, and that in form, either of grain, kernel, or berry. See Grain, Nucleus, Acinus, &c.

The *ſeed* is the natural offspring of the flower, and that for whoſe production all the parts of the flower are intended; ſo that when this is once well formed, the ſeveral parts of the flower dwindle, and diſappear. See Flower.

It is produced from the farina of the apices, let fall on the head of the piſtil, and thence forwarded to an uterus at the bottom thereof, divided into ſeveral cells; where, coming to receive the nutritious juice of the plant, it is firſt ſoftened, then ſwelled, increaſed both in matter and bulk, and at length comes to its ſtate of maturity.—For a more particular account of the manner of the generation of the *ſeed*, ſee Generation.

That the whole plant is contained in the *ſeed*, is an opinion as old as Empedocles, and is ſtill the prevailing doctrine among the generality of naturaliſts. Experience, the microſcope, and the modern philoſophy, give it great countenance. In effect, by the uſe of good microſcopes, we diſcover, in the *ſeed*, ſeveral of the parts of the future tree, only in miniature; particularly a little root, called the *radicle*, and the ſtem called the *plumule.* See Radicle and Plumule.

In Malpighi's life, we have a debate between him and ſeignior Triumphetti, provoſt of the phyſic garden at Rome, whether the whole plant be actually contained in the *ſeed?* The affirmative is maintained by Malpighi, with cogent arguments; among which this is one, that in a kidney bean ere ſown, the eye, aſſiſted with a microſcope, eaſily diſcovers leaves, a bud, end even the knots, or implantations of the leaves on the ſtem. The ſtem itſelf is very conſpicuous, and plainly conſiſts of woody fibres, and ſeries's of little utricles.—And whereas ſeignior Triumphetti had objected, that by poverty, tranſplantation, &c. ſeveral plants degenerate into others, particularly wheat into tares, and tares again into wheat; in anſwer to this, which is one of the ſtrongeſt objections againſt that opinion, Malpighi replies, that he is not fully ſatisfied as to the truth of the objection; for that both himſelf, and his friends, making the experiment, no metamorphoſis of the wheat ſucceeded: but granting the metamorphoſis, it is the ſoil, or the air, or the culture, is in the fault. Now, from a morbid, and monſtrous condition of nature, there is no inferring her genuine and permanent ſtate. See Degeneration.

To the ſame effect, Mr. Leewenhoeck, after a nice obſervation of an orange-kernel he had made to germinate in his pocket, &c. concludes, "Thus we ſee how ſmall a particle, "no bigger than a coarſe ſand, is increaſed, &c." A plain demonſtration, that the plant, and all that belongs to it, was actually in the *ſeed, viz.* the body, root, &c.—Mr. Derham adds, that of all the *ſeeds* he has viewed, except the maple, the plant appears the plaineſt to the naked eye in the nux vomica.

The fecundity of plants, in the production of *ſeeds*, is very ſurprizing. M. Dodart, in the memoirs of the French academy of ſciences, computes, that an elm, living 100 years, ordinarily produces of itſelf 33000000 grains; and adds, that had its crown, or head, been cut off, it would have put forth as many branches, within half an inch of the place where it was cut, as it had before; and that at whatever height it were cut off, the effect would have been ſtill the ſame.—Hence he concludes, that the whole trunk, from the ground to the riſe of the branches, is full of the principles, or little embryo's of branches, which, it is true, cannot all appear at once, but which being conceived, as ſeparated by circular rims, half an inch high, compoſe ſo many ſets of branches, each whereof is ready to appear, and will really appear, if the head be lopped off juſt over it.

Now theſe inviſible branches exiſt as really as thoſe which appear: for whence elſe ſhould they come? the trunk cannot produce them, as being itſelf no more than a packet of fibres, deſtitute of all action: nor can the ſap, which, like the blood, is fit to nouriſh the parts, but not to form any new ones.—The branches thereof exiſted before the tree was lopped; and if they had appeared, would have bore an equal number of *ſeeds* as thoſe which did. Theſe *ſeeds*, therefore, they muſt already contain in little.

On which footing, the tree may be ſaid actually to contain in itſelf 1584000000 *ſeeds*, wherewith to multiply itſelf as many times.—But what ſhall we ſay, if each *ſeed*, or grain of a tree, contain in itſelf another tree, containing the ſame number of *ſeeds?* and, if we can never come either at a *ſeed* which does not contain trees, nor at a tree which does not contain *ſeed?* by this means we ſhall have an increaſing geometrical progreſſion, the firſt term whereof is 1, the ſecond 1584000000, the third, the ſquare of 1584000000; the fourth, its cube, *&c.* to infinity. See FECUNDITY.

Several ſpecies of plants have been always ſuppoſed to be deſtitute of *ſeed*, in regard no obſervation, no microſcope, no anatomy had diſcovered any thing like them: ſuch are the capillaries, the ſeveral kinds of fuci, ſea-plants, moſſes, *&c.* —But the happy induſtry of the preſent age has diſcovered the *ſeeds* of ſome of them; and has left us out of all doubt, that the reſt are not without the ſame.

The *ſeeds* of fern, and the capillary-plants, were firſt diſcovered by Cæſius; and ſince, more fully and critically by Mr. W. Cole. The *ſeeds* of ſome ſea-plants, were diſcovered by the Count de Marſigli, and thoſe of others, by M. Reaumur, the firſt mentioned in the hiſtory of the French academy for the year 1712, and the latter for the year 1711. The *ſeeds* of ſome kinds of fuci have been diſcovered by Mr. Samuel Doody: thoſe of coralloid ſhrubs, by Dr. Tanc. Robinſon, as alſo, thoſe of ſeveral fungi, particularly truffles, and crepitus lupi's, or puff-balls; and thoſe of ſome other by Dr. Liſter. See MUSHROOM: under which article, a new theory of the propagation of theſe apparently *ſeedleſs* plants is laid down.

Echinate SEEDS, ECHINATE.
Naked SEEDS, See the articles NAKED.
Winged SEEDS, WINGED.

SEEDS, in gardening, and agriculture.—Mr. Bradley obſerves, that the *ſeeds* of plants, though exceedingly good, will degenerate from the mother-plant, if they be ſown on the ſame ground, whence they were gathered; ſo that there is a great neceſſity for a yearly change of *ſeeds* of foreſt trees, as acorns, maſt, *&c.* If the place be too cold to ſow them when gathered in Auguſt, they may be kept barrelled, or potted up, in moiſt ſand or earth, *ſtratum ſuper ſtratum*, during the winter; at the end of which they are found ſprouted, and if gently ſown, will be as forward as if ſown in autumn, beſides their miſſing the vermin to which the winter *ſeed* is much expoſed.

The *ſeed* is not to be choſen from the moſt fruitful trees, ſo much as from the moſt ſolid and fair; nor are we to covet the largeſt acorns, but the moſt weighty, clean, and bright. Porous, inſipid, mild ſorts of *ſeed*, are to be ſown as ſoon as ripe: hot, bitter *ſeeds* to be kept a year before ſown.

The ſhape and weight of *ſeeds*, direct how they are to be ſet: moſt of them, when they fall, lie on one ſide, with the ſmall end towards the earth, which ſhews that poſture to be beſt to ſet any ſtone or nut in: if they be heavy, ſow them the deeper. Acorns, peaches, *&c.* to be ſown two or three inches deep. See SEMINATION and PERPENDICULARITY.

SEEDS, in pharmacy, *&c.*—The medicinal *ſeeds*, eſpecially thoſe imported from the Indies, Levant, *&c.* are ſeverally deſcribed under their reſpective articles, which ſee.

Among thoſe cultivated at home, the principal are the four *greater hot*, and the four *greater cold ſeeds*, as they are called.—The firſt are thoſe of annice, fennel, cummin, and caraway: the latter, thoſe of gourd, citrul, melon, and cucumber.

The chief uſe of the four cold *ſeeds*, is for the making of emulſions, cool refreſhing drinks, paſts for the hands, and oils uſed by the ladies for the complection.

Amber SEED, AMBER *ſeed.*
Aniſe SEED, ANISE *ſeed.*
Line SEED, See the articles LINE *ſeed.*
Muſtard SEED, MUSTARD *ſeed.*
Worm SEED, WORM *ſeed.*

SEED *of pearls.* See the article PEARL.

SEEDLINGS, among gardeners, denote ſuch roots of gilliflowers as come from ſeed ſown.—Alſo, the young tender ſhoots of any plants, that are newly ſowed.

SEEING, the act of perceiving objects by the organ of ſight; or the ſenſe we have of external objects, by means of the eye. See SIGHT.

For the apparatus, or diſpoſition of the parts neceſſary to *ſeeing*, ſee EYE.—For the manner wherein *ſeeing* is performed, and the laws thereof, ſee VISION.

Our beſt anatomiſts differ greatly as to the cauſe why we do not *ſee* double with the eyes?—Galen, and others after him, aſcribe it to a coalition or decuſſation of the optic nerve behind the os ſphenoides. But whether they diſcuſſate or coaleſce, or only barely touch one another, is not ſo well agreed. The Bartholines and Veſalius ſay expreſly, they are united by a perfect confuſion of their ſubſtance: Dr. Gibſon allows them to be united by the cloſeſt conjunction, but not confuſion of their fibres. See OPTIC *nerve.*

Des Cartes, and others, account for the effect another way, *viz.* by ſuppoſing that the fibrillæ conſtituting the medullary part of thoſe nerves, being ſpread in the retina of each eye, have each of them correſponding parts in the brain; ſo that when any of thoſe fibrillæ are ſtruck by any part of an image, the correſponding parts of the brain are affected thereby.—Somewhat like which is the opinion of Dr. Briggs; who takes the optic nerves of each eye to conſiſt of homologous fibres, having their riſe in the thalamus nervorum opticorum, and thence continued to both the retinæ which are compoſed of them: and farther, that thoſe fibrillæ have the ſame paralleliſm, tenſion, *&c.* in both eyes; conſequently, when an image is painted on the ſame correſponding, ſympathizing parts of each retina, the ſame effects are produced, the ſame notice carried to the thalamus, and ſo imparted to the ſoul.—Hence, that double viſion enſuing upon an interruption of the paralleliſm of the eyes; as when one eye is depreſſed by the finger, or their ſymphony interrupted by diſeaſe. But Dr. Briggs maintains, that it is but in few ſubjects, there is any diſcuſſation; in none, any conjunction more than mere contact.

Whence it is that we *ſee* objects erect, when it is certain, the images thereof are painted invertedly on the retina, is another difficulty in the theory of *ſeeing!*—Des Cartes accounts for it hence; that the notice the ſoul takes of the object, does not depend on any image, nor on any action coming from the object, but merely on the ſituation of the minute parts of the brain, whence the nerves ariſe. *E. gr.* the ſituation of a capillament of the optic nerve, correſponds to a certain part of the brain, which occaſions the ſoul to *ſee* all thoſe places lying in a right line therewith.

But Mr. Molyneux gives us another account: the eye, he obſerves, is only the organ, or inſtrument: it is the ſoul that *ſees.* To enquire, then, how the ſoul perceives the object erect by an inverted image, is to enquire into the ſoul's faculties. Again, imagine that the eye receives an impulſe on its lower part, by a ray from the upper part of an object; muſt not the viſive faculty be hereby directed to conſider this ſtroke as coming from the top rather than the bottom of the object, and conſequently, be determined to conclude it the repreſentation of the top? See SIGHT, VISIBLE, *&c.*

SEEING *faith.* See the article FAITH.

SEELING. A horſe is ſaid to *ſeel*, when he begins to have white eye-brows; that is, when there grows on that part about the breadth of a farthing of white hairs, mixed with thoſe of his natural colour; which is a mark of old age. See AGE.

It is ſaid a horſe never *ſeels* till he is fourteen years old, and always before he is ſixteen.—The light ſorrel and black, ſooner *ſeel* than any other.

Horſe-jockeys uſually pull out thoſe hairs with pincers; but if there be ſo many that it cannot be done, without making the horſe look bald and ugly, then they colour their eye-brows, that they may not appear old.

SEEM, or SEME. See the article SEAM.

SEGMENT *of a circle*, in geometry, a part of a circle comprehended between an arch and the chord thereof.—Or, it is a part of a circle comprehended between a right line leſs than a ſemi-circle and a part of the circumference. See CIRCLE, ARCH, CHORD, *&c.*

Thus the portion A F B A (*Tab. Geometry*, *fig.* 23.) comprehended betwen the arch A F B, and the chord A B, is a *ſegment* of the circle A B E D, *&c.* a *ſegment* of ſo many degrees.

As it is evident every *ſegment* of a circle muſt either be greater or leſs than a ſemi-circle; the greater part of the circle cut off by a chord, *i. e.* the part greater than a ſemicircle, is called the *greater ſegment*, as A D E B; and the leſſer part, or the part leſs than a ſemi-circle, the *leſſer ſegment*, as A F B, *&c.*

The angle which the chord A B, makes with a tangent L B, is called the *angle of a ſegment.* See ANGLE.

Some alſo call the two mixt angles comprehended between the two extremes of the chord, and the arch, *angles of the ſegment.*

Angle in the SEGMENT. See the article ANGLE.

Similar SEGMENTS. See the article SIMILAR.

The height of a SEGMENT D E, *fig.* 22, and half its baſe or chord A E, being given, to find the area of the *ſegment.* Find the diameter of the circle. See DIAMETER. On this deſcribe a circle, and draw the baſe of the *ſegment* A B; draw the radii A C, B C; and find the number of degrees of the arch ADB. From the diameter had, and its ratio to the periphery, find the periphery itſelf; and from the ratio of the periphery to the arch ADB, and the periphery itſelf, find the length of the arch A D B. This done, find the area of the ſector A D B C A. See SECTOR. And that of the triangle ACB. See TRIANGLE. Laſtly, ſubtract the triangle from the ſector, the remainder is the area of the *ſegment.* See SINE.

If the area of the greater *ſegment* B F A, were required, the triangle ACB muſt be added to the ſector ADEBC.

SEGMENT *of a ſphere*, is a part of a ſphere terminated by a portion of its ſurface, and a plane which cuts it off; paſſing ſomewhere out of the centre. See SPHERE.

This is more properly called a *ſection of a ſphere*. See SECTION.

The baſe of ſuch a *ſegment*, it is evident, is always a circle whoſe centre is in the centre of the ſphere.

The ſolid content of a *ſegment* of a ſphere is found, by multiplying the ſurface of the whole ſphere by the altitude of the *ſegment*, and then dividing the product by the diameter of the ſphere, and to the quotient adding the area of the baſe of the *ſegment*.—Or, if it be leſs than a hemiſphere, thus; take the altitude of the *ſegment* from the radius of the ſphere, and by the difference multiply the area of the baſe of the *ſegment*; and ſubtract this product, from that which will ariſe by multiplying the ſemi-axis of the ſphere into the convex ſurface of the *ſegment*; then divide the remainder by 3, and the quotient is the ſolidity ſought.

This latter method ſuppoſes the axis of the ſphere to be given; if not, it may be found thus: let the altitude of the *ſegment* be called a, and its ſemi-diameter s, then will $a . s :: s . \frac{ss}{a}$; add $\frac{ss}{a}$ to a, and that ſhall give the axis ſought.

Reſiſtance of a SEGMENT. See the article RESISTANCE.

SEGMENT is ſometimes alſo extended to the parts of ellipſes, and other curvilinear figures. See ELLIPSIS, CURVE, &c.

Line of SEGMENTS. On Gunter's ſector there are uſually two lines, called *lines of ſegments*; they are numbered with 5, 6, 7, 8, 9, 10, and lie between the lines of ſines, and thoſe of ſuperficies. They repreſent the diameter of a circle, ſo divided into 100 parts, as that a right line drawn through thoſe parts, and normal to the diameter, ſhall cut the circle into two *ſegments*, of which the greater ſhall have that proportion to the whole circle, which the parts cut have to 100. See SECTOR.

SEGMENT *leaves*, a denomination given by botaniſts to thoſe leaves that are cut and divided into many ſhreds, or ſlices; as fennel, &c. See LEAF.

SEGMOIDAL *valves*, in anatomy, are little valves of the pulmonary artery; thus called from their reſembling ſegments of circles; but more uſually ſemilunar valves. See SEMILUNAR.

SEGREANT, is the herald's word for a griffon, when drawn in a leaping poſture, and diſplaying his wings, as if ready to fly.

SEJANT, is a term uſed in heraldry, when a lion, or other beaſt, is drawn in an eſcutcheon, ſitting like a cat, with his fore-feet ſtreight.

SEIGNEUR, or SEIGNOUR, *lord*. See SIRE, SIEUR, MONSEIGNEUR, LORD, &c.

SEIGNORAGE, or SEIGNOURAGE, a right or due belonging to a ſeigneur, or lord. See LORD.

SEIGNORAGE is particularly uſed for a duty belonging to the prince for the coining of money, called alſo *coinage*; in the baſer Latin, *monetagium*. See COINAGE.

This duty is not always the ſame; but changes according to the pleaſure of the prince, and the occaſions of ſtate. It is in ſome meaſure for the the diſcharge of this duty that alloy was invented; that is, the mixture of other metals with gold and ſilver. See ALLOY.

Under our ancient kings, for every pound of gold brought in the maſs to be coined, the king's duty was five ſhillings; one ſhilling, and ſometimes eighteen-pence whereof went to the maſter of the mint. Under Edward III. the *ſeignorage* of every pound weight of ſilver, was eighteen-penny weight, which was then equivalent to a ſhilling. Under Henry V. the king's *ſeignorage* for every pound of ſilver was fifteen-pence.—At preſent, the king claims no *ſeignorage* at all, but the ſubject has his money coined at the publick expence: nor has the king any advantage therefrom, but what he has by the alloy.

In France, under Philip Auguſtus, the *ſeignorage* was one third of the profit made by the coining: St. Louis fixed it at one fifteenth part of the value of the money coined: king John at three livres the mark of gold: Charles VII. by reaſon of the diſtreſſed ſtate of his finances, raiſed it to three fourths of the value: Louis XIII. fixed it at ſix livres the mark, or eight ounces of gold, and ten ſols the mark of ſilver.—Louis XIV. took away the right of *ſeignorage* in 1679; though it was re-eſtabliſhed in 1689, on the foot of ſeven livres, ten ſols the mark of gold, and twelve ſols, ſix deniers the marks of ſilver.

It muſt be obſerved, that for the levying of this duty of *ſeignorage*, the juſt value of the money is augmented by the value of the duty.

SEISIN, SEISINA, in law, ſignifies poſſeſſion. See POSSESSION.

In this ſenſe we ſay, *primier ſeiſin*, for the firſt poſſeſſion, &c. See PRIMI .

Seiſin is two-fold; *ſeiſin in fact*, and *ſeiſin in law*.

SEISIN *in fact*, is, when an actual and corporal poſſeſſion is taken.

SEISIN *in law*, is, when ſomething is done, which the law accounteth a *ſeiſin*; as an inrollment.

This in law gives a right to lands and tenements, though the owner be by wrong diſſeized of them.—He who hath but an hour's poſſeſſion quietly taken, hath *ſeiſin de droit, & de claime*, whereof no man may diſſeize him by his own force, or ſubtlety, without proceſs of law. See DISSEISIN. The civilians call the latter *civilem poſſeſſionem*, the former *naturalem*. See POSSESSION.

SEISINAM *habere facias*. See the article HABERE.

SEISOR. See the article DISSEISOR.

SEIZE, SEAZE, or SEASE, in the ſea language, is to make faſt, or bind; particularly to faſten two ropes together, with rope-yarn.

The *ſeazing*, *ſeaſing*, or *ſeaſon* of a boat, is a rope tied to a ring, or little chain in the fore-ſhip of the boat, by which mea. ; it is faſtened to the ſide of the ſhip.

SEIZING, in falconry, is when an hawk gripes her prey, or any thing elſe faſt between her claws.

SEIZURE, in commerce, an arreſt of ſome merchandize, moveable, or other matter, either in conſequence of ſome law, or of ſome expreſs order of the ſovereign.

Contraband goods, thoſe fraudulently entered, or landed without entering at all, or landed at wrong places, are ſubject to *ſeizure*. See CONTRABAND.

In *ſeizures*, among us, one half goes to the *ſeizor*, or informer, and the other half to the king.—In France, half the painted linens, &c. ſeized, uſed to be burnt, and the other half ſent abroad: but in 1715, by an arret of council, the whole was ordered to be burnt.

SELENITE *, SELENITES, in natural hiſtory, *moon-ſtone*; a ſtone ſaid to be ſtill found in China, which has this remarkable property, that it increaſes and decreaſes, as the moon waxes and wains.—There are ſome of theſe *ſelenites* preſerved in the palace of Peking, valued at an incredible rate. Martinius.

* The word is formed from the Greek, σεληνη, moon.

SELENITES, among the ancient naturaliſts, denotes a white, or tranſparent figured ſtone; thus called from its repreſenting the moon as in a glaſs. It was alſo denominated *lapis ſpecularis*. See SPECULARIS.

Some give the ſame appellation to Muſcovy-talc, from an opinion, that its brightneſs increaſes and diminiſhes with the moon. See TALC.

SELENOGRAPHY *, a branch of coſmography, which deſcribes the moon, and all the parts and appearances thereof; as geography does thoſe of the earth.

* The word is formed from σεληνη, moon, and γραφη, deſcription.

Since the invention of the teleſcope, *ſelenography* is vaſtly improved. We have now diſtinct names for moſt of the regions, ſeas, lakes, mountains, &c. viſible in the moon's body. Hevelius, a celebrated aſtronomer and burgher-maſter of Dantzick, who publiſhed the firſt *ſelenography*, named the ſeveral places of the moon from thoſe of the earth; Ricciolus, from the names of the celebrated aſtronomers and philoſophers.—Thus what the one calls *mons Porphyrites*, the other calls *Ariſtarchus*. What the one calls *Ætna*, *Sinai*, *Athos*, *Apenninus*, &c. the other calls *Copernicus*, *Poſſidonius*, *Tycho*, *Gaſſendus*, &c. See MOON.

At the royal obſervatory at Paris, they continue to make *ſelenographic* maps. M. Caſſini has publiſhed a work called *Inſtructions Seleniques*.

SELEUCIANS, SELEUCIANI, a ſect of ancient hereticks, called alſo *Hermiani*. See HERMIANS.

Seleucus and Hermias joining forces, and dogmatizing together, taught, that God was corporeal; that the elementary matter was co-eternal with him, and that the human ſoul was formed by the angels, of fire and air.—They alſo denied that Jeſus Chriſt ſat at the right hand of God; aſſerting, that he had quitted that right, and had removed his throne into the ſun. See ASCENSION.

SELEUCIDÆ, in chronology.—Æra of the SELEUCIDÆ, or the Syro-Macedonian æra, is a computation of time, commencing from the eſtabliſhment of the *Seleucidæ*, a race of Greek kings, who reigned as ſucceſſors of Alexander the Great in Syria; as the Ptolemy's did in Egypt. See EPOCHA.

This æra we find expreſſed in the book of Maccabees, and on a great number of Greek medals ſtruck by the cities of Syria, &c.—The Rabbins and Jews call it, the *æra of contracts*, becauſe being then ſubject to the kings of Syria, they were obliged to follow their method of computing in all contracts.

The Arabs call it *therik dilkarnain*, æra of two horns, which ſome ſay ſignifies the æra of Alexander the Great; by reaſon that prince bore two rams horns on medals, in imitation of Jupiter Ammon, whoſe ſon he would needs be.—But others underſtand it much better of the two kingdoms of Syria and Egypt, which were now cloven or divided; and of one ſingle empire parted into two monarchies.

The grand point, is to know the year wherein the ſeparation was made; or, which is the ſame thing, when Seleucus Nicanor, one of Alexander's captains, and the firſt of the *Seleucidæ*, eſtabliſhed his throne in Syria.—Without detailing the various ſentiments of various authors, it may ſuffice to obſerve, that, according to the beſt accounts, the firſt year of this æra falls in the year 311 before Chriſt, which was 12 years after Alexander's death. See EPOCHA.

SELF *abuſe*, } See the articles { ABUSE.
SELF *examination*, } { EXAMINATION.

SELL, in building, is of two kinds, *viz.*—*Groundſell*, which denotes the loweſt piece of timber in a timber-building, and that whereon the whole ſuperſtructure is raiſed.

Window-ſell, called alſo *window-ſoil*, is the bottom piece in a window-frame. See WINDOW.

SELLA *equina*, *turcica*, or *ſphenoides*, is a name given the four apophyſes of the os ſphenoides, or cuneiforme, in the brain; in regard of their forming a reſemblance of a ſaddle, which the Latins call *ſella*. See SPHENOIDES and BRAIN. They are ſometimes alſo called by the Greek name *clinoides*. Herein is contained the pituitary gland, and in ſome beaſts, the *rete mirabile*. See PITUITARY and RETE.

SEMBIANI, SEMBIANS, a ſect of ancient hereticks, denominated from their leader, *Sembius* or *Sembianus*, who condemned all uſe of wine, as evil of itſelf; perſuaded his followers, that the wine was a production of Satan and the earth; denied the reſurrection of the dead, and rejected moſt of the books of the Old Teſtament. Jovet.

SEMBRADOR, an engine, invented by Don Joſ. de Lucatello, for the evenly ſowing of ſeeds; deſcribed in the Philoſophical Tranſactions, under the title of the *Spaniſh Sembrador*. See SEED and SEMINATION.

The perfection of agriculture is allowed to conſiſt much in ſetting plants at proportional diſtances, and giving ſufficient depth to the roots, that they may ſpread, and receive their neceſſary nouriſhment: yet is very little care taken in the practice of this important part of huſbandry; but all ſorts of grains ſown by handfuls, caſt at random; by which means four parts in five of the ſeed are loſt.—To remedy this inconvenience, the *ſembrador* or ſower is invented, which being faſtened to the plough, the whole buſineſs of plowing, ſowing, and harrowing is done at once; the ſeed-man's trouble ſaved, and the grain ſpread at equal diſtances, and equally deep at the bottom of the furrow.

An experiment hereof was made before the emperor Leopold in the fields of Laxemburgh in Auſtria, where the land uſually yields four or five-fold; but the crop from the ground ſowed by this inſtrument, was ſixty-fold; as appears by a certificate of the emperor's officer, appointed to ſee the experiment: ſigned Vienna, Auguſt 1, 1663.

A figure of the *ſembrador*, we have in the Tranſactions, N°. 60. by the earl of Caſtlemain.

SEME, or SEEME. See the article SEAM.

SEMEIOSIS, ΣΗΜΕΙΩΣΙΣ, in medicine. See SEMEIOTICA, DIAGNOSIS, and PROGNOSIS.

SEMEIOTICA *, ΣΗΜΕΙΩΤΙΚΗ, that part of medicine which conſiders the ſigns, or indications of health, and diſeaſes; and enables the phyſician to judge what is, was, or will be the ſtate, degree, order and effect of health or ſickneſs. See SIGN and INDICATION; ſee alſo MEDICINE.

* The word is formed from the Greek, σημειωτικη, of σημειον, *ſign*, *ſymptom*.

SEMEN *ſanctum*, or *ſantonicum*. See WORM-*ſeed*.

SEMENTINÆ *feriæ*, in antiquity, feaſts held annually among the Romans, to obtain of the gods a plentiful harveſt. See FERIÆ.

They were celebrated in the temple of Tellus, or the earth; where ſolemn ſacrifices were offered to Tellus and Ceres. The time of the celebration was about ſeed time, uſually in the month of January; for Macrobius obſerves, they were moveable feaſts.—They had their name from *ſemen*, ſeed.

SEMETS, SUMMETS, or SUMMITS, in botany, are uſed by Dr. Grew, and others, for the apices of the attire of plants. See APICES.

SEMI, a word borrowed from the Latin, ſignifying *half*; but only uſed in compoſition with other words, as in the following articles.

The French, inſtead of *ſemi* frequently uſe *demi*; the Greeks *hemi*. See HEMI and DEMI.

In muſic, *ſemi* has three ſeveral uſages: firſt, when prefixed to the name of a note, it expreſſes a diminution of half its value; as in *ſemi-breve*, &c. See SEMI-BREVE.

Secondly, when added to the name of an interval, it expreſſes a diminution, not of half, but of a leſſer ſemi-tone, or four commas in the whole compaſs; as in *ſemi-diapante*, &c.

Thirdly, it ſometimes alſo ſignifies an imperfection: thus, *ſemicircolo* or *circolo mezzo*, ſignifies an imperfect circle, which is the mark of imperfect time, that is, of double time; whereas, the circle, being a character of perfection, marks triple time.

SEMI-ARIANS, a branch of the ancient Arians; conſiſting, according to Epiphanius, of ſuch as, in appearance, condemned the errors of that hereſiarch, but yet acquieſced in ſome of the principles thereof; only palliating and hiding them under ſofter, and more moderate terms. See ARIANS.

It is true, they ſeparated from the Arian faction; but yet could never be brought to acknowledge, that the Son was homoouſios, that is, conſubſtantial, or of the ſame ſubſtance with the Father.—They would only allow him to be homoiouſios, that is, of a like ſubſtance with the Father. See HOMOOUSIAN, *&c.*

Though, as to expreſſion, they only differed from the orthodox by a ſingle letter; yet were they, in effect, in the error of the Arians, as they placed the Son in the rank of creatures.—It did not avail the teaching, that there was no other creature of the ſame claſs with him; ſince by denying him conſubſtantial with God, they effectually precluded him from being truly God.

Yet ſome, even among the orthodox, uſe the word homoiouſios, in ſpeaking of the Son; applying ſuch an idea to it, as, it ſeems, is conſiſtent with orthodoxy. See CONSUBSTANTIAL.

But the name *ſemi-arians* is given by the ſecond general council to another branch of Arians, who believed orthodoxly of the Father and Son, but denied the deity of the Holy Ghoſt; thus rejecting that part of the Arian hereſy relating to the Son, but ſtifly retaining that which related to the Holy Ghoſt.

As the zeal of the Arians was chiefly levelled againſt the ſecond perſon in the trinity, that of the *ſemi-arians* was bent againſt the third; whence as the former were ſometimes called χριςομαχοι, the latter were denominated πνευματομαχοι. Macedonius, biſhop of Conſtantinople made an innovation in this ſect in 360, and gave riſe to a new branch of Macedonian *ſemi-arians*, or pneumatomachi; who allowed the Son not to be ὁμοουσιος, of the ſame ſubſtance, but ὁμοιος, of like ſubſtance, with the Father; and at the ſame time openly aſſerted the Holy Ghoſt to be a creature.

SEMI-BREVE, in muſic, a note, or meaſure of time, comprehending the ſpace of two minims, or four crotchets, or half a breve. See NOTE, MEASURE, and CHARACTERS *of muſic*.

The *ſemi-breve* is accounted one meaſure or time; or the integer, in fractions and multiples whereof the time of the other notes is expreſſed. See TIME.

Thus the minim is expreſſed by $\frac{1}{2}$; a crotchet by $\frac{1}{4}$, *&c.* i. e. by $\frac{1}{4}$ of a meaſure or *ſemi-breve*. A breve by 2; a long by 4, that is, by 4 meaſures or *ſemi-breves*. See MINIM, CROTCHET, BREVE, *&c.* See alſo SEXTUPLE.

The character of the *ſemi-breve* is O.

SEMI-CIRCLE, in geometry, a figure comprehended between the diameter of a circle, and half the circumference. See CIRCLE, ANGLE and CENTRE.

Two *ſemi-circles* can only cut each other in one point.

SEMI-CIRCLE, is alſo an inſtrument in ſurveying, ſometimes called *graphometer*. See SURVEYING.

It conſiſts of a *ſemi-circular* limb, as FIG (*Tab. Surveying*, *fig.* 16.) divided into 180 degrees, and ſometimes ſubdivided, diagonally or otherwiſe, into minutes. This limb is ſubtended by a diameter F G, at the extremities whereof are erected two ſights. In the centre of the *ſemi-circle*, or the middle of the diameter, is fixed a box and needle. On the ſame centre is fitted an alidade or moveable index, carrying two other ſights, as H I. The whole is mounted on a ſtaff with a ball and ſocket.

The *ſemi-circle*, then, is nothing elſe but half a theodolite; with this only difference, that whereas the limb of the theodolite, being an intire circle, takes in all the 360° ſucceſſively; in the *ſemi-circle* the degrees only going from 1 to 180, it is uſual to have the remaining 180°, or thoſe from 180° to 360°, graduated in another line on the limb, within the former.

To take an angle with a SEMI-CIRCLE.—Place the inſtrument in ſuch manner, as that the radius C G may hang over one leg of the angle, to be meaſured, and the centre C over the vertex of the ſame. The firſt is done by looking through the ſights F and G at the extremities of the diameter, to a mark fixed up in one extremity of the leg: the latter is had by letting fall a plummet from the centre of the inſtrument. This done, turn the moveable index H I on its centre towards the other leg of the *ſemi-circle*, till through the ſights fixed on it, you ſee a mark in the extremity of the leg. Then, the degree which the index cuts on the limb, is the quantity of the angle.

For further uſes of the *ſemi-circle*, they are the ſame with thoſe of the theodolite. See THEODOLITE.

SEMICIRCULAR *arches*, } See the articles { ARCH.
Canales SEMICIRCULARES, } { CANALES.

SEMI-COLON, in grammar, one of the points or ſtops, uſed to diſtinguiſh the ſeveral members of ſentences from each other. See SENTENCE and POINT.

The mark or character of the *ſemi-colon* is (;)—It has its name, as having a ſomewhat leſs effect than a colon, or as demanding a ſhorter pauſe.

The uſe of the *ſemi-colon*, the grammarians generally ſay, is, to mark a ſenſe leſs compleat than the colon, and more compleat than the comma; but this only conveys a very obſcure idea. In effect, the preciſe office of the *ſemi-colon*, or what office it is diſtinguiſhes it from the colon, is a thing very little known in the world. Our beſt authors ſeem to uſe them promiſcuouſly. See COLON.

Mr. Ward, profeſſor at Greſham, we believe, is the firſt who ſettled the juſt uſe of the *ſemi-colon*. His poſition is, that the *ſemi-colon* is properly uſed to diſtinguiſh the conjunct members of ſentence.—Now, by a conjunct member of a ſentence, he means, ſuch a one as contains at leaſt two ſimple members. See Sentence.

Whenever, then, a ſentence can be divided into ſeveral members of the ſame degree, which are again diviſible into other ſimple members, the former are to be ſeparated by a *ſemi-colon*.

For an inſtance: If fortune bear a great ſway over him, who has nicely ſtated and concerted every circumſtance of an affair; we muſt not commit every thing, without reſerve to fortune, leſt ſhe have too great a hold of us. Again, *Si quantum in agro locïſque deſertis audacia poteſt, tantum in foro atque judiciis impudentia valeret; non minus in cauſa cederet Aulus Cæcinna Sexta Æbutii impudentiæ, quam tum in vi faciendo ceſſit audaciæ.* An inſtance in a more complex ſentence we have in Cicero. *Res familiaris primum bene parta ſit, nulloque turpi quæſtu; tum quam plurimis, modo dignis, ſe utilem præbeat; deinde augeatur ratione, diligentia, parſimonia; nec libidini potius luxuriæque, quam liberalitati & beneficentiæ pareat.*

But though the proper uſe of the *ſemi-colon*, be to diſtinguiſh conjunct members, it is not neceſſary that all the members divided hereby, be conjunct. For upon dividing a ſentence into great and equal parts, if one of them be conjunct, all thoſe other parts of the ſame degree are to be diſtinguiſhed by a *ſemi-colon*.—Thus: Whoever is overtaken with poverty; the ſame will find, that coldneſs, contempt, injuries, *&c.* are not far behind: or thus: *Nihil eſt tam molle, tam tenerum, tam aut fragile, aut flexible; quam voluntas civium.*

Sometimes alſo it happens, that members that are oppoſite to each other, but relate to the ſame verb, are ſeperated by a *ſemi-colon*: thus Cicero. *Ex hac parte pudor, illinc petulantia; hinc fides, illinc fraudatio; hinc pietas, illinc ſcelus*, &c.

Hither likewiſe may be referred ſuch ſentences, where the whole going before, the parts follow: as, The parts of rhetorick are four; invention, diſpoſition, elocution, and pronunciation.

SEMI-CROMA, *ſextuple of.* See the article Sextuple.

SEMI-CUPIUM, a half bath, wherein the patient is only up to the navel. See Insessus and Bath.

SEMI-DIAMETER, a right line drawn from the centre of a circle or ſphere, to its circumference; the ſame with what we otherwiſe call *radius.* See Diameter, Circle and Radius.

The diſtances, diameters, *&c.* of the heavenly bodies, are uſually eſtimated by aſtronomers in *ſemi-diameters* of the earth. See Earth; ſee alſo Sun, Planet, *&c.*

To find the *ſemi-diameters* of the primary planets in *ſemi-diameters* of the earth.—Since the ſun's true *ſemi-diameter* is 152 *ſemi-diameters* of the earth; and we have the ratio of the diameters of the primary planets to that of the ſun (ſee Diameter) their *ſemi-diameters* are eaſily found by the rule of three.—Thus, the *ſemi-diameter* of Saturn will be found $\frac{20}{7}$; that of his ring $45\frac{5}{37}$; that of Jupiter $27\frac{8}{11}$; that of Mars $\frac{11}{12}$; that of Venus $\frac{4}{7}$; and that of Mercury $\frac{19}{7}$. See Planet.

SEMI-DIAPANTE, in muſic, a defective fifth, called uſually by the Italians, *falſa quinta*, and by us a *falſe fifth.* See Fifth.

SEMI-DIAPASON, in muſic, a defective octave; or an octave diminiſhed by a leſſer ſemi-tone, or four commas. See Diapason.

SEMI-DIATESSARON, in muſic, a defective fourth, called, properly, a *falſe fourth.* See Fourth.

SEMI-DIATONE, *diapaſon*, } See { Diapason.
Dis-Diapaſon Semi-Ditone, } See { Dis-Diapason.

SEMI-DOUBLE, in the Romiſh breviary, a term applied to ſuch offices and feſtivals as are celebrated with leſs ſolemnity than the double ones; but yet with more than the ſingle ones.

The *ſemi-double* office has double veſpers, and nine leſſons at mattins; but the anthems are not redoubled.—It is performed on ſundays, on the octaves, and on feaſts marked for *ſemi-double* in the calendar.

SEMI-FISTULAR *flowers.* See the article Flowers.

SEMI-LUNAR *valves*, in anatomy, are three little valves or membranes of a *ſemi-lunar* figure, placed in the orifice of the pulmonary artery; to prevent the relapſe of the blood into the heart at the time of its dilatation.—See *Tab. Anat.* (Angeiol.) *fig.* 1. *lit. a.* See alſo the article Valve.

SEMINAL, Seminalis, in medicine, ſpermatic, or ſomething belonging to the ſemen, or ſeed. See Seed and Spermatic.

SEMINARY, a place appointed for the inſtruction of young perſons deſtined for the ſacred miniſtry, in the duties, ceremonies, and offices thereof; firſt inſtituted, as Thomaſſin tells us, by St. Auguſtin. See Canon, Clergy, Academy, *&c.*

Of theſe *ſeminaries* there are many abroad, furniſhed with halls for the aſſemblies of the exercitants, and little chambers, or cells, where each perſon retires, ſtudies, and prays apart.—Such is the *ſeminary* of St. Sulpitius at Paris.

The council of Trent decrees, that children exceeding 12 years of age, be taken, brought up, and inſtructed in common, to qualify them for the eccleſiaſtical ſtate; and that there be a *ſeminary* of ſuch belonging to each cathedral, under the direction of the biſhop.

In France, the eſtabliſhment of *ſeminaries* is ſomewhat different from the decree of the council: none are taken in but young people ready to ſtudy theology, and be ordained: ſo that the *ſeminaries* are a kind of houſes of probation where the vocation of clerks is examined, and they are prepared to receive orders.

For the ſubſiſtence of theſe *ſeminaries*, there are ſeveral unions of benefices, or elſe the clergy of the dioceſe are obliged to contribute to maintain them.

Pope Pius IV. having eſtabliſhed a *ſeminary* at Rome, in conſequence of the decree of the council of Trent; by advice of the cardinal, it was given to the Jeſuits, who have made good uſe thereof.

Among the canons of St. Auguſtin, Seminary is uſed for a kind of college, or ſchool, where penſioners are kept, and inſtructed in the claſſical, and other learning.

The houſes of the ſociety *de propaganda fide*, eſtabliſhed for the preparing of eccleſiaſticks for miſſions among infidels and hereticks, are alſo called *ſeminaries.*—The principal whereof is that at Rome, called, the *apoſtolical college*, *apoſtolical ſeminary*, *paſtoral ſeminary*, *ſeminary* of the *propaganda*, &c. See Society.

SEMINATION, Seminatio, in natural hiſtory, *&c.* the act of ſowing, or ſhedding ſeed; particularly that of vegetables. Sec Seed and Sembrador.

As ſoon as the ſeed is ripe, Dr. Grew obſerves, nature takes ſeveral methods for its being duly ſown; not only by the opening of the uterus, but in the make of the ſeed itſelf.—Thus, the ſeeds of many plants, which affect a peculiar ſoil or ſeat, as arum, poppy, *&c.* are heavy and ſmall enough, without farther care, to fall directly down to the ground. Others, that are large, are light enough to be expoſed to the wind, are often furniſhed with one or more hooks to ſtay them from ſtraying too far from their proper place: thus, the ſeeds of avens have a ſingle hook; thoſe of agrimony and gooſe-graſs, many; both the former loving a warm bank, and the laſt a hedge for its ſupport.

On the contrary, many ſeeds are furniſhed with wings, or feathers, partly with the help of the wind to carry them, when ripe, off the plant, as thoſe of aſh, *&c.* and partly to enable them to make their flight more or leſs abroad, that they may not, by falling together, come up too thick; and, that if one ſhould miſs a good ſoil or bed, another may hit. —So the kernels of pines have wings, though ſhort ones, whereby they do not fly in the air, but only flutter on the ground. But thoſe of typha, dandelion, and moſt of the pappous kind, have numerous long feathers, by which they are wafted every way.

Others are ſown by being laid in ſpringy elaſtic caſes, which, when they crack and burſt, dart their ſeed at convenient diſtances: thus, wood-ſorrel having a running root, nature ſees fit to ſow the ſeed at ſome diſtance, the doing of which is effected by a white, ſturdy, tendinous cover, which beginning to dry, burſts open on one ſide in an inſtant, and is violently turned inſide outwards. The ſeed of hartstongue, and codded arſmart, is flung, or ſhot away, by means of a ſpring, wound or girt round the ſeed-caſe. When the ſpring is become ſtark and tenſe enough, it ſuddenly breaks the caſe into two halves, like little cups, and ſo flings the ſeed.

Divers notable means of *ſemination* are obſerved by other authors: a quantity of fern-ſeed, Mr. Ray tells us, laid in a lump, on a paper, the ſeminal veſiculæ are heard to crackle, burſt, and, by a microſcope, the ſeeds are ſeen to be projected to a conſiderable diſtance from each other.—Dr. Sloane obſerves, that the gentianella flore cæruleo, or ſpirit leaf, requiring wet weather to be ſown in, as ſoon as the leaſt drop of rain touches the end of the ſeed-veſſels, with a ſmart noiſe, and a ſudden leap, it opens itſelf, and, with a ſpring, ſcatters it ſeed.

The plants of the cardamine family, throw their cods open, and dart out their ſeed upon a ſlight touch of the hand. Nay, Mr. Ray adds, that the pods of the cardamine impatient not only burſt upon the ſlighteſt touch, but even by an approach of the hand to touch them, without any real contact.

Other plants ſow their ſeeds by inviting birds, by their agreeable taſte and ſmell, to feed of them, ſwallow them, and carry them about; thereby alſo fertilizing them, by paſſing through their bodies.—In ſuch manner are nutmegs and miſſeltoe, ſown and propagated. See Nutmeg and Misseltoe.

SEMI-ORDINATES, in geometry, the halves of the ordinates or applicates. See Ordinate.

SEMI-PARABOLA, in geometry, a curve defined by the equation, $ax^{m-1} = y^m$; as $ax^2 = y^3$, $ax^3 = y^4$. See Parabola and Curve.

In *ſemi-parabolas* $y^m : v^m :: ax^{m-1} : az^{m-1} = x^{m-1} : z^{m-1}$, or the powers of the *ſemi-ordinates* are as the powers of the abſciſſes one degree lower; *e. gr.* in cubical *ſemi-parabolas*, th cubes of the ordinates y^3 and v^3 are as the ſquares of the abſciſſes x^2 and z^2.

SEMI-PELAGIANS, a name anciently, and even at this day, given to ſuch as retain ſome tincture of Pelagianiſm. See PELAGIANS.

S. Proſper, in a letter to St. Auguſtin, calls them *reliquia Pelagii.*

Many learned men, principally in the Gauls, who could not come into St. Auguſtin's doctrine of grace, *&c.* were accuſed of *Semi-pelagianiſm:* they were alſo called *Maſſilians.* or *prieſts of Marſeilles*, in regard their errors had their firſt riſe in that city.

Caſſian, who had been a deacon of Conſtantinople, and was afterwards a prieſt at Marſeilles, was the chief of theſe *Semi-pelagians:* S. Proſper, who was co-temporary with him, and who attacked him very vigorouſly, tells us, that Caſſian endeavouring to keep I know not what medium betwen the Pelagians and the orthodox, did not agree either with the one or the other.

The *Semi-palagians*, with the orthodox, allowed of original ſin; but denied, that man's free agency could be ſo wounded by this ſin, that he could not of himſelf do ſomething which might induce God to afford his grace to one man more than another.—They alſo taught, that the grace which ſaves men, was not given them of the mere will of God, but according to his eternal preſcience, whereby he foreſaw who they were that would believe in him.—They owned, that the vocation or call to the goſpel, was gratuitous; but added, at the ſame time, that it was common to all, inaſmuch as God deſired all ſhould be ſaved.—As to election, they held, that it depended on our perſeverance; God only chuſing ſuch to eternal life, as ſhould perſevere in the faith.

SEMI-PROOF, an imperfect proof. See PROOF.

In the French law, the depoſitions of a ſingle evidence only make a *ſemi-proof.* See WITNESS.

The teſtament of a perſon deceaſed, is deemed a *ſemi-proof.*—In enormous caſes, the *ſemi-proof* frequently determines them to try the torture. See TORTURE.

SEMI-QUARTILE, or SEMI-QUADRATE, is an aſpect of the planets, when diſtant from each other 45 degrees, or one ſign and an half. See ASPECT.

SEMI-QUAVER, in muſic. See the article QUAVER.

SEMI-QUINTILE, is an aſpect of the planets, when at the diſtance of 36 degrees from one another. See ASPECT.

SEMI-SEXTILE, or SEMI-SEXTUS, or S. S. an aſpect of two planets, wherein they are diſtant from each other, one twelfth part of a circle, or 30 degrees. See ASPECT.

The *ſemi-ſextile* was added to the ancient aſpects by Kepler; and, as he ſays, from meteorological obſervations.

SEMI-SPINATUS, in anatomy. See TRANSVERSALIS *dorſi.*

SEMITA *luminoſa*, a name given to a kind of lucid tract in the heavens, which, a little before the vernal equinox, may be ſeen about ſix a clock at night, extending from the weſtern edge of the horizon, up towards the pleiades.

The phænomenon has been taken notice of by Caſſini and Facio, who both evince, that this light comes diffuſed from both ſides of the ſun.—Its brightneſs is much the ſame with that of the via lactea, or the tail of a comet: it is ſeen plaineſt with us about the beginning of October, or the latter end of February.

Facio conjectures, that the bodies, or rather the congeries or aggregate of bodies, which occaſion this light, conforms to the ſun like a lens; and takes it to have ever been the ſame; but Caſſini thinks it ariſes from a vaſt number of ſmall planets, which encompaſs the ſun, and give this light by reflexion; eſteeming it alſo not to have exiſted long before he obſerved it.

SEMI-TEINTS. See the article TEINTS.

SEMI-TONE, in muſic, one of the degrees, or concinnous intervals of concords. See DEGREE and CONCORD.

There are three degrees, or leſſer intervals, by which a ſound can move upwards and downwards ſucceſſively from one extreme of any concord to the other, and yet produce true melody; and, by means whereof, ſeveral voices and inſtruments are capable of the neceſſary variety in paſſing from concord to concord.—Theſe degrees are the greater and leſſer tone, and the *ſemi-tone.* The ratio of the firſt is 8 : 9; that of the ſecond 9 : 10. See TONE.

The ratio of the *ſemi-tone* is 15 : 16, its compaſs is five commas; which interval is called a *ſemi-tone*, not that it is geometrically the half of either of the tones, for it is more; but becauſe it comes ſomewhat near it. It is alſo called the *natural ſemi-tone*, and the *greater ſemi-tone*, becauſe greater than the part it leaves behind, or its complement to a tone, which is four commas.—The Italians alſo call it *ſeconda minore*, or a leſſer ſecond. See SECOND.

Every tone of the diatonic ſcale is divided into a *greater* and *leſs*, or a *natural* and *artificial ſemi-tone.* Mr. Malcolm obſerves, it was very natural to think of a diviſion of each tone, where 15 : 16 ſhould be one part in each diviſion, in regard this being an unavoidable and neceſſary part of the natural ſcale, would readily occur as a fit degree, and the more, as it is not far from an exact half-tone. In effect, the *ſemi-tones* are ſo near equal, that, in practice, at leaſt, on moſt inſtruments, they are accounted equal, ſo that no diſtinction is made into *greater* or *leſs.*

Theſe *ſemi-tones* are called *fictitious notes*, and, with reſpect to the natural ones, are expreſſed by characters called *flats* and *ſharps.* See FLAT and SHARP.

Their uſe is to remedy the defects of inſtruments, which having their ſounds fixed, cannot always be made to anſwer to the diatonic ſcale. See SCALE.

By means of theſe we have a new kind of ſcale, called the

SEMI-TONIC *ſcale*, or the *ſcale of ſemi-tones:* a ſcale or ſyſtem of muſic, conſiſting of 12 degrees, or 13 notes, in the octave, being an improvement on the natural or diatonic ſcale, by inſerting between each two notes thereof, another note, which divides the interval or tone into two unequal parts, called *ſemi-tones.* See SCALE and SEMI-TONE.

The uſe of this ſcale is for inſtruments that have fixed ſounds, as the organ, harpſicord, *&c.* which are exceedingly defective on the foot of the natural or diatonic ſcale.—For the degrees of the ſcale being unequal, from every note to its octave there is a different order of degrees; ſo that from any note we cannot find any interval in a ſeries of fixed ſounds: which yet is neceſſary, that all the notes of a piece of muſic carried through ſeveral keys, may be found in their juſt tune, or that the ſame ſong may be begun indifferently at any note, as may be neceſſary for accommodating ſome inſtruments to others, or to the human voice, when they are to accompany each other in uniſon.

The diatonic ſcale, beginning at the loweſt note, being firſt ſettled on an inſtrument, and the notes thereof diſtinguiſhed by their names *a . b . c . d . e . f . g*; the inſerted notes, or ſemi-tones, are called *fictitious notes*, and to take the name or letter below with a ♯ as *c* ♯ called *c ſharp*; ſignifying, that it is a ſemi-tone higher than the ſound of *c* in the natural ſeries, or this mark ♭ called a *flat*, with the name of the note above, ſignifying it to be a ſemi-tone lower. See FLAT and SHARP.

Now $\frac{15}{16}$ and $\frac{128}{135}$ being the two ſemi-tones the greater tone is divided into; and $\frac{15}{16}$ and $\frac{24}{25}$, the ſemi-tones the leſs tone is divided into; the whole octave will ſtand as in the following ſcheme, where the ratio's of each term to the next, are wrote fraction-wiſe between them below.

Scale of SEMI-TONES.

c . c ♯ *. d . d* ♯ *e . f . f* ♯ *. g . g .* ♯ *. a .* ♭ *. b . cc*
$\frac{15}{16}$ $\frac{128}{135}$ $\frac{15}{16}$ $\frac{24}{25}$ $\frac{15}{16}$ $\frac{128}{135}$ $\frac{15}{16}$ $\frac{15}{16}$ $\frac{24}{25}$ $\frac{15}{16}$ $\frac{128}{135}$ $\frac{15}{16}$

For the names of the intervals in this ſcale it may be conſidered, that as the notes added to the natural ſcale are not deſigned to alter the ſpecies of melody, but leave it ſtill diatonic, and only correct ſome defects ariſing from ſomething foreign to the office of the ſcale of muſic, *viz.* the fixing and limiting the ſounds: we ſee the reaſon why the names of the natural ſcale are continued, only making a diſtinction of each into a greater and leſs.—Thus an interval of one ſemitone is called a *leſſer ſecond*; of two ſemi-tones, a *greater ſecond*; of three ſemi tones, a *leſs third*; of four, a *greater third*, &c.

A ſecond kind of *ſemitonic-ſcale* we have from another diviſion of the octave into ſemi-tones; which is performed by taking an harmonical mean between the extremes of the greater and leſs tone of the natural ſcale, which divides it into two ſemi-tones nearly equal.—Thus the greater tone 8 : 9 is divided into 16 : 17, and 17 : 18; where 17 is an arithmetical diviſion, the numbers repreſenting the lengths of chords; but if they repreſent the vibrations, the lengths of the chords are reciprocal, *viz* as $1 : {}^{16} : \frac{8}{9}$, which puts the greater ſemi-tone $\frac{16}{17}$ next the lower part of the tone, and the leſſer $\frac{17}{18}$ next the upper, which is the property of the harmonical diviſion.—After the ſame manner the leſſer tone 9 : 10 is divided into the two ſemi-tones 18 : 19 and 19 : 20, and the whole octave ſtands thus:

c . c ♯ *. d . d* ♯ *e . f . f* ♯ *. g . g .* ♯ *. a .* ♭ *. b . c*
$\frac{16}{17}$ $\frac{17}{18}$ $\frac{18}{19}$ $\frac{19}{20}$ $\frac{15}{16}$ $\frac{16}{17}$ $\frac{17}{18}$ $\frac{18}{19}$ $\frac{19}{20}$ $\frac{16}{17}$ $\frac{17}{18}$ $\frac{15}{16}$

This ſcale, Mr. Salmon tells us, in the Philoſophical Tranſactions, he made an experiment of, before the royal ſociety, on chords, exactly in theſe proportion, which yielded a perfect conſort with other inſtruments, touched by the beſt hands.—Mr. Malcolm adds, that having calculated the ratio's thereof, for his own ſatisfaction, he found more of them falſe than in the preceding ſcale; but their errors were conſiderable leſs, which made amends.

SENA, or SENNA, in medicine, a purgative leaf, much uſed in draughts and compoſitions of that intention.

The ſhrub which bears it, is cultivated in ſeveral parts of the Levant, and grows five or ſix foot high: it puts forth woody branches, furniſhed with leaves on one ſide: its flowers are yellow, its fruit a greeniſh flat pod, containing ſeveral lodges or cells of ſeeds, reſembling grape-ſtones.—Theſe pods ſome phyſicians prefer to the leaves themſelves.

There is alſo a kind of *ſena* growing about Florence; but it is inferior to that of the Levant, as is owned by the Italians themſelves. Father Plumier mentions a third kind growing in the Antilles iſlands.

M. Lemery diſtinguiſhes three ſorts of *ſena* of the Levant:

the firſt brought from Seyda, called *ſena of Apalio*, that is, *cuſtom-ſena*, by reaſon of the cuſtom paid the grand ſeignior, for the privilege of exporting it: the ſecond comes from Tripoli: the third is called *ſena of Mocha*.

The beſt of theſe kinds is the firſt, which Pomet directs us to chuſe, in narrow leaves, of a moderate ſize, ſhaped like the end of a pike, of a pale green colour, a pungent ſmell, ſoft to the touch, &c.

The *ſena* of Tripoli holds the ſecond rank in goodneſs: its difference from that of Seyda, conſiſts in its colour, which is green; its ſmell, which is very weak; and in a certain harſhneſs, or roughneſs, which it diſcovers upon a touch.

Beſides theſe three kinds of *ſena*, and their pods, the druggiſts ſell the duſt found at the bottom of the bales, which is a very poor commodity, and yet much better than what they call the *ſmall ſena*, which comes with it in the bales, by way of package, and which many hold to be a plant of no virtue, put in by chance, or, at beſt, to increaſe the weight.

The beſt *ſena*, ordinarily found in our ſhops, Dr. Quincy obſerves, is that which is ſharpeſt leaved, and ſmells freſheſt: the brightneſs of its colour, and quickneſs of its flavour, are alſo indications of its goodneſs; for when it has loſt its ſcent, and grows duſky, it is good for little.

Sena, at firſt taking, is apt to nauſeate the ſtomach; and therefore, if a little cinnamon, or a dram or two of its diſtilled water, be added, it paſſes through with leſs ſickneſs.

This is exactly conformable to the ſentiments of Ludovicus, who ſays, that the purgative quality of this herb reſides in is mucilaginous or gummy juice; which, the more it is divided, gripes the leſs in its operation.

Rulandus imagined a ſudorifick quality in *ſena*; and accordingly ordered it in ſome compoſitions of that intention.

SENATE, SENATUS, an aſſembly or council of ſenators; that is, of the principal inhabitants of a ſtate, who have a ſhare in the government. See SENATOR.

Such were the *ſenates* of Rome, of Carthage, &c. among the ancients; and ſuch are the *ſenates* of Venice, of Genoa, &c. among the moderns. See REPUBLIC.

The *ſenate* of ancient Rome, was, of all others, the moſt celebrated, during the ſplendor of the republic. The Roman *ſenate* exerciſed no contentious juriſdiction: it appointed judges either out of the *ſenate*, or among the knights; but never ſtooped to judge any proceſſes in a body.—The *ſenate* concerted matters of war; appointed who ſhould command the armies; ſent governors into the provinces; took order, and diſpoſed of the revenues of the commonwealth.—Yet did not the whole ſovereign power reſide in the *ſenate*: it could not elect magiſtrates, make laws, nor decide of war and peace: but in all theſe caſes, they were to conſult the people.

Under the emperors, when the *ſenate* became deſpoiled of moſt of its other offices, they began to hear cauſes. For thoſe of leſs conſequence they appointed particular judges; the reſt, principally criminal cauſes, they reſerved for their own cognizance, to be judged by them in a body, and that frequently in the emperor's preſence. This was to keep their heads from ſtate affairs. Nero further committed to the *ſenate*, the judgment of all appeals: but this did not hold long; nor do we find any footſteps thereof any where but in the 62d novel.

The *ſenate* aſſembled on certain ſtated days, *viz.* ordinarily on the calends, nones and ides of each month: their extraordinary meetings were on any other days; when the conſul, dictator, or tribune, thought fit to call them. Their place of meeting, was either the temple of Concord at the Capuan gate, or in the temple of Bellona.—The conſul preſided as chief of the *ſenate*. See CONSUL.

Till Auguſtus's time, the *ſenate* was always opened with a ſacrifice: but that prince, in lieu thereof, appointed, that each ſenator, ere he took his place, ſhould offer wine and incenſe on the altar of the god in whoſe temple they were met; and take an oath, that he would give his vote according to his conſcience.

Halicarnaſſeus, and other authors, mention it as a great defect in the authority of the Roman *ſenate*, that they had none under their command, to execute their orders. Hence the leaſt tribune had it in his power to obſtruct their decrees; and hence it is, that when they gave their orders to the conſuls, and prætors, they did it with a kind of ſubmiſſion, *ſi eis ita videtur*; if they think fit.

SENATOR, a member of a ſenate. See SENATE.

There were two orders, or degrees, among the Roman nobility; that of the *ſenators*, and that of the *knights*: after the two, came the people.—The firſt hundred *ſenators* were appointed by Romulus, and called *patres*, fathers.—Upon the union with the Sabines, Romulus, or as others ſay, Tullus, added a ſecond hundred, called *patres majorum gentium*, to diſtinguiſh them from a third hundred added by the elder Tarquin, and called *patres minorum gentium*, fathers of the lower rank. See PATRES, and CONSCRIPT.

The number of *ſenators* was not fixed: in the time of Gracchus they were 600; during the civil wars, they were reduced to 300. Julius Cæſar augmented that number to 800 or 900; and Auguſtus brought them back again to 600.

The choice of *ſenators* belonged at firſt to the kings, then to the conſuls, then to the cenſors, who in their cenſus or ſurvey every fifth year, appointed new *ſenators* in lieu of thoſe dead or degraded: at length it fell to the emperors.

Though, for a long time, none were raiſed to the dignity of *ſenators*, but thoſe moſt conſpicuous for their prudence, &c. yet ſome regard was afterwards had to their eſtate, leſt the dignity ſhould become debaſed by poverty.—To hold the *ſenatorial* dignity, a yearly revenue of 800,000 ſeſterces was required, which amounts to nearly 6000 pounds of our money. Half as much was required for the knights. The *ſenators* who ſunk below this revenue, were diſcarded, and expunged out of the liſt by the cenſor.

The *ſenators* were ordinarily choſe from among the knights, or among ſuch as had bore the principal offices.—At firſt the magiſtrates were taken wholly from among the *ſenators*; whence Tacitus calls the ſenate, the *ſeminary of all dignities*: but after the people had been admitted to magiſtratures, *ſenators* were taken from among ſuch as had diſcharged thoſe offices, though, before, plebeians.

The *ſenators* carried their children with them to the ſenate, to inform them betimes of affairs of ſtate: though their children had not admittance till 17 years of age. See AGE.

Some make a diſtinction among the *ſenators*: beſides the *ſenators* who were allowed to ſpeak, and were aſked their opinions, there were others, who, without ſpeaking, or being ever aſked their judgment, were only to follow the opinion of thoſe they thought the moſt reaſonable, and were hence called *pedarii*. A. Gellius gives us another notion of the pedarii, and ſays, thoſe were thus called, who having never bore the office of curule magiſtrate, were obliged to go to the ſenate on foot.

The *ſenators* alone were allowed to wear the habit called *latus clavus*. See LATUS CLAVUS.—They had a right to ſit, and be carried in curule chairs, to aſſiſt at plays and ſhews, in the orcheſtra; at feaſts of the gods, &c. All which privileges were reſerved to ſuch as Auguſtus (in the reform he made of the too numerous ſenate of Julius Cæſar) ſet aſide.

They had the name *ſenators*, q. d. *old men*, given them in imitation of the Greeks, who called their ſenate γερουσια. So when the Athenians aſſembled the people to conſult about the affairs of the public, the officers ſummoned none but ſuch as were fifty years old. The Ægyptians and Perſians followed the ſame example, after the Hebrews. The Lacedæmonians and Carthaginians received none but ſuch as were ſixty years of age.

SENATUS-CONSULTUM, a vote, or reſolution of the Roman ſenate, pronounced on ſome queſtion, or point of law propoſed to it. See SENATE.

The *ſenatus-conſulta* made a part of the Roman law, when paſſed. They were depoſited in the temple of Ceres, under the cuſtody of the ædiles, and at laſt carried, by the cenſor, to the temple of Liberty, and put up in an armory called *tabularia*. See CIVIL LAW.

SENEGA. See the article GUM *ſenega*.

SENESCHAL, SENESCALLUS, a name anciently uſed for a ſteward or majordomo; formed from the German *ſind*, houſe or family, and *ſcalc*, ſervant. See MAJORDOMO.

Thus the *ſeneſchal* of a lord or a baron, is his ſteward or bailiff, who holds his courts, and manages his demeſne lands: *ſub-ſeneſchal*, his under ſteward.

High ſeneſchal of England, is the high ſteward of England: *high ſeneſchal del hotel du Roi*, the ſteward of the king's houſhold.

The ancients uſed the term *ſeneſcallus* indifferently with that of *dapifer*, whence we are ſure it ſignifies *ſteward*. See STEWARD and DAPIFER.

SENNA. See the articles SENA and DIASENNU.

SENOPLE. See the article SINOPLE.

SENSATION, the act of perceiving external objects, by means of the organs of ſenſe. See SENSE and PERCEPTION.

To conceive the manner wherein *ſenſation* is effected; obſerve, that all the organs conſiſt of little filaments, or nerves which have their origin in the middle of the brain, are diffuſed thence throughout all the members which have any ſenſe, and terminate in the exterior parts of the body: that when we are in health, and awake, one end of theſe nerves cannot be agitated or ſhaken, without ſhaking the other; by reaſon they are always a little ſtretched; as is the caſe of an extended chord, one part of which cannot be ſtirred without a like motion of all the reſt.

Obſerve, further, that theſe nerves may be agitated two ways, either at the end out of the brain, or that in the brain.—If they be agitated from without, by the action of objects and their agitation be not communicated as far as the brain; as frequently happens in ſleep, when the nerves are in a ſtate of relexation; the ſoul does not then receive any new *ſenſation*.—But if the nerves happen to be agitated in the brain, by the flux of the animal ſpirits, or any other cauſe; the ſoul perceives ſomething, though the parts of thoſe nerves, that are out of the brain, diffuſed through the ſeveral parts of the body, remain at perfect reſt: as likewiſe is frequently the caſe in ſleep.

Laſtly, obſerve, that experience tells us, we may ſometimes feel pain in parts of the body that have been entirely cut off; by reaſon the fibres in the brain correſponding to them, being agitated in the ſame manner, as if they were really hurt; the ſoul feels a real pain in thoſe imaginary parts.

All theſe things ſeem to ſhew, that the ſoul reſides immediately in that part of the brain wherein the nerves of all the organs of ſenſe terminate: we mean, it is there it perceives all the changes that happen with regard to the objects that cauſe them, or that have been uſed to cauſe them; and, that it only perceives what paſſes out of this part, by the mediation of the fibres terminating in it. See NERVE, FIBRE, SOUL, BRAIN, SENSORY, &c.

Theſe things premiſed, it will not be difficult to explain how *ſenſation* is performed: the manner whereof may be conceived from what follows. When the point of a needle, for inſtance, is thruſt againſt the hand, that point ſtirs and ſeparates the fibres of the fleſh; which fibres are extended from that place to the brain, and when we are awake, are in ſuch a degree of tenſion, as that they cannot be ſtirred without ſhaking thoſe of the brain. If then the motion of the fibres of the hand be gentle, that of the fibres of the brain will be ſo too; and if the firſt be violent enough to break any thing in the hand, the laſt will be ſtronger and more violent in proportion.—In like manner, if the hand be held to the fire; the little particles of the wood it throws off in great numbers, and with a great deal of violence, ſtriking againſt theſe fibres, and communicating a part of their agitation thereto; if the action be moderate, that of the extremities of the fibres of the brain correſponding to thoſe of the hand, will be moderate likewiſe: if it be violent enough to ſeparate any of the parts of the hand, as it happens in burning; the motion of the fibres in the brain will be proportionably more violent. This is what befals the body, when objects ſtrike upon it.—We are now to conſider how the mind is affected.

The mind, we have obſerved, reſides principally, if we may be allowed to ſay ſo, in that part of the brain where all the fibres of the nerves terminate. It attends here, as its ſenſory, or office, to look to the preſervation of all the parts of the body; and, of conſequence, muſt be here advertiſed of all the changes that happen, and muſt be able to diſtinguiſh between thoſe agreeable to the conſtitution of the body, and thoſe hurtful thereto. Any other abſolute knowledge, without a relation to the body, were uſeleſs.—Thus, though all the changes in our fibres, do, in reality, conſiſt in motions, which ordinarily only differ as to more and leſs; it is neceſſary the ſoul ſhould conſider them as changes eſſentially different; for though in themſelves they differ but very little, yet, with regard to preſervation of the body, they are to be looked on as eſſentially different.

The motion, for inſtance, which cauſes pain, frequently differs exceeding little from that which occaſions a pleaſing titillation: it is not neceſſary there ſhould be an eſſential difference between theſe two motions; but it is neceſſary there be an eſſential difference between the pain and the tickling, which thoſe two motions occaſion in the ſoul; for the agitation of the fibres, which accompanies the titillation, informs the ſoul of the good ſtate of the body, that it is able to reſiſt the impreſſion of the objects, and that it need not apprehend its being hurt: but the motion which occaſions pain, being ſomewhat more violent, is capable of breaking ſome of the fibres of the body; wherefore it is neceſſary the ſoul be advertiſed hereof by ſome diſagreeable *ſenſation*, that it may provide againſt it.

Thus, though all the motions which paſs in the body only differ in themſelves, as to more or leſs, yet, when conſidered with regard to the preſervation of life, they may be ſaid to be eſſentially different: for this reaſon it is, that the ſoul does not perceive the ſhakes, or motions themſelves, which objects excite in the fibres of the fleſh: it would be uſeleſs to perceive them; and ſhe would never be able, thence, to learn whether the objects were capable of doing hurt or good. But ſhe perceives herſelf affected with *ſenſations*, which differ eſſentially, and which ſhewing preciſely the qualities of the objects, as they regard the body, make her perceive diſtinctly, whether or no thoſe objects are capable of hurting it.

In effect, from a ſtrict examination of the ſeveral ſenſes, it appears, that ſenſible objects act no otherwiſe upon the body, for the producing of *ſenſation*, than by exciting a change in the extreme ſurface of the fibres of the nerves: the quality of which change depends on the figure, bulk, hardneſs, and motion of the object; ſo that according to all appearance, the moſt different objects, which ſhould agree in theſe four circumſtances, would produce the ſame *ſenſation*.

From the various texture of the object, the diverſity of the nerve affected, the different fabric of the organ of ſenſe, the different place in the medulla of the brain where the nerve ariſes, and the different degree of motion wherewith the action of the object is applied, ariſe various *ſenſations*, and ideas, in the mind; none of which repreſent any thing in the action of the object, or in the paſſion of the organ. And yet the ſame action of the ſame object, on the ſame organ, always produces the ſame *ſenſation* or idea: and the ſame ideas neceſſarily follow the ſame diſpoſition of the ſame ſenſible organ, in the ſame manner as if the idea perceived, were the natural and neceſſary effect of the action on the organ. See IDEA, KNOWLEDGE, &c.

SENSE, a faculty of the ſoul, whereby it perceives external objects, by means of ſome action or impreſſion made on certain parts of the body, called *organs of ſenſe*, and propagated by them to the ſenſory. See SENSATION and SENSORY.

Some uſe the word *ſenſe* in a greater latitude; and define it a faculty whereby the ſoul perceives ideas or images of objects, either conveyed to it from without, by the impreſſion of objects themſelves, or excited within by ſome effort of the ſoul of the ſenſory itſelf.

Under which notion, *ſenſe* becomes diſtinguiſhable into two kinds, *external* and *internal:* correſponding to the two ſeveral manners wherein the images of the objects perceived, are occaſioned, and preſented to the mind, *viz.* either immediately from without, or from within; that is, either by what we commonly call the *five external ſenſes*, hearing, ſeeing, &c. or by the *internal* ones, imagination, memory, and attention; to which ſome add hunger and thirſt.

But as theſe *internal ſenſes* are not ordinarily conſidered in the notion of *ſenſes*, nor implied under the word *ſenſe*; but are thus only denominated by analogy; we ſhall wave them to be further conſidered, under their reſpective articles, IMAGINATION, MEMORY, &c.

External SENSES, or, ſimply, *the* SENSES, in their general ſignification, are the means whereby the ſoul apprehends, or takes cognizance of external objects: the means, we mean, both on the part of the mind, and of the body.

The means, on the part of the mind, are always the ſame; it being one and the ſame faculty, whereby we ſee, hear, &c—The means, on the part of the body, are different; as different as are the objects we are concerned to perceive: for the being, and well-being of the animal, being the end, nature had in view in giving him any perception of external bodies; by this, the meaſure and manner of that perception is regulated: and we have ſo many ways of perceiving, and of perceiving ſo many things, as the relation we bear to external bodies renders neceſſary for the preſervation, &c. of our being.

Hence thoſe ſeveral organs of *ſenſe*, called *eye*, *ear*, *noſe*, *palate*, and the univerſal one *cutis*; each of which is ſo diſpoſed as to give ſome repreſentation and report to the mind, of the ſtate of external things, the nearneſs, convenience, hurtfulneſs, and other habitudes; and each of them a different one, according to the degree, and immediateneſs, &c. of the danger, or conveniency. And hence the ſeveral exerciſe of thoſe organs, hearing, ſeeing, ſmelling, taſting, and feeling. See ORGAN, &c.

A late excellent author gives us a more ingenious, extenſive, and philoſophical notion of *ſenſe*.—On his principle, *ſenſe* is defined, a power of perception, or, a power of receiving ideas; if what is abſolutely paſſive may be properly called a power. See POWER and FACULTY.

On ſome occaſions, inſtead of power, he chuſes to call it, a determination of the mind to receive ideas.—The ideas thus perceived, or raiſed in the mind, he calls *ſenſations*. See IDEA and SENSATION.

Senſe, he conſiders, either as natural or moral: and the natural, either as external or internal: though the diſtribution is chiefly ſounded on the common ways of conceiving; for, in reality, they appear to be all natural, and neceſſary: ſome reaſons, however, for the diſtinction, will be ſhewn under the ſeveral articles thereof.

External SENSES, then, are powers of perceiving ideas, upon the preſence of external objects.—On ſuch occaſions, we find the mind is merely paſſive, and has not power directly to prevent the perception, or idea, or to vary it at its reception; as long as the body is continued in a ſtate fit to be acted upon by the external object.

When two perceptions are intirely different from each other, or agree in nothing but the general idea of ſenſation; the power of receiving thoſe different perceptions, is called *different ſenſes*. Thus ſeeing and hearing denote the different powers of receiving the ideas of colours, and ſounds. And though colours, as well as ſounds, have vaſt differences amongſt themſelves; yet is there a greater agreement among the moſt oppoſite colours, than between any colour and a ſound: and hence all colours are deemed perceptions of the ſame *ſenſe*.

All the ſeveral *ſenſes* ſeem to have their diſtinct organs, except feeling, which is, in ſome degree, diffuſed over the whole body. See ORGAN and FEELING.

Internal SENSES, are powers, or determinations of the mind, to be pleaſed with certain forms, and ideas, which occur to our obſervation, in objects perceived by the external *ſenſes*. Of theſe there are two different ſpecies, diſtinguiſhed by the different objects of pleaſure, *viz.* pleaſurable or beautiful forms of natural things, and pleaſurable or beautiful actions, or characters of rational agents: whence the internal *ſenſes* become diviſible into natural and moral; though what we call the *internal natural ſenſe*, our author calls ſimply, and by way of eminence, the *internal ſenſe*.

In reflecting on our external *ſenſes*, we plainly ſee, that our perceptions of pleaſure, and pain, do not depend directly on our will. Objects do not pleaſe us according as we incline they ſhould: the preſence of ſome objects neceſſarily pleaſes us, and the preſence of others as neceſſarily diſpleaſes us; nor can we, by our will, any otherwiſe procure pleaſure, or avoid pain, than by procuring the former kind of objects, and avoiding the latter. By the very frame of our nature, the one is made the occaſion of delight, and the other of diſſatisfaction. In effect, our ſenſitive perceptions are pleaſant, and painful, immediately, and without any knowledge of the caſe of this pleaſure and pain, or of the manner how they excite it, or are occaſions of it, or without ſeeing to what further advantage, or detriment, the uſe of ſuch objects might tend. Nor would the moſt accurate knowledge of theſe things vary either the pleaſure, or the pain, of the perception; however it might give a rational pleaſure diſtinct from the ſenſible; or might raiſe a diſtinct joy, from proſpect of further advantage in the object, or averſion, from apprehenſion of evil. There is ſcarce any object, which our minds are employed about, but is conſtituted the neceſſary occaſion of ſome pleaſure or pain. Thus we ſhall find ourſelves pleaſed with a regular form, a piece of architecture, or painting, a compoſition of notes, a theorem, an action, an affection, a character; and we are conſcious that this pleaſure naturally ariſes from the contemplation of the idea then preſent in the mind, with all its circumſtances, though ſome of thoſe ideas have nothing of what we call ſenſible perception in them; and in thoſe which have, the pleaſure ariſes from ſome uniformity, order, arrangement, imitation; and not from the ſimple ideas of colour, or ſound, or mode of extenſion ſeparately conſidered.

It ſeems hence to follow, that when inſtruction, education, or prejudice of any kind, raiſe any deſire or averſion toward an object; this deſire, or averſion, is founded on an opinion of ſome perfection, or deficiency, in thoſe qualities, for perception whereof we have the proper *ſenſes*. Thus, if beauty be deſired by one who has not the *ſenſe* of ſight; the deſire muſt be raiſed by ſome apprehended regularity of figure, ſweetneſs of voice, ſmoothneſs, ſoftneſs, or ſome other quality perceivable by the other *ſenſes:* without relation to the ideas of colour.

The only pleaſure of *ſenſe*, which our philoſophers ſeem to conſider, is that which accompanies the ſimple ideas of ſenſation; but there are vaſtly greater pleaſures in thoſe complex ideas of objects, which obtain the names of beautiful and harmonious.—The power, then, whereby we receive ideas of beauty, and harmony, has all the characters of a *ſenſe*. It is no matter, whether we call theſe ideas of beauty and harmony, perceptions of the external *ſenſes* of ſeeing and hearing, or not: we ſhould rather chuſe to call theſe ideas an *internal ſenſe*, were it only for the convenience of diſtinguiſhing them from other ſenſations of ſeeing and hearing, which men may have without perception of beauty and harmony. See Pleasure, Beauty and Harmony.

Moral Sense, is a determination of the mind, to be pleaſed with the contemplation of thoſe affections, actions, or characters of rational agents, which we call *good* or *virtuous*. See Moral.

This moral *ſenſe* of beauty, in actions, and affections, may appear ſtrange at firſt view: ſome of our moraliſts themſelves are offended at it in my lord Shaftſbury, as being accuſtomed to deduce every approbation, or averſion, from rational views of intereſt. Our gentlemen of good taſte can tell us of a great many *ſenſes*, taſtes and reliſhes for beauty, harmony, imitation in painting and poetry; and may we not find, too, in mankind, a reliſh for a beauty in characters, in manners? The truth is, human nature does not ſeem to have been left quite indifferent in the affair of virtue, to form to itſelf obſervations concerning the advantage or diſadvantage of actions, and accordingly to regulate its conduct. The weakneſs of our reaſon, and the avocations ariſing from the infirmity and neceſſities of our nature, are ſo great, that very few of mankind could have framed thoſe long deductions of reaſon, which may ſhew ſome actions to be, in the whole, advantageous, and their contraries pernicious. The author of nature has much better furniſhed us for a virtuous conduct, than our moraliſts ſeem to imagine; by almoſt as quick and powerful inſtructions, as we have for the preſervation of our bodies; he has made virtue a lovely form, to excite our purſuit of it, and has given us ſtrong affections, to be the ſprings of each virtuous action. See Virtue.

For the general manner wherein our Senses act; or, more properly, the manner wherein we become *ſenſible*, that is, perceive external objects; ſee Sensation.

For the particular Senses, or, more properly, the particular manners wherein we become ſenſible, by the particular organs of *ſenſe*; ſee Hearing, Seeing, Smelling, &c.

For the ſeveral organs of Sense, miniſtring to the ſeveral manners of ſenſation; ſee Eye, Ear, Nose, &c.

Pliny obſerves, that of all the *ſenſes*, feeling and taſting are thoſe which man enjoys in the greateſt perfection.—As to ſeeing, he is excelled by the eagle, &c. as to ſmelling, by the vulture, &c. and as to hearing, by the mole, even when hid under ground. *Nat. Hiſt. lib.* 10.

The *ſenſes* have been ſometimes found greatly ſharpened and improved by diſeaſes: Mr. Boyle mentions a gentleman, who, during a diſtemper he had in his eyes, had his organs of ſight brought to be ſo ſenſible, that when he waked in the night, he could, for a while, plainly ſee and diſtinguiſh colours, and other objects; and the ſame author gives an inſtance of another perſon, who, after getting half-fuddled with claret, if he waked in the night, could ſee, for ſome time, to read a moderate print.

Grimaldi affirms, that ſome women of Megara were able, by their eyes alone, to diſtinguiſh between eggs layed by black hens, and thoſe by white ones. *Grimald. de Lum. & Col.*

In the Philoſoph. Tranſ. N°. 312. we have an account of Dan. Fraſer, who continued deaf and dumb, from his birth to the 17th year of his age; when, upon recovering from a fever, he perceived an uneaſy motion in his brain, after which he began to hear, and, by degrees, to ſpeak.

SENSIBLE *horizon*,	See the articles	Horizon.
Sensible *point*,		Point.
Sensible *qualities*,		Quality.

SENSITIVE or SENSIBLE *ſoul*, the ſoul of brutes, or that which man is ſuppoſed to have in common with brutes. See Soul.

It is thus called, as intimating its utmoſt faculty, to be that of ſenſation; or, perhaps, becauſe it is ſuppoſed to be material, and to come under our ſenſes.

My lord Bacon aſſerts, that the *ſenſible* or brute ſoul, is plainly no more than a corporeal ſubſtance, attenuated by heat, and thus rendered inviſible; or a kind of aura or vapour partly of an aerial, and partly a fiery nature; endued with the ſoftneſs of air, to be fit to receive impreſſions, and with the vigour of fire to communicate its action; fed partly with oily matters, and partly with aqueous ones; incloſed in the body, and in the more perfect animals, principally in the head; moving along the nerves; and reſtored and repaired by the ſpirituous blood of the arteries. Bac. *de Augment. Scient. lib.* IV. See Life.

Sensitive *plants*, a ſpecies of plants, called by the ancients *æſchynomenous*, and by us *ſenſitive*, *living* or *mimic plants*, as giving ſome tokens of ſenſe. See Æschynomenous.

Theſe are ſuch whoſe frame and conſtitution is ſo nice and tender, that at the touch, or leaſt preſſure of one's hand, they will contract their leaves and flowers, as if *ſenſible* of the contact.

Botanic writers mention many kinds hereof; ſome of which contract with the hand, or a ſtick; others with heat, others with cold.—The truth is, many, if not moſt, vegetables expend their flowers, down, &c. in warm, ſun-ſhiny weather, and again cloſe them towards evening or in rain, &c. eſpecially at the beginning of flowering, whilſt the ſeed is yet young and tender: as is very evident in the down of dandelion, &c. and in the flower of the pimpernel, the opening and ſhutting whereof are the country-man's weather-wiſer; whereby, Gerard ſays, he foretels what weather ſhall follow next day: for if the flowers be cloſe ſhut up, it betokens rain and foul weather; if they be ſpread abroad, fair weather. Ger. *Herb. lib.* II. See Semination.

SENSORY, Sensorium *commune*, the ſeat of the common ſenſe; or that part or place where the ſenſible ſoul is ſuppoſed more immediately to reſide. See Soul and Sense.

The *ſenſory* is ſuppoſed to be that part of the brain wherein the nerves from all the organs of ſenſe, terminate: which is generally allowed to be about the beginning of the medulla oblongata: Des Cartes will have it in the conarion, or pineal gland. See Conarion.

Sir Iſaac Newton deſcribes the *ſenſory* of animals as the place to which the ſenſible ſpecies of things are carried through the nerves and brain, that they may be there perceived by their immediate preſence to the ſoul.—The organs of ſenſe are not for enabling the ſoul to perceive the ſpecies of things, in its *ſenſory:* but only for conveying them thither. See Sense and Organ.

The ſame great author conſiders the univerſe, as the *ſenſory* of the godhead. See God, Universe, Nature, &c.

SENTENCE, in law, *doom:* a judgment paſſed in court by the judge, upon ſome proceſs, either civil, or criminal. See Judge and Judgment.

Sentences are either *definitive*, *interlocutory*, *contradictory*, &c.

There are *ſentences* of abſolution, excommunication, &c.

Superior judges either confirm or annul the *ſentences* of inferior ones. See Appeal.

Three conformable Sentences, *tres* Sententiæ *conformes:* in the Romiſh eccleſiaſtical law, it is allowed to appeal three times; ſo that there muſt be three *conformable ſentences* ere the deciſions of the judges can take effect.—The firſt degree of juriſdiction is in the biſhop's official: from him an appeal lies to the metropolitan; and from the metropolitan to the primate, or immediately to the pope. If the appeal come from the metropolitan to the pope, the pope is obliged to delegate judges *in partibus*; and then if the three *ſentences* paſſed in theſe three ſtages be *conformable*, there is no further appeal: but if one of them annul another, new judges are to be required of the pope for a fourth *ſentence*; and thus they ſometimes proceed to a ſixth, or ſeventh *ſentence*.—Such a number of juriſdictions is found infinitely prejudicial to the public, and vexatious to private perſons.

Sentence, in grammar, denotes a period; or a ſet of words comprehending ſome perfect ſenſe, or ſentiment of the mind. See Period.

Every *ſentence* comprehends at leaſt three words. See Proposition.

The buſineſs of pointing, is to diſtinguiſh the ſeveral parts and members of *ſentences*, ſo as to render the ſenſe thereof the cleareſt, apteſt, and fulleſt poſſible. See Punctuation.

In every *ſentence* there are two parts neceſſarily required; a noun for the ſubject, and a definite verb, whatever is found more than theſe two, affects one of them, either immediately, or by the intervention of ſome other, whereby the firſt is affected. See Noun and Verb.

Again, every *ſentence* is either ſimple or conjunct: a *ſimple ſentence* is that conſiſting of one ſingle ſubject, and one finite verb.—A *conjunct ſentence* contains ſeveral ſubjects and finite verbs, either expreſly or implicitely.

A ſimple *ſentence* needs no point or diſtinction; only a period to cloſe it: as, *A good man loves virtue for itſelf*.—In ſuch a *ſentence*, the ſeveral adjuncts affect either the ſubject or the verb in a different manner. Thus the word *good*, expreſſes the quality of the ſubject, *virtue* the object of the action, and, *for itſelf*, the end thereof.—Now none of theſe adjuncts can be ſeparated from the reſt of the *ſentence*: for if one be, why ſhould not all the reſt? And if all be, the *ſentence* will be minced into almoſt as many parts as there are words.

But if ſeveral adjuncts be attributed in the ſame manner either to the ſubject or the verb, the *ſentence* becomes conjunct, and is to be divided into parts.

In every conjunct *ſentence*, as many ſubjects, or as many finite verbs as there are, either expreſly, or implied, ſo many diſtinctions may there be. Thus, *My hopes*, *fears*, *joys*, *pains*, *all centre in you*: and thus Cicero, *Catilina abiit*, *exceſſit*, *evaſit*, *erupit*.—The reaſon of which pointing is obvious; for as many ſubjects or finite verbs as there are in a *ſentence*, ſo many members does it really contain. Whenever, therefore, there occur more nouns than verbs, or contrariwiſe, they are to be conceived as equal. Since, as every ſubject requires its verb, ſo every verb requires its ſubject, wherewith it may agree: excepting, perhaps, in ſome figurative expreſſions.

Indeed, there are ſome other kinds of *ſentences* which may be ranked amongſt the conjunct kind, particularly the abſolute *ablative*, as it is called: Thus, *Phyſicians*, *the diſeaſe once diſcovered*, *think the cure half wrought*: where the words, *diſeaſe once diſcovered*, are equivalent to, *when the cauſe of the diſeaſe is diſcovered*.—So alſo in nouns added by appoſition; as, *The Scots*, *a hardy people*, *endured it all*; ſo alſo in vocative caſes, and interjections; as, *This*, *my friend*, *you muſt allow me*: And, *What*, *for heaven's ſake*, *would he be at?*

The caſe is much the ſame, when ſeveral adjuncts affect either the ſubject of the *ſentence*, in the verb, in the ſame manner; or at leaſt ſomething, whereby one of them is affected: as, *A good*, *wiſe*, *learned man*, *is an ornament to the commonwealth*: where the ſeveral adjectives denoting ſo many qualities of the ſubject, are to be ſeparated from one another.—Again, when I ſay, *Your voice*, *countenance*, *geſture terrified him*: the ſeveral nominative caſes denote ſo many modes of the verb, which are likewiſe to be diſtinguiſhed from each other. The caſe is the ſame in adverbs; as, *He behaved himſelf modeſtly*, *prudently*, *virtuouſly*.—In the firſt example, the adjuncts immediately affect the ſubject; in the third, the verb; in the following one, another adjunct: as, *I ſaw a man loaden with age*, *ſickneſs*, *wounds*.

Now, as many ſuch adjuncts as there are, ſo many ſeveral members does the *ſentence* contain; which are to be diſtinguiſhed from each other, as much as ſeveral ſubjects, or finite verbs: and that this is the caſe in all conjunct *ſentences*, appears hence, that all theſe adjuncts, whether they be verbs or nouns, &c. will admit of a conjunction copulative, whereby they may be joined together.—But, where-ever there is a copulative, or room for it, there a new member of a *ſentence* begins.—For the other partitions, &c. of *ſentences*, ſee Colon, Semicolon, Period.

Sentence, is alſo uſed in rhetoric and poetry, for a ſhort, pithy remark, or reflection, containing ſome ſentiment of uſe in the conduct of life. See Apophthegm, Adage, Proverb, &c.

Such are, *Diſcite juſtitiam moniti*, & *non temnere divos*; or, *A teneris aſſueſcere multum eſt*, &c.

Sentences, father Boſſu obſerves, render poems uſeful; and, beſides, add I know not what luſtre and ſpirit, which pleaſes. But there is no virtue which is not accompanied with ſome dangerous vice. Too many *ſentences* give a poem too philoſophical an air, and ſink it into a kind of gravity, that is leſs fit for the majeſty of a poem, than the ſtudy of a learned man, and the quaintneſs of a dogmatiſt. Such thoughts not only contain, but inſpire, a certain calm wiſdom, which is directly oppoſite to the paſſions; it cools them, both in the hearers and in the ſpeaker. Laſtly, the affectation of ſpeaking *ſentences*, leads a perſon to trifling and impertinent ones; inſtances whereof we have, in abundance, in Seneca's tragedies.—Petronius recommends it to authors, to diſguiſe their *ſentences*, that they may not ſtand glaring above the thread or ground of the diſcourſe. See Ellipsis.

SENTIMENTS, in poetry, and particularly dramatic, are the thoughts which the ſeveral perſons expreſs; whether they relate to matters of opinion, paſſion, buſineſs or the like. See Thought.

The manners form the tragic action, and the *ſentiments* explain it; diſcovering its cauſes, motives, &c.—The *ſentiments* are to the manners, what thoſe are to the fable. See Manners.

In the *ſentiments*, regard is to be had to nature and probability; a madman, for inſtance, muſt ſpeak as a madman; a lover as a lover; a hero as a hero.—The *ſentiments*, in great meaſure, are to ſuſtain the character. See Character, Diction, Hero, &c.

SENTINEL *, Centinel, or Sentry, in war, a private ſoldier taken out of a corps de garde of foot, and placed in ſome poſt to watch any approach of the enemy, to prevent ſurprizes; and to ſtop ſuch as would paſs without orders, or without diſcovering who they are.

* The word is modern: it is not long ſince they ſaid, *To be on the ſcout*, in the ſame ſenſe as we now ſay, *To ſtand ſentry*, &c. Menage derives the word *à ſentiendo*, from perceiving.

Sentinel perdu, is a *ſentinel* placed at ſome very advanced and dangerous poſt, whence it is odds he never returns. See Perdu.

The *ſentinel's* word, when he challenges, is, *Who is there? Qui vive*, or *Qua va la? Stand! Demeure la!*

SEPARABLE *modes*. See the article Mode.

SEPARATE *affection*. See the article Affection.

Penultimate of the Separate. See Penultimate.

SEPARATION, in navigation, the ſame with what we more uſually call *departure*. See Departure.

Separation *of man and wife*. See Divorce.

Waters of Separation. See the article Water.

SEPARATISTS, a religious ſect in England, denominated from their ſetting up a *ſeparate* church, in oppoſition to that eſtabliſhed by law. See Dissenters, &c.

At preſent, *ſeparatiſts*, is rather the name of a collection of ſects, than of any particular one; but nearer their original, there was that agreement among them, that one name ſerved them all. Their diviſion into preſbyterians, anabaptiſts, independants, &c. is a modern thing. See Nonconformist, Presbyterian, &c.

The *ſeparatiſts*, Hornius tells us, *Hiſt. Eccl.* are ſuch as under Edward VI. Elizabeth and James I. refuſed to conform to the church of England: and who were firſt called *puritans*, then *ſeparatiſts*, and laſtly *nonconformiſts*. See Puritan.

The firſt leader of the *ſeparatiſts*, was Bolton; who, upon quitting the party he had formed, was ſucceeded by Robert Brown, from whom the *ſeparatiſts* were called *Browniſts*, a name they long retained: though Brown himſelf deſerted the ſect, and, in imitation of Bolton, abjured his errors. See Brownist.

He was ſucceeded by Barrow, who was hanged at the inſtigation of the biſhops: their fourth chief was Johnſon, who ſet up a church at Amſterdam; which afterwards divided into ſeveral ſects, at the head of one whereof was Johnſon's brother, who excommunicated him, and was reciprocally excommunicated by him. Soon afterwards, a fifth, named Smith, erected a like church at Leyden, but it dwindled away after his death: and *ſeparatiſm* was brought very low, when Robinſon appeared, and raiſed its head.—He ſoftened the dogma's of Brown, and ſet on foot a good underſtanding among them; but was not able to unite the whole ſect. Part of them ſtill adhered to the rigid opinions of their old maſter Brown, and part of them followed Robinſon. The firſt retained the old name of *ſeparatiſts*, the latter aſſumed that of *ſemi-ſeparatiſts*, and at length degenerated into *independants*, which is the name whereby they are now uſually called, both in New and Old England. See Independants.

Hornius mentions another order of *ſeparatiſts*, called *ſeſquiſeparatiſts*, that is, *ſeparatiſts and a half*. Some will have theſe to be a diſtinct ſect; others, the ſame with the *ſemiſeparatiſts*: for it is added, that the *ſemi-ſeparatiſts*, under pretence of taking a medium between the Browniſts and the church of England, went further even than the Browniſts themſelves, and under the name of *ſeparatiſts* degenerated into *ſeparatiſts and a half*.

SEPIUM, Sepiæ *os*, or *teſta*, cuttlefiſh bone; is a white, ſpongy, teſtaceous ſubſtance, growing on the back of the cuttle-fiſh; and ſeeming almoſt to be calcined by the ſun. It is rough and abſterſive, and chiefly uſed in medicine as a dentrifice.

SEPTA, in antiquity, were incloſures, or rails, made of boards; through which they went in, to give their votes, in the aſſemblies of the Romans. See OVILIA.

SEPTEMBER, the ninth month of the year, reckoned from January; and the ſeventh, from March: whence its name, *viz.* from *ſeptimus*, ſeventh. See MONTH and YEAR.

The Roman ſenate would have given this month the name of *Tiberius*; but that emperor oppoſed it: the emperor Domitian gave it his own name *Germanicus*: the ſenate under Antoninus Pius gave it that of *Antoninus*: Commodus gave it his firname *Herculeus*; and the emperor Tacitus, his own name, *Tacitus*.—But theſe appellations are all gone into diſuſe.

SEPTEMVIR, in antiquity. See QUINQUEVIR, QUINDECIMVIR, EPULO, &c.

The Germans ſometimes uſe the word *ſeptemvirate*, for the ſeven electors of the empire. See ELECTOR.

SEPTEMTRIO *, or SEPTENTRIONES, in aſtronomy, a northern conſtellation of ſtars, more uſually called *urſa minor*, or the *little bear*; and by the people, *Charles's wain.* See URSA *minor*.

* The word is formed from the Latin, *ſeptem*, ſeven; and *triones*, bullocks, which, in the ancient conſtellation, were yoaked to the plough.

SEPTENTRIO, in coſmography, the ſame with *north*; thus called from the ancient conſtellation *ſeptentrio*, one of whoſe ſtars is the pole-ſtar. See NORTH, POLE-STAR, &c.

Hence alſo SEPTENTRIONAL, SEPTENTRIONALIS, ſomething belonging to the *north*; as *ſeptentrional ſigns*, *ſeptentrional parallels*, &c. thoſe on the northern ſide of the equator.

SEPTIER or **SETIER**, a French meaſure, differing according to the ſpecies of the things meaſured. See MEASURE. For liquors, the *ſeptier* is the ſame thing with the chopine or half-pint. See CHOPINE.

For dry meaſure, the *ſeptier* is very different, in different places and different commodities; as not being any veſſel of meaſure, but only an eſtimation of ſeveral other meaſures.—At Paris, the *ſeptier* of wheat conſiſts of two mines, the mine of two minots, and the minot of three buſhels. See BUSHEL.

Twelve *ſeptiers* make the mine.—The *ſeptier* of oats is double that of wheat.

SEPTIZON, SEPTIZONIUM, in the ancient architecture, a term almoſt appropriated to a famous mauſoleum of the family of the Antonines; which Aur. Victor tells us, was built in the tenth region of the city of Rome: being a large inſulated building, with ſeven ſtages or ſtories of columns.

The plan was ſquare; and the upper ſtories of columns falling back much, rendered the pile of a pyramid form; terminated a-top, with the ſtatue of the emperor Septimius Severus, who built it.

It had its name *ſeptizon*, *ſeptizonium*, from *ſeptem* and *zona*, *q. d.* ſeven zones or girdles, by reaſon of its being girt with ſeven rows of columns.

Hiſtorians make mention of another *ſeptizon*, more ancient than that of Severus, built near the Thermæ of Antoninus.

SEPTUAGESIMA *, in the calendar, denotes the third ſunday before lent; or before quadrageſima; as quinquageſima is the next before quadrageſima, then ſexageſima, and *ſeptuageſima*: being all days appropriated by the church to acts of penance and mortification, by way of preparation for the devotion of the lent enſuing. See QUADRAGESIMA.

* It is ſuppoſed by ſome to take its name from its being about 70 days before Eaſter: pope Teleſphorus firſt made it a feaſt day, and appointed lent to commence from it. See LENT.

The laws of king Canutus ordained a vacation from judicature, from *ſeptuageſima* to *quindena paſchæ*. See QUINQUAGESIMA. From *ſeptuageſima* to the octaves after Eaſter, marriage is forbidden by the canon-law.

SEPTUAGINT *, LXX, or *the* SEVENTY, a term famous among divines and criticks, for a verſion of the Old Teſtament, out of Hebrew into Greek, performed by ſeventy-two Jewiſh interpreters, in obedience to an order of Ptolemy Philadelphus. See BIBLE.

* The word is formed from the Latin, *ſeptuaginta*, ſeventy.

The ancients, till Jerom's time, univerſally believed, that the *ſeventy* were inſpired perſons, not mere tranſlators; grounding their belief on a fabulous hiſtory of this verſion, given by Ariſteas: who tells us, that the high-prieſt Eleazer, choſe ſix doctors out of each tribe for this office, which made the number of ſeventy-two; and that theſe being ſhut up, each in his ſeveral cell, each tranſlated the whole; and without ſeeing what any of the reſt had done, they were all found to agree to a letter.

Chronology of the SEPTUAGINT, or SEVENTY, is an account of the years of the world, very different from what is found in the Hebrew text, and the vulgate; making the world 1466 years older than it is found in theſe latter. See AGE, CHRONOLOGY, EPOCHA, &c.

The criticks are much divided, as to the point of preference. Baronius prefers the account of the *ſeventy*: and Iſ. Voſſius makes an apology for it.—The two lateſt and moſt ſtrenuous advocates, are father Pezron, a Bernardine, and father le Quien, a Dominican; the firſt of whom defends the chronology of the *ſeptuagint*, and the latter that of the Hebrew text.

SEPTUM, in anatomy, a term literally ſignifying an incloſure or partition; applied to ſeveral parts of the body, which ſerve to ſeparate one part from another.

SEPTUM *lucidum*, or *pellucidum*, is a partition ſeparating the two upper ventricles of the brain; thus called, as being tranſparent. See BRAIN.

SEPTUM *medium*, or *cordis*, is a ſeparation between the two ventricles of the heart.—It is about a finger thick, fleſhy, and of the ſame ſubſtance with the heart itſelf; conſiſting of muſcular fibres, which aſſiſt it in its motions. Some have imagined it to be perforated with a great number of holes; but miſtakenly. See HEART and VENTRICLE.

SEPTUM *tranſverſum*, is the ſeparation of the two bellies, or venters, called alſo *diaphragm*. See DIAPHRAGMA.

SEPTUM *narium*, the partition of the noſtrils. See NOSE.

SEPTUM *bulbi*, divides the bulb of the urethra lengthwiſe. See URETHRA.

SEPTUM *gallinaginis*. See CAPUT GALLINAGINIS.

SEPTUM *clitoridis*, a membranous partition running all along between the two corpora cavernoſa, from the glans to its divarication at the os pubis. See CLITORIS.

SEPTUM *auris*. See the article EAR.

SEPTUM *teſtium*. See the article TESTICLE.

SEPULCHRAL, SEPULCHRALIS, ſomething belonging to ſepulchres or tombs. See SEPULCHRE.

SEPULCHRAL *inſcriptions* are the ſureſt monuments we have of antiquity. See INSCRIPTION, EPITAPH, MONUMENT, &c.

SEPULCHRAL *lamps*, are thoſe ſaid to have been found burning in the tombs of ſeveral martyrs, and others. See LAMP.

SEPULCHRAL *column*, is a column erected over a tomb, with an inſcription on its ſhaft. See COLUMN.

SEPULCHRAL, or SEPULCHRALIS, is alſo the appellation of a ſect; thus called, from their principal error, which was, that by the word *hell*, whither the ſcripture tells us Jeſus Chriſt deſcended after his death, they underſtood his grave or ſepulchre. See HELL.

The *ſepulchrales*, or *ſepulchral* hereticks, maintained, that Jeſus Chriſt only deſcended into hell according to the fleſh; that this hell was nothing elſe but the grave where he was laid, and wherein his ſoul could not reſt. Prateolus.

SEPULCHRALIS *pecunia*. See the article PECUNIA.

SEPULCHRE, SEPULCHRUM, a tomb, or place deſtined for the interrment of the dead. See INTERRMENT.

The term is chiefly uſed in ſpeaking of the burying-places of the ancients: thoſe of the moderns we uſually call *tombs*. See TOMB, COEMETERIUM, &c.

Beſides the uſual *ſepulchres* for the interrment, either of the whole body, or of the aſhes of the body burnt, the ancients had a peculiar kind, called *cenotaphia*; being empty *ſepulchres*, made in honour of ſome perſon, who, perhaps, had no burial at all; from a ſuperſtitious opinion, that the ſouls of thoſe who wanted burial, wandered an hundred years, ere they were admitted to paſs into the Elyſian fields. See CENOTAPH, FUNERAL, &c.

The pyramids were built to ſerve as *ſepulchres* for the kings of Egypt. See PYRAMID. And the obeliſks had generally the ſame intention. See OBELISK.

Sepulchres were held ſacred, and inviolable; and the care taken thereof deemed a religious duty; grounded on the fear of God, and the belief of the ſoul's immortality. Thoſe who ſearched or violated them, were odious to all nations, and ſeverely puniſhed.

The Egyptians called their *ſepulchres*, *eternal houſes*, in contradiſtinction to their houſes and palaces, which they called *inns*; by reaſon of the ſhort ſojourn we have in the one, in compariſon of the long ſtay in the other.

The eaſtern pilgrimages are all made with deſign to viſit the holy *ſepulchre*, that is, the tomb of Jeſus Chriſt. Nobody enters here but bare-footed, and with a world of ceremonies. The Turks exact 24 crowns of each pilgrim, whom devotion carries to the holy *ſepulchre*. See PILGRIM.

St. SEPULCHRE, or the *holy* SEPULCHRE, gives the denomination to an order of regular canons, anciently inſtituted in Jeruſalem, in honour of the holy *ſepulchre*. See CANON.

They aſcribe their inſtitution to Godfrey of Boulogne; who, they ſay, upon his taking Jeruſalem in the year 1099, placed canons in the patriarchal church of the holy *ſepulchre*; which, indeed, is true; but then they were not regulars.—In effect, it was Arnoul, who, of archdeacon of the church of Jeruſalem, got himſelf elected patriarch thereof, that in 1114, firſt obliged his canons to live in community, and to follow the rule of St. Auguſtin.

From the holy land, numbers of theſe canons were brought into Europe, particularly into France by Louis the younger; into England by king Henry; into Poland by Jaxa, a Poliſh gentleman; and into Flanders by the counts thereof.

But the order was afterwards ſuppreſſed by Innocent VIII.

and its effect given to that of our lady of Bethlehem, which itſelf ceaſing, they were beſtowed in 1484, on that of the knights of St. John of Jeruſalem.—But the ſuppreſſion did not take place in Poland, nor in ſeveral provinces of Germany, where they ſtill ſubſiſt: their general is in Poland: their habit, father Helyot obſerves, was different in different places.

St. SEPULCHRE, or the *holy* SEPULCHRE, is alſo the name of a military order, eſtabliſhed in Paleſtine.

Moſt writers who mention this order, carry its inſtitution as far back as the time of the apoſtle St. James, biſhop of Jeruſalem, or at leaſt to that of Conſtantine; pretending that Godfrey of Boulogne, and Baldwin, were only the reſtorers thereof: but this antiquity is chimerical. It is not even certain, that it was founded ſo early as Godfrey of Boulogne, or his ſucceſſor Baldwin; though Favyn and de Belloy attribute it to this latter.

It is certain, there was nothing but canons in the church of St. *Sepulchre*, till the year 1114; and it is more than probable, the knights were only inſtituted upon the ruins of the canons 400 years after, and that by pope Alexander VI. in order to excite rich and noble perſons to viſit the holy places, by giving them the title of *knights of the holy ſepulchre*, and to this end, inſtituting an order under that name, whereof he reſerved the quality of maſter to himſelf and his ſucceſſors.—Leo X. and Clement VII. granted to the guardian of the religious of St. Francis, in the holy land, the power of making theſe knights; which power, firſt granted *viva voce*, was afterwards confirmed by a bull of Pius IV.

In 1558, the knights of this order in Flanders, choſe Philip II. king of Spain, their maſter; and afterwards his ſon; but the grand maſter of the order of Malta prevailed on him to reſign; and when afterwards the duke of Nevers aſſumed the ſame quality in France, the ſame grand maſter, by his intereſt and credit, procured a like renunciation of him, and a confirmation of the union of this order to that of Malta. See MALTA.

SEPULCHRI *pretium*. See the article PERTIUM.

SEQUEL, SEQUELA, in logic, a conſequence drawn from ſome preceding propoſition. See CONSEQUENCE and CONCLUSION.

As, if I ſay, *The human ſoul is immaterial*; *and therefore immortal*, the laſt member of the ſentence is a *ſequel* of the firſt.

SEQUENCE, in gaming, a ſeries or ſet of cards immediately following each other in the ſame ſuit, or colour.

We ſay, a *ſequence* of four cards, of five, *&c.*—At picquet, theſe are called tierces, quarts, quints, *&c.* See PICQUET.

SEQUESTRATION, SEQUESTRATIO, in common law, the act of ſeparating a thing in controverſy, from the poſſeſſion of both parties, till the right be determined by courſe of law.

This is of two ſorts; *voluntary* and *neceſſary*.

Voluntary SEQUESTRATION, is that which is done by conſent of both parties.

Neceſſary SEQUESTRATION, is that which the judge doth by his authority, whether the parties will, or not.

SEQUESTRATION, in the civil law, is the act of the ordinary, diſpoſing of the goods and chattels of one deceaſed, whoſe eſtate no man will meddle with.

A widow is alſo ſaid to *ſequeſter*, when ſhe diſclaims having any thing to do with the eſtate of her deceaſed huſband.

Among the Romaniſts, in queſtions of marriage, where the wife complains of impotency in the huſband, ſhe is to be *ſequeſtred* into a convent, or the hands of matrons, till the proceſs be determined.

SEQUESTRATION, is alſo uſed for the act of gathering the fruits of a benefice void, to the uſe of the next incumbent. In the time of the civil wars, *ſequeſtration* was uſed for a ſeizing of the eſtates of delinquents, for the uſe of the commonwealth.

SEQUIN *, ZECHIN, ZECCHINO, a gold coin ſtruck at Venice, and in ſeveral parts of the grand ſeignior's ſtates, particularly Cairo; which laſt are called *Turkiſh ſequins*, or *cheriſs*. See COIN and MONEY.

* Ablancourt derives the word from *cizicum*, or *cizicenicum*; as ſuppoſing the *ſequin* firſt ſtruck ar *Cizicum*: Menage, from the Italian *zecchino*, of *zecca*, the name of the mint at Venice.

At Conſtantinople, the ducats ſtruck in ſeveral parts of Germany, are called *Hungarian ſequins*. See DUCAT.

The value of theſe *ſequins* is different; thoſe of Venice exceeding thoſe of Turkey and Germany, by one fifteenth. In the Eaſt-Indies the difference is ſtill more ſenſible: the Venetian *ſequin* being current for four rupees, and ſix peſſas, or 9 s. 4d. ſterling, and the Turkiſh *ſequin* only for four rupees, or 9 s.

SERAGLIO, among the Levantines, the palace of a prince, or lord. See PALACE.

At Conſtantinople, they ſay, the *ſeraglio* of the embaſſador of England, of France, *&c.*—The word is originally Perſian, where it has the ſame ſignification.

The SERAGLIO is uſed by way of excellence for the palace of the grand ſeignior at Conſtantinople, where he keeps his court, and where his concubines are lodged, and where the youth are trained up for the chief poſts of the empire.

It is a little triangle about two miles round, wholly within the city, at the end of the promontory Chryſoceras, now called the *ſeraglio* point.—The buildings run back to the top of the hill, from whence are gardens that reach to the edge of the ſea.—The outward appearance, du Loir tells us, is not beautiful, in regard the architecture is irregular, being cantoned out into ſeparate edifices and apartments, in manner of pavillions and domes. No ſtranger has ever yet been admitted to the inmoſt parts of the *ſeraglio*.

The old *ſeraglio* is the place where the emperor's old miſtreſſes are kept.

Balzac obſerves, that the *ſeraglio* at Conſtantinople, is only a copy of that which Solomon anciently built at Jeruſalem, for his wives and concubines.

SERAPH, or SERAPHIN, in the hierarchy of angels, a ſpirit of the firſt, or higheſt rank. See ANGEL and HIERARCHY.

The *ſeraphs*, or rather *ſeraphim*, make that claſs of angels ſuppoſed to be the moſt inflamed with divine love, by their nearer and more immediate attendance on the throne; and communicate their heat to the inferior, and remoter orders.—Hence their name, which is formed from the Hebrew root, שרף, to burn, inflame.

SERAPHICK, ſomething belonging to the ſeraphim. See SERAPH.

Mr. Boyle has a treatiſe of *ſeraphick* love, *i. e.* of divine love, or the love of God.

In the ſchools, St. Bonaventure is called *the ſeraphick doctor*, from his abundant zeal and fervour. See DOCTOR.

St. Francis, founder of the Cordeliers and Franciſcans, is called the *ſeraphick father*, in memory of a viſion he ſaw on mount Alverna, after a faſt of forty days, accompanied with many other ſeverities: when, falling into an ecſtaſy, he ſaw a ſeraph glide rapidly from heaven upon him; which impreſſed on him certain ſtigmata or marks, repreſenting the wounds which the nails and the ſpear made in our Saviour's body, at his crucifixion. See FRANCISCAN.

SERAPHIM. See the article SERAPH.

SERENADE, SERENATA, a kind of concert given in the night-time by a gallant, at his miſtreſs's door, or under her window.

Sometimes it conſiſts wholly of inſtrumental muſick; ſometimes voices are added; and the pieces compoſed or played on theſe occaſions, are alſo called *ſerenades*.

We do not know whence the word ſhould be derived, unleſs from the French, *ſerein*, the dew falling in the night-time.

SERENA *gutta*, in medicine, the ſame as *amauroſis*. See GUTTA *ſerena* and AMAUROSIS.

SERENE, SERENUS, a quality or title of honour given to certain princes, and chief magiſtrates of republicks. See TITLE and QUALITY.

The king of England is ſtiled, *the moſt ſerene*: the ſame term is alſo applied to the doge of Venice.—The pope, and the ſacred college writing to the emperor, to kings, or the doge, give them no other title but that of *moſt ſerene*. Indeed the Venetians ſet the title of *ſerenity* above that of highneſs. See HIGHNESS.

In 1646, Wicquefort obſerves, there was a claſhing between the courts of France and Vienna; becauſe the emperor refuſed the king of France any other title than that of *ſerene*.—Biſhops anciently were addreſſed under the title of *ſerene*.

The kings of France of the firſt and ſecond race, ſpeaking of themſelves, uſe no other quality, but *nôtre ſerenité*. The emperor gives no other title to the king of England, nor even to any other king, excepting the king of France. The king of Poland, and other kings, give it to the electors. The emperor, writing to the electors or other princes of the empire, only uſes the term *dilection*; but in treating with them, uſes *electoral ſerenity* to the electors; and *ducal ſerenity* to the other princes. See ELECTOR, *&c.*

SERGE, in commerce, a woollen quilted ſtuff, manufactured on a loom with four treddles, after the manner of rateens, and other ſtuffs, that have the whale. See RATEEN, *&c.*

The goodneſs of *ſerges* is known by the quilting, as that of cloths by the ſpinning. See CLOTH.

Of *ſerges* there are various kinds, denominated either from the different qualities thereof, or from the places where they are wrought.—The moſt conſiderable is the *London ſerge*, now highly valued abroad, particularly in France, where the manufacture is carried on with good ſucceſs, under the title of *ſerge de façon de Londres*.

Manufacture of London SERGES.—For wool, the longeſt is choſen for the warp, and the ſhorteſt for the woof. Ere either kind is uſed, it is firſt ſcoured, by putting it in a copper of liquor, ſomewhat more than luke-warm, compoſed of three quarts of fair water, and one of urine. After having ſtayed long enough therein to diſſolve, and take off the greaſe, *&c.* it is ſtirred briſkly about with a wooden peel; taken out of the liquor; drained and waſhed in a running water; dried in the ſhade; beaten with ſticks on a wooden rack, to drive out the coarſer duſt and filth; and than picked clean with the hands.—Thus far prepared, it is greaſed with oil of olives, and the longeſt part, deſtined for the warp, combed with large combs, heated in a little furnace for the purpoſe.—To clear off the oil again, the wool is put in a liquor compoſed of hot water, with ſoap melted therein: whence being taken out, wrung, and dried, it is ſpun on the wheel.

As to the ſhorter wool, intended for the woof, it is only carded on the knee, with ſmall fine cards, then ſpun on the wheel, without being ſcoured of its oil.—Note, the thread for the warp is always to be ſpun much finer, and better twiſted, than that of the woof.

The wool, both for the warp, and the woof, being ſpun, and the thread divided into ſkains; that of the woof is put on ſpools (unleſs it have been ſpun upon them) fit for the cavity or eye of the ſhuttle; and that for the warp wound on a kind of wooden bobins, to fit it for warping. When warped, it is ſtiffened with a kind of ſize, whereof, that made of the ſhreds of parchment is held the beſt; and when dry, is put on the loom.

When mounted on the loom; the workman raiſing and falling the threads (which are paſſed through a reed) by means of four treadles placed underneath the loom, which he makes to act tranſverſly, equally, and alternately, one after another, with his feet, in proportion as the threads are raiſed and lowered, throws the ſhuttle acroſs from one ſide to the other; and each time that the ſhuttle is thrown, and the thread of the woof croſſed between thoſe of the warp, ſtrikes it with the frame to which the reed is faſtened through whoſe teeth the threads of the warp paſs; and this ſtroke he repeats twice, or thrice, or even more, till he judges the croſſing of the *ſerge* ſufficiently cloſe: thus he proceeds, till the warp is all filled with woof.

The *ſerge* now taken off the loom is carried to the fuller, who fulls, or ſcours it, in the trough of his mill, with a kind of fat earth, for the purpoſe, firſt purged of all ſtones and filth. After three or four hours ſcouring, the fuller's earth is waſhed out in fair water, brought by little and little, into the trough, out of which it is taken when all the earth is cleared: then, with a kind of iron pincers, or plyers, they pull off all the knots, ends, ſtraws, &c. ſticking out on the ſurface, on either ſide: then return it into the fulling trough, where it is worked with water ſomewhat more than luke-warm, with ſoap diſſolved therein, for near two hours. It is then waſhed out, till ſuch time as the water becomes quite clear, and there be no ſigns of ſoap left: then it is taken out of the trough, the knots, &c. pulled off, and then put on the tenter to dry, taking care, as faſt as it dries, to ſtretch it out both in length and breadth, till it be brought to its juſt dimenſions. When well dried, it is taken off the tenter, dyed, ſhorn, and preſſed. See DYING, PRESSING, and SHEERING.

SERGEANT, or SERJEANT, a term in our law, applied to ſundry offices.—SERGEANT *at law*, or *of the coif*, is the higheſt degree taken in the common law, as that of doctor is in the civil law. See DEGREE and DOCTOR.

Sergeants were anciently called *ſervientes ad legem*, and *ſervientes narratores*: Mr. Selden adds, that they were alſo called *doctores legis*; though others are of opinion, that the judges are, more properly, the *doctores legis*, and *ſergeants*, the bachelors of law.—Spelman obſerves, that however a *ſergeant* may be richer than all the doctors of the commons, yet a doctor is ſuperior in degree to a *ſergeant*; for the very name of a doctor is magiſterial, but that of a *ſergeant* miniſterial. Hence the doctors are ſeated and covered when they plead; but the *ſergeants* ſtand uncovered at the bar, excepting for their coif.

As theſe are ſuppoſed the moſt learned and experienced; there is one court appropriated to plead in by themſelves, which is the common-pleas, where the common law of England is moſt ſtrictly obſerved.—But they are not prohibited pleading in other courts, where the judges (who muſt firſt be *ſergeants*) call them *brothers*. See COURT and COMMON-PLEAS.

They are called by the king's mandate, or writ, directed to them; commanding them to take upon them that degree, by a day aſſigned.

Out of theſe, one is made the king's *ſergeant* (more may be) to plead for him in all cauſes, eſpecially treaſon.

SERGEANT *at arms*, is an officer appointed to attend the perſon of a king, to arreſt traitors, and perſons of quality offending, and to attend the lord high-ſteward, when he ſits in judgment on any traitor.

Of theſe by ſtatute there are not to be above 30 in the realm.—There are now eight at court, at 100 l *per annum* ſalary each: they are called the king's *ſergeants at arms*, to diſtinguiſh them from others: they are created with great ceremony; the perſon kneeling before the king, his majeſty lays the mace on his right ſhoulder, and ſays, *Riſe up, ſergeant at arms, and eſquire, for ever.*—They have, beſides, a patent for the office, which they hold for life.

They have their attendance in the preſence-chamber, where the band of gentlemen-penſioners wait; and receiving the king at the door, carry the maces before him to the chapel-door, whilſt the band of penſioners ſtand foremoſt, and make a lane for the king; as they alſo do when the king goes to the houſe of lords.

There are four others created in the ſame manner; one, who attends the lord chancellor; a ſecond, the lord treaſurer; a third, the ſpeaker of the houſe of commons; and a fourth, the lord mayor of London, on ſolemn occaſions.

They have a conſiderable ſhare of the fees of honour, and travelling charges allowed them, when in waiting, *viz.* five ſhillings *per* day, when the court is within ten miles of London, and ten ſhillings when twenty miles off London: they are in the lord chamberlain's gift.

SERGEANT, or SERJEANT, in war, is an inferior officer in a company of foot, or troop of dragoons; armed with a halbard, and appointed to ſee diſcipline obſerved, to teach the ſoldiers the exerciſe of their arms, to ſee due diſtances kept, to order, ſtraiten, form ranks, files, &c. See OFFICER.

SERGEANTY, or SERJEANTY, a ſervice anciently due to the king for lands held of him; and which could not be due to any other lord. See TENURE and SERVICE.

It is divided into *grand* and *petty ſergeanty*.

Grand SERGEANTY, is where one holds land of the king by ſervice which he ought to do in his own perſon; as to bear the king's banner, or ſpear, aſſiſt at his coronation, or do ſome office in his court.

Petit SERGEANTY, is where a man holds land of the king to yield him yearly ſome ſmall thing towards his wars; as a ſword, dagger, bow, ſpurs, &c.

Coke, on Littleton, tells us, that Sir Richard Rockeſly held lands at Seaton, by *grand ſergeanty*, to be *vantrarius regis*, *i. e.* the king's fore-footman, when he went into Gaſcogne, till he had worn out a pair of ſhoes of the price of fourpence.

By the ſtatute, 12 Car. II. all tenures of any honours, manors, lands, &c. are turned into free and common ſoccage; but the honorary ſervice of *grand ſergeanty* are thereby continued. See TENURE.

SERIES, a continued ſucceſſion of things in the ſame order, and which have ſome relation or connection with each other. See CLASS, ORDER, &c.

Medals are formed into *ſuites* or *ſeries's*, both with regard to the metal, and to the ſubject. The different metals of medals, conſtitute three different *ſeries's*, in the cabinets of the curious; we mean, as to the order and arrangement of the ſeveral medals.—The gold *ſeries*, for inſtance, of imperials, amounts to about 1000 or 1200; that of ſilver may amount to 3000; and that of copper, in all the three ſizes, great, middle, and ſmall, to 6 or 7000.—Of theſe, the *ſeries* of middle copper is the moſt compleat and eaſily formed, as it may be brought down to the fall of the empire in the weſt, and the time of the Palæologi in the eaſt.

The *ſeries's* of medals are uſually formed from the ſide called the *head*: in the firſt claſs, is diſpoſed the *ſeries* of kings: in the ſecond, that of Greek and Latin cities; in the third, the Roman conſular families; in the fourth, the imperial; in the fifth, the deities: to which may be added a ſixth *ſeries*, conſiſting of medals of illuſtrious perſons.

There are alſo *ſeries's* of modern medals: that of the popes only commences from Martin V. in 1430. From that time we have a *ſeries* of papal medals, tolerably compleat, to the number of 5 or 600.—One might likewiſe have a *ſeries* of emperors from Charlemaign; provided one took in the current coins: but, in practice they commonly commence with Frederick II. in 1463.—The *ſeries* of kings of France is the moſt numerous and moſt conſiderable of all the modern kings. See MEDAL.

SERIES, in algebra, denotes a rank or progreſſion of quantities, increaſing or decreaſing in ſome conſtant ratio; which, in its progreſs, approaching ſtill nearer and nearer ſome ſought value, is called a *converging ſeries*; and if infinitely continued, becomes equal to that quantity: whence its uſual appellation of *infinite ſeries*. See CONVERGING, &c.

Thus $\frac{1}{2}$ $\frac{1}{4}$ $\frac{1}{8}$ $\frac{1}{16}$ $\frac{1}{32}$ $\frac{1}{64}$, &c. make a *ſeries*, which always converges, or approaches to the value of 1, and infinitely continued, becomes equal thereto. See INFINITE, APPROXIMATION, &c.

The doctrine and uſe of *infinite ſeries's*, one of the greateſt improvements of the preſent age, we owe to Nic. Mercator of Holſtein, who, however, ſeems to have taken the firſt hint of it from Dr. Wallis's arithmetick of *infinites*.—It takes place principally in the quadratures of curves; where, as we frequently fall upon quantities, which cannot be expreſſed by any preciſe definite numbers, ſuch as is the ratio of the diameter of a circle to the circumference; we are glad to expreſs them by a *ſeries*, which, infinitely continued, is the value of the quantity required. See CIRCLE, QUADRATURE, &c.

Nature, origin, and uſe of infinite SERIES's.—Though arithmetic furniſh us with very adequate and intelligible expreſſions for all rational numbers, yet it is very defective as to irrational ones; which are infinitely more numerous than the other; there being, for inſtance, an infinity of them between 1 and 2. Were it now required to find a mean proportional between 1 and 2, in rational numbers, which alone are clearly intelligible, (the root of 2 being certainly a very obſcure idea) we could ſtill approach nearer and nearer to the juſt value of the quantity required, but without ever arriving at it: thus, if for the mean proportional between 1 and 2, or the root of 2, we firſt put 1, it is evident we have not put enough; if we add $\frac{1}{2}$ we put too much, for the ſquare of $1+\frac{1}{2}$ is greater than two. If then we take away $\frac{1}{8}$, we ſhall find we have taken away too much, and if we return $\frac{1}{16}$, the whole will be too great: thus may we proceed, without ever coming at the juſt quantity ſought.—These numbers thus found, and thoſe found after the ſame manner to infinity, being diſpoſed in their natural order, make what we call an *infinite ſeries.* See NUMBER and SURD.

Sometimes the *ſeries's* do not proceed by alternate additions and ſubtractions, but by ſimple additions, or an infinity of ſubtractions; according to the poſition of the firſt term. In all theſe *infinite ſeries's* it is viſible, that as all the terms are only equal to a finite magnitude, they muſt be ſtill decreaſing; and it is even convenient that they be ſo, as much as poſſible, that one may take only a certain number of the firſt terms for the magnitude ſought, and neglect all the reſt.

But it is not irrational numbers only, that are expreſſed in rational ones, by *infinite ſeries's.* Rational numbers themſelves may be expreſſed in the ſame manner: 1, for inſtance, being equal to the *ſeries* $\frac{1}{2}\ \frac{1}{4}\ \frac{1}{8}$, *&c.* but there is this difference between them, that whereas irrational numbers can only be expreſſed in rational numbers, by ſuch *ſeries*; rational ones need no ſuch expreſſion.

Among *infinite ſeries's*, there are ſome whoſe terms only make a finite ſum; ſuch is the geometrical progreſſion $\frac{1}{2}\ \frac{1}{4}\ \frac{1}{8}$, *&c.* and in general, all geometrical decreaſing progreſſions: in others, the terms make an infinite ſum; ſuch is the harmonical progreſſion $\frac{1}{2}\ \frac{1}{3}\ \frac{1}{4}\ \frac{1}{5}$, *&c.* See HARMONICAL. It is not that there are more terms in the harmonical, than in the geometrical progreſſion, though the latter has no term which is not in the former, and wants ſeveral the former has; ſuch a difference would only render the two infinite ſums unequal, and that of the harmonical progreſſion the greateſt: the cauſe lies deeper.

From the received notion of infinite diviſibility, it follows, that any finite thing, *e. gr.* a foot is a compound both of finite and infinite: finite, as it is a foot; infinite, as it contains an infinity of parts, into which it is diviſible.—If theſe infinite parts be conceived, as ſeparated from one another, they will make an *infinite ſeries*, and yet their ſum only be a foot; only, no terms are to be here put, but ſuch as may, diſtinct from each other, be parts of the ſame finite whole: now this is the caſe in the geometrical, decreaſing *ſeries* $\frac{1}{2}\ \frac{1}{4}\ \frac{1}{8}$, *&c.* for it is evident, that if you firſt take $\frac{1}{2}$ of a foot, then $\frac{1}{2}$ of what remains, or $\frac{1}{4}$ of a foot, then $\frac{1}{2}$ of what remains, or $\frac{1}{8}$ of a foot; you may proceed to infinity, ſtill taking new decreaſing halves, all diſtinct from each other, and which all together only make a foot.

In this example, we not only take no parts but what were in the whole, diſtinct from each other; but we take all that were there; whence it comes to paſs, that their ſum makes the preciſe whole again: but were we to follow the geometrical progreſſion $\frac{1}{3}\ \frac{1}{9}\ \frac{1}{27}$, *&c.* that is, at firſt take $\frac{1}{3}$ of a foot, and from what remains $\frac{1}{9}$ of a foot, and from what ſtill remains $\frac{1}{27}$ of a foot, *&c.* it is true, we ſhould take no parts but what were diſtinct from each other in the foot; but we ſhould not take all the parts that were there, ſince we only take the ſeveral thirds, which are leſs than the halves; of conſequence, all theſe decreaſing thirds, though infinite in number, could not make the whole; and it is even demonſtrated, that they would only make half.—In like manner, all the fourths decreaſing to infinity, would only make one third, and all the hundredths, only the ninety-ninth part: ſo that the ſum of the terms of an *infinite ſeries* decreaſing geometrically, is not only always finite, but may even be leſs than any finite quantity that can be aſſigned.

If an infinite decreaſing *ſeries* expreſs parts which cannot ſubſiſt in the whole, diſtinctly from each other; but ſuch, as to take their values, we muſt ſuppoſe the ſame quantity taken ſeveral times, in the ſame whole; then will the ſum of theſe parts make more than a whole, nay, infinitely more; that is, the *ſeries* will be infinite, if the ſame quantity be taken an infinity of times.—Thus, in the harmonical progreſſion $\frac{1}{2}\ \frac{1}{3}\ \frac{1}{4}$, *&c.* if we take $\frac{1}{2}$ of a foot, or 6 inches, then $\frac{1}{3}$ 4 inches, it is evident we cannot take further $\frac{1}{4}$ of a foot, or 3 inches, without taking 1 inch more than was left in the foot. Since then the whole is already exhauſted by the three firſt terms, we can take no more of the following terms, without taking ſomething already taken: and, ſince thoſe terms are infinite in number, it is very poſſible that the ſame finite quantity may be repeated an infinite number of times, which will make the ſum of the *ſeries* infinite.

We ſay poſſible; for though of two *infinite ſeries's*, the one may make a finite ſum, and the other an infinite; it is true, that there may be ſuch a *ſeries*, where the finites, having exhauſted the whole, the following ones, though infinite in number, ſhall only make a finite ſum; and, in effect, ſince it is demonſtrated, by the laws of geometrical progreſſion, that there are *ſeries's*, whoſe ſums are leſs than the whole, nay, infinitely leſs, it follows, that there muſt likewiſe be *ſeries's* which make infinitely more.

There are two further remarks neceſſary to be made on *ſeries's* in general. 1°. That there are ſome, wherein, after a certain number of terms, all the other terms, though infinite in number, become each a cypher. Now, it is evident, that the ſum of theſe *ſeries's* is finite, and eaſily found; they having only an appearance of infinity.

2°. That the ſame magnitude may be expreſſed by different *ſeries's*; and may be expreſſed both by a *ſeries*, whoſe ſum may be found, and by another, whoſe ſum cannot be found.

Geometry does not labour under the ſame difficulty as arithmetick: it expreſſes irrational numbers exactly in lines, and needs not have recourſe to *infinite ſeries's.* Thus the diagonal of a ſquare, whoſe ſide is 1, is known to be the ſquare root of 2.—But, in ſome other caſes, geometry itſelf is under the like embarraſs; there being ſome right lines, which cannot be expreſſed otherwiſe than by an *infinite ſeries* of ſmaller lines, whoſe ſum cannot be found: of which kind are the right lines equal to curves; ſo that in ſeeking, for inſtance, a right line equal to the circumference of a circle, we find, that the diameter being 1, the line ſought will be $\frac{4}{1}$, minus $\frac{4}{3}$, plus $\frac{4}{5}$, minus $\frac{4}{7}$, plus $\frac{4}{9}$, *&c.* See RECTIFICATION.

As to the finding of an *infinite ſeries* to expreſs quantities ſought; Mercator, the firſt inventor of the method, did it by diviſion: but Sir Iſ. Newton and M. Leibnitz, have improved the doctrine very conſiderably: the firſt finding his *ſeries* by the extraction of roots, and the ſecond by another *ſeries* preſuppoſed.

To find a SERIES *expreſſing a quantity ſought, by diviſion.*—Suppoſe a *ſeries* required to expreſs the quotient of *b* divided by $a+c$. Divide the dividend by the diviſor, as in common arithmetick; continuing the diviſion till the quotient ſhew the order of the progreſſion, or the law, according to which the terms proceed to infinity: ſtill obſerving the rules of ſubtraction, multiplication, and diviſion, about the changing of the ſigns.—The proceſs carried on, the quotient will be found $\frac{b}{a}-\frac{bc}{a^2}+\frac{bc^2}{a^3}-\frac{bc^3}{a^4}$ *&c. in infinitum.*

Theſe four or five terms thus found, both the quotient and manner of the diviſion ſhew, that the quotient conſiſts of an infinite *ſeries* of terms, whoſe numerators are the powers of *c*, whoſe exponents differ from the number of the order by unity, whoſe denominators are the powers of *a*, and their exponents equal to the number of the order of the terms.—*E. gr.* In the third term, the power of *c* is the ſecond in the numerator; and the power of *a* the third in the denominator.

Hence, 1°. If $b=1$ and $a=1$ ſubſtituting this value for that, we have, in that quotient $1-c+c^2-c^3$, *&c.* to infinity. Wherefore $\frac{1}{1+2}=1-c+c^2-c^3$, *&c. in infinitum.*

If then, ſecondly, the terms in the quotient continually decreaſe, the *ſeries* will give a quotient as near the truth as poſſible.—*E. gr.* If $b=1$, $c=1$ and $a=2$; theſe values ſubſtituted in the general *ſeries*, or the diviſion performed as in the general example; we ſhall find $\frac{1}{3}=\frac{1}{2+1}=\frac{1}{2}-\frac{1}{4}+\frac{1}{8}-\frac{1}{16}+\frac{1}{32}-\frac{1}{64}+\frac{1}{128}$, *&c.* Suppoſe then, the *ſeries* to be broke off in the fourth term; there will be a deficiency: but it will be leſs than $\frac{1}{32}$. If it be broke off in the ſixth, there will be a deficiency, but that leſs than $\frac{1}{128}$. The further therefore the *ſeries* is continued, the nearer it approaches to truth, but never arrives at it

After the like manner we find $\frac{1}{4}=\frac{1}{3+1}=\frac{1}{3}-\frac{1}{9}+\frac{1}{27}-\frac{1}{81}+\frac{1}{243}$, *&c. in infinitum* $\frac{1}{5}=\frac{1}{4+1}=\frac{1}{4}-\frac{1}{16}+\frac{1}{64}-\frac{1}{256}$, *&c. in infinitum* $\frac{1}{6}=\frac{1}{5+1}=\frac{1}{5}-\frac{1}{25}+\frac{1}{125}-\frac{1}{625}$, *&c. in infinitum.* This is a conſtant law, whereby all fractions, whoſe numerator is unity, may be expreſſed by infinite *ſeries's*: thoſe *ſeries's* being all geometrical progreſſions, decreaſing in ſuch manner as that the numerator is always unity; and the denominator of the firſt term, which is alſo the exponent of the ratio, differs by unity from the denominator of the fraction to be reſolved.

If the terms of the quotient be continually increaſing, the *ſeries* recedes ſo much the farther from the quotient as it is continued longer; nor does it ever become equal to the quotient, unleſs it be terminated, and have the laſt remainder added under its ſign. *E. gr.* Suppoſe $\frac{1}{3}=\frac{1}{1+2}$; the quotient will be found $1-2+4-8+16-64+128$, &c. One term, 1 exceeds $\frac{1}{3}$ by an exceſs of $\frac{2}{3}$; two terms comes ſhort by $\frac{4}{3}$; three terms exceeds by $\frac{8}{3}$; four fall ſhort by $\frac{15}{3}$, &c. If the *ſeries* be ſuppoſed terminate in -8; then will

$$\frac{1}{1+2}=1-2+4-8+\frac{16}{3}.$$

But $1-2+4-8=-5=-\frac{15}{3}$. Therefore, $\frac{1}{1+2}=\frac{16}{3}-\frac{15}{3}=\frac{1}{3}$. Suppoſe the general *ſeries* to terminate in $-c^3$; then will

$$\frac{1}{1+c}=1-c+c^2-c^3+\frac{c^4}{1+c}=$$

$$\frac{1+c-c-c^2+c^2+c^3-c^3-c^4+c^4}{1+c}=\frac{1}{1+c}$$

To find an *infinite ſeries* by extracting of roots. } See { QUADRATURE *of the circle.*
To find an *infinite ſeries* by a preſuppoſed *ſeries*, }

To extract the roots of an *infinite ſeries*, } See { EXTRACTION *of roots.*

Reverſion of SERIES. See the article REVERSION.

SERMOLOGUS, SERMOLOGUE, an eccleſiaſtical book compoſed of ſermons, or homilies of popes, and other perſons of eminence and ſanctity, formerly read at the feaſts of the confeſſors, the Purification, All Saints, and on every day from Chriſtmas to the octave of the Epiphany. See HOMILY.

SERMON, *funeral.* See the article FUNERAL.

SERMONES, the title which Horace gives his ſatyrs. See the article SATYR.

Criticks are divided about the reaſon of the name: the opinion of father Boſſu ſeems beſt grounded. A mere obſervance of feet, and meaſure, ſuch as we find in Terence, Plautus, and in Horace's ſatyrs, he thinks, is not ſufficient to conſtitute verſe, to determine the work to be poetical, or to diſtinguiſh it from proſe: unleſs it have ſome further air, or character of poetry; ſomewhat of the fable, or the ſublime. See POETRY.

Hence it is, that Horace calls his ſatyrs, *proſe ſermones.*—His odes have quite another air, and are therefore called, *poems, carmina.* See POEM, PROSE and VERSIFICATION.

SERMONIUM, in old records, a kind of interlude or hiſtorical play, which the inferior orders of clergy, aſſiſted by boys, &c. uſed to act in the body of the church, ſuitable to the ſolemnity of ſome feſtival or high proceſſion day.

This is ſuppoſed to have been the origin of the modern drama. See COMEDY.

SERON *of almonds*, is the quantity of two hundred weight; of aniſe-ſeeds, from 3 to 400; of caſtle-ſoap, from 200 and a half, to 300 and 3 quarters.

SEROSITY, in medicine, an aqueous liquor, or lympha, found in the blood and other humours. See LYMPHA.

Degori defines it, a ſharp, bilious juice, approaching nearly the nature of blood; but which, being extravaſated, does not coagulate like the blood. See SERUM.

Diſorders of the ſpleen are attended with *ſeroſities*: the kidneys help to purge off *ſeroſities*.

SERPENS, in aſtronomy, a conſtellation in the northern hemiſphere, called more particularly *ſerpens ophiuchi.*

The ſtars in the conſtellation *ſerpens*, in Ptolemy's catalogue are 17; in Tycho's 19; in the Britannic catalogue 59. The longitudes, latitudes, magnitudes, &c. whereof are as follow.

SERPENT, a muſical inſtrument, ſerving as a baſs to the cornet, or ſmall ſhawm, to ſuſtain a chorus of ſingers in a large edifice.

It has its name *ſerpent*, from its figure; as conſiſting of ſeveral folds or wreaths, which ſerve to reduce its length, which would otherwiſe be ſix or ſeven feet.

It is uſually covered with leather; and conſiſts of three parts; a mouth-piece, a neck, and a tail.—It has ſix holes by means whereof it takes in the compaſs of two octaves.

SERPENTARIA, a medicinal plant, called by the ancients *piſtolochia*, and *dracunculus*; by us properly, *ſnake-root*, and *dragon's wort*.

The ancients were only acquainted with two kinds of this plant; the *great* and the *ſmall*: but ſince the diſcovery of America, botaniſts have added ſeveral others; as, the *ſerpentaria Virginiana*, or *Virginia ſnake-root*: beſides that of Canada, and that of Braſil.

They are all ſuppoſe to be alexipharmicks, or counter-poiſons; and as ſuch are ingredients in Venice-treacle. The *great ſerpentaria*, called by the ancients *dracunculus major*, has its ſtem very ſtreight, ſmooth, and marked with red ſpots, like the ſkin of a ſerpent; whence, probably, as much as from its virtues, it is, that it takes its name.—Its root is big, round and white, covered with a thin ſkin.

The *ſmaller ſerpentaria* has its ſtalk much like that of the larger, only its leaves are like thoſe of ivy; whereas thoſe of the larger are folded in one another, after the manner of baſtard rhubarb.—Its root is round and bulbous.

The *ſerpentaria of Virginia*, called alſo *colubrina Virginiana*, *aſarum Virginianum*, *ſerpentaria nigra*, and *contrayerva of Virginia*, has its leaves green and large, almoſt in figure of a heart; its fruit round, and its root, which is of a very ſtrong aromatick ſmell, has, at bottom, an infinite number of long ſmall filaments, repreſenting a kind of beard.

It was firſt brought into Europe from Virginia by the Engliſh; where it is eſteemed a ſovereign antidote againſt the bite of the rattle ſnake.—We are told by travellers, that this root not only cures the bite of the rattle ſnake but that that animal flies the ſmell thereof: for which reaſon the Indian, and other travellers, always carry it with them on the end of a ſtaff, to preſent towards the ſnake, when, by chance, they meet it.

SERPENTARIUS, in aſtronomy, a conſtellation of the northern hemiſphere, called alſo *Ophiuchus*, and anciently *Æſculapius*. See CONSTELLATION.

The ſtars in the conſtellation *ſerpentarius* in Ptolemy's catalogue are 29; in Tycho's 25; in the Britannic catalogue 69. The longitudes, latitudes, magnitudes, &c. whereof are as follow.

SERPENTINE *verſes*, are ſuch as begin and end with the ſame word.—As,

Ambo florentes ætatibus, Arcades ambo.

Serpentine, in chymiſtry, a worm, or pipe of copper, or pewter, twiſted into a ſpiral, and aſcending from the bottom of the alembick to the capital, and ſerving as a refrigeratory in the diſtillation of brandy and other liquors. See Refrigeratory and Distillation.

Serpentine *marble*, or *ſtone*, a kind of marble called by the antients *ophites*, from the Greek ὀφις, *ſerpent*, as being ſpeckled like a ſerpent's ſkin. See Marble and Stone.

The ground of the *ſerpentine* is blackiſh; but it is beſet with green and yellowiſh ſtains, ſtreaks, &c. being withal exceeding hard, precious and antique.

The ſcarceneſs of the *ſerpentine* is ſuch as only allows it to be uſed by way of incruſtation.—The largeſt pieces we know of, are ſome tables in the compartiments of the attic of the Pantheon; and two columns in the church of St. Laurence in Lucina at Rome.

There is alſo a kind of *ſerpentine* brought from Germany, uſed to make veſſels of, but not in building.

Serpentine *column*. See the article Column.

SERPI *grotta dei*. See the article Grotta.

SERPIGO, in medicine, a kind of herpes, popularly called a *tetter* or *ring-worm*. See Herpes.

It conſiſts of a number of very ſmall poſtules, riſing cloſe to each other, ſometimes in a circular form, with great pain and itching. It never comes to digeſtion, and is not cured without difficulty. For after it appears to have been quite extinguiſhed, it frequently breaks forth again at certain ſeaſons of the year.—The common people uſe to anoint it with ink: but where the diſeaſe is fixed, ſome univerſals ſhould be firſt applied. See Lichen, Impetigo, &c.

SERRATUS, in anatomy, a name given to ſeveral muſcles, from their reſemblance in ſhape, to a ſaw. Such are the

Serratus *anticus minor*, which ariſes thin and fleſhy from the ſecond, third, fourth, and fifth ſuperior ribs, and aſcending obliquely, is inſerted fleſhy into the proceſſus coracoides of the ſcapula, which it draws forward. It alſo helps in reſpiration.—See *Tab. Anat.* (Myol.) *fig.* 2. *n.* 10.

Serratus *anticus major*, comes from the whole baſis of the ſcapula, and is inſerted into the ſeven true ribs, and firſt of the falſe ribs, by ſo many diſtinct portions, repreſenting the teeth of a ſaw.—See *Tab. Anat.* (Myol.) *fig.* 7. *n.* 15. 15. *fig.* 1. *n.* 42. *fig.* 2. *n.* 26.

Serratus *poſticus ſuperior*, ariſes by a broad and thin tendon, from the two inferior ſpines of the vertebræ of the neck, and the three ſuperior of the back, and growing fleſhy, is inſerted into the ſecond, third, and fourth ribs, by ſo many diſtinct indentations.—See *Tab. Anat.* (Myol.) *fig.* 7. *n.* 31.

Theſe two help to draw the ribs upwards, and bring them to right angles with the vertebræ; and, conſequently, make the cavity of the thorax wider and ſhorter.

Serratus *poſticus inferior*, ariſes by a broad and thin tendon from the three inferior ſpines of the vertebræ of the back, and from the two ſuperior of the loins: its fibres, aſcending obliquely, grow fleſhy, and are inſerted by four indentations, into the four laſt ribs.

SERVAGE. See the article Service.

SERVANT, Servus, a term of relation ſignifying a perſon who owes and pays a limited obedience for a certain time, to another, in quality of maſter. See Master.

The Romans, beſides their ſlaves, whom they alſo called *ſervi*; had another kind of *ſervants* whom they called *nexi* and *addicti*, who were ſuch as being in debt, were delivered up to their creditors by the prætor, to work out their debt; after which they were again at liberty. See Slave.

The pope, out of his wonderful humility, calls himſelf in his bulls, *the ſervant of the ſervants of God*, *ſervus ſervorum Dei*. The firſt who uſed the appellation, as Diaconus tells us, were pope Damaſus and Gregory the great; which laſt is ſaid to have uſed it to check, by his modeſty, the arrogance of John, patriarch of Conſtantinople, who took the title of *œcumenical*.—Du Cange adds, that the title *ſervant* has been aſſumed by ſome biſhops, ſome kings, and ſome monks.

SERVETISTS, the diſciples or followers of Michael Servetus, the ring-leader of the antitrinitarians of theſe laſt ages. See Antitrinitarian.

In reality, however, Servetus had not any diſciples; as being burnt, together with his books, at Geneva, in 1553, before his dogma's had time to take root.—But the name *Servetiſts* is given to the modern antitrinitarians, becauſe they follow the footſteps he had marked out.

Sixtus Senenſis calls the anabaptiſts, *Servetiſts*, and ſeems to uſe the two terms indifferently. The truth is, in many things, the ancient anabaptiſts in Switzerland, &c. chimed in with Servetus. See Anabaptist.

As the books that he wrote againſt the trinity are very rare, his real ſentiments are but little known: M. Simon, who had a copy of the firſt edition, delivers them at large in his critical hiſtory.

Though Servetus uſes many of the ſame arguments againſt the trinity, as the Arians, yet he profeſſes himſelf very far from their ſentiments. He alſo oppoſes the Socinians in ſome things; and declares his diſſent from the opinions of Paulus Samoſatenus; though Sandius miſtakenly charges him with having the ſame ſentiments. In effect, he does not ſeem to have had any fixed regular ſyſtem of religion, at leaſt not in the firſt edition of his book againſt the trinity, publiſhed in 1531, under the title, *de trinitatis erroribus, libri ſeptem, per Michaelem Servetum, alias Reves, ab Arragonia Hiſpanum.*

The year following he publiſhed his dialogues on the myſtery of the trinity. In the preface to which laſt work, he declares himſelf diſſatisfied therewith.—It was on this account he undertook another on the ſame ſubject, of much greater extent; which did not appear till the year 1553, a little before his death. Thoſe of Geneva having ſeized the copies of this edition, had it burnt; nor were there above two or three that eſcaped; one of which was kept at Baſil, where the book was printed, but is now in the college library at Dublin.

It was lately put to the preſs, ſecretly, in England; but being diſcovered, the impreſſion was ſeized and deſtroyed.

SERVICE, or SERVAGE, SERVITIUM, in law, a duty which the tenant, by reaſon of his fee, owes to the lord. See FEE.

Ancient law-books make divers diviſions of *ſervice*, viz. into *perſonal*, *real* and *mixed*; *military* and *baſe*; *intrinſic* and *extrinſic*, &c. But ſince the ſtatute 12 Car. II. whereby all tenures are turned into free and common ſoccage; much of that learning is ſet aſide.—Yet it may not be amiſs to mention how the ſeveral kinds of *ſervice* are deſcribed in our ancient law-books.

Perſonal SERVICE, is that to be performed by the perſon.—Such is that due from a ſlave to his maſter.

Real SERVICE, is either *urbane* or *ruſtic*; which two kinds differ, not in the place, but the thing.—The firſt is that due from a building or houſe, in whatever place ſituate, whether city or country; as the keeping a drain, a viſta, or the like.

Ruſtic SERVICES, are thoſe due for grounds where there is no building; ſuch is the right of paſſage through ways, *&c.*

Mixt SERVICE, is that due from the perſon, by reaſon of the thing, as an uſu-fruit, *&c.* See SERGEANTRY.

Our ancient law-books tell us of lands held of the king, by the tenant's letting a fart before the king on new year's-day; others, by furniſhing the king with whores whenever he travelled that way; others, by bringing the king a meſs of pottage at his coronation feaſt, *&c.*

There are alſo *natural* SERVICES.—For inſtance, if a man cannot gather the produce of his lands without paſſing through his neighbour's grounds, the neighbour is obliged to allow a paſſage, as a *natural ſervice.*

Forenſic, or *extrinſic* SERVICE, SERVITIUM *forenſicum*, &c. was a *ſervice* which did not belong to the chief lord, but to the king.

It was called *forenſic* and *extrinſic*, becauſe done *foris*, out of doors; and *extra ſervitium.*—We meet with ſeveral grants in the monaſticon, of all liberties, with the apurtenances, *ſalvo forenſi ſervitio.*

Intrinſic SERVICE, SERVITIUM *intrinſicum*, that due to the chief lord alone, from his vaſſals within his manor.

Frank SERVICE, SERVITIUM *liberum*, a *ſervice* done by the feudatory tenants, who were called *liberi homines*, and diſtinct from vaſſals: as likewiſe was their *ſervice*; for they were not bound to any baſe *ſervices*, as to plough the lord's lands, *&c.* but only to find a man and horſe to attend the lord into the army or court.

Baſe SERVICE,	See the articles	VILLENAGE,
Bord SERVICE,		BORD,
Foreign SERVICE,		FOREIGN,
Honorary SERVICE,		HONORARY,
Knights SERVICE,		KNIGHT,
Military SERVICE,		MILITARY,
Rent SERVICE,		RENT.
Ovelty of SERVICE,	See the articles	OVELTY,
Suit of SERVICE,		SUIT.

SERVIENTES *virgatores.* See VIRGATORES.

SERVITES, an order of religious, denominated from their vowing a peculiar attachment to the ſervice of the virgin.

The order was founded by ſeven Florentine merchants, who, about the year 1233, began to live in community on mount Senar, two leagues from Florence. In 1239, they received from the biſhop, the rule of St. Auguſtin; with a black habit, in lieu of a grey one which they had wore before.—In 1251, Bonfilio Monaldi, one of the ſeven, of ſimple prior of mount Senar, was named general.

The order was approved of by the council of Lateran, notwithſtanding the decree it had paſſed to prevent the multiplication of religious orders. And it was again approved by cardinal Raynerius, legat of pope Innocent IV; who put it under the protection of the holy ſee. The ſucceeding popes have granted it a great many favours, particularly Alexander IV. and Innocent VIII.—It has alſo undergone ſome reforms.

At preſent it conſiſts of twenty-ſeven provinces. It is become famous in Italy, by the hiſtory of the Council of Trent, of Fra. Paolo, a Venetian, who was a religious *ſervite.* M. Hermant gives this order the name of the *annunciate*, doubtleſs from this miſtake, that in ſome cities of Italy, they are called *religious of the annunciate*, becauſe in thoſe cities, their church is dedicated under that name. F. Archang. Giani derives the name *ſervites*, ſervants of the holy virgin, from hence; that when they appeared for the firſt time in the black habit given them by the biſhop, the ſucking children cried out; *Behold the ſervants of the virgin.*—There are alſo nuns of this order.

SERVITIA.—*Per quæ* SERVITIA. See the article PER.

SERVITIIS *conſuetudinibus.* See CONSUETUDINIBUS.

SERVITOR, in the univerſity of Oxford, a ſcholar or ſtudent, who attends or waits on another for his maintenance there.

SERVITORS *of bills*, denote ſuch ſervants or meſſengers of the marſhal of the king's-bench, as were ſent abroad with bills or writs, to ſummon men to that court.—They are now commonly called *tip-ſtaves.* See TIP-STAVES, MARSHAL, *&c.*

SERVITUDE, the condition of a ſervant, or rather ſlave. See SLAVE and SERVANT.

Under the declenſion of the Roman empire, a new kind of *ſervitude* was introduced, different from that of the ancient Romans: it conſiſted in leaving the lands of ſubjugated nations to the firſt owners, upon condition of certain rents, and ſervile offices, to be paid in acknowledgment.—Hence the names of *ſervi cenſiti*, *adſcriptitii* and *addicti glebæ:* ſome whereof were taxable at the reaſonable diſcretion of the lord; others at a certain rate agreed on; and others were mainmortable, who, having no legitimate children, could not make a will to above the value of five-pence, the lord being heir of all the reſt: others were prohibited marrying, or going to live out of the lordſhip. Moſt of which ſervices ſtill ſubſiſt in one province or other of France; though all aboliſhed in England.—Such was the original of our tenures, *&c.* See TENURE, VASSAL, VILLAIN, *&c.*

SERUM, a thin, tranſparent, watry liquor, ſomewhat ſaltiſh, which makes a conſiderable part in the maſs of blood. See HUMOUR and SEROSITY.

The blood conſiſts of two kinds of parts; the *cruor*, or red part; and the *ſerum*, or wheyiſh, limpid part. See BLOOD. Mr. Boyle, and ſome others, have taken the *ſerum* to be more ponderous than the *cruor*; but Dr. Jurin, in the Philoſophilcal Tranſactions, from repeated experiments, aſſures us of the contrary. See CRUOR.

The *ſerum* is, in reality, the ſame with the lympha: it is carried by the arteries throughout the ſeveral parts of the body; whence it returns partly in the veins, and partly in the lymphatick veſſels. See LYMPHA.

The uſe of the *ſerum* is to nouriſh the parts of the body; and to render the chyle and blood more fluid. See NUTRITION.

Urine and ſweat, are nothing but *ſerum* drained of their nutritious parts, by repeated circulations, and ſecreted from the blood in the glands of the kidneys and ſkin. See URINE and SWEAT.

The redundancy and other vices in the *ſernm*, are the cauſe of various diſeaſes. See DISEASE.

SESAMOIDEA *oſſa*, in anatomy, ſeveral very ſmall bones, placed between the joints of the fingers and toes, to fortify them, and prevent diſlocations. See FINGER and TOE.

They have their name from their reſemblance in figure and ſize, to a grain of ſeſamum: from *ſeſamum*, and εἶδος, *form.*

SESQUI, a Latin particle, ſignifying a whole and a half; which, joined with *altera*, *terza*, *quarta*, &c. is much uſed in the Italian muſick, to expreſs a kind of ratio's; particularly ſeveral ſpecies of triples. See RATIO.

The ratio expreſſed by *ſeſqui*, is the ſecond ratio of inequality, called alſo *ſuper-particular ratio*; and is, when the greater term contains the leſs, once, and ſome certain part, over: as 3 : 2; where the firſt term contains the ſecond once, and unity over; which is a quota part of two.

Now, if this part remaining, be juſt half the leſs term, the ratio is called *ſeſqui-altera:* if the remaining part be a third part of the leſſer term, as 4 : 3, the ratio is called *ſeſquitertia*, or *ſeſqui-terza:* if a fourth part, as 5 : 4, the ratio is called *ſeſqui-quarta*; and thus to infinity, ſtill adding to *ſeſqui* the ordinal number of the ſmaller term.

In Engliſh, we ſometimes ſay, *ſeſqui-alteral*, or *ſeſqui-alterate*, *ſeſqui-third*, *ſeſqui-fourth*, &c.—Though this is a little hybrid.

As to the kinds of triples expreſſed by the particle *ſeſqui*, they are theſe.—The *greater perfect* SESQUI-ALTERATE, which is a triple, where the breve is three meaſures, or ſemi-breves, and that without having any point or dot annexed to it.

Greater imperfect SESQUI-ALTERATE, which is where the breve, when pointed, contains three meaſures, and without any point, two.

Leſſer perfect SESQUI-ALTERATE, which is where the ſemibreve contains three meaſures, and that without any point.

Leſſer imperfect SESQUI-ALTERATE, a triple, where the ſemi-breve, with a point, contains three meaſures, and two without.

According to Buontempi, one may likewiſe call the triples $\frac{6}{4}$ and $\frac{12}{8}$, *ſeſqui-alterates.*

SESQUI-OCTAVE, is a kind of triple, marked C $\frac{8}{9}$, called by the Italians, *nonupla di crome*, where there are 9 quavers in every meaſure or bar, in lieu of 8.

Dupla SESQUI-QUARTA, is a kind of triple, marked C $\frac{9}{4}$, called by the Italians, *nonupla di ſemiminime*, where there are 9 crotchets in each meaſure, inſtead of 4; that is, three crotchets to each time.

SESQUI-ALTERATE, in geometry and arithmetic, is a ratio between two lines, two numbers, or the like, where one of them contains the other once, with the addition of an half. See RATIO.

Thus 6 and 9 are in a *ſeſqui-alterate* ratio; ſince 9 contains 6 once, and 3, which is half of 6, over: and 20 and 30 are in the ſame; as 30 contains 20, and half 20 or 10.

SESQUIDITONE, in muſic, a concord reſulting from the ſounds of two ſtrings, whoſe vibrations, in equal times, are to each other in the ratio of 5 to 6. See DITONE.

SESQUI-DUPLICATE *ratio*, is, when of two terms, the greater contains the leſs twice, with half another over: as 15 and 6; 50 and 20. See RATIO.

SESQUIQUADRATE, an aſpect, or poſition, of the planets, when at the diſtance of four ſigns and an half, or 135 degrees, from each other. See ASPECT.

SESQUIQUINTILE, an aſpect of the planets, when 108 degrees diſtant from each other. See QUINTILA and ASPECT.

SESSION, SESSIO, denotes each ſitting, or aſſembly, of a council. See COUNCIL.

In quoting councils, we ſay, in ſuch a *ſeſſion*, ſuch a canon, *&c.*

SESSION *of Parliament* is the ſeaſon, or ſpace, from its meeting to its prorogation, or diſſolution. See PROROGATION and PARLIAMENT.

SESSION, in law, denotes a ſitting of juſtices in court, upon their commiſſion.—As, the *ſeſſion of oyer and terminer*, &c. *Quarter-ſeſſions*, called *general-ſeſſions*, or *open-ſeſſions*, ſtand oppoſite to *eſpecial*, otherwiſe called *privy-ſeſſions*, which are procured upon ſome ſpecial occaſion, for the more ſpeedy diſpatch of juſtice. See QUARTER-SESSIONS.

Petit-ſeſſions, or *ſtatute-ſeſſions*, are kept by the high-conſtable of every hundred, for the placing of ſervants. See STATUTE.

Kirk SESSIONS. See the article KIRK.

SESTERCE, SESTERTIUS, a ſilver coin, in uſe among the ancient Romans, called alſo *nummus*, and ſometimes *nummus ſeſtertius*. See COIN and NUMMUS.

The *ſeſterce* was the fourth part of the denarius, and originally contained two as's and an half; eſtimated in Engliſh money, at ſomewhat above one penny half-penny farthing.

The *ſeſterce* was at firſt denoted by L L S; the two L's ſignifying two libræ, and the S half. But the librarii, afterwards, converting the two L's into an H, expreſſed the *ſeſterce* by H S.

The word *ſeſtertius* was firſt introduced by way of abbreviation for *ſemiſtertius*, which ſignifies two, and a half of a third, or litterally, only half a third; for in expreſſing half a third, it was underſtood, that there were two before.

Some authors make two kinds of *ſeſterces*; the *leſs*, called *ſeſtertius*, in the maſculine gender; and the *great* one, called *ſeſtertium* in the neuter: the firſt, that we have already deſcribed; the latter containing a thouſand of the other, or 8 *l.* 1 *s.* 1 *d.* ½ of our money.—Others will have any ſuch diſtinction of great and little *ſeſterces*, unknown to the Romans: *ſeſtertius*, ſay they, was an adjective, and ſignified *as ſeſtertius*, or two as's and a half: and when uſed plurally, as in *quinquaginta ſeſtertium*, or *ſeſtertia*, it was only by way of abbreviation, and there was always underſtood *millia* thouſands: this laſt is the more probable opinion.

To be qualified for a Roman knight, an eſtate of four hundred thouſand *ſeſterces* was required; and, for a ſenator, eight hundred thouſand.

Authors alſo mention a copper *ſeſterce*, worth about ⅓ of a penny Engliſh.

SESTERCE, SESTERTIUS, was alſo uſed in antiquity, for a thing containing two wholes and a half of another: as *as* was taken for any whole, or integer. See AS.

SESTUPLO, in muſic. See the article SEXTUPLE.

SETHIANS, or SETHINIANS, SETHIANI, or SETHINIANI, a branch of the ancient gnoſticks; thus called, becauſe of their pretending to fetch their origin from Seth, ſon of Adam, whom they called Jeſus and Chriſt; from an opinion, that Seth and Jeſus were the ſame perſon, who came down from heaven two ſeveral times.

As the *Sethians* had the ſame philoſophy with the other gnoſticks, they had numerous other fables in their ſyſtem. See GNOSTICKS.

They pretended to have ſeveral books of the ancient patriarchs; particularly, ſeven of their great maſter Seth: beſides one of Abraham, full of manifeſt falſities, which yet they called *apocalypſe*, or *revelation*. The book called the *little Geneſis*, anciently very common in the churches of the eaſt, was borrowed from them. From this book they learned the name of Seth's wife, who, they ſay, was called *Horæa*.—Some imagine, they borrowed a great many of their fictions from the Helleniſt Jews.

SETIER. See the article SEPTIER.

SETON, SETACEUM, in chirurgery, *&c.* a kind of topical remedy, uſed like a cautery, or an iſſue, to divert defluxions from the eyes; by making a wound in the ſkin of the hind-part of the neck, which is kept ſuppurating, by means of a little ſkain of ſilk, or cotton, paſſed through it.

Setons are alſo applied to ſuch as are apt to fall into epileptic fits.—They are of more efficacy than a common iſſue, but are preſcribed with much the ſame intention. See ISSUE.

The like operation is frequently practiſed on horſes, *&c.* and called, by the farriers, *rowelling*. See ROWEL.

Setons evacuate with a gentle pain; ſhake the nervous kind; diſcharge ſerum, and give vent to repletions and coarcervations of humours.

SETTER, among farmers.—To *ſetter*, is to cut the dew-lap of an ox or cow, and into the wound to put helleboraſter, whereby an iſſue is made, for all humours to vent themſelves. See ISSUE and SETON.

SETTING, in aſtronomy, the withdrawing of a ſtar or planet; or its ſinking below the horizon. See RISING.

Aſtronomers and poets make three different kinds of *ſetting* of the ſtars: *coſmical*, *acronycal*, and *heliacal*.—The firſt, when the ſtar *ſets* with the ſun. See COSMICAL. The ſecond, when it *ſets* at the time the ſun riſes. See ACRONYCAL. The third, when it is immerged, and hid, in the ſun's rays. See HELIACAL.—To find the times of the *ſetting* of the ſun and ſtars. See GLOBE.

SETTING, in ſea language.—To *ſet the land or the ſun by the compaſs*, is to obſerve how the land bears on any point of the compaſs; or, on what point of the compaſs the ſun is.

Alſo, when two ſhips ſail in ſight of one another, to mark on what point the chaſed bears, is termed, *ſetting the chaſe by the compaſs*.

SEVENTH, SEPTIMA, in muſic, an interval, called by the Greeks *heptachordon*; whereof there are four kinds.

The firſt, the *defective* or *diminiſhed ſeventh*, conſiſting of three tones, and three greater ſemi-tones, as from *ut* ſharp to *ſi* flat.

The ſecond, called by Zarlin and the Italians, *ſemi-ditono con diapente*, or *ſettimo minore*; is compoſed diatonically of ſeven degrees, and ſix intervals, four whereof are tones, and the reſt greater ſemi-tones, as from *de* to *ut*; and chromatically of ten ſemi-tones, ſix whereof are greater, and four leſs: it takes its form from the *ratio quadripartiens quintas*, 9 to 5.

The third, called by the Italians, *il ditono con diapente*, or *ſettimo maggiore*, is compoſed diatonically, like the former, of ſeven degrees, and ſix intervals, ſix whereof are full tones, and a ſingle one a greater ſemi-tone; ſo that only one greater ſemi-tone is wanting of the octave: as from *ut* to *ſi*; and chromatically of eleven ſemi-tones, ſix whereof are greater, and five leſſer. It takes it origin from the ratio of 15 to 8.

The fourth, is the *redundant ſeventh*, compoſed of five tones, a greater ſemi-tone, and a leſſer; as from *ſi* flat to *la* ſharp: ſo that it only wants a comma of an octave; that is, ſo much as it wants to render its ſecond ſemi-tone a greater. Hence many confound it with the octave itſelf; maintaining, with good reaſon, that only the three firſt *ſevenths* can be of any uſe. See OCTAVE.

SEVENTH *pair of nerves*. See the article NERVE.

SEVERAL *tail*, in law, is that whereby land is given, and *entailed ſeverally* to two: *e. gr.* to two men and their wives, and the heirs of their bodies begotten. See TAIL.

The donees, here, have joint eſtate for their two lives, yet they have *ſeveral* inheritance; for the iſſue of the one ſhall have his moiety, and that of the other, the other.

SEVERANCE, in law, the *ſingling*, or *ſevering* two or more that join, or are joined, in the ſame writ, or action.

As if two join in a writ, *de libertate probanda*, and the one be afterwards non-ſuited; here, *ſeverance* is permitted, ſo, as notwithſtanding the non-ſuit of the one, the other may ſeverally proceed.

There is alſo *ſeverance of the tenants* in an aſſize; when one, two, or more diſſeiſees appear upon the writ, and not the other. And—*Severence in debt*, where two executors are named plaintiffs, and the one refuſes to proſecute.—We alſo meet with *ſeverance of ſummons*, *ſeverance in attaints*, &c.

SEVERIANS, SEVERIANI.—There were two ſects of hereticks thus called: the firſt, who are as old as the beginning of the third century, were an impure branch of gnoſticks; thus called from their chief, *Severus*. See GNOSTICK.

The ſecond, by ſome called *Severites*, were a ſect of acephali, or Eutychians: their leader, Severus, was preferred to the ſee of Antioch in 513, where he did his utmoſt to ſet aſide the council of Chalcedon. See EUTYCHIANS and MONOTHELITES.

SEWER *, in the houſhold, an officer who comes in before the meat of a king, or nobleman, to place and range it on the table.

* The word is formed from the French, *eſcuyer*, eſquire, gentleman or uſher. See ESQUIRE.

SEWERS, in building, are ſhores, conduits, or conveyances, for the ſuillage and filth of a houſe. See CLOACA.

Sir Henry Wotton adviſes, that art imitates nature in theſe ignoble conveyances, and ſeparate them from ſight (where there wants a running water) into the moſt remote, loweſt and thickeſt part of the foundation, with ſecret vents paſſing up through the walls, to the wide air, like tunnels; which all the Italian architects commend for the diſcharge of noiſom vapours, though elſewhere little practiſed.

Clerk of the SEWERS. See the article CLERK.

SEX, SEXUS, ſomething in the body, which diſtinguiſhes male from female. See MALE and FEMALE.

The number of perſons, of the two *ſexes*, are exceedingly well balanced; ſo that every man may have his wife, and every woman her huſband. See MARRIAGE.

Hermaphrodites have both the *ſexes* in one. See HERMAPHRODITE.

PHRODITE.—It is expreſly forbid by the law of Moſes, to diſguiſe the *ſex*.

SEXAGENARY, Sexagenarius, ſomething relating to the number ſixty: more particularly, a perſon arrived at the age of ſixty years.

Some caſuiſts diſpenſe with *ſexagenarius* for not faſting: the Papian law prohibits *ſexagenarii* from marriage; becauſe, at that age, the blood and humours are frozen.

Sexagenary *arithmetick*. See Sexageſimal and Arithmetic.

Sexagenary *tables*, are tables of proportional parts, ſhewing the product of two *ſexagenaries* that are to be multiplied; or the quotient of two to be divided.

SEXAGESIMA, the ſecond ſunday before lent, or the next to ſhrove-ſunday.—So called, as being about the ſixtieth day before Eaſter. See Lent.

Sexageſima, is that which follows ſeptuageſima, and precedes quinquageſima. See Septuageſima, &c.

SEXAGESIMAL, or Sexagenary *arithmetic*, a method of computation, proceeding by ſixties. See Arithmetic.

Such is that uſed, in the diviſion of a degree into 60 minutes; of the minute, into 60 ſeconds; of the ſecond, into 60 thirds, &c. See Degree.

SEXAGESIMALS, or Sexageſimal *fractions*, are fractions, whoſe denominators proceed in a ſexagecuple ratio; that is, a prime, or the firſt minute $= \frac{1}{60}$, a ſecond $= \frac{1}{3600}$, a third, $\frac{1}{216000}$. See Degree.

Anciently there were no other than *ſexageſimals* uſed in aſtronomical operations, and they are ſtill retained in many caſes; though decimal arithmetic begins to grown in uſe now in aſtronomical calculations.

In theſe fractions, which ſome alſo call *aſtronomical fractions*, the denominator being always 60 or a multiple thereof, is uſually omitted, and the numerator only written down; $4^{\circ}, 59', 32'', 50''', 16''''$, is to be read, 4 degrees, 59 minutes, 32 ſeconds of a degree, or 60th part of a minute, 50 thirds, 16 fourths, &c. See Fractions.

SEXTANS, Sextant, a *ſixth* part of certain things.

The Roman divided their *as*, which was a pound of braſs, into 12 ounces: the ounce was called *uncia*, from *unum*; and two ounces *ſextans*, as being the *ſixth* part of the pound. See the article As.

Sextans was alſo a meaſure, which contained two ounces of liquor, or two cyathi.—Hence, *Sextantes, Calliſte, duos infunde Falerni.*

SEXTANT, in mathematicks, denotes the *ſixth* part of a circle; or an arch, comprehending 60 degrees. See Arch and Degree.

Sextant is more particularly uſed for an aſtronomical inſtrument, made like a quadrant; excepting that its limb only comprehends 60 degrees.

The uſe and application of the *ſextant*, is the ſame with that of the quadrant. See Quadrant.

In the obſervatories of Greenwich, and Pekin, are very large and fine *ſextants*. See Observatory.

SEXTARIUS, an ancient Roman meaſure, containing two cotylæ, or two heminæ. See Measure, Cotyla and Hemina.

SEXTILE, Sextilis, the poſition or aſpect of two planets, when at 60 degrees diſtant; or at the diſtance of two ſigns from one another.—It is marked thus (*). See Aspect and Semisextile.

SEXTON, a church officer, thus called by corruption of the Latin *ſacriſta*, or Saxon *ſegerſtane*, which denotes the ſame. His office is to take care of the veſſels, veſtments, &c. belonging to the church; and to attend the miniſter, church-wardens, &c. at church.—He is uſually choſe by the parſon only.

The office of *ſexton of the pope's chapel* is appropriated to the order of the hermits of St. Auguſtin.—He is generally a biſhop, though ſometimes the pope only gives a biſhoprick, *in partibus*, to him he confers the poſt on.—He takes the title of *prefect of the pope's ſacriſty*; has the keeping of the veſſels of gold and ſilver, the relicks, &c.

When the pope ſays maſs, the *ſexton* always taſtes the bread and wine firſt. If it be in private he ſays maſs, his holineſs, of two wafers, gives him one to eat; and if in publick, the cardinal, who aſſiſts the pope in quality of deacon, of three wafers, gives him two to eat. When the pope dies, he adminiſters to him the ſacraments of extreme unction, &c. and enters the conclave, in quality of firſt conclaviſt.

SEXTUPLE, Sestuplo, in muſic, denotes a mixed ſort of triple time, which is beaten in double time. See Triple.

This, the Italians call *ſeſtuplo*; the French ſometime call it *ſixth time*, *meſure a ſex temps*; though improperly: according to M. Broſſard it ought rather to be denominated *triple binary* time. See Time.

Authors uſually make mention of three ſpecies hereof; to which M. Broſſard adds two more, *viz.*

Sextuple *of the ſemi-breve*, by the French called *triple* of 6 for 1, as being denoted by thoſe two numbers, $\frac{6}{1}$; or becauſe here are required ſix ſemi-breves to a meaſure, in lieu of one, *viz.* three riſing and three falling.

Sextuple *of the minim*, called by the French triple of 6 for 2, as being denoted by $\frac{6}{2}$, which ſhew that ſix minims are here required to a meaſure, inſtead of 2.

Sextuple *of the crotchet*, called by the French triple of 6 for 4, becauſe denoted by C$\frac{6}{4}$, or $\frac{6}{4}$, which ſhew that there muſt be 6 crotchets to a meaſure, in lieu of 4.

Sextuple *of the chroma*, by the French called triple of 6 for 8, as being denoted by $\frac{6}{8}$; which ſhew that 6 quavers here make the meaſure or ſemi-breve, inſtead of 8.

Sextuple *of the ſemichroma*, or triple of 6 for 16; ſo called, becauſe denoted by $\frac{6}{16}$, which ſhews, that 6 quavers are here required to a meaſure, inſtead of 16.

SEXTUS, Sixth, in the canon law, denotes a collection of decretals, made by pope Boniface VIII. uſually thus called from the title, which is *liber ſextus*; as if it were a *ſixth* book added to the five books of decretals, collected by Gregory IX. See Decretal.

The *ſextus* is a collection of papal conſtitutions, publiſhed after the collection of Gregory IX. containing thoſe of the ſame Gregory, Innocent IV. Alexander IV. Urban IV. Clement IV. Gregory X. Nicholas III. and Boniface VIII. by whoſe order the compilation was made.—The perſons employed in making of it were Will. de Mandegot, archbiſhop of Ambrun; and Berenger, biſhop of Beziers, and Richard of Sienna. See Canon *law*.

SGRAFFIT, Sgraffiata, in painting, denotes *ſcratch-work*; a method of painting in black and white only, not in freſco, yet ſuch as will bear the weather.

Sgraffit performs both the deſign and the painting, all in one.—It is chiefly uſed to embelliſh the fronts of palaces, and other magnificent buildings. See Scratch-Work.

SHACK, in ancient cuſtoms, a liberty of winter-paſturage.

In the counties of Norfolk and Suffolk, the lord of the manor has *ſhack*, i. e. a liberty of feeding his ſheep at pleaſure upon his tenants lands, during the ſix winter months.

In Norfolk, *ſhack* alſo extends to the common for hogs, in all mens grounds, from the end of harveſt, till ſeed-time.—Whence, to go *a-ſhack*, is to feed at large.

SHADOW, Shade, a plane where the light is weakened by the interpoſition of ſome opake body before the luminary. See Light.

The *ſhadow* of yew, cypreſs, and wallnut-tree, are held dangerous to men: the *ſhadow* of aſh is deadly to ſerpents; for which reaſon ſerpents are never found under its *ſhade*.

The doctrine of *ſhadows* makes a conſiderable article in opticks and geography, and is the foundation of dialling. See Dial and Dialling.

Shadow, in opticks, is a privation of light, by the interpoſition of an opake body.

As nothing is ſeen but by light, a mere *ſhadow* is inviſible: when therefore we ſay, we ſee a *ſhadow*, we mean partly, that we ſee bodies placed in the *ſhadow*, and illuminated by light, reflected from collateral bodies; and partly, that we ſee the confines of the light. See Light.

If the opake body, that projects the *ſhadow*, be perpendicular to the horizon, and the place it is projected on, be horizontal, the *ſhadow* is called a *right ſhadow*.—Such are the *ſhadows* of men, trees, buildings, mountains, &c.

If the opake body be placed parallel to the horizon, the *ſhadow* is called a *verſed ſhadow*; as the arms of a man ſtretched out, &c.

Laws of the projection of Shadows *from opake bodies.*—1°. Every opake body projects a *ſhadow* in the ſame direction with its rays; that is, towards the part oppoſite to the light. Hence, as either the luminary, or the body changes place, the *ſhadow* likewiſe changes.

2°. Every opake body projects as many *ſhadows*, as there are luminaries to inlighten it.

3°. As the light of the luminary is more intenſe, the *ſhadow* is the deeper. Hence the intenſity of the *ſhadow* is meaſured by the degrees of light that ſpace is deprived of.

4°. If a luminous ſphere be equal to an opake one it illumines, the *ſhadow* this latter projects, will be a cylinder; and, of conſequence, will be propagated ſtill equal to itſelf, to whatever diſtance the luminary is capable of acting: ſo that, if it be cut in any place, the plane of the ſection will be a circle equal to a great circle of the opake ſphere.

5°. If the luminous ſphere be greater than the opake one, the *ſhadow* will be conical. If therefore the *ſhadow* be cut by a plane parallel to the baſe, the plane of the ſection will be a circle, and that ſo much the leſs, as it is at a greater diſtance from the baſe.

6°. If the luminous ſphere be leſs than the opake one, the *ſhadow* will be a truncated cone: conſequently it grows ſtill wider and wider: and therefore, if cut by a plane parallel to the ſection, that plane will be a circle ſo much the greater, as it is further from the baſe.

7°. To find the length of the *ſhadow*, or the axis of the ſhady cone, projected by a leſs opake ſphere, illumined by a larger; the ſemi-diameters of the two, as C G, and I M, *Tab. Opticks, fig.* 12. and the diſtances between their centers G M being given.

Draw F M parallel to C H; then will $IM = CF$; and therefore F G will be the difference of the ſemi-diameters G C and I M. Conſequently, as F G, the difference of the ſemi-diameters is to GM, the diſtance of the centers; ſo is C F, the ſemi-diameter of the opake ſphere, to M H, the diſtance of the vertex of the ſhady cone, from the center of the opake ſphere. If then, the ratio of P M to M H be very ſmall; ſo that M H and P H do not differ very notably, MH may be taken for the axis of the *ſhadowy* cone: otherwiſe the part P M muſt be ſubtracted from it; which to find, ſeek the arch L K; for, this ſubtracted from a quadrant, leaves the arch I Q; which is the meaſure of the angle I M P. Since then, in the triangle M I P, which is rectangular at P, beſides the angle I M Q, we have the ſide I M; the ſide M P is eaſily found by plain trigonometry.

E. gr. If the ſemi-diameter of the earth $MI = 1$; the ſemi-diameter of the ſun, according to Ricciolus, will be $= 33$; and therefore $GF = 32$; and of conſequence $MH = 228\frac{4}{8}$; ſince then, M P is found by calculation to bear a very ſmall ratio to M H; P H may be taken to be $288\frac{4}{8}$ ſemi-diameters of the earth.

Hence, as the ratio of the diſtance of the opake body, from the luminous body G M, to the length of the *ſhadow* M H, is conſtant; if the diſtance be diminiſhed, the length of the *ſhadow* muſt be diminiſhed likewiſe. Conſequently, the *ſhadow* continually decreaſes as the opake body approaches the luminary.

8°. To find the length of the *ſhadow* projected by an opake body, T S, *fig.* 13; the altitude of the luminary, *e. gr.* of the ſun above the horizon, *viz.* the angle S V T, and that of the body being given.—Since, in the rectangle triangle S T V, which is rectangular at T, we have given the angle V, and the ſide T S; the length of the *ſhadow* T V is had by trigonometry. See TRIANGLE.

Thus, ſuppoſe the altitude of the ſun 37° 45′, and the altitude of a tower 187 feet; T V will be found $241\frac{1}{2}$ feet.

9°, The length of the *ſhadow* T V, and the height of the opake body T S, being given; to find the altitude of the ſun above the horizon.

Since, in the rectangle triangle S T V, rectangular at T, the ſides TV and T S, are given; the angle V is found thus: as the length of the *ſhadow* T V, is to the altitude of the opake body T S, ſo is the whole ſine to the tangent of the ſun's altitude above the horizon. Thus, if T S be 30 foot, and T V 45′; T V S will be found 33° 41′.

10°. If the altitude of the luminary, *e. gr.* the ſun above the horizon T V S, be 45°, the length of the *ſhadow* T V is equal to the height of the opake body.

11°. The lengths of the *ſhadows* T Z and T V of the ſame opake body T S, in different altitudes of the luminary, are as the co-tangents of thoſe altitudes.

Hence, as the co-tangent of a greater angle is leſs than that of a leſs angle; as the luminary riſes higher, the *ſhadow* decreaſes: whence it is, that the meridian *ſhadows* are longer in winter than in ſummer.

12°. To meaſure the altitude of any object, *e. gr.* a tower A B (*fig.* 14.) by means of its *ſhadow* projected on a horizontal plane.

At the extremity of the *ſhadow* of the tower C, fix a ſtick, and meaſure the length of the *ſhadow* A C; fix another ſtick in the ground of a known altitude D E, and meaſure the length of the *ſhadow* thereof E F. Then, as E F is to A C, ſo is D E to A B. If therefore, A C be 45 yards, and ED 5 yards; A B will be $32\frac{1}{7}$ yards.

13°. The *ſhadows* of equal opake bodies have their lengths proportionable to their diſtances from the ſame luminaries equally high. Hence, as the opake approaches to the luminary, or the luminary to the opake body, the length of the *ſhadow* is increaſed; and as either of them recedes, is diminiſhed. Hence, from the different lengths of *ſhadows* of the ſame opake bodies at the ſame height of the Sun, Moon, Jupiter, Venus, *&c.* we may gather their different diſtances from the earth; though not accurately enough for aſtronomical purpoſes. See DISTANCE.

14°. The right *ſhadow* is to the height of the opake body, as the co-ſine of the luminary, to the ſine.

15°. The altitude of the luminary being the ſame in both caſes, the opake body A C (*fig.* 15.) will be to the verſed *ſhadow* AD, as the right *ſhadow* EB, to its opake body DB.

Hence, 1°. The opake body is to its verſed *ſhadow*, as the co-ſine of the altitude of the luminary to its ſine; conſequently, the verſed *ſhadow* A D is to its opake body A C, as the ſine of the altitude of the luminary to its co-ſine.—2°. If $DB = AC$; then will D B be a mean proportional between E B and A D; that is, the length of the opake body is a mean proportional between its right *ſhadow* and verſed *ſhadow*, under the ſame altitude of the luminary.—3°. When the angle C is 45°, the ſine and co-ſine are equal; and therefore the verſed *ſhadow* equal to the length of the opake body.

16°. A right ſine is to a verſed ſine of the ſame opake body, under the ſame altitude of the luminary, in a duplicate ratio of the co ſine to the ſine of the altitude of the luminary.

Right and verſed *ſhadows*, are of conſiderable uſe in meaſuring; as by their means we can commodiouſly enough meaſure altitudes, both acceſſible and inacceſſible, and that too when the body does not project any *ſhadow*. The right *ſhadows* we uſe, when the *ſhadow* does not exceed the altitude; and the verſed *ſhadows*, when the *ſhadow* is greater than the altitude. On this footing, is made an inſtrument called the *quadrat*, or *line of ſhadows*, by means whereof the ratio's of the right and verſed *ſhadow* of any object, at any altitude, are determined. This inſtrument is uſually added on the face of the quadrant. Its deſcription and uſe, ſee under the article QUADRAT.

SHADOW, in geography.—The inhabitants of the globe are divided, with reſpect to their *ſhadows*, into *aſcii*, *amphiſcii*, *heteroſcii*, and *periſcii*. The firſt are ſuch as at a certain ſeaſon of the year have no *ſhadows* at all, while the ſun is in the meridian. See ASCII. The ſecond are ſuch, whoſe meridian *ſhadow*, at one ſeaſon of the year looks to the north and at another to the ſouth. See AMPHISCII. The third are ſuch, whoſe *ſhadows* conſtantly tend either to the north or ſouth. See HETEROSCII. The laſt are thoſe, whoſe *ſhadows*, in one and the ſame day, ſucceſſively turn to all the points. See PERISCII.

SHADOW, in painting, denotes an imitation of a real *ſhadow*, effected by gradually heightening, and darkening the colours of ſuch figures as by their diſpoſition cannot receive any direct rays from the luminary ſuppoſed to enlighten the piece. The management of the *ſhadows* and lights, makes what painters call the *clair obſcure*: the laws whereof ſee under the article CLAIR-OBSCURE.

SHADOW, in perſpective.—The appearance of an opake body, and a luminous one, whoſe rays diverge (*e. gr.* a candle, lamp, *&c.*) being given; to find the juſt appearance of the *ſhadow* according to the laws of perſpective.—The method is this. From the luminous body, which is here conſidered as a point, let fall a perpendicular to the perſpective plane or table; *i. e.* find the appearance of a point upon which a perpendicular drawn from the middle of the luminary, falls on the perſpective plane; and from the ſeveral angles, or raiſed points of the body let fall perpendiculars to the plane. Theſe points whereon the perpendiculars fall, connect by right lines, with the point upon which the perpendicular let fall from the luminary, falls. And continue the lines to the ſide oppoſite to the luminary. Laſtly, through the raiſed points, draw lines through the center of the luminary, interſecting the former; the points of interſection are the terms or bounds of the *ſhadow*.

E. gr. Suppoſe it required to project the appearance of the *ſhadow* of a priſm, ABCFED (*Tab. Perſpective*, *fig.* 8. N°. 2.) ſcenographically delineated: ſince A D, B E, and C F, are perpendicular to the plane, and L M is likewiſe perpendicular to the ſame; (for the luminary is given, if its altitude LM be given) draw the right lines GM and HM, through the points D and E. Through the raiſed points A and B, draw the right lines G L and H L, interſecting the former in G and H. Since the *ſhadow* of the right line A D terminates in G; and the *ſhadow* of the right line B E in H; and the *ſhadows* of all the other right lines conceived in the given priſm are comprehended within theſe terms; GDEH will be the appearance of the *ſhadow* projected by the priſm.

Geneſis of Curves by SHADOWS. See the article CURVE.

SHAFT, in building: the *ſhaft of a column*, is the body thereof; thus called from its ſtreightneſs: but by architects more frequently the *fuſt*.—See *Tab. Archit. fig.* 24, 26, 28, 30, 32. See alſo FUST and COLUMN.

SHAFT, is alſo uſed for the ſpire of a church-ſteeple.—And for the ſhank or tunnel of a chimney. See CHIMNEY, TUNNEL, *&c.*

SHAFT *of a mine*, is the hollow entrance or paſſage into a mine, ſunk or dug to come at the ore. See MINE and ADIT. In the tin-mines, after this is ſunk about a fathom, they leave a little, long, ſquare place, which is called a *ſhamble*.

SHAGREEN, or CHAGREEN, a kind of grained leather, chiefly uſed in the covers of caſes, books, *&c.* It is very cloſe and ſolid, and covered over with little roundiſh grains, or papillæ. It is brought from Conſtantinople, Tauris, Tripoli, Algiers, and ſome parts of Poland.

There is a diſpute among authors what the animal is whence the *ſhagreen* is prepared? Rauwolf aſſures us it is the onager, which according to him and Bellonius is a kind of wild aſs. V. Ray Synopſ. An. Quad. p. 63.

It is added, that it is only the hard part of the ſkin is uſed for this purpoſe. Borel ſays it is a ſea-calf; others a kind of fiſh called by the Turks *ſhagrain*, whoſe ſkin is covered with grains; and thoſe ſo hard that they will raſp and poliſh wood.

There is alſo a ſort of *ſhagreen* made of the ſkin of the ſquatina, in Engliſh the monk or angel fiſh. V. Willoughby Ichth. p. 80.

Manner of preparing SHAGREEN.—The ſkin being juſt flead off, is ſtretched out, covered over with muſtard-ſeed, and the ſeed bruiſed on it; and thus expoſed to the weather for ſome days; then tanned.

The beſt is that brought from Conſtantinople, of a browniſh colour; the white is the worſt. It is extremely hard, yet, when ſteeped in water, becomes very ſoft and pliable; whence it becomes of great uſe among caſe-makers. It takes any colour that is given it; red, green, yellow, black. It is frequently counterfeited by maroquin formed like *ſhagreen*; but this laſt is diſtinguiſhed by its peeling off, which the firſt does not. See Morocco.

SHALLOP, Shalloop, or Sloop, is a ſmall light veſſel, with only a ſmall main-maſt, and fore-maſt, and lug-ſails, to hale up, and let down, on occaſion. *Shalloops* are commonly good ſailers; and are therefore often uſed as tenders upon men of war.

SHAMADE, in war. See the article Chamade.

SHAMMY, or Chammy, Chamois, a kind of leather, either dreſſed in oil, or tanned; much eſteemed for its ſoftneſs, pliancy, *&c.*

It is prepared from the ſkin of the *chamois*, or *ſhamois*, a kind of rupi-capra, or wild goat, called alſo *iſard*; inhabiting the mountains of Dauphine, Savoy, Piedmont, and the Pyreneans.

Beſides the ſoftneſs and warmneſs of the leather, it has the faculty of bearing ſoap without damage, which renders it very uſeful on many accounts.

In France, *&c.* ſome wear the ſkin raw, without any preparation: it is alſo uſed for the purifying of mercury; which is done by paſſing it through the pores of this ſkin, which are very cloſe. See Mercury.

The true *chamoiſe leather* is counterfeited with common goat kid, and even ſheep-ſkin; the practice of which makes a particular profeſſion, called by the French *chamoiſure.* The laſt, though the leaſt eſteemed, is yet ſo popular, and ſuch vaſt quantities prepared, eſpecially about Orleans, Marſelles and Tholouſe, that it may not be amiſs to give the method of preparation.

Manner of Shamoising, *or of preparing ſheep, goat, or kid-skins in oil, in imitation of* Shammy.—The ſkins being waſhed, drained, and ſmeared over with quick-lime on the fleſhy ſide, are folded in two, length-wiſe, the wool outwards, and laid on heaps; and ſo left to ferment eight days; or, if they had been left to dry after fleaing, 15 days.

Then they are waſhed out, drained, and half dried; laid on a wooden leg, or horſe, the wool ſtripped off with a round ſtaff for the purpoſe, and laid in a weak pit, the lime whereof had been uſed before, and had loſt the greateſt part of its force.

After 24 hours they are taken out, and left to drain 24 more; then put in another ſtronger pit This done, they are taken out, drained, and put in again, by turns; which begins to diſpoſe them to take oil: and this practice they continue for ſix weeks in ſummer, or three months in winter; at the end whereof they are waſhed out, laid on the wooden leg, and the ſurface of the ſkin on the wool-ſide peeled off, to render them the ſofter; then, made into parcels, ſteeped a night in the river, in winter more; ſtretched, ſix or ſeven over one another, on the wooden leg; and the knife paſſed ſtrongly on the fleſh-ſide, to take off any thing ſuperfluous, and render the ſkin ſmooth.

Then they are ſtretched, as before, in the river; and the ſame operation repeated on the wool-ſide; then thrown into a tub of water with bran in it, which is brewed among the ſkins till the greateſt part ſtick to them; and then ſeparated into diſtinct tubs, till they ſwell, and riſe of themſelves above the water.

By this means, the remains of the lines are cleared out: they are then wrung out, hung up to dry on ropes, and ſent to the mill, with the quantity of oil neceſſary to ſcour them: the beſt oil is that of ſtock-fiſh.

Here, they are firſt thrown in bundles into the river for 12 hours, then laid in the mill-trough and fulled without oil till they be well ſoftened; then oiled with the hand, one by one, and thus formed into parcels of four ſkins each, which are milled and dried on cords a ſecond time, then a third; then oiled again and dried.

This proceſs is repeated as often as neceſſity requires: when done, if there be any moiſture remaining, they are dried in a ſtove, and made up into parcels wrapped up in wool: after ſome time they are opened to the air, but wrapped up again as before, till ſuch time as the oil ſeems to have loſt all its force, which it ordinarily does in 24 hours.

The ſkins are then returned from the mill to the *chamoiſer*, to be ſcoured; which is done by putting them in a lixivium of wood-aſhes, working and beating them in it with poles, and leaving them to ſteep till the lye have had its effect; then they are wrung out, ſteeped in another lixivium, wrung again, and this repeated till all the greaſe and oil be purged out. When this is done, they are half dried, and paſſed over a ſharp-edged iron inſtrument, placed perpendicular in a block, which opens, ſoftens, and makes them gentle: laſtly, they are thoroughly dried, and paſſed over the ſame inſtrument again, which finiſhes the preparation, and leaves them in form of *ſhammy.*

Kid and goat ſkins are *ſhamoiſed* in the ſame manner as thoſe of ſheep; excepting that the hair is taken off, without the uſe of any lime; and that when brought from the mill, they undergo a particular preparation, called *ramalling*; the moſt delicate and difficult of all the others.

It conſiſts in this, that as ſoon as brought from the mill, they are ſteeped in a fixt lixivium; taken out, ſtretched on a round wooden leg, and the hair ſcraped off with the knife; this makes them ſmooth, and, in working, caſt a kind of fine nap. The difficulty is in ſcraping them evenly.

SHANKER, in medicine, a malignant ulcer, which gnaws and eats the fleſh; uſually occaſioned by ſome venereal diſorder. See Carcinoma.

SHARP, in muſic, a kind of artificial note or character, (thus formed ♯) which being prefixed to a note, ſhews that it is to be ſung or played a ſemi-tone, or half a note higher than the natural note would have been without. See Semitone.

When the ſemi-tone takes the name of the natural note next above it, it is marked with a character called a *flat.* See Flat.

It is indifferent, in the main, which of the two be uſed, though there are ſometimes particular reaſons for the one rather than the other.

The uſe of flats and *ſharps*, is by way of remedy to the deficiencies of the fixed ſcales of inſtruments. See Scale.

Sharp *nails.* See the article Nail.

SHARPING *corn*, a cuſtomary preſent of corn, which at every Chriſtmas, the farmers, in ſome parts of England, make to their ſmith, for ſharpening their ploughing-irons, harrow-tines, *&c.*

SHEADING, a riding, tything, or diviſion in the Iſle of Man: the whole iſland being divided into ſix *ſheadings*, in every one of which, is a coroner or chief conſtable, appointed by the delivery of a rod at the annual convention.

SHEARING. See the article Sheering.

SHEATHING *of a ſhip*, is the caſing that part of her hull, which is to be under water, with ſomething to keep the worms from eating into her planks.

It is uſually done by laying tar and hair mixed together all over the old plank, and then nailing on thin new boards.—But this hinders a ſhip's ſailing; and therefore of late ſome have been *ſheathed* with milled lead, which is much ſmoother, and conſequently better for ſailing, and alſo more cheap and durable than the other way. It was firſt invented by Sir Philip Howard, and major Watſon.

SHEER *hooks*, or Shear-*hooks*, are large iron hooks, uſed when a ſhip deſigns to board another.

Sheer-*ſhanks*, or Shear *ſhanks*, a kind of knots by which they tie up and ſhorten a runner when it is too long.

SHEERING, or Shearing, in the woollen manufactures, the cloth-worker or *ſheerman's* craft or office; or the cutting off, with large *ſheers*, the too long and ſuperfluous nap, or ſhag found on the ſurface of woollen ſtuffs, fuſtians, cottons, *&c.* in order to make them more ſmooth and even.—Stuffs are *ſhorn* more or fewer times, according to their quality and fineneſs. See Cloth.

Some uſe the phraſe *ſheering of hats*, for the paſſing of hats made of wool, over the flame of a clear fire made of ſtraw, or ſpray, to take off the long hairs. Others call this *flaming*, and others *ſindging*. Other hats, as caſtors, ſemi-caſtors, *&c.* are *ſhorn*, by rubbing them over with pumice-ſtone. See Hat.

Sheering, or Shearing, is alſo a ſea term for the motion of a ſhip when ſhe goes in an out, and not right forward; either by reaſon ſhe is not ſteered ſteddily, or on account of the ſwift running of the tide, *&c.* in which caſe ſhe is ſaid to *ſheer*, or go *ſheering*.

When ſhe lies at anchor, near port, *&c.* by reaſon of the ſwift running of a tide-gate, *&c.* ſhe is ſaid to be in danger of *ſheering home her anchor*, or *ſheering a-ſhore.*

SHEETING *nails.* See the article Nail.

SHEKEL, Shekle, Sheckle, Siclus, an ancient Hebrew coin, equal to four Attick drachms, to four Roman denarii, or to 2 s. 3 d. ¼ ſterling.

In the Bible, the *ſhekel* is ſometimes alſo rendered *ſolidus*, and ſometimes *ſtater.*

The Jewiſh doctors are in great doubt about the weight of the *ſhekel*; and it is only by conjecture, and by the weight of the modern *ſhekel*, that the ancient one is judged equal to four Attick drachmas.

Father Souciet has deſcribed ſeveral of theſe *ſhekels*, in his diſſertation on the Hebrew medals. By the way he obſerves, that the third and fourth parts of a *ſhekel*, deſcribed by Waſerus *de Ant. Num. Heb.* are counterfeits of that author.

The Hebrew *ſhekel*, according to F. Merſenne, weighs 268 grains, and is compoſed of 20 oboli, each obolus weighing 16 grains of wheat. This, he ſays, is the juſt weight, as he found by weighing one in the French king's cabinet. He adds, that ſuch as come ſhort of this weight have been filed or clipped. Biſhop Cumberland tells us, he has weighed ſeveral, and always found them near the weight of a Roman ſemuncia, or half-ounce.

Some are of opinion, that the Hebrews had two kinds of *ſhekels*: the *common* or *prophane ſhekel*, called *didrachma*; and the *ſhekel of the ſanctuary*, which laſt they will have to be double the former.—By this expedient they think we may get clear of ſome difficulties occurring in ſcripture, where things are mentioned as of incredible weight; particularly that paſſage where it is ſaid, that every time Abſalom cut off his hair, the weight whereof uſed to incommode him, he cut off the weight of 200 *ſhekels.*

But Villalpandus will not hear of ſuch a diſtinction; nor does biſhop Cumberland, M. Morin, *&c.* take the opinion to have any foundation. The *prophane ſhekel*, or *ſhekel* of four drachmas, they agree, was the ſame with the *ſacred ſhekel*; and it was only called by this laſt name in regard the ſtandard thereof was kept in the ſanctuary, by the prieſts. See SANCTUARY.

It is maintained by ſeveral, that the Jews had alſo a gold *ſhekel*, *ſiclus aureus*, of the ſame weight with the ſilver one, and valued at 1 l. 16 s. 6 d. ſterling.

The *ſhekel* is ſuppoſed to have been firſt ſtruck in the deſart, on the footing of 100 to the Attick mina, weighing 160 grains of wheat, and current for 10 geratis or oboli. But afterwards they were ſtruck of double that weight.

Some will have the *ſhekel* to be the oldeſt piece of money in the world, as being in uſe in Abraham's time; but this was not coined, or ſtamped; nor had any other value beſides its intrinſic worth. See MONEY.

Xenophon mentions *ſhekels*, as current in Arabia: Du Cange ſpeaks of others ſtruck and current in England.

SHELF, is what the miners, eſpecially in tin mines, call the *faſt-country*; by which they mean, an imaginary ſurface of the earth, which, at the concuſſion of the waters at the deluge, was never moved; and to the *ſhelf*, they think, all the loads or mineral veins at firſt lay even, and parallel; though after the flood, ſome were elevated, ſome depreſſed.

By *ſhelf*, they now mean that hard ſurface, or coat of the earth which lies under the mould, uſually about a foot deep; for they ſuppoſe, that ſince the flood, the earth hath gotten a new coat of vegetable earth, or ſuch as is made by the corruption of vegetables and animals. See DELUGE, STRATA, FOSSIL, MINE, *&c.*

SHELL, *Concha*, in natural hiſtory, a hard cruſt, ſerving to cover, and incloſe a kind of animals, hence called *teſtaceous.* See TESTACEOUS.

Naturaliſts have been generally miſtaken as to the manner of the formation of *ſhells.* The animal and its *ſhell* have been always ſuppoſed to ariſe from the ſame egg. But M. Reaumur has ſhewn the ſuppoſition to be falſe. He has found, by certain experiments, that the *ſhells* of garden ſnails are formed of a matter which perſpires from their bodies, and hardens and condenſes in the air.

It is certain, that all animals perſpire, and are encompaſſed with a kind of cloud or atmoſphere, which exhales from them, and, in all probability, aſſumes pretty nearly their external figure. Snails have nothing peculiar in this reſpect; unleſs that the atmoſphere of their perſpiration, condenſes and hardens about them, and forms a viſible cover, whereof the body is the mould or model; whereas that of other animals is evaporated and loſt in air. This difference ariſes from the different ſubſtance perſpired; that coming from ſnails, is viſcous and ſtony.—This is no ſuppoſition; but a matter of fact, which M. Reaumur has well proved by experiments.

On this principle, though the *ſhell* ſerve the animal as an univerſal bone, yet it does not grow like a bone, nor like any of the other parts, by vegetation; that is, by a juice circulating within itſelf; but by an external addition of parts laid one over another; as is commonly ſuppoſed of ſtones.

But, to conſider the thing more particularly; it is to be remembered, that the ſnail's head is always at the aperture of the *ſhell*, and its tail in the tip or point of the *ſhell*; and that its body is naturally turned into a ſpiral form, the different ſpires or circumvolutions whereof are in different planes.—This ſuppoſed: take the ſnail juſt hatched; as the matter it perſpires petrifies around it, there muſt be firſt formed a little cover, proportioned to the bigneſs of its body; and as its body is yet too little to make a circumvolution of a ſpiral, at leaſt a whole one; this cover will only be the centre, or, at moſt, the firſt beginning of a little circle of a ſpiral. But the animal grows: if, then, it ceaſed to perſpire, it is evident, all that is added to its body, would remain naked: but as it continues to perſpire, it makes itſelf a cover in proportion as it needs it.—Thus is an entire circumvolution of a ſpiral formed; and thus is a ſecond and a third; and ſtill every new ſpire is bigger than the laſt; in regard the animal grows in thickneſs, at the ſame time as it grows in length. When the animal ceaſes to grow, yet it does not ceaſe to perſpire; accordingly, the *ſhell* continues to grow thicker, though not longer.

SHELLS, *Conchæ* and *Cochleæ*, make a conſiderable article in the cabinets of the curious: the fineſt and rareſt are theſe that follow, *viz.*—The *papal crown*, *tiara pontificia*, which takes its name from its form, and which is all ſtreaked with red on a white ground.—The *feather*, *pluma*, whoſe whiteneſs, with its carnation ſtains, have an admirable effect.—The *Hebraica*, which, on a ground as white as ſnow, has ſpots as black as jet, much reſembling Hebrew characters.—The *Chineſe ſnail*, *limax Sinicus*, which has a green and black embroidery, on a dark brown ground.—The *cloth of gold*, *textile aureum*, remarkable for an admirable tiſſue of yellow, brown and black.—The *cloth of ſilver*, *textile argenteum*, which does not come behind that of gold in beauty.—The *leopard*, *pardus*, which is all ſpeckled.—The *tyger*, *tigris*, *ſeu concha cinericea*, whoſe ſpots exceed thoſe of the leopard.—The *hart's-horn*, *cornu cervinum*, which has black ſtains on a white ground.—The *purſe*, *crumena*, thus called from its figure; it is embroidered with three or four colours.—The *ſun dial*, *ſolarium manuarium*.—The *caterpillar*, *eruca*, both denominated from their forms.—Add the *nerites*, *white nautilus*, *lepas*, *lepaſia*, *apporays*, *tuba*, *galea*, &c. In Aldrovand, Geſner and Fabius Columna, we have all that the ancients have ſaid on the ſubject of *ſhells.*—In 1692, Dr. Liſter publiſhed a natural hiſtory of *ſhells*, in folio, full of cuts, repreſenting the various kinds of *ſhells.*—Under the firſt claſs, he ranges the terreſtrial or land *ſhells*: in the ſecond, the freſh-water *ſhells*, both thoſe called *turbinata*, and thoſe *bivalvia*: in the third, he diſpoſes all the ſea *ſhells*, the *bivalvia* and *multivalvia*: and in the fourth, he divides, into ſeveral claſſes, the ſea *ſhells*, called *turbinata.* See BIVALVE, TURBINATED, *&c.*

SHELLS, are frequently found under ground, in places far remote from the ſea, in mines, and even on the tops of mountains: but how they ſhould come there, is a thing the naturaliſts are greatly divided about.—The moſt uſual and eaſy opinion is, that thoſe parts have been formerly ſea, or at leaſt have been overflown thereby; and many even go as high as the grand deluge. See DELUGE.

But others take theſe to be the natural places of their birth or formation; ſome of them being found little other than rude clay; others of the ſame texture with the rock whereto they grow; and others of as abſolute a *ſhelly* ſubſtance, as any in the ſea.—In effect, theſe may be only ſo many different gradations of nature, which can as well produce *ſhells* in mines, as in the ſea; there being no want of ſaline or earthy particles for the purpoſe; nor is there any great difference between ſome ſort of ſpars, and ſea *ſhells.* See SPAR, PETRIFACTION, *&c.*

Dr. Liſter judges, that the *ſhells* found in ſtone-quarries, were never any part of an animal; and gives this reaſon for it, that quarries of different ſtone, yield quite different ſpecies of *ſhells*; different not only from one another, but from any thing in nature beſides, which either ſea or land does yield. See FOSSIL.

Littoral SHELLS. See the article LITTORAL.

SHELL *gold.* See the article GOLD.

SHELL *ſilver.* See the article SILVER.

Tortoiſe SHELL. See the article TORTOISE.

SHELL-FISH, a collective name for all fiſhes naturally incloſed in *ſhells.* See TESTACEOUS.

SHELTERS *horizontal.* See the article HORIZONTAL.

SHERIFF *, or SHIRE-REVE, an officer in each county of England, whoſe buſineſs is to ſee the execution of the king's orders, particularly of all writs directed to him out of the king's courts; to impannel juries; bring cauſes and criminals to trial; take care of the diſpatch of affairs both civil and criminal; collect the revenues, impoſts, fines, confiſcations, *&c.* ariſing in his county, for which he accounts to the exchequer; and to attend and aſſiſt the itinerant judges. See COUNTY, *&c.*

* The word is formed from the Saxon, *ſcir*, province, ſhire, and *geref*, grave, reve or perfect; or rather from *ſcyran*, to divide; the *ſheriff* being denominated from the firſt diviſion of the kingdom into counties. See GRAVE and REVE.—In Latin he is called *vice-comes.* See VISCOUNT.

The *ſheriff* is, as it were, the ſoul of the policy of the county, and the preſerver of the peace thereof. His office only laſts one year.

He was anciently choſe by the people in the county-court, as knights now are for parliament; but he is now nominated by the king: in order to which the itinerant judges every year nominate ſix perſons for each county; whereof the lord chancellor, treaſurer, privy-council, *&c.* aſſembled in the exchequer-chamber, make choice of three; out of which number, the King chuſes one.—Only the county of Middleſex has two *ſheriffs*, choſe, as anciently, by the citizens of London: and Durham, Weſtmoreland, and Cumberland, none.

The *ſheriff*, beſides his miniſterial office, of executing proceſſes and precepts of the courts, and making returns of the ſame, has a judicial office, whereby he holds two ſeveral kinds of courts; the one called the *ſheriff's turn*, held in divers places of the county, to enquire of all offences againſt common law not prohibited by any ſtatute.—The other called the *county court*, wherein he hears and determines all civil cauſes of the county, under forty ſhillings. See COURT and TURN.

Appoſal of SHERIFFS. See the article APPOSAL.

SHEWAGE. See the article SCAVAGE.

SHIDES. See the article SHINGLES.

SHIELD, an ancient weapon of defence, in form of a light buckler; born on the arm to fend off lances, darts, *&c.* See BUCKLER.

The form of the *ſhield* is repreſented by the eſcutcheon in coats of arms. See ESCUTCHEON.

SHIELD, in heraldry, denotes the eſcutcheon or field whereon the bearings of an armory are placed. See FIELD.

SHILLING *, an Engliſh ſilver coin, equal to twelve-pence, or the 20th part of a pound. See POUND and PENNY.

* Freherus derives the Saxon *ſcilling*, whence our *ſhilling*, from a corruption of *ſiliqua*; proving the derivation by ſeveral texts of law, and among others by the XXI. law, *de annuis legatis*. Skinner with more probability deduces it from the Saxon *ſcild*, ſhield; by reaſon of the eſcutcheon of arms thereon. See COIN.

It is obſerved, there were no *ſhillings* or twelve-penny-pieces coined in England till the year 1504; and theſe, Stow calls *groats*, though Fabian mentions them under the name of *ſhillings*, 34 Hen. VIII.

The Dutch, Flemiſh, and Germans have likewiſe their *ſhilling*; called *ſchelin*, *ſchilling*, *ſchelling*, *ſcalin*, &c. But theſe not being of the ſame weight or fineneſs with the Engliſh *ſhilling*, are not current on the ſame foot.—The Engliſh *ſhilling* is worth about 23 French ſols; thoſe of Holland and Germany about eleven ſols and a half. Thoſe of Flanders about nine. The Dutch *ſhillings* are alſo called *ſols de groſs*, becauſe equal to 12 groſs. The Danes have copper *ſhillings*, worth about ¼ of a farthing ſterling.

SHINGLES, or SHIDES, in building, ſmall pieces of wood, or quartered oaken boards, ſawed to a certain ſcantling, or more uſually cleft to about an inch thick at one end, and made like wedges, four or five inches broad, and eight or nine inches long. They are uſed in covering, eſpecially churches and ſteeples, inſtead of tiles, or ſlates.

This covering is dear; yet where tiles, &c. are very ſcarce, and a light cover required, is preferable to thatch. If made of good oak, and cleft, not ſawed, and well ſeaſoned, *ſhingles* make a ſure, light, and durable covering.

The building is firſt to be covered all over with boards, and the *ſhingles* nailed thereon. See COVERING.

SHINGLES, in medicine, a kind of herpes, called alſo the *miliary herpes*. See HERPES and MILIARY.

It conſiſts of innumerable little puſtules breaking out in various parts of the body, *viz.* the neck, breaſt, loins, thighs, &c.—The place affected is ſomewhat inflamed, and the patient a little feveriſh.—White puſtules ariſe and ſuppurate, and are ſucceeded by little round ſcabs reſembling millet-ſeeds.

It is to be attacked with diſcutients; and the higher-puſtules cut off with ſciſſars, and a cerate of oil and wax to be applied.

Wiſeman obſerves, that the *ſhingles* come near the nature of a pſora, and are therefore to be cured with mercurial catharticks. See PSORA.

SHIP, a general name for all great veſſels with ſails, fit for navigation on the ſea; excepting galleys, which go with oars and ſmack-ſails.—See *Tab.* SHIP, *fig.* 1 and 2. See alſo the articles GALLEY, VESSEL, BOAT, &c.

The Sieur Aubin, defines a *ſhip*, a timber-building, conſiſting of various parts and pieces, nailed and pinned together with iron and wood, in ſuch form as to be fit to float, and to be conducted by wind and ſails, from ſea to ſea. See SAIL, SAILING, &c.

The invention of *ſhips* is very ancient, and, at the ſame time very uncertain: mythologiſts attribute it to Dædalus; and pretend, that the wings he invented to ſave himſelf withal from the labyrinth of Crete, were nothing but ſails, which he firſt gave to veſſels, and wherewith he eluded the vigilance and purſuit of Minos. Others give the honour to Janus, on the credit of ſome ancient Greek and Latin coins, on one ſide whereof is repreſented his double face, and on the reverſe a *ſhip*. Laſtly, others, and thoſe who go on the ſureſt grounds, look on Noah as the firſt *ſhip-builder*. See ARK and NAVIGATION.

SHIPS are uſually divided into three claſſes: *ſhips of war*, *merchant ſhips*, and an intermediate kind, half war, half merchant; being ſuch, as though built for merchandize, yet take commiſſions for war.

Ships of war are again divided into ſeveral orders, called *rates*. See RATE.

Merchant *ſhips* are eſtimated by their burthen, that is, by the number of tuns they bear; each tun reckoned at two thouſand pounds weight.—The eſtimate is made by gauging the hold, which is the proper place of loading. See BURDEN.

The moſt celebrated *ſhips* of antiquity are, that of Ptolemy Philopater, which was 280 cubits long, 38 broad, and 48 high; it carried 400 rowers, 400 ſailors, and 3000 ſoldiers. That which the ſame prince made to ſail on the Nile, we are told, was half a ſtadium long.—Yet theſe were nothing in compariſon with Hiero's *ſhip*, built under the direction of Archimedes; on the ſtructure whereof, Moſchion, as we are told by Snellius, wrote a whole volume. There was wood enough employed in it to make fifty gallies. It had all the variety of apartments of a palace; banqueting-rooms, galleries, gardens, fiſh-ponds, ſtables, mills, baths, a temple of Venus, &c. It was incompaſſed with an iron rampart, eight towers, with walls and bulwarks, furniſhed with machines of war; particularly one, which threw a ſtone of 300 pounds, or a dart 12 cubits long, the ſpace of half a mile; with many other particulars related by Athenæus.

Among modern *ſhips*, one of the moſt conſiderable is a firſt rate *ſhip* of war, built at Woolwich in 1701; the dimenſions whereof, whence thoſe of other rates may be deduced, are as follow: the length 210 foot; number of guns 110: number of men 1250: number of tuns 2300: draught of water 22 foot; the main-ſail in length 54 yards, depth 19: main-maſt in length 39 foot; in diameter 38 inches: weight of the anchor 82 hundred, 1 quarter, 14 pound: cable in length 200 yards: diameter of the cable 22 inches.—The expence of building a common firſt rate *ſhip*, with guns, tackling and rigging, is computed at 60,000 l. ſterling. See NAVY, FREIGHT, CHARTER-PARTY, POLICY *of aſſurance*, &c.

To give the reader an idea of the ſeveral parts and members of a *ſhip*, both internal and external, with their reſpective denominations in the ſea language (the principal whereof are explained in the reſpective places of this dictionary) we here give him two draughts: the one, a ſection of the body of a firſt rate; to ſhew its conſtruction, the diſpoſition of its inſide, &c.—The other, the ſame *ſhip* entire, with the ſails, rigging, &c.

For the moſt convenient form of SHIPS; or that wherein they ſhall meet with the leaſt reſiſtance from the water; ſee VESSEL and RESISTANCE.

Bulk of a SHIP,	See the articles	BULK.

Regiſter SHIPS,		REGISTER.
Tranſport SHIP,		TRANSPORT.

SHIP-MONEY, an impoſition anciently charged upon the ports, towns, cities, boroughs, and counties of the realm; by writs commonly called *ſhip-writs*, under the great ſeal of England, for the providing and furniſhing certain ſhips for the king's ſervice.

This impoſition was revived by king Charles I. in the years 1635 and 1636; but by ſtat. 17. Car. I. it was declared to be contrary to the laws and ſtatutes of the realm, claim of right, liberty of the ſubject, &c.

SHIPPER, SKIPPER, or SCHIPPER, a Dutch term, ſignifying the maſter of a ſhip. See MASTER.

We alſo uſe the word popularly for any common ſeamen.

SHIPWRACK. See the article WRECK.

SHIRE *, SCYRA, a part or portion of the land, called alſo *county*. See COUNTY.

* The word is originally Saxon, *ſcir* or *ſcire*, formed from *ſcyran*, to divide.

King Alfred firſt divided the land into *ſatrapias*, which we now call *ſhiers*, and thoſe into *centurias*, which we now call *hundreds*. See HUNDRED. And thoſe again into *decennias*, which we call *tithings*. See TITHING.

The aſſizes of the *ſhire*, or aſſembly of the people of a county, was called by the Saxons, *ſcyrgemot*. See SCYRGEMOT.

SHIRE *reve*,	See the articles	SHERIFF.
Knights of the SHIRE,		KNIGHT.

SHOAL, in the ſea phraſe, is the ſame as *ſhallow*, and is applied to flats in the water.

They ſay, it is *good ſhoaling*, when a ſhip ſailing towards ſhore, they find by her ſounding, it grows ſhallower and ſhallower by degrees, and not too ſuddenly; for then the ſhip goes in ſafety.

SHOALED, the miners term in the tin mines, for thoſe fragments of ore, which by rains, currents of water, &c. are torn off from the load, or veins of ore.—Theſe are waſhed down from the mountains; and by finding them, they gueſs where to look for a load of ore. Sometimes it is called *ſquad*, and *ſquod*. Harris.

SHOAR, or SHORE, a prop or counterfort, ſet up to ſupport any thing of weight, which leans on one ſide. See BUTTRESS.

SHOE, a covering for the foot, uſually of leather.

Its ſtructure, though the object of a particular art, is too popular to need explaining. See CORDWAINER.

Its hiſtory is more obſcure: Bened. Baudoin, a *ſhoe-maker* by profeſſion, has a learned treatiſe of the ancient *ſhoe*, *de ſolea veterum*; where the origin, matter, form, &c. thereof, are particularly enquired into.

Baudoin maintains, that God, in giving Adam ſkins of beaſts to cloath him, did not leave him to go bare-footed; but gave him *ſhoes* of the ſame matter. That after raw ſkins, men came to make their *ſhoes* of ruſhes, broom, paper, flax, ſilk, wood, iron, ſilver, gold: ſo different has their matter been.—Nor was their form more ſtable, with regard either to the ſhape, colour, or ornaments: they have been ſquare, high, low, long, and quite even, cut, carved, *&c.*

Pliny, lib. 7. c. 56. tells us, that one Tychius of Bœotia was the firſt who uſed *ſhoes.*—M. Nilant, in his remarks on Baudoin, obſerves, that he quotes Xenophon in vain, to ſhew, that even in his time they ſtill wore *ſhoes* of raw ſkins. Xenophon relates, that the ten thouſand Greeks, who had followed the young Cyrus, wanting *ſhoes*, in their retreat, were forced to cover their feet with raw ſkins, which occaſioned them great inconveniencies. Nilant will not even allow, that the *ſhoes* of the country people, called *carbatinæ*, and *peroneæ*, were of crude ſkin, without any preparation.

The patricians among the Romans, wore an ivory creſcent on their *ſhoes:* Heliogabalus had his *ſhoes* covered over with a very white linen; in conformity to the prieſts of the ſun, for whom he profeſſed a very high veneration: this kind of *ſhoe* was called ὐδῶς, *udo*, or *odo*. Caligula wore *ſhoes* enriched with precious ſtones. The Indians, like the Egyptians, wore *ſhoes* made of the bark of the papyrus. The Turks put off their *ſhoes*, and leave them at the doors of the moſques.

Horſe SHOE, } See the articles { HORSE.
Horſe SHOE *head*, } { HORSE-SHOE *head*.

SHOE *houſing*. See the article HOUSING.

SHOOTING. See GUNNERY and PROJECTILE.

SHOOTING *of bombs*, } See the articles { BOMB.
SHOOTING *with air*, } { WIND-GUN.

SHOOTS.—*Hot* SHOOTS, } See the articles { HOT.
Water SHOOT, } { WATER.

SHOP-LIFTER, a perſon, who on pretence of buying goods, or otherwiſe, takes an opportunity to ſteal them.

SHORE, or *common* SHORE, a corruption of *ſewer.* See SEWERS and CLOACA.

SHORN *velvet*. See the article VELVET.

SHORT *accent*, in grammar, a mark which ſhews, that the time of pronouncing a ſyllable is to be *ſhort.*—It is wrote thus (˘). See ACCENT.

SHORT *ſails*, in a man of war, are the ſame with *fighting-ſails*; being the fore-ſail, main-ſail, and foretop-ſail, which are all that are uſed in fight, leſt the reſt ſhould be fired, and ſpoiled; beſides the trouble of managing them when a ſhip gives chaſe to another.

If a chaſe have a mind to fight, they ſay, the chaſe *ſtrips into her ſhort ſails, i. e.* puts out her colours in the poop, her flag at the main-top, and her ſtreamers, or pendants, at the yard's arms; furls her ſprit-ſail, peeks her mizzen, and ſlings her main-yard.

SHORT-SIGHTEDNESS, *myopia*, a fault in the conformation of the eye, wherein the cryſtallin, *&c.* being too convex, the rays reflected from different objects are refracted too much, and made to converge too faſt, ſo as to unite ere they reach the retina; by which means the viſion is rendered dim, and confuſed. See MYOPIA.

The ordinary remedy, for *ſhort-ſightedneſs*, is a concave lens, held before the eye; which making the rays diverge, or at leaſt, diminiſhing much of their convergency, makes amends for the too great convexity of the cryſtallin. See LENS.

Dr. Hook ſuggeſts another remedy: finding, that many *ſhort-ſighted* perſons are but little helped by concaves; he recommends a convex glaſs, placed between the object and the eye; by means whereof the object may be made to appear at any diſtance from the eye, and conſequently, all objects may be thereby made to appear at any required diſtance from the eye; ſo that the *ſhort-ſighted* eye ſhall contemplate the picture of the object, in the ſame manner, as if the object itſelf were in the place.—It is true, the image will appear inverted; but we have expedients to remedy this too: for, in reading, there needs nothing but to hold the book upſide down.—To write, the beſt will be for the perſon to learn to read upſide down. For diſtant objects, the doctor aſſerts, from his own experience, that, with a little practice in contemplating inverted objects, one gets as good an idea of them, as if ſeen in their natural poſture.

SHOT, in the military art, includes all ſorts of ball or bullets for fire-arms, from the cannon to the piſtol. See BULLET, FIRE-ARM, CANNON, *&c.*

Thoſe for cannon are of iron; thoſe for muſquets, carabines and piſtols, are of lead.

SHOT, for ordnance, eſpecially in the ſea ſervice, are of ſeveral ſorts; as—*Round* SHOT, bullets fitted to the bore of the piece.

Bar SHOT, is two bullets, or rather half bullets, joined together by an iron bar; ſerving to cut down maſts, ſails, *&c.*

Caſe SHOT, } { CASE *ſhot*.
Chain SHOT, } { CHAIN *ſhot*.
Langrel SHOT, } See the articles { LANGREL *ſhot*.
Random SHOT, } { RANDOM *ſhot*.
Trundle SHOT, } { TRUNDLE *ſhot*.

SHOT, for fowling, is otherwiſe called *hail*, by reaſon of its figure and ſize.

The method of caſting it is as follows. The lead being melted, ſtirred, and ſkimmed, a quantity of powdered yellow orpiment is ſtrewed in it; as much as will lie on a ſhilling, to 12 or 15 pounds of lead. The whole being well ſtirred, the orpiment will flame. To judge whether there be orpiment enough in, a little of the lead is dropped into a glaſs of water, and if the drops prove round, and without tails, there is orpiment enough, and the degree of heat is as it ſhould be.

This done, a copper-plate, hollow in the middle, and three inches in diameter, bored through with 30 or 40 ſmall holes, according to the ſize of the *ſhot*, is placed on an iron frame, over a tub of water, four inches above the water: the hollow part is to be very thin. On this plate are laid burning coals, to keep the melted lead in fuſion. The lead is now poured gently, with a ladle, on the middle of the plate, and it will make its way through the holes in the bottom of the plate into the water, in round drops.—Great care is taken to keep the lead on the plate in its proper degree of heat: if too cold it will ſtop the holes; and if too hot, the drops will crack and fly.

The *ſhot*, thus made, are dried over a gentle fire, always ſtirring them that they do not melt: this done, the greater are ſeparated from the ſmaller, by paſſing them through ſieves for that purpoſe.

Freſh SHOT, } { FRESH *ſhot*.
Hip SHOT, } See the articles { HIP *ſhot*.
Water SHOT, } { WATER *ſhot*.

SHOT-FLAGON, a ſort of *flagon* ſomewhat bigger than ordinary; which in ſome counties, particularly Derbyſhire, it is the cuſtom for the hoſt to ſerve his gueſts in, after they have drank above a ſhilling.

SHOTTEN *herrings*, } See the articles { HERRING.
Blood SHOTTEN, } { BLOOD *ſhotten*.

SHOULDER-BLADE, a bone of the ſhoulder, of a triangular figure, covering the hind part of the ribs; called by anatomiſts, *ſcapula* and *omoplata*. See SCAPULA.

SHOULDER-BONE. See the article HUMERUS.

SHOULDERING, in fortification. See EPAULEMENT.

SHOULDERING-PIECE, in building. See BRACKET.

SHOULDER-PITCHT, is a diſeaſe in a horſe, when the pitch or point of the ſhoulder is diſplaced, which makes the horſe halt downright.

SHOULDER-SPLAIT, or SHOULDER-TORN, is a hurt which befals a horſe by ſome dangerous ſlip, whereby the ſhoulder is parted from the breaſt.

SHOULDER-WRENCH, is a ſtrain in the ſhoulder.

SHOWER, a cloud reſolved into rain, and diſcharged on a certain tract of ground. See RAIN.

In natural hiſtory we meet with abundance of inſtances of extraordinary and præternatural *ſhowers:* as, *ſhowers of blood*, mentioned by Gaſſendus, and others; a *brimſtone ſhower*, mentioned by Wormius; *ſhowers of frogs*, mentioned by Pliny, and even Dr. Plott; a *ſhower of millet-ſeed*, in Sileſia, mentioned in the Ephem. German. *ſhowers of aſhes*, frequent in the Archipelago: a *ſhower of wheat*, in Wiltſhire: a *ſhower of whitings*, mentioned in the Philoſophical Tranſactions—The natural reaſons of many whereof may be ſeen under the article RAIN.

SHRINE *, a caſe to hold the relicks of ſome ſaint. See RELICKS.

* The word is formed from the Latin *ſcrinium*, a deſk or cabinet.

SHROUDS. See the article SHROWDS.

SHROVE-TIDE, the time immediately before lent; thus called by our anceſtors, becauſe employed in *ſhriving*, that is, in confeſſing their ſins to the prieſt; in order to a more devout keeping the enſuing lent faſt.

Shrove-tueſday is the day next before the firſt of lent. See LENT.

SHROWDING *of trees*, the cutting or lopping off the top branches; only practiſed to trees that are not fit for timber, but deſigned for fuel, or ſome other preſent uſe. See PRUNING.

Such trees the huſbandmen find much preferable to copſe; as they need no fence to ſecure them, becauſe ſtanding in no danger of the browzings and rubbings of cattle, which too, have the benefit of grazing under them.

For the time of *ſhrowding*, it is not to be practiſed till the trees have ſtood three or four years; either at the beginning of the ſpring, or the end of autumn.

The harder ſort are not to be lopped above once in ten or twelve years, and that at any time in the winter. The pithy and ſofter woods are beſt *ſhrowded* in the ſpring.—The ſtumps left, ſhould always be cut aſlope, and ſmooth, in order to caſt the water off, and prevent its ſinking in and rotting the tree.

SHROWDS or SHROUDS, are great ropes in a ſhip, which go up on both ſides of all maſts, except the bowſprit. See MAST, *&c.*

They are faſtened below by chains to the ſhip's ſides, and aloft, over the head of the maſt; their pennants, fore-tackle, and ſwifters, being firſt put under them; and they are ſerved there, to prevent their galling the maſt.—The top-maſt *ſhrowds* *ſhrouds* are faſtened to the puttocks, by plates of iron, and by dead-men's eyes, and lanniers alſo, as the others are.—See *Tab. Ship*, *fig.* 1. *n.* 4, 12, 23, 41, 52, 62, 84, 104 and 135.

The terms are, *Eaſe the ſhrouds*; that is, ſlacken them.

Set taught the ſhrouds; that is, ſet them faſter.

SHRUB, *frutex*, a little, low, dwarf tree; or a woody plant, of a ſize leſs than a tree; and which, beſides its principal ſtem, and branches, frequently, from the ſame root, puts forth ſeveral other conſiderable ſets, or ſtems. See TREE and PLANT.

Such are privet, phyllirea, holley, box, honey-ſuckle, *&c.* *Shrubs* and trees put forth in autumn, a kind of buttons, or gems, in the axis of the leaves: theſe buttons are as ſo many little ova, which coming to expand by the warmth of the following ſpring, open into leaves, and flowers.—By this, together with the height, ſome diſtinguiſh *ſhrubs* from *ſuffrutices*, or *under-ſhrubs*; which are low buſhes, that do not put forth any of theſe buttons; as roſemary, thyme, *&c.* See SUFFRUTICES.

SHUTTING *the mouth.* See the article MOUTH.

SHUTTLE, in the manufactures, an inſtrument uſed by the weavers, which, with a thread it contains either of woollen, ſilk, flax, or other matter, ſerves to form the woofs of ſtuffs, cloths, linens, ribbands, *&c.* by throwing the *ſhuttle* alternately from left to right, and from right to left, a-croſs between the threads of the warp, which are ſtretched out lengthwiſe on the loom. See LOOM and WEAVING.

In the middle of the *ſhuttle* is a kind of cavity, called the *eye* or *chamber* of the *ſhuttle*; wherein is incloſed the ſpoul, which is a part of the thread deſtined for the woof; and is wound on a little tube of paper, ruſh, or other matter.

The ribband-weaver's *ſhuttle* is very different from that of moſt other weavers, though it ſerve for the ſame purpoſe: it is of box, ſix or ſeven inches long, one broad, and as much deep: ſhod with iron at both ends, which terminate in points, and are a little crooked, the one towards the right, and the other towards the left, repreſenting the figure of an ∽ horizontally placed.

SI, in muſic, a ſeventh note, added within this ſixty years, by one le Maire, to the ſix ancient notes invented by Guido Aretin, *ut*, *re*, *mi*, *fa*, *ſol*, *la*, *ſi*: by means whereof, the embarraſs of the ancient gamut is avoided. See SCALE and GAMMUT.

So buſy a thing is jealouſy, that, for a matter of thirty years, that le Maire kept preaching to the muſicians of his time, in behalf of the new note; not a man would allow it: but he was no ſooner dead, than all the world came into it. See NOTE.

SIBYLS*, SIBYLLÆ, in antiquity, virgin-propheteſſes, or maids ſuppoſed to be divinely inſpired; and who, in the height of their enthuſiaſm, gave oracles, and foretold things to come.

* The word is ſuppoſed formed of an aſſemblage of the two Greek words, σιȣ, for θεȣ, *Dei*, and βȣλη, council.

Authors do not agree about the number of the *ſibyls*: Capella reckons but two, *viz.* Europhyle of Troy, called *ſibylla Phrygia*; and Sinuachia of Erythræa, called *ſibylla Erythræa*. Solinus mentions three, *viz.* Cumæa, Delphica, and Erythræa. Ælian makes their number four: and Varro increaſes it to ten, denominating them from the places of their birth; the Perſian, Lybian, Delphic, Cumæan, Erythræan, Samian, Cumane, Helleſpontic or Trojan, Phrygian, and Tiburtin.—Of theſe, the moſt celebrated are, the Erythræan, Delphic, and Cumæan *ſibyls*.

The *ſibylline* oracles were held in great veneration by the more credulous among the ancients; but were much ſuſpected by many of the more knowing. The books wherein they were written, were kept by the Romans with infinite care, and nothing of moment undertaken without conſulting them. Tarquin firſt committed them to the cuſtody of two patrician prieſts, inſtituted for that purpoſe. See ORACLE.

SICILIAN *meaſures*,	See the articles	MEASURE.
SICILIAN *money*,		MONEY.
SICILIAN *ſilk*,		SILK.
SICILIAN *veſpers*,		VESPERS.

SICILIAN, in muſic, denotes a kind of gay ſprightly air, or dance; ſomewhat of the nature of an Engliſh jig: uſually marked with the characters $\frac{6}{8}$ or $\frac{12}{8}$.

SICK *herrings*,	See the articles	HERRING.
Iron SICK,		IRON *ſick*.

SICKNESS,	See the articles	DISEASE.
Green SICKNESS,		CHLOROSIS.
Sweating SICKNESS,		SUDOR *Anglicanus*.
Falling SICKNESS,		EPILEPSY.

SICUT *alias*, a writ ſent out in the ſecond place, where the firſt writ was not executed. See WRIT.

It is thus called from its beginning, which is in this form: *Georgius D. G.* &c. *Vice-comiti Heref. ſalutem. Precipimus tibi* (ſicut alias) *prœcepim'*, &c.

SIDE, *latus*, in geometry.—The SIDE *of a figure*, is a line making part of the periphery of any ſuperficial figure. See FIGURE.

In triangles, the *ſides* are alſo called *legs*. In a rectangle triangle, the two *ſides*, including the right angle, are called *cathei*; and the third the *hypotenuſe*. See CATHETUS and HYPOTENUSE.

SIDE *of a polygonal number*, is the number of the terms of the arithmetical progreſſion, that are ſummed up. See POLYGONAL *number*.

SIDE *of a power*, is what we otherwiſe call the *root*, or *radix*. See ROOT.

SIDES *of horn-works*, *crown-works*, *double tenalles*, and the like *out-works*, are the ramparts and parapets which incloſe them on the right and left, from the gorge to the head. See HORNWORK, TENAILLE, *&c.*

Right SIDE,	in conicks. See	LATUS *rectum*.
Tranſverſe SIDE,		LATUS *tranſverſum*.

SIDE *grafting*. See the article ENGRAFTING.

SIDE *lays*, is a term made uſe of by huntſmen, when dogs are placed in the way, to be let ſlip at a deer, as he paſſes by.

SIDERATION, SIDERATIO, in chirurgery, a mortification of ſome part of the body; called alſo *ſphacelus*, and *necroſis*. See MORTIFICATION and SPHACELUS.

SIDERATION is alſo uſed for a being ſuddenly benumbed, and deprived of the uſe of one's limbs, ſenſes, *&c.* which the people call being *planet-ſtruck*. See APOPLEXY, PALSY, *&c.*

SIDERATION alſo denotes the blaſting or blighting of trees, plants, *&c.* by eaſtern winds, exceſſive heat, drought, or the like. BLIGHT and DISEASES *of plants*.

SIDERIAL *year*. See the articles YEAR and SOLAR.

SIDERITES, a name which ſome authors give the loadſtone. See MAGNET.

SIDES-MEN, properly called *ſynods-men* or *queſt-men*, perſons, who in larger pariſhes are appointed to aſſiſt the church-wardens, in enquiring into the manners of inordinate livers, and in preſenting offenders at viſitations. See QUESTMEN and SYNODALES.

SIEGE *, in war, the encampment of an army around a place, with deſign to take it, either in the way of diſtreſs and famine, by making lines all around it, to prevent any relief from without; or by main force, as by digging trenches, and making formal attacks. See LINE, TRENCH, APPROACH, *&c.*

* The word is French, and, ſignifies literally *ſeat*; alluding to the army's taking its ſeat here till the reduction of the place.

The moſt celebrated *ſieges* of antiquity, are thoſe of Troy, Tyre, Alexandria, Numantium, *&c.* Among the moderns, thoſe of Oſtend, Candia, Grâve, *&c.*

SIEVE, or SEARCE, an inſtrument ſerving to ſeperate the fine from the coarſe parts of powders, liquors, and the like; or to cleanſe pulſe from duſt, light grains, *&c.*

It is made of a rim of wood; the circle, or ſpace whereof is filled with a tiſſue of ſilk, tiffany, hair, linnen, wire, or even thin ſlices of wood.

The *ſieves* which have large holes, are ſometimes alſo called *riddles*; ſuch is the coal or lime *ſieve*, garden *ſieve*, &c,

When drugs, apt to evaporate, are to be paſſed through the *ſieve*, it is uſual to have it covered with a lid.

SIEUR, a title of honour, or quality among the French; chiefly uſed among the lawyers, and in publick acts, and other writings of that kind. See SIRE.

They ſay, I plead for the *ſieur* ſuch an one, the *ſieur* abbot, the *ſieur* marquis, *&c.* See MONSIEUR.

The title *ſieur* is properly given by a ſuperior to an inferior, in his letters and other private writings.—As, Tell the *ſieur* Hubert, that he proceed, *&c.*

In this ſenſe, authors ſometimes uſe it, by way of modeſty, in ſpeaking of themſelves: thus, at the heads of books, we ſee, *Traduction du* ſieur *d' Ablancourt*; *O Euvres du* ſieur *d' Eſpreaux*, &c.

SIEUR, is alſo a term expreſſing *ſeigneury*, or lordſhip: as *ecuyer* or *ſieur* of ſuch a place. See LORD and ESQUIRE.

SIGHT, the exerciſe, or act of the ſenſe of ſeeing. See SENSE, SEEING, VISION, VISIBLE, *&c.*

Our *ſight*, the nobleſt and moſt uſeful of all our ſenſes, father Malebranche ſhews, deceives us in abundance of inſtances; nay almoſt in all: particularly with regard to the magnitude, and extent of things; their figures, motions, *&c.* Our eyes do not ſhew us any thing leſs than a mite: half a mite is nothing, if we believe their report. A mite is only a mathematical point, with regard thereto; and we cannot divide it without annihilating it. In effect, our *ſight* does not repreſent extenſion, ſuch as it is in it ſelf; but only the relation and proportion it has to our body. Hence, as half a mite has no relation to our bodies, and that it cannot either preſerve or deſtroy us, our *ſight* hides it intirely. Were our eyes made like microſcopes, or were we ourſelves as ſmall as mites, we ſhould judge very differently of the magnitude of bodies.

It may be added, that our own eyes are really no other than a kind of natural ſpectacles; that their humors do the ſame office as the lens's in ſpectacles; and that, according to the figure of the cryſtallin, and its diſtance from the retina, objects are ſeen very differently; inſomuch, as we are not ſure, that there are any two perſons in the world, who ſee them equally big.—It is even very rare, that the ſame perſon ſees the ſame object equally big with both eyes; as both eyes are very ſeldom perfectly alike: on the contrary, we generally ſee things bigger with the left than the right eye; of which we have ſome very good obſervations in the journal of the learned at Rome, for the year 1669. See VISION.

Short SIGHT,	See the articles	MYOPIA.
Second SIGHT,		SECOND *ſight*.
Point of SIGHT,		VIEW and POINT.

SIGHTS, in mathematicks, denote two thin pieces of braſs raiſed perpendicularly on the two extremes of an alidade or index of a theodolite, circumferentor, or other like inſtrument: each whereof has an aperture or ſlit up the middle, through which the viſual rays paſs to the eye, and diſtant objects are ſeen.—Their uſe is for the juſt direction of the index to the line of the object. See TELESCOPE, CIRCUMFERENTOR, ALHIDADE, *&c.*

Sometimes the ſlits or apertures have glaſſes, or lenſes fitted into them; in which caſe they are called *teleſcopic ſights:* by way of diſtinction from the former. which in reſpect hereof are denominated *plain ſights*. See TELESCOPE, LENS, *&c.* Mr. Flamſteed and Dr. Hook, abſolutely explode the uſe of *plain ſights* in aſtronomical obſervations. The errors in Tycho's latitudes of the ſtars, Mr. Flamſteed aſcribes wholly to his uſing *plain ſights*; and ſuſpects, that Hevelius uſing the ſame kind of *ſights*, will fall into the like errors.—Hevelius, on the contrary, in a paper in the Philoſophical Tranſactions, vindicates the uſe of *plain ſights*, and prefers them to *teleſcope* ones: the main objection he makes to the latter, is, that no obſervation can be ſafely taken with them, without firſt examining and rectifying them: in which examination, many and groſs miſtakes are liable to be committed.—To which he adds, that in ſextants, octants, azimuth quadrants, *&c.* he does not ſee how ſuch examination can be made, at all times, without much loſs of time. See ASTRONOMICAL.

SIGILLARIA, a ſolemn feaſt held among the ancient Romans; thus called from a cuſtom which obtained therein, of ſending little preſents from one to another, conſiſting of ſeals, little figures, and ſculptures, made of gold, ſilver, braſs, or even earthen ware, and of devoting them to Saturn as an atonement for themſelves and friends.

The *ſigillaria* followed immediately after the ſaturnalia, and held two days; which, with the five days of the ſaturnalia, made a ſolemnity of ſeven days. See SATURNALIA.

Some derive the origin of *ſigils* and figures in this ſolemnity from the argei or ruſhan figures of men thrown annually into the Tiber, from the Pons Sublicius, by the veſtals, on the ides of March. Vid. Macrob. Saturn. l. 1. c. 7, 10 and 11. See alſo ARGEA.

SIGILLATA *terra*, a kind of earth, or bole, dug in the iſle of Lemnos; and thence alſo called *Lemnian* earth; of conſiderable uſe in painting, and medicine. See LEMNIAN *earth*.

It is of different colours, but moſt commonly red; heavy, ſoft, and friable; held very aſtringent, and, as ſuch, uſed in hæmorrhages; as alſo againſt the plague and poiſons.—Pliny attributes ſeveral other virtues, which experience does not juſtify; nor is it in that eſteem it anciently was; yet it is ſtill an ingredient in Venice-treacle.

It was anciently found in a mountain, in the neighbourhood of the city Hephæſtia; where Diana's prieſts went at certain times, with great ceremony, to dig it up. After a little preparation, they made it up into troches, and ſealed them with Diana's ſeal; whence the appellation of *ſigillata*, *ſealed*.

It is now brought from Conſtantinople in little flat cakes, round on one ſide, flat and ſealed on the other. See BOLE.

SIGILLUM, a ſeal or ſignet. See SEAL and SIGNET.

SIGN, SIGNUM, a ſenſible mark or character, denoting ſomething abſent, or inviſible. See CHARACTER and MARK.

Anciently, the monks, in all religious houſes, were not allowed to ſpeak; nor to expreſs their minds otherwiſe than by *ſigns*, which they learned in their novitiate. C. Rhodiginus and Porta have wrote of the ancient *ſigns*, and ciphers, uſed in ſpeaking, and writing.

SIGN, in algebra, denotes a ſymbol, or character. See CHARACTER, ALGEBRA, *&c.*

Like SIGNS,	See the articles	LIKE.
Radical SIGNS,		RADICAL.

SIGN, in medicine, denotes ſome appearance in the body, diſtinguiſhable by the ſenſes; whence, by juſt reaſoning, is inferred the preſence, nature, ſtate, event of health, a diſeaſe, or death. See INDICATION.

Thoſe which denote the preſent condition of a body, whether ſick or well, dying or the like, are called *diagnoſtic ſigns*. See DIAGNOSTIC.

Thoſe which foretel the future ſtate thereof, are called *prognoſtic ſigns*. See PROGNOSTIC.

That *ſign* which is peculiar to the diſeaſe, and inſeparable from it, as ariſing from the nature thereof, is called a *pathognomonic ſign*. See PATHOGNOMONIC.

As all *ſigns* are effects produced by the cauſe of the diſeaſe, the diſeaſe itſelf, and its ſymptoms; they uſually note the preſent condition of the matter which firſt produced the diſeaſe, and even of that produced by the diſeaſe: on which footing, the *ſigns* are all reducible to theſe three claſſes, *viz.* *ſigns* of the crudity and coction of the diſeaſe; of its event, whether in health, ſickneſs, or death; and of its ſecretion and excretion: which laſt *ſigns* are called *critical* ones. See CRUDITY, DIGESTION, *&c.* each under its proper article. See alſo HEALTH and DISEASE.

Antecedent SIGN. See the article ANTECEDENT.

SIGN, in aſtronomy, a twelfth part of the ecliptic, or zodiac; or a portion containing thirty degrees thereof. See ZODIAC.

The zodiac was divided by the ancients into twelve ſegments, called *ſigns*; commencing from the point of interſection of the ecliptic and equinoctial: which *ſigns* they denominated from the twelve conſtellations which, in Hipparchus's time poſſeſſed thoſe ſegments.—But, the conſtellations have ſince ſo changed their places, by the preceſſion of the equinox, that aries is now got out of the *ſign* called *aries*, into taurus, taurus into gemini, *&c.* See PRECESSION, ECLIPTIC, EQUINOX, *&c.*

The names of the twelve *ſigns*, and their order, are as follow; *aries*, *taurus*, *gemini*, *cancer*, *leo*, *virgo*, *libra*, *ſcorpio*, *ſagittarius*, *capricornus*, *aquarius*, *piſces:* each of which, with the ſtars thereof, ſee under its proper article, ARIES, TAURUS, *&c.*

The *ſigns* are diſtinguiſhed with regard to the ſeaſon of the year, when the ſun is in them, into *vernal*, *æſtival*, *autumnal*, and *brumal*. See AUTUMNAL and VERNAL.

The *vernal*, or *ſpring* SIGNS, are aries, taurus, gemini.

The *æſtival*, or *ſummer* SIGNS, are cancer, leo, and virgo.

The *autumnal* SIGNS, are libra, ſcorpio, and ſagittarius.

The *brumal*, or *winter* SIGNS, are capricornus, aquarius, and piſces.

The *vernal* and *ſummer ſigns*, are alſo called *northern ſigns*. —And the *autumnal* and *brumal ſigns*, *ſouthern ſigns*. See NORTHERN, *&c.*

Aſcending SIGNS,	See the articles	ASCENDING.
Fixt SIGNS,		FIXT.
Maſculine SIGNS,		MASCULINE.

SIGN *manual*, the ſetting one's hand and ſeal to a writing. See SIGNATURE.

Among the Saxons, before the invention of ſeals, a ✝ was a common *ſign* or *ſignum*, prefixed to the names of moſt ſubſcribing witneſſes in charters and other deeds; as ✝ *ſignum Roberti Epiſcop. Lond.* &c.

SIGNAL, a certain ſign agreed upon for the conveying of intelligence whither the voice cannot reach. See SIGN.

Signals are given for the beginning of a battle, or an attack; uſually with drums, and trumpets: at ſea, they are given by cannon or muſket-ſhot, by lights, ſails, flags, *&c.* See SALUTATION.

Signals have been in uſe in all ages. The ancients who had no regular couriers or poſts, made uſe thereof to convey intelligence of what paſſed at a great diſtance. For which purpoſe they placed centinels on the eminences, from ſpace to ſpace; ſome mention whereof, we find made by Homer himſelf. Iliad. Θ. v. 553, &c. Odyſſ. Ξ. v. 261. Thoſe people thus diſpoſed, lighted fires, or flambeaux in the nighttime. In the Agamemnon of Æſchylus, that prince at his departure for Troy, promiſes Clytemneſtra, that the very day the city ſhould be taken, he would apprize her of his victory by fires lighted expreſs. He keeps his word, and tidings are brought the princeſs, that Troy is taken, and that Agamemnon's *ſignals* are ſeen. Frontinus obſerves, they were in uſe among the Arabs; and Bonaventura Vulcanius, in his Scholia on Ariſtotle's book *de mundo*, adds, that while the Moors were maſters of the greateſt part of Spain, they built on the tops of the mountains, an infinity of turrets, or watch-houſes, called in the Arabic, *atalayas*, a word the Spaniards ſtill retain; whence, by fires, they could immediately alarm the whole kingdom. Indeed the cuſtom was much more ancient than the Moors in Spain. Q. Curtius obſerves, it was very frequent among the Aſiaticks, in the time of Alexander. Livy and Cæſar both mention it as uſed among the Romans. Polydore Virgil ſhews it of great antiquity in England; and Bœthius adds, that in ſeveral places in England, there are the remains of huge poles that have ſerved for this purpoſe. See BEACON.

SIGNALS *at ſea*, are ſigns made by the admiral or commander in chief of a ſquadron of ſhips, either in the day or by night, whether for ſailing, for fighting, or for the better ſecurity of the merchant ſhips, under their convoy.

Theſe *ſignals* are very numerous and important; being all appointed and determined by order of the lord high admiral, or lords of the admiralty; and communicated in the inſtructions ſent to the commander of every ſhip of the fleet or ſquadron before their putting out to ſea.

Signals *by day.*—When the commander in chief would have them prepare for ſailing, he firſt looſes his fore-top-ſail, and then the whole fleet are to do the ſame. When he would have them unmoor, he looſes his main-top-ſail, and fires a gun, which in the royal navy is to be anſwered by every flag-ſhip. When he would have them weigh, he looſes his fore-top-ſail, and fires a gun, and ſometimes hawls home his ſheats: the gun is to be anſwered by every flag-ſhip, and every ſhip to get to ſail as ſoon as it can. If with the leeward-ſide, the ſtern-moſt ſhip is to weigh firſt. When he would have the weather-moſt, and head-moſt ſhips to tack firſt, he hoiſts the union-flag at the fore-top-maſt-head, and fires a gun, which each flag-ſhip anſwers; but if he would have the ſtern-moſt and leeward-moſt ſhips to tack firſt, he hoiſts the union-flag at the mizen-top-maſt-head, and fires a gun; and when he would have all the whole fleet tack, he hoiſts an union, both on the fore, and mizen-top-maſt-heads, and fires a gun. When in bad weather, he would have them wear, and bring to the other tack, he hoiſts a pendant on the enſign-ſtaff, and fires a gun: and then the leeward-moſt and ſtern-moſt ſhips are to wear firſt, and bring on the other tack, and lie by, or go on with an eaſy ſail, till he comes a-head: every flag is to anſwer with the ſame *ſignal.* If they are lying by, or ſailing by a wind, and the admiral would have them bear up and ſail before the wind, he hoiſts his enſigns, and fires a gun, which the flags are to anſwer: and then the leeward-moſt ſhips are to bear up firſt, and to give room for the weather-moſt to wear, and ſail before the wind with an eaſy ſail, till the admiral comes a-head. But if it ſhould happen when the admiral hath occaſion to wear and ſail before the wind, that both jack and enſign be abroad, he will hawl down the jack, before he fires the gun to wear, and keep it down till the fleet is before the wind. When they are ſailing before the wind, and he would have them bring to, with the ſtar-board tacks aboard, he hoiſts a red flag at the flag-ſtaff, on the mizen-top-maſt head, and fires a gun. But if they are to bring to, with the lar-board tack, he hoiſts a blue flag at the ſame place, and fires a gun, and every ſhip to anſwer the gun. When any ſhip diſcovers land, he is to hoiſt his jack and enſign, and keep it abroad, till the admiral or commander in chief anſwer him, by hoiſting his; on ſight of which, he is to hawl down his enſign. If any diſcovers danger, he is to tack and bear up from it, and to hang his jack abroad from the main-top-maſt croſs-trees, and fire two guns: but if he ſhould ſtrike or ſtick faſt, then, beſides the ſame *ſignal* with his jack, he is to keep firing, till he ſees all the fleet obſerve him, and endeavour to avoid the danger. When any ſees a ſhip or ſhips more than the fleet, he is to put abroad his enſign, and there keep it, till the admiral's is out, and then to lower it, as often as he ſees ſhips, and ſtand in with them, that ſo the admiral may know which way they are, and how many; but if he be at ſuch a diſtance, that the enſign cannot well be diſcovered, he is then to lay his head towards the ſhip or ſhips ſo deſcryed, and to brail up his low ſails, and continue hoiſting and lowering his top-ſails, and making a waſt with his top-gallant ſails, till he is perceived by the admiral. When the admiral would have the vice-admiral, or he that commands in the ſecond poſt of the fleet, to ſend out ſhips to chaſe, he hoiſts a flag, ſtriped white and red on the flag-ſtaff, at the fore-top-maſt head, and fires a gun. But if he would have the rear admiral do ſo, he then hoiſts the ſame *ſignal* on the flag-ſtaff, at the mizen-top-maſt-head, and fires a gun. When the admiral would have any ſhip to chaſe to windward, he makes a *ſignal* for ſpeaking with the captain, and he hoiſts a red flag in the mizen ſhrowds, and fires a gun: but if to chaſe to leeward, a blue flag; and the ſame *ſignal* is made by the flag, in whoſe diviſion that ſhip is. When he would have them give over chaſe, he hoiſts a white flag on his flag-ſtaff at the fore-top-maſt-head, and fires a gun: which *ſignal* is to be made alſo by that flag-ſhip which is neareſt the ſhip that gives chaſe, till the chaſing ſhip ſees the *ſignal* In caſe of ſpringing a leak, or any other diſaſter, that diſables their ſhip from keeping company, they are to hawl up their courſes, and fire two guns. When any ſhip would ſpeak with the admiral, he muſt ſpread an Engliſh enſign, from the head of his main, or fore-top-maſt, downwards on the ſhrowds, lowering his main, or fore-top-ſail, and firing guns, till the admiral obſerve him; and if any ſhip perceive this, and judgeth the admiral doth not, that ſhip muſt make the ſame *ſignal*, and make the beſt of his way to acquaint the admiral therewith, who will anſwer by firing one gun. When the admiral would have the fleet to prepare to anchor, he hoiſts an enſign, ſtriped red, blue, and white on the enſign-ſtaff, and fires a gun, and every flag-ſhip makes the ſame *ſignal.* If he would have the fleet moor, he hoiſts his mizen-top-ſail, with the clew-lines hawled up, and fires a gun. If he would have the fleet cut or ſlip, he looſes both his top-ſails, and fires two guns; and then the leeward ſhips are to cut or ſlip firſt, to give room to the weathermoſt to come to ſail. So if he would have any particular ſhip to cut or ſlip, and to chaſe to windward, he makes the *ſignal* for ſpeaking with that ſhip, hoiſts a red flag in the mizen ſhrowds, and fires a gun: but if the ſhip is to chaſe to leeward, he hoiſts a blue flag as before. If he would have the fleet exerciſe their ſmall arms, he hoiſts a red flag on the enſign-ſtaff, and fires a gun; but if the great guns, then he puts up a pendant over the red flag.

Signals *by night.*—To be obſerved at an anchor, weighing anchor, and ſailing, are as follow. When the admiral would have the fleet to unmoor, and ride ſhort, he hangs out three lights, one over another in the main-top-maſt ſhrowds, over the conſtant light in the main-top, and fires two guns, which are to be anſwered by flag-ſhips; and each private ſhip hangs out a light in the mizen-ſhrowds. Note, That all guns, fired for *ſignals* in the night, muſt be fired on the ſame ſide, that they may make no alteration in the ſound. When he would have them weigh, he hangs a light in the main top-maſt ſhrowds, and fires a gun, which is to be anſwered by all the flags, and every private ſhip muſt hang out a light in his mizen-ſhrowd. When he would have them tack, he hoiſts two flags on the enſign-ſtaff, one over another, above the conſtant light in his poop, and fires a gun, which is to be anſwered by all the flags; and every private ſhip is to hang out a light extraordinary, which is not to be taken in, till the admiral takes in his. After the *ſignal* is made, the leeward-moſt, and ſtern-moſt ſhips muſt tack as faſt as they can, and the ſtern-moſt flag-ſhip, after he is about on the other tack, is to lead the fleet, and him they are to follow, to avoid running through one another in the dark. When he is upon a wind, and would have the fleet veer, and bring to on the other tack, he hoiſts up one light at the mizen-peek, and fires three guns, which is to be anſwered by all the flag-ſhips, and every private ſhip muſt anſwer, with one light at the mizen-peek. The ſtern-moſt, and leeward-moſt ſhips, are to bear up ſo ſoon as the *ſignal* is made. When he would have them, in blowing weather, to lie a try, ſhort, or a hull, or with the head-ſails braced to the maſt, he will form lights of equal height, and fire five guns, which are to be anſwered by the flag-ſhips, and then every private ſhip muſt ſhew four lights: and after this, if he would have them to make ſail, he then fires ten guns, which are to be anſwered by all the flags, and then the head-moſt, and weather-moſt ſhips, are to make ſail firſt. When the fleet is ſailing large, or before the wind, and the admiral would have them bring to, and lie by with their ſtar-board tacks aboard, he puts out four-lights in the fore-ſhrowds, and fires ſix guns; but if with the lar-board tacks aboard, he fires eight guns, which are to be anſwered by the flag-ſhips; and every private ſhip muſt ſhew four lights. The wind-moſt ſhips muſt bring to firſt. Whenever the admiral alter his courſe, he fires one gun, (without altering his lights) which is to be anſwered by all the flag-ſhips. If any ſhip hath occaſion to lie ſhort, or by, after the fleet hath made ſail, he is to fire one gun, and ſhew three lights in his mizen-ſhrowds. When any one firſt diſcovers land, or danger, he is to ſhew as many ſigns as he can, to fire one gun, and to tack, or bear away, from it: and, if any one happen to ſpring a leak, or any be diſabled from keeping company with the fleet, he hangs out two lights of equal height, and fires guns till he is relieved by ſome ſhip of the fleet. If any one diſcovers a fleet, he is to fire guns, make falſe fires, put one light out on the main-top, three on the poop, to ſteer after them, and to continue firing of guns. unleſs the admiral call him off, by ſteering another courſe, and fire two or three guns; for then he muſt follow the admiral. When the admiral anchors, he fires two guns, a ſmall ſpace of time one from the other, which are to be anſwered by the flag-ſhips; and every private ſhip muſt ſhew two lights. When the admiral would have the fleet to moor, he puts a light on each top-maſt-head, and fires a gun, which is to be anſwered by the flag-ſhips, and every private ſhip is to ſhew one light. If he would have them lower their yards and top-maſts, he hoiſts one light upon his enſign-ſtaff, and fires one gun; which is to be anſwered by the flag-ſhips; and every private ſhip muſt ſhew one light. And when he would have them hoiſt their yards and top-maſts, he puts out two lights, one under the other, in the mizen-top-maſt-ſhrowds, and fires one gun; which is to be anſwered by the flag-ſhips; and each private ſhip muſt ſhew one light in the mizen-ſhrowds. If any ſtrange ſhip be diſcovered coming into the fleet, the next ſhip is to endeavour to ſpeak with her, and bring her to an anchor, and not ſuffer her to paſs through the fleet. And if any one diſcovers a fleet, and it blow ſo hard that he cannot come to give the admiral notice timely, he is to hang out a great number of lights, and to continue firing gun after gun, till the admiral anſwers him with one. When the admiral would have the fleet to cut or ſlip, he hangs out four lights, one at each main-yard-arm, and at each fore-yard-arm, and fires two guns, which are to be anſwered by the flag-ſhips, and every private ſhip is to ſhew one light.

Signals *uſed, when a fleet ſails in a fog* —If the admiral would have them weigh, he fires ten guns; which every flag-ſhip is to anſwer. To make them tack, he fires four guns,

guns, which are to be anſwered by the flag-ſhips; and then the leeward-moſt, and ſtern-moſt ſhips muſt tack firſt, and after they are about, to go with the ſame ſail they tacked with, and not to lie by, expecting the admiral to come a-head: and this is to avoid the danger of running through one another in thick weather.

When the admiral brings to, and lies with his head-ſails to the maſt; if with the ſtar-board tack aboard, he fires ſix guns; but if with the lar-board tack, he fires eight guns, which the flag-ſhips are to anſwer. And after this, if he makes ſail, he fires ten guns, which the flag-ſhips muſt anſwer, and then the head-moſt and weather-moſt ſhips are to make ſail firſt. If it grow thick and foggy weather, the admiral will continue ſailing, with the ſame ſail ſet, that he had before it grew foggy, and will fire a gun every hour, which the flag-ſhips muſt anſwer, and the private ſhips muſt anſwer, by firing of muſkets, beating of drums, and ringing of bells. But if he be ſorced to make either more or leſs ſail than he had, when the fog began, he will fire a gun every half hour, that the fleet may diſcern, whether they come up with the admiral, or fall a-ſtern of him; and the flags and private ſhips are to anſwer as before. If any one diſcovers danger, which he can avoid, by tacking and ſtanding from it, he is to make the *ſignal* for tacking in a fog; but if he ſhould chance to ſtrike and ſtick faſt, he is to fire gun after gun, till he thinks the reſt have avoided the danger. When the admiral would have the fleet to anchor, he fires two guns, which the flags are to anſwer; and after he hath been half an hour at an anchor, he will fire two guns more, to be anſwered by the flags, as before; that all the fleet may know it.

Signals *for calling officers on board the admiral.*—When the admirals puts aboard an union-flag in the mizen ſhrowds, and fires a gun, all the captains are to come aboard him: and if, with the ſame *ſignal*, there be alſo a waft made with the enſign, then the lieutenant of each ſhip is to come on board. If an enſign be put aboard in the ſame place, all the maſters of the ſhips of war are to come on board the admiral. If a ſtandard on the flag-ſtaff be hoiſted at the mizen-top-maſt-head, and a gun fired, then all the flag-officers are to come aboard the admiral. If the Engliſh flags only; then a ſtandard in the mizen-ſhrowds; and fire a gun: if the flags, and land general officers; then the admiral puts aboard a ſtandard at mizen-top-maſt-head, and a pendant at mizen-peek, and fires a gun. If a red flag be hoiſted in the mizen-ſhrowds, and a gun fired; then the captains of his own ſquadron are to come aboard the admiral; and if, with the ſame *ſignal*, there be alſo a waft with the enſign, the lieutenant of each ſhip muſt come aboard. If he hoiſts a white flag, as before, then the vice-admiral, or he that commands in the ſecond poſt, and all the captains of his ſquadron, are to go on board the admiral: if a blue flag, &c. then the rear-admiral, and the captains of his ſquadron, muſt come on board; and if a waft, as before, the lieutenants. When a ſtandard is hoiſted on the enſign-ſtaff, and gun fired, the vice and rear-admirals muſt come on board the admiral's ſhip. When the admiral would ſpeak with the captains of his own diviſion, he will hoiſt a pendant on the mizen-peek, and fire a gun; and if with the lieutenants, a waft is made with the enſign, and the ſame *ſignal*: for whenever he would ſpeak with the lieutenants of any particular ſhip, he makes the *ſignal* for the captain, and a waft alſo with the enſign. When the admiral would have all the tenders in the fleet come under his ſtern, and ſpeak with him; he hoiſts a flag, yellow and white, at the mizen-peek, and fires a gun. But if he would ſpeak with any particular ſhip's tender, he makes a *ſignal* for ſpeaking with the captain ſhe tends upon, and a waft with the jack. If all the pinnaces and barges are to come on board, manned and armed, the *ſignal* is a pendant on the flag-ſtaff, hoiſted on the fore-top-maſt-head, and a gun fired; and if he would have them chaſe any ſhip, veſſel, or boat, in view, he hoiſts the pendant, and fires two guns. The *ſignal* for the long-boats to come on board him, manned and armed, is the pendant hoiſted on the flag-ſtaff, and the mizen-top-maſt-head, and a gun fired; and if he would have them chaſe any ſhip, veſſel, or boat, in open view, without coming on board him, he hoiſts the pendant, as aforeſaid, and fires two guns. When the admiral would have all the boats in the fleet come on board him, manned and armed, he hoiſts a pendant on the flag-ſtaff, both on the fore-top-maſt, and mizen-top-maſt-head, and fires one gun; but if he would have them chaſe, he hoiſts his pendants, as before, and fires two guns. When the admiral would ſpeak with the victualler, or his agent, he puts an Engliſh enſign in the mizen-top-maſt ſhrowds; and when with him that hath the charge of the gunner's ſtores, he will ſpread an enſign at his main-top-ſail-yard-arm.

Signals *for managing a ſea-fight.*—When the admiral would have the fleet form a line of battle, one ſhip a-head of another, he hoiſts an union flag at the mizen-peek, and fires a gun; and every flag-ſhip does the like. But when they are to form a line of battle, one a-breaſt of another, he hoiſts a pendant with the union-flag, &c. When he would have the admiral of the white, or he that commands in the ſecond

poſt, to tack, and endeavour to gain the wind of the enemy, he ſpreads a white flag under the flag at the main-top-maſt-head, and fires a gun; and when he would have the vice-admiral of the blue do ſo, he doth the ſame with the blue flag. If he would have the vice-admiral of the red do ſo, he ſpreads a red flag from the cap, on the fore top-maſt-head, downward on the back-ſtay: if the vice-admiral of the blue, he ſpreads a blue flag, &c. and fires a gun. If he would have the rear-admiral of the red do ſo, he hoiſts a red flag at the flag-ſtaff, at the mizen-top-maſt-head; if the rear-admiral of the white, a white flag; if the rear-admiral of the blue, a blue flag, and under it a pendant of the ſame colour, with a gun. If he be to leeward of the fleet, or any part of it, and he would have them bear down into his wake or grain, he hoiſts a blue flag at the mizen-peek, and fires a gun. If he would be to leeward of the enemy and his fleet, or any part of it to be to leeward of him; in order to bring theſe ſhips into the line, he bears down with a blue flag at the mizen-peek, under the union-flag (which is the *ſignal* for battle) and fires a gun; and then thoſe ſhips, that are to leeward of him, muſt endeavour to get into his wake or grain, according to their ſtation in the line of battle. When the fleet is ſailing before the wind, and he would have him, who commands in the ſecond poſt, and the ſhip of the ſtar-board quarter, to clap by the wind, and come to the ſtar-board tack, he hoiſts a red flag at the mizen-top-maſt-head: but a blue one, if he would have ſhips of the lar-board quarter, come to the lar-board tack, with a gun. If the van are to tack firſt, he ſpreads the union-flag at the flag-ſtaff, on the fore-top-maſt-head, and fires a gun, if the red flag be not abroad; but if it be, then he lowers the fore-top-ſails a little; and the union-flag is ſpread from the cap of the fore-top-maſt downwards; and every flag-ſhip doth the ſame. If the rear be to tack firſt, he hoiſts the union-flag on the flag-ſtaff, at the mizen-top-maſt-head, and fires a gun; which all the flag-ſhips are to anſwer. If all the flag-ſhips are to come into his wake or grain, he hoiſts a red flag at his mizen-peek, and fires a gun; and all the flag-ſhips muſt do the ſame. If he would have him that commands in the ſecond poſt of his ſquadron to make more ſail (though he himſelf ſhorten ſail) he hoiſts a white flag on the enſign-ſtaff. But if he that commands in the third poſt be to do ſo, he hoiſts a blue flag, and fires a gun, and all the flag-ſhips muſt have the ſame *ſignal*. Whenever he hoiſts a red flag on the flag-ſtaff at the fore-top-maſt-head, and fires a gun; every ſhip in the fleet muſt uſe their utmoſt endeavour to engage the enemy, in the order preſcribed them. When he hoiſts a white flag at his mizen-peek, and fires a gun; then all the ſmall frigates of his ſquadron, that are not of the line of battle, are to come under the ſtern. If the fleet by ſailing by a wind in the line of battle, and the admiral would have them brace their head-ſails to the maſt, he hoiſts up a yellow flag, on the flag-ſtaff, at the mizen-top-maſt-head, and fires a gun; which the flag-ſhips are to anſwer: and then the ſhips in the rear muſt brace firſt. After this, if he would have them fall their head-ſails, and ſtand on, he hoiſts a yellow flag on the flag-ſtaff of the fore-top-maſt-head, and fires a gun, which the flag-ſhips muſt anſwer, and then the ſhips in the van, muſt fall firſt, and ſtand on. If, when this *ſignal* is made, the red flag at the fore-top-maſt-head be abroad, he ſpreads the yellow flag under the red. If the fleets being near one another, the admiral would have all the ſhips to tack together, the ſooner to lie in a poſture to engage the enemy; he hoiſts an union-flag on the flag-ſtaves at the fore and mizen-top-maſt-heads, and fires a gun; and all the flag-ſhips are to do the ſame. The fleet being in a line of battle, if he would have the ſhip that leads the van, hoiſt, lower, ſet, or hawl up any of the ſails, he ſpreads a yellow flag, under that at his main-top-maſt-head, and fires a gun, which *ſignal* the flag-ſhips are to anſwer; and then the admiral will hoiſt, lower, ſet, or hawl up the ſail, which he would have the ſhip that leads the van, do; which is to be anſwered by the flag-ſhips of the fleet. When the enemies run, and he would have the whole fleet follow them, he makes all the ſail he can after them himſelf, takes down the *ſignal* for the line of battle, and fires two guns out of his fore-chaſe, which the flag-ſhips anſwer; and then every ſhip is to endeavour to come up with, and board the enemy. When he would have the chaſe given over, he hoiſts a white flag at the fore-top-maſt-head, and fires a gun. If he would have the red ſquadron drawn into a line of battle, one a-breaſt of another, he puts abroad a flag, ſtriped red and white, on the flag-ſtaff at the main-top-maſt-head, with a pendant under it, and fires a gun: if the white or ſecond ſquadron is to do ſo, the flag is ſtriped red, white and blue: if the blue or third ſquadron is to do ſo, the flag is a Genoeſe enſign and pendant: but if they are to draw into a line of battle, one a-head of another, the ſame *ſignals* are made without a pendant. If they are to draw into the line of battle one a-ſtern of another, with a large wind, and he would have the leaders go with the ſtar-board tacks, aboard by the wind; he hoiſts a red and white flag at the mizen-peek, and fires a gun: but if they ſhould go with the lar-board tacks aboard, by the wind, he hoiſts a Genoeſe

flag

flag at the ſame place; which *ſignals*, like others, muſt be anſwered by the flag-ſhips.

SIGNATURE, SIGNATURA, *ſigning*, a ſubſcription or putting of one's name at the bottom of an act, or deed, in one's own hand-writing. See SUBSCRIPTION.

Anciently, when very few people could write, they diſpenſed with the uſe of *ſignatures*; and contented themſelves with the party's ſeal. See SEAL.

SIGNATURE *of the court of Rome*, is a ſupplication anſwered by the pope, whereby he grants a favour, diſpenſation, or collation to a benefice, by putting the *fiat* at the bottom thereof, in his own hand; or the *conceſſum eſt* wrote in his preſence.—This *ſignature*, at the bottom of the ſupplication, gives the name to the whole inſtrument.

The *ſignature* contains the clauſes, derogations, and diſpenſations wherewith the pope grants the favour, or the benefice; with a commiſſion for the execution thereof, either in forma dignum, or in gracious form.

A *ſignature* of the pope's own hand, whereby he anſwers, *fiat ut petitur*, is preferred to another anſwered by the prefect, in his preſence, in theſe words, *conceſſum uti petitur in præſentia D. N. papæ*. Sometimes in *ſignatures* with the *fiat*, the pope adds, *proprio motu*; which clauſe gives them ſtill further force.

There are three kinds of *ſignatures*; one in *forma gratioſa*, diſpatched on an atteſtation of the ordinary; another in *forma dignum antiqua*, diſpatched for canonicates; the third in *forma dignum noviſſima*, which is a kind of ſecond *ſignature*, or executorial letter granted where, upon the ordinary's failing to execute the firſt within thirty days, the neareſt other ordinary is enjoined to execute it.

SIGNATURE, in printing, denotes a mark at the bottom of each ſheet, to facilitate the gathering and binding of the book; and to ſhew the order and number of the quires and ſheets. See PRINTING.

The *ſignatures* conſiſt of the capital letters of the alphabet; and change in every ſheet. If there be more ſheets than letters in the alphabet; to the capital letter, they add a ſmall one of the ſame ſort, *i. e.* a little a after a great A, &c. which they repeat, as often as is neceſſary.

SIGNATURE, SIGNATTRA, is alſo uſed by ſome naturaliſts for the reſemblance a vegetable or mineral bears to any part of the human body; ſuppoſed to afford an indication of its virtues and uſe.

SIGNET, one of the king's ſeals, uſed for ſealing his private letters, and ſigning all grants which paſs his majeſty's hand by bill. See SEAL.

The *ſignet* is always in the cuſtody of the king's ſecretaries: on whom attend four clerks of the *ſignet-office*. See SECRETARY and CLERK.

SIGNIFICATION, the ſenſe or meaning of a ſign, word, phraſe, emblem, deviſe or the like; that is, the thing denoted by ſuch ſign, word, figure, &c. See SIGN, WORD, EMBLEM, DEVISE, &c.

We are perfectly at a loſs as to the *ſignification* of the hieroglyphic characters of the ancients. See HIEROGLYPHIC.

SIGNIFICATION, in law, is the notification of an act, &c. made to the oppoſite party, by a copy, &c. thereof, given and atteſted by a proper officer.

Some *ſignifications* are to be made to the perſon himſelf; or, at leaſt, at his houſe: for others, it is enough they be made to the party's attorney, or agent.

SIGNIFICAVIT, a writ which iſſues out of chancery, upupon a certificate given by the ordinary, of a man that ſtands obſtinately excommunicate for the ſpace of forty days; for the laying him up in priſon, without bail or mainprize, till he ſubmit himſelf to the authority of the church. See EXCOMMUNICATION.

SIGNING. See SIGNATURE and COUNTER-*ſigning*.

SILENCIARY, SILENTIARIUS, an officer among the ancient Roman ſlaves; being, according to ſome authors, a ſlave placed over the reſt, to prevent any noiſe and din, and keep them ſilent.

Seneca, in his epiſtles, mentioning the great care taken to keep the ſlaves mute, has given occaſion to Lipſius, Popma, and ſome others, to ſuppoſe, that the *ſilenciary* was eſtabliſhed in his time: but others, as Pignorius, think no ſuch concluſion can be drawn from Seneca's words; nor any thing, but that they were, even then, very ſevere in preventing any noiſe among the ſlaves.—As to the name and office of the *ſilenciary*, it was not eſtabliſhed till about the time of Salvian; who is the firſt author that mentions it.

There were alſo *ſilentiarii* eſtabliſhed in the emperor's court, called *quietis miniſtri*, and *ſilentiarii palatii*; and honoured with the further titles of *clariſſimi*, *ſpectabiles*, *devotiſſimi*, and in Greek, θαυμασιωτατοι, *q. d.* moſt admirable.

There were a great number of them; but only thirty ordinarily officiated; who were divided into three bands, each whereof had its *decurio*.—The council of Chalcedon, call the body of *ſilentiaries*, *ſchola devotiſſimorum ſilentiariorum*.

SILENI, in antiquity, a ſort of heathen demi-gods, the ſame with *ſatyrs*, which were called *ſileni* when they came to be advanced in age. See SATYR.

Yet was there one principal *Silenus* elder than any of the reſt.—Diod. Siculus ſays, he was the maſter, or tutor of Bacchus, whom he diſciplined nobly, and followed him to the wars. He quotes an ancient poet named Thymætas, who relates, that the *ſileni* aſſiſted Bacchus in the war he waged againſt the Titans; adding, that the firſt *Silenus* reigned in an iſland made by the river Triton in Lybia.—He is repreſented, as having a long tail hanging behind; which is likewiſe an attribute of all his poſterity.—The poets always mount him on an aſs.

Nonnus makes *Silenus* a ſon of Tellus; and gives him three ſons, Aſtræus, Maron and Lenæus. Servius, on Virgil's eclogue, makes *Silenus* * the ſon of Mercury; others, the ſon of Pan, and a nymph: others will have him born of the drops of the blood of Cœlus, father of Saturn.

SILIQUA, in botany, the ſeed-veſſel, huſk, pod, or ſhell of a plant of the leguminous kind.—Whence

SILIQUOUS *plants*, thoſe which produce *ſiliquæ*, or ſeed-pods. See PLANT and SEED.

SILK, SERICUM, a very ſoft, fine, bright, delicate thread; the work of an inſect, called *bombyx*, or the *ſilk-worm*.

The ancients were but little acquainted with the uſe and manufacture of *ſilk*: they took it for the work of a ſort of ſpider, or beetle, who ſpun it out of its entrails, and wound it with its feet about the little branches of trees.—This inſect they called *ſer*, from *Seres*, a people in Scythia, who kept it; whence the *ſilk* itſelf they called *ſericum*.—But the *ſer* has very little affinity with our *ſilk-worm*, *bombyx*: the former living five years; but the latter dying annually, enveloped in a yellowiſh bag, or ball; which, wound out into little threads, makes what we call *ſilk*.

It was in the iſle of Cos, that the art of manufacturing *ſilk* was firſt invented; and Pamphila, daughter of Platis, is honoured as the inventor.—The diſcovery was not long unknown to the Romans. *Silk* was brought them from Serica, where the worm was a native. But ſo far were they from profiting by the diſcovery, that they could not be induced to believe ſo fine a thread ſhould be the work of a worm; and thereupon formed a thouſand chimerical conjectures of their own.

This temper rendered *ſilk* a very ſcarce commodity among them for many ages: it was even ſold weight for weight with gold; inſomuch, that Vopiſcus tells us, the emperor Aurelian, refuſed the empreſs, his ſpouſe, a ſuit of *ſilk*, which ſhe ſolicited of him with much earneſtneſs; merely on account of its dearneſs.—At length, two monks, coming from the Indies to Conſtantinople in 555, brought with them great quantities of *ſilk-worms*, with inſtructions for the hatching of their eggs, rearing and feeding the worms, drawing out the *ſilk*, ſpinning and working it. Upon this, manufactures were ſet up at Athens, Thebes and Corinth.

About the year 1130, Roger king of Sicily, eſtabliſhed a *ſilk* manufactory at Palermo, and another in Calabria; managed by workmen, who were part of the plunder brought from Athens, Corinth, &c. wherefore that prince made a conqueſt in his expedition to the holy land.—By degrees, Mezeray adds, the reſt of Italy and Spain learned from the Sicilians and Calabrians, the management of the *ſilk worms*, and the working of *ſilk*: and at length the French, by right of neighbourhood, a little before the reign of Francis I. began to imitate them.

The great advantage the new manufacture turned to, made our King James I. very earneſt for its being introduced into England: accordingly, it was recommended ſeveral times from the throne, and in the moſt earneſt terms, to plant mulberry-trees, &c. for the propagation of *ſilk-worms*; but, unhappily, without effect: though from the various experiments we meet withal in the Philoſophical Tranſactions, and other places, it appears, that the *ſilk-worm* thrives and works as well, in all reſpects, in England, as in any other part of Europe.

The *ſilk worm* is an inſect, not more remarkable for the precious matter it furniſhes for divers ſtuffs, than for the many forms it aſſumes, before and after its being inveloped in the rich cod or ball it weaves itſelf. From a ſmall egg about the ſize of a pin's head, which is its firſt ſtate, it becomes a pretty big worm, or maggot, of a whitiſh colour, inclining to yellow. In this ſtate it feeds on mulberry-leaves, till being come to maturity, it winds itſelf up into a *ſilken* bag, or caſe, about the ſize and ſhape of a pidgeon's egg; and becomes metamorphoſed into an aurelia: in this ſtate it remains without any ſigns of life, or motion: till at length it awakes, to become a butter-fly; after making itſelf a paſſage out of its *ſilken* ſepulchre. And, at laſt, dying indeed, it prepares itſelf, by an egg, or ſeed it caſts, for a new life; which the warmth of the ſummer-weather aſſiſts it in reſuming. See INSECT.

---

* Bochart, in his Canaan, will have *Silenus* to take his name from שלח; or שיל, *Silo*; whence שילן, *Silan*, the name of the Meſſiah. He adds, that all attributed to this imaginary deity, is taken from what the prophets have foretold of Jeſus Chriſt.—Thus, whereas it is ſaid, the Meſſiah ſhall be the inſtructor of the people; *Silenus* is made preceptor of Bacchus. Becauſe it is ſaid, that our Saviour ſhall bind his aſs to the vine, and his colt to the young vine; *Silenus* is made to ride on an aſs. Becauſe our Saviour waſhed his garments in blood, as thoſe who trod the wine-preſs; *Silenus* was made to preſide over thoſe who preſſed the vintage. Becauſe, it is added, his eyes were red by reaſon of wine; *Silenus* was made always fuddled. Bochart, however, advances all this with a deal of diſtruſt, as he has reaſon; it having no warrant: he adds, that the devil invented the fable of *Silenus*, to turn the myſteries of our religion into ridicule. But it muſt be a very ignorant devil, to take *rubent illi oculi ex vino, & dentes ejus ex lacte albeſcunt*, in the ſenſe he has done; as if the words ſignified any thing more, in the propriety of the Hebrew tongue, than, His eyes are redder than wine; his teeth whiter than milk. We may add, that no-body, before Bochart, neither chriſtian nor idolater, ever ſaw any thing of Jeſus Chriſt in the fable of *Silenus*.

As ſoon as the *ſilk-worm* is arrived at the ſize and ſtrength neceſſary for beginning his cod; he makes his web: for it is thus they call that ſlight tiſſue, which is the beginning, and ground of this admirable work. This is his firſt day's employment. On the ſecond, he forms his folliculus or ball, and covers himſelf almoſt over with *ſilk*. The third day, he is quite hid; and the following days employs himſelf in thickening and ſtrengthening his ball: always working from one ſingle end, which he never breaks by his own fault; and which is ſo fine, and ſo long, that thoſe who have examined it attentively, think they ſpeak within compaſs, when they affirm, that each ball contains *ſilk* enough to reach the length of ſix Engliſh miles.

In ten days time, the ball is in its perfection; and is now to be taken down from the branches of the mulberry-tree, where the worms have hung it.—But this point requires a deal of attention; for there are ſome worms more lazy than others; and it is very dangerous waiting till they make themſelves a paſſage, which uſually happens about the fifteenth day of the month.

The firſt, fineſt and ſtrongeſt balls, are kept for the grain; the reſt are carefully wound: or, if it is deſired to keep them all, or if there be more than can be well wound at once; they lay them for ſome time in an oven moderately hot, or elſe expoſe them, for ſeveral days ſucceſſively, to the greateſt heats of the ſun, in order to kill the inſect; which, without this precaution, would not fail to open itſelf a way to go and uſe thoſe new wings abroad, it has acquired within.

Ordinarily, they only wind the more perfect balls. Thoſe that are double, or too weak, or too coarſe, are laid aſide; not as altogether uſeleſs, but that, being improper for winding, they are reſerved to be drawn out into ſkains. The balls are of different colours; the moſt common are yellow, orange-colour, iſabella, and fleſh colour.—There are ſome alſo of a ſea-green; others of a ſulphur-colour, and others white: but there is no neceſſity for ſeparating the colours and ſhades to wind them apart; as all the colours are to be loſt in the future ſcouring and preparing of the *ſilk*.

To wind the SILK *from off the balls.* Two machines are neceſſary; the one a furnace, with its copper; the other a reel, or frame, to draw the *ſilk*.—The winder, then, ſeated near the furnace, throws into the copper of water over the furnace (firſt heated and boiled to a certain degree, which cuſtom alone can teach) a handful or two of balls, which have been firſt well purged of all their looſe furry ſubſtance. He then ſtirs the whole very briſkly about with birchen rods, bound and cut like bruſhes; and when the heat and agitation have detached the ends of the *ſilks* of the pods, which are apt to catch on the rods, he draws them forth; and joining ten or twelve, or even fourteen of them together, he forms them into threads, according to the bigneſs required to the works they are deſtined for: eight ends ſufficing for ribbands, and velvets, &c. requiring no leſs than fourteen. The ends thus joined into two or three threads, are firſt paſſed into the holes of three iron rods, in the fore-part of the reel, then upon the bobbins, or pullies, and at laſt are drawn out to the reel itſelf, and there faſtened; each to an end of an arm or branch of the reel. Thus diſpoſed, the workman, giving motion to the reel, by turning the handle, guides his threads; ſubſtitutes new ones, when any of them break, or any of the balls are wound out; ſtrengthens them where neceſſary, by adding others; and takes away the balls wound out, or that having been pierced, are full of water.

In this manner, two workmen will ſpin and reel three pounds of *ſilk* in a day; which is an otherguiſe diſpatch than is made by the ſpinning-wheel, or diſtaff.—Indeed, all *ſilks* cannot be ſpun and reeled after this manner: either by reaſon the balls have been perforated by the *ſilk-worms* themſelves, or becauſe they are double, or too weak to bear the water; or becauſe they are coarſe, &c. Of all theſe together, they make a particular kind of *ſilk* called *floretta*: which being carded, or even ſpun on the diſtaff, or the wheel, in the condition it comes from the ball, makes a tolerable *ſilk*.

As to the balls, after opening them with ſciſſars, and taking out the inſects (which are of ſome uſe for the feeding of poultry) they are ſteeped three or four days in troughs, the water whereof is changed every day to prevent their ſtinking. When they are well ſoftened by this ſcouring, and cleared of that gummy matter, the worm had lined the inſide withal, and which renders it impenetrable to the water, and even to air itſelf, they boil them half an hour in a lye of aſhes, very clear and well ſtrained: and after waſhing them out in the river, and drying them in the ſun, they card and ſpin them on the wheel, &c. and thus make another kind of floretta, ſomewhat inferior to the former.

The ſeveral preparations which *ſilks* undergo, to fit them to be uſed in the manufacture of *ſilken* ſtuffs, are the ſpinning, reeling, milling, bleaching and dying.—The two firſt we have already ſpoke of, as they are concerned in drawing the *ſilk* from off the balls.—As to the ſpinning and reeling of raw *ſilks* off the balls, ſuch as they are brought hither from Italy, the Levant, &c. the firſt is chiefly performed on the ſpinning-wheel; and the latter, either on hand-reels, or on reels mounted on machines, which ſerve to reel ſeveral ſkains at the ſame time.—As to the milling, they uſe a mill compoſed of ſeveral pieces, which may mill two or three hundred bobbins at once, and make them into as many ſkains. See MILLING. For the bleaching and dying, ſee BLEACHING and DYING.

Silk is diſtinguiſhed by different names according to its different ſtates.—Thus,

Raw SILK, is that taken from the ball, without fire, and wound without any coction: ſuch as is moſt, if not all, that is brought into England from the Levant.

In the French *ſilk-works*, the greateſt part of this *raw ſilk* paſſes for little better than a kind of fine floretta; yet, when ſpun, it makes a bright thread, and ſerves for the manufacture of ſtuffs of moderate value and luſtre. But the *raw ſilks* of the Levant, whence moſt of ours come, are exceeding fine and beautiful.—This difference ariſes hence, that in France the beſt balls are ſpun and wound in boiling water, and only the refuſe made into *raw ſilk*: whereas, in the Levant, there is no ſuch thing as ſpinning and winding on the fire; but the *ſilks* are all ſent in bales or packs, as they are drawn from off the balls: ſo that they are only diſtinguiſhed by their quality of fine, middling, and coarſe.

Boiled SILK, is that which has been boiled in water, to facilitate the ſpinning and winding.—This is the fineſt of all the ſorts of *ſilk* manufactured in France, and is ſeldom uſed, but in the richeſt ſtuffs; as velvets, taffaties, damaſks, brocades, &c.

There is alſo another kind of *boiled ſilk*, which is prepared by boiling, to be milled; and which cannot receive that preparation, without being firſt paſſed through hot water.

By the laws of France, it is prohibited to mix raw with *boiled ſilk*; both as ſuch a practice ſpoils the dying, and as the raw *ſilk* corrupts and cuts the boiled.

Throwed or *twiſted* SILKS, are ſuch, as, beſide their ſpinning and winding, have received their milling or throwing.

This they receive in a different degree, as they are paſſed oftener, or ſeldomer, over the mill: properly, however, *throwed ſilks*, are thoſe wherein the threads are pretty thick throwed, and are twiſted ſeveral times.

Slack SILKS are ſuch as are not twiſted, but are prepared, and dyed, for tapeſtry, and other works, with the needle.

Eaſtern, or *Eaſt-Indian* SILK.—That particularly thus called, is not the work of the *ſilk-worms*, but comes from a plant that produces it, in pods, much like thoſe of the cotton-tree. The matter this pod contains is extremely white, fine, and moderately gloſſy: it ſpins eaſily, and is made into a kind of *ſilk*, that enters the manufacture of ſeveral Indian and Chineſe ſtuffs.

French SILKS.—It is only in the moſt ſouthern provinces of France, that *ſilk* is cultivated, mulberry-trees planted, and worms bred. The principal are thoſe of Languedoc, Dauphine, Provence, Avignon, Savoy and Lyons.—This laſt place, indeed, furniſhes very few *ſilks* of its own growth; but is the great ſtaple whence the merchants of Paris and the other cities are to fetch them: at leaſt, they are obliged to have them paſs through Lyons, if they bring them from elſewhere, either by land or ſea.

There are computed to enter Lyons, *communibus annis*, 6000 bales; the bale valued at 160 pound weight: of which 6000 bales, there are 1400 from the Levant, 1600 from Sicily, 1500 from Italy, 300 from Spain, and 1200 from Languedoc, Provence and Dauphine.

At the time when the manufactures of Lyons were in their proſperity, there were reckoned 18000 looms employed in the *ſilk* manufacture; but they are ſo fallen, that even in 1698, there were not reckoned 4000.—The decay is not leſs notable at Tours: they had formerly 700 mills for winding and preparing the *ſilks*; 8000 looms to weave them, and 40,000 perſons employed in the preparation and manufacturing thereof; which are now reduced to 70 mills, 1200 looms, and 4000 perſons.

Sicilian SILKS.—The commerce of the *ſilks* of Sicily is very conſiderable; and the Florentines, Genoeſe and Luccefe, are the people who chiefly make it. Great quantities are yearly brought thence, eſpecially from Meſſina; part whereof they uſe in their own manufactures, and ſell the reſt to their neighbours, the French, &c. with profit.—The Italians have this advantage, eſpecially the Genoeſe, over other people, that having large eſtabliſhments in the iſland, they are reputed as natives, and pay no duty for the export.

Part of the *Sicilian ſilks* are raw; the reſt ſpun and milled; of which laſt kind, thoſe of St. Lucia and Meſſina, are the moſt valued.--The raw, unwrought *ſilks* are always ſold for ready money; the others, ſometimes, in exchange for other goods.

Italian SILKS.—The *ſilks* brought from Italy are partly wrought, and partly raw, and unwrought. Milan, Parma, Lucca and Modena, furniſh none but the latter kind; Genoa moſt of the former; Boulogna affords both kinds.

Spaniſh SILKS, are all raw; and are ſpun, milled, *&c.* in England, according to the ſeveral works they are to be uſed in.

Turky SILKS, are all raw.—One advantage we have in the commerce of the Levant, in *ſilks*, wanting in thoſe of Sicily, is, that the latter are confined to a particular ſeaſon of the year; whereas the former are bought at all times. They are brought from Aleppo, Tripoli, Sayda, from the iſle of Cyprus, Candia, *&c.*—But the principal place of commerce, eſpecially for the *ſilks* of Perſia, is Smyrna. The *ſilks* are brought hither in caravans, from the month of January to September. The caravans in January, are loaden with the fineſt *ſilks*; thoſe of Feburary and March bring indifferent ones; the reſt, the coarſeſt.

They all come from the ſeveral Provinces of Perſia, chiefly thoſe of Quilan and Schiruvan, and the city of Schamachia, ſituate near the edge of the Caſpian ſea; from which three places, a Dutch author aſſures us, there do not come leſs than 30,000 bales of *ſilk* in a year.—Ardeuil or Ardebil, another city of Perſia, not far diſtant from theſe *ſilk* countries, is the place where the *ſilks* are laid up, and whence the caravans ſet out for Smyrna, Aleppo and Conſtantinople; and it is this city, with Schamachia, that have always been eſteemed the centre of the *ſilk* trade; which has been ſeveral times attempted to be removed from Smyrna and the Mediterranean, in favour of Archangel and the white ſea, by carrying them acroſs Muſcovy, by the Volga and Dwina, two rivers that traverſe the principal provinces of that vaſt empire.

This new courſe of the Perſian *ſilks* into Europe, was firſt propoſed by Paolo Centurio, a Genoeſe, to the czar Baſil, under the pontificate of Leo X. The French had the ſame deſign in 1626. The duke of Holſtein, in 1633, ſent ambaſſadors to the court of Perſia purely with the ſame view: and in 1668, the czar Alexis Michael attempted the thing himſelf; but was diſappointed by the rebellion of the Coſſacks, and the ſurprize of Aſtracan.

In 1688, the commerce of Perſian *ſilks* had like to have been removed from Smyrna, by an earthquake, which almoſt overturned the whole city: and, doubtleſs, the removal had been effected, but for the vigorous means uſed by the Turks to prevent it.—Smyrna, however, ſtill remains in her ancient poſſeſſion; and the ſeveral nations of Europe continue every year to ſend their fleets, to fetch away the *ſilks*; and matters are like to remain ſo, unleſs the conqueſts made by the late czar, along the Caſpian ſea, enable his ſucceſſors, as it is certain he himſelf had ſuch a thing in view, to put this great deſign in execution.

China, *Japan* and *Indian* SILKS.—Several provinces of China are ſo fertile in mulberry trees, and their climate ſo agreeable to the nature of *ſilk-worms*, that the quantity of *ſilk* here produced is incredible: the ſingle province of Tchekiam might ſupply all China, and even a great part of Europe, with this commodity. The *ſilks* of this province are the moſt eſteemed, though thoſe of Nanquin and Canton be excellent.

The *ſilk* trade is the principal in China, and that which employs the moſt hands: but the European merchants, who deal in it, eſpecially in wrought *ſilks*, are to be careful of the ſpinning, *&c.* the waſte being uſually very great, as the French Eaſt-India company lately found to their coſt.

Japan would not afford fewer *ſilks* than China; but that the Japaneſe, a barbarous and diſtruſtful people, have interdicted all commerce with ſtrangers, eſpecially with Europeans; excepting with the Dutch; who are ſaid to be admitted on certain impious terms, related by Tavernier, but which we muſt own we cannot credit. Accordingly, the Dutch have endeavoured to vindicate themſelves by the pens of ſeveral famous writers.

The *ſilks* of the ſtates of the great mogul, are brought almoſt wholly from Kaſem-bazar, a mediterranean place, whence they are conveyed by a canal of fifteen leagues into the Ganges, by which, they are forwarded fifteen leagues further, to the mouth of the famous river of Indoſtan.—The *ſilk* of Kaſem-bazar is yellowiſh; as are alſo thoſe of Perſia and Sicily; there being none, that we know of, naturally white, but that of Paleſtine. The Indians, however, whiten it with a lye made of the Aſhes of a tree, called *Adam's fig-tree*; but as the tree is pretty ſcarce, the Europeans are forced to take the greateſt part of their *ſilks* in the native yellow.

Kaſem-bazar alone, is computed to furniſh every year twenty-two thouſand bales of *ſilk*, each bale weighing 100 pounds. The Dutch buy it almoſt all up; not to bring it into Europe, no more than they do that of Japan; but to exchange it for other rich merchandizes; particularly bars of ſilver, *&c.*

Spider SILK.—Within a few years the ſecret has been found in France, of procuring and preparing *ſilk* of the webs of ſpiders; and uſing it in ſeveral manufactures. This diſcovery is owing to M. Bon, in 1710, who publiſhed a diſſertation on the ſubject; whence what follows is extracted. See *Spider*-WEB.

Spiders are uſually diſtinguiſhed, either with regard to their colour; as, into black, brown, yellow, white, *&c.* or with regard to the number, or arrangement, of their eyes; ſome having 6, others 8, others 10.—But with regard to the *ſilk-ſpider*, M. Bon reduces them all to two kinds, thoſe with long legs, and thoſe with ſhort: which laſt, are thoſe which furniſh the raw *ſilk*.

The *ſilk-ſpider* makes a *ſilk*, every whit as beautiful, gloſſy, and ſtrong as the *ſilk-worm*: it ſpins it out of the anus, around which are five papillæ, or ſmall nipples, and behind theſe, two others; all muſculous, and furniſhed with ſphincters.—Theſe nipples ſerve, as ſo many wire-drawing-irons, to form and mould a viſcous liquor, which, when dried in the air, after being drawn through them, makes the *ſilk*.

Each of theſe nipples, M. Reaumur obſerves, conſiſts of a number of leſſer and inſenſible ones; which one may be convinced of, by preſſing a ſpider's belly between the fingers, to oblige the liquor to flow into the nipples; for by this means, applying the finger againſt the anus, ſeveral diſtinct threads will be drawn out through the ſeveral perforations of the nipples.—The threads are too fine to be told with any certainty; but M. Reaumur reckons, each larger nipple may ſend forth ſix or ſeven.

Hence we ſee, how the ſpiders make their threads bigger, or ſmaller: for as, before they begin to ſpin, they always apply more or fewer of theſe ſix nipples, againſt the body whence the web is begun; or as they apply each more or leſs ſtrongly, ſo as more or fewer of the minuter nipples come to take; the thread thus ſpun, will be a compound of more or fewer of the ſingle threads. Indeed, as the threads come from the anus, all joined together, they appear to be ſingle; but M. Bon has diſtiguiſhed one of the ſingle ones to conſiſt of 15 or 20 diſtinct threads.

The threads are of two kinds: the firſt is weak, and only ſerves for that kind of web wherewith they catch flies.—The ſecond is much ſtronger, and ſerves to wrap up their eggs in; which by this means, are ſheltered from the cold, as well as from inſects, which might otherways gnaw and ſpoil them. Theſe threads they wind very looſely round the eggs, reſembling the balls or bags of *ſilk-worms*, that have been prepared and looſened for the diſtaff.

The ſpider-bags are of a grey colour when new; but turn blackiſh when long expoſed to the air: indeed, one might find other ſpider-bags of other colours, and which would afford a better *ſilk*, but their ſcarcity would render the experiment difficult; for which reaſon we confine ourſelves to the bags of the commoneſt ſpiders, which are the ſhort-legged kind.—Theſe always find out ſome place ſecure from the wind and rain, to make their bags; as, hollow trees, the corners of windows, or vaults, or under the eaves of houſes.

By collecting a quantity of theſe bags, a new *ſilk* is made, inferior in nothing to the common *ſilk*. It takes all kinds of dyes, and may be made into all kinds of ſtuffs.—M. Bon had ſtockings and gloves made of it, which he preſented to the academy; and others to the royal ſociety.

For the manner of preparing the bags to get the *ſilk*, it is thus: after having gathered 12 or 13 ounces of theſe bags, M. Bon had them well beaten for ſome time, with the hand, and a ſtick, to get out all the duſt: he then waſhed them, in luke-warm water, till they left the water very clean: after this, he laid them to ſteep, in a large veſſel, with ſoap and ſalt petre, and gum-arabic. The whole was left to boil over a gentle fire, for three hours. The bags were next waſhed, in warm water, to get out the ſoap; and, after all, laid to dry ſome days, to fit them for carding; which was performed by the common *ſilk-carders*, but with cards much finer than ordinary.—By this means, he had a *ſilk*, of a very particular aſh-colour, which was eaſily ſpun, and the thread ſpun from it, both ſtronger and finer than that of common *ſilk*; which ſhews, that all ſorts of works may be made of it: nor is there any reaſon to fear, but it will ſtand any trials of the loom, after having paſſed that of the ſtocking weavers.

The only difficulty, now, is in procuring a ſufficient quantity of ſpiders bags to make any conſiderable work of it: which M. Bon obſerves, would be no difficulty at all, had we but the art of breeding them as they do *ſilk-worms*. For they multiply much more; every ſpider laying 6 or 700 eggs, whereas the *ſilk-worms* do not lay above 100; yet are theſe laſt ſo tender, *&c.* that one half die without making any bags, or are hindered by ſome little accident, from making their bags: whereas the ſpiders hatch of themſelves, without any care, in the months of Auguſt and September, in fifteen or ſixteen days after they are laid; the old ſpiders that lay them, dying ſoon after. The young ones thus bred, live ten or twelve months without eating, and continue in their bags without growing, till the hot weather putting their viſcid juices in motion, forces them to come forth, ſpin and run about to ſeek food.—Were a way, therefore, found of breeding young ſpiders in rooms, they would, doubtleſs, furniſh a much greater quantity of bags than *ſilk-worms* do. For of ſeven or eight hundred young ſpiders, which M. Bon kept, ſcarce one died in a year; whereas of one hundred *ſilk-worms*, not forty lived to make their bags. M. Bon having ordered all the ſhort-legged ſpiders that could be found in the months of Auguſt and September, to be brought to him, ſhut them up in paper coffins, and pots; covering the pots with papers, which he pricked full of pin-holes, as well as the coffins, to give them air. He fed them with flies, and found ſometime afterwards the greateſt part of them had made their bags.—The ſame excellent perſon found that ſpiders bags, with regard to their weight, afford much more *ſilk* than thoſe of the *ſilk-worms:* as a proof hereof, he obſerves, that thirteen ounces yield near four ounces of clear *ſilk*, two ounces whereof will make a pair of ſtockings; whereas ſtockings of common *ſilk* weigh ſeven or eight ounces.

Nor is there any venom in the *ſilk*, or even in the ſpider, as many have imagined. M. Bon has been bit by them ſeveral times, without any manner of harm; and as for the *ſilk* it is uſed with very good ſucceſs, to ſtop bleeding and cure wounds, the natural gluten thereof acting as a kind of balſom.—It likewiſe yields, by diſtillation, ſeveral ſpecific medicines, particularly great quantities of ſpirit, and volatile ſalt, which being prepared after the ſame manner as that drawn from the bags of *ſilk-worms*, in making the guttæ Anglicanæ, or Engliſh drops, ſo famous over all Europe; may ſerve to make other drops of greater efficacy, which M. Bon calls *drops of Montpellier*, to be uſed in all ſleepy diſeaſes. See GUTTÆ.

M. Reaumur being appointed by the royal academy, to make a further enquiry into this new *ſilk-work*, has raiſed ſeveral objections and difficulties againſt it; which are found in the memoirs of the academy for the year 1710. The ſum of what he has urged, amounts to this.—The natural fierceneſs of the ſpiders, renders them unfit to be bred and kept together: four or five thouſand being diſtributed into cells, 50 in ſome, 100 or 200 in others; the big ones killed and eat the leſs, ſo that in ſhort time, there were ſcarce left one or two in each cell: and to this inclination of mutually eating one another, M. Reaumur aſcribes the ſcarcity of ſpiders, conſidering the vaſt number of eggs they lay.

But this is not all: he even affirms, that the ſpider's bag is inferior to that of the *ſilk-worm*, both in luſtre and ſtrength; and that it produces leſs matter to be manufactured. The thread of the ſpider's web only bears a weight of two grains without breaking; that of the bag bears 36. The latter, therefore, in all probability, is eighteen times thicker than the former; yet is it weaker than that of the *ſilk-worm*, which bears a weight of two drams and a half. So that five threads of the ſpider's bag muſt be put together to equal one thread of the *ſilk-worm*'s bag.

Now, it is impoſſible theſe ſhould be applied ſo juſtly over one another, as not to leave little vacant ſpaces between them, whence the light will not be reflected; and of conſequence, a thread thus compounded, muſt fall ſhort of the luſtre of a ſolid thread. Add to this, that the ſpider's thread cannot be wound off, as that of the *ſilk-worm* may; but muſt, of neceſſity, be carded; by which means being torn in pieces, its evenneſs, which contributes much to its luſtre, is deſtroyed. In effect, this want of luſtre was taken notice of by M. de la Hire, when the ſtockings were preſented to the academy.

Again, ſpiders furniſh much leſs *ſilk* than the worms: the largeſt bags of theſe latter, weigh four grains; the ſmaller three grains; ſo that 2304 worms, produce a pound of *ſilk*. The ſpiders bags do not weigh above one grain: yet, when cleared of their duſt and filth, loſe two thirds of their weight. The work of 12 ſpiders, therefore, only equals that of one *ſilk-worm*; and a pound of *ſilk* will require at leaſt 27648 ſpiders. But, as the bags are wholly the work of the females, who ſpin them to depoſit their eggs in; there muſt be kept 55296 ſpiders, to yield a pound of *ſilk*. Yet will this only hold of the beſt ſpiders, thoſe large ones ordinarily ſeen in gardens, *&c.* ſcarce yielding a twelfth part of the *ſilk* of the others. 280 of theſe, he ſhews, would not do more than one *ſilk-worm*; and 663552 of them would ſcarce yield a pound.

SILLON, in fortification, an elevation of earth made in the middle of the moat, to fortify it, when too broad. See DITCH.

The *ſillon* is more uſually denominated *envelope*. See ENVELOPE.

SILVER, a white, rich ſort of metal; being the fineſt, pureſt, moſt ductile, and moſt precious of all metals, except gold. See METAL.

There are *ſilver mines* in all the four quarters of the world. Europe has its ſhare; nor is our own iſland quite deſtitute thereof, though it has none of much value.

The mines of Peru, and ſome other parts of America, are much the richeſt, and moſt abundant; they appear almoſt inexhauſtible; particularly thoſe of Potoſi, which continue to be dug with equal advantage as when firſt diſcovered; with this only difference, that the veins which were then almoſt in the ſurface of that famous mountain, are now ſunk to prodigious depths, the workmen going into them by a painful deſcent of four or five hundred ſteps.—Many millions of Indians have periſhed in them; and prodigious numbers continue to be deſtroyed yearly.

The ores, or mineral ſtones they dig, are not all of the ſame quality, conſiſtence, or colour: ſome are white, or aſh-coloured, ſpotted with red, or blue: and called *plata blancha:* others are black, and called *plomo-ronco:* theſe laſt are the richeſt, and the eaſieſt wrought; no mercury being here needed; nor any thing, but to put them in the fire: where the lead evaporating, leaves the *ſilver* pure. The Indians, who, till the arrival of the Spaniards, knew nothing of the uſe of mercury, melted none but of this kind of mineral.—The *roſſicler*, is another black mineral diſtinguiſhed by whetting and rubbing it againſt iron, which turns it red. It is very rich and, the metal it yields, of the beſt ſort. The *zoroche* burns like talc, and looks as if *ſilvered*; though it does not yield much. The *paco* is a yellow red, very ſoft, and found almoſt broke in pieces; it is not rich. The *cobriſſo* is green, and half friable. Though the *ſilver* of this be viſible, yet it is exceedingly difficultly drawn from it, by reaſon of the copper wherewith it is intermixed. Laſtly, the *arannea*, which is only found in Potoſi, and that only in the mine of Cotamito, conſiſts of threads of pure *ſilver*, interwove like a *ſilver* galoon, that has been burnt to get out the ſilk.

The *ſilver veins*, of what quality ſoever, are uſually richer in the middle, than towards the extremes: but the richeſt places are thoſe where the veins interſect.—It is reckoned a great addition to the richneſs of a mine to be near a river, for the advantage of mills to grind ore. At Lipes and Potoſi, for inſtance, the caxon of ore muſt yield ten marks to defray expences; whereas, at Tanava, there need not above five.

The moſt uſual way of ſeparating the *ſilver* from the ore, is by what they call *pinea's*. See PINEA.—Sometimes, however, they uſe nothing but fire frequently repeated: or aqua fortis.

What renders the working of the mines exceedingly dangerous, is the exhalations ariſing from them; which are even felt on the out-ſide; and make an impreſſion on animals grazing in the neighbourhood; but in the in-ſide, ſtupify the miners, none of whom can bear ſo poiſonous an air above a day together. Sometimes it is ſo fatal, that it kills on the ſpot; and obliges them to ſtop up the veins again, whence it exhales.—The mines of Potoſi, are much the leaſt ſubject to them; and yet, without the herb paraguay, the infuſion whereof is taken by the miners, as we do that of tea, thoſe mines muſt be ſoon abandoned.

Though the mines of Potoſi and Lipes, ſtill keep up their reputation, yet are there ſeveral diſcovered within theſe few years, that exceed them much in richneſs: ſuch are the mines of Oruro, eight leagues from Arica, and thoſe of Ollachea, near Cuſco, opened in 1712.—It is remarkable, that moſt of the mines in America, are found in cold and barren places.

The method of ſeparating *ſilver* from the ore, in Europe, is the ſame as that of gold: that is, by means of quick-ſilver; with this difference, that for *ſilver*, to every fifty hundred weight of ore, is added one hundred weight of rock-ſalt, or ſome other natural ſalt.—That curious operation may be ſeen at length under the article GOLD.

To ſeparate the *ſilver* from the mercury, wherewith it is amalgamated; they have a furnace open a-top; and the aperture covered with a kind of capital made of earth, of a cylindrical form; that may be clapped on, or taken off at pleaſure.—The maſs of *ſilver*, and mercury, being laid in the furnace, the capital applied, and the fire lighted underneath; the quick-ſilver raiſed by the action of the fire, in form of vapour, is caught in the capital, and taken thence, to be uſed in a ſecond operation.

The ſtandard of fine *ſilver* is 12 penny-weights, each conſiſting of 24 grains. When it is below this, it muſt be raiſed to it by refining; which is uſually performed by means of lead.—In order to this, a coppel is filled with a mixture of brick-aſhes, and aſhes of a bullock's or other bones. It is ſet on the fire, and heated red hot; in which ſtate the lead is put in, and when this is melted, the *ſilver*, in the proportion of a pound of lead to four or five ounces of *ſilver*, and even ſomewhat more lead, if the *ſilver* be very coarſe. As theſe two metals melt together, the copper, before mixed with the *ſilver*, diſſipates in ſmoak, or goes away with the ſcum and litharge; and ſo does the lead itſelf; leaving the *ſilver* alone in the coppel, in its proper degree of fineneſs. See LITHARGE.

In this method of refining, wherein 6 or 7000 pounds may be refined at ounce; the metal is drawn out of the coppel two ways; the one by plunging in it, while ſtill liquid, a thick bar of iron, round which, the *ſilver* ſticks in form of a ſhell, or cruſt; repeating this again and again: the other, is by letting the coppel ſtand till it be cold; in the bottom whereof, the *ſilver* fixes in form of a cake.

Beſides the refining of *ſilver* with lead, there is another manner of doing it with ſalt-petre; which ſee under the article REFINING.

But both the one and the other are tedious and troubleſome; when performed on large quantities. This occaſioned M. Homberg to endeavour to ſhorten the operation; which he effected with good ſucceſs.—His method is; to calcine the *ſilver* with half its weight of common ſulphur; and after melting the whole together, to caſt a quantity of ſteel filings upon it at ſeveral times: upon this, the ſulphur quits the *ſilver*, and joins itſelf to the iron, and both are converted into ſcoria, which ſwim on the *ſilver*; and the metal itſelf is found pure at the bottom of the crucible.

The eſſay of *ſilver* is alſo made by the coppel, in the ſame manner as the refining by lead. If the *ſilver*, after this eſſay, preſerve its weight, it is ſtandard; if it loſe, the grains, or even penny-weights of its diminution, are accounted. See ESSAY. See alſo STANDARD.

SILVER *wire*, is *ſilver* drawn through the holes of a wire-drawing-iron, and by this means reduced to the fineneſs of a thread or hair.—The manner of drawing it, ſee under the article GOLD-WIRE. See alſo WIRE and DRAWING.

SILVER *leaf*, is that which the gold-beaters have reduced into fine, thin leaves, to be uſed by gilders, &c. See GOLD LEAF.

Shell SILVER, is made of the ſhreads of *ſilver* leaves, or of the leaves themſelves: uſed in painting, and *ſilvering* certain works.—It is prepared after the ſame manner as ſhell-gold. See GOLD.

SILVER, in chymiſtry, is called *luna*, moon; and ſeveral preparations are made from it: particularly, a

Tincture of SILVER, made by diſſolving thin *ſilver* plates, or *ſilver* ſhot in ſpirit of nitre; and pouring the diſſolution in another veſſel full of ſalt-water. By this means, the *ſilver* is immediately precipitated in a very white powder, which they waſh ſeveral times in ſpring-water. This powder they put in a matraſs; and pour rectified ſpirit of wine, and volatile ſalt of urine upon it. The whole is left to digeſt in a moderate heat for fifteen days; during which, the ſpirit of wine aſſumes a beautiful ſky-blue colour, and becomes an ingredient in ſeveral medicines.—This is alſo called *potable ſilver*, *argentum potabile*.

Silver is likewiſe converted into cryſtals, by means of the ſame ſpirit of nitre; and it is this is called *vitriol of ſilver*. See CRYSTAL.

The *lapis infernalis argenteus* is nothing but the cryſtals of *ſilver* melted with a gentle heat in a crucible; and then poured into iron moulds.

Ale SILVER,		ALE *ſilver*.
Herring SILVER,		HERRING.
King's SILVER,	See	KING'S *ſilver*.
Rep SILVER.		REP *ſilver*.
White hart SILVER,		WHITE HART *ſilver*.

Quick SILVER. See the article MERCURY.

SILVERING, the covering of any work with ſilver-leaf. See SILVER-*leaf*.

It is uſual to ſilver metals, wood, paper, &c. which is performed either with fire, oil, or ſize. Metal-gilders ſilver by the fire: painter-gilders, all the other ways. See GILDING.

SILVESTRIS, or SYLVESTRIS, a red grain or ſeed uſed by ſome to dye in ſcarlet. See DYING and SCARLET.

The tree that produces it, is peculiar to the province of Guatimala in New Spain: it is not unlike that which produces the cochineel, only in this, that the fruit containing the grain is ſomewhat longer than that of the cochineel-tree.—When the fruit of the former is ripe, it opens of itſelf, and caſts out its ſeed upon a gentle ſhaking; and the Indians gather it in earthen plates ſet under the tree for the purpoſe.

Eight or ten of theſe fruits do not yield above an ounce of ſeed; whereas four of the cochineel fruits yield an ounce of inſects.—The two drugs are much like one another, as to the eye, but prove very different; the tincture of cochineel being infinitely more beautiful than that of the *ſilveſtris*. See COCHINEEL.

SIMA, or CYMA, in architecture, a term uſed by Wolfius, and ſome other writers, for what we otherwiſe call *cymatium* or *ſimatium*. See CYMA and CYMATIUM.

SIMATIUM, or SIMAISE, in architecture. See CYMATIUM.

Simatium and *cymatium*, are generally confounded together; yet they ought to be diſtinguiſhed: the latter being the genus and the former the ſpecies.—*Simatium* of *ſima*, camous, according to Felibien, is the laſt and uppermoſt member of grand corniches, called particularly the great *doucine*, or *gula recta*; and by the Greeks, *epititheta*.

In the antique buildings, the *ſimatium*, a-top of the Doric corniche, is generally in form of a cavetto, or ſemi-ſcotia; as we ſee particularly in the theatre of Marcellus.—This, ſome modern architects have imitated; but in the Ionic order, the *ſimatium* is always a doucine.

The *ſimatium*, or doucine, then, is diſtinguiſhed from the other kinds of *cymatia*, by its being camous, or flat-noſed. See DOUCINE.

SIMELIUM *, a Latin term, uſed by ſome to ſignify a table, with ranges of little cavities therein, for the diſpoſing of medals in chronological order. See MEDAL and SERIES.

* The word is but ill wrote: it ſhould rather be *cimelium*; as being formed of the Greek κειμηλιον, curioſities, or a cabinet of precious things.

We more uſually ſay, a cabinet of medals, than a *ſimelium*.

SIMILAR, in arithmetic and geometry, the ſame with *like*. See LIKE.

Thoſe things are ſaid to be *ſimilar*, or *like*, which cannot be diſtinguiſhed but by their com-preſence; that is, either by immediately applying the one to the other, or ſome other third to them both. So that there is nothing found in one of the *ſimilar* things, but is equally found in the other.

Thus, if you note all the things in A, which may be diſcerned and conceived, without aſſuming any other; and, in like manner, note all the things in B, which may be thus conceived: and A be *ſimilar* to B; all things in A will be the ſame with thoſe in B.

Since a quantity cannot be underſtood, otherwiſe, than by aſſuming ſome other quantity to refer it to; *ſimilar* things notwithſtanding their ſimilitude, may differ in quantity: and ſince, in *ſimilar* things, there is nothing wherein they differ, beſide the quantity; quantity itſelf is the internal difference of *ſimilar* things. See SIMILITUDE.

In mathematicks, *ſimilar* parts, as A a, have the ſame ratio to their wholes B b; and if the wholes have the ſame ratio to the parts, the parts are *ſimilar*.—*Similar parts* A a, are to each other as their wholes B b. See PART.

SIMILAR *angles*, are alſo equal angles.—In ſolid angles, when the planes, under which they are contained, are equal both in number, and magnitude, and are diſpoſed in the ſame order; they are *ſimilar*, and conſequently equal. See ANGLE.

SIMILAR *rectangles*, are thoſe which have their ſides about the equal angles, proportional. See RECTANGLE.

Hence 1°. All ſquares muſt be *ſimilar rectangles*. See SQUARE.—2°. All *ſimilar rectangles* are, to each other, as the ſquares of their homologous ſides.

SIMILAR *triangles*, are ſuch as have all their three angles reſpectively equal to each other. See TRIANGLE.

Hence 1°. All *ſimilar triangles* have their ſides about the equal angles, proportional.—2°. All *ſimilar triangles* are, to each other, as the ſquares of their homologous ſides.

In *ſimilar triangles*, and parallelograms, the altitudes are proportional to the homologous ſides; and the baſes are cut proportionably by thoſe ſides. See TRIANGLE, &c.

SIMILAR *polygons* are thoſe, whoſe angles are ſeverally equal, and the ſides about thoſe angles proportional.

And the like of other *ſimilar* rectilinear figures. See POLYGON and RECTILINEAL *figure*.

Hence, all *ſimilar polygons* are, to each other, as the ſquares of the homologous ſides.

In all *ſimilar figures*, the homologous angles are equal; and the homologous ſides proportional. All regular figures, and *ſimilar* irregular ones, are in a duplicate ratio of their homologous ſides. Circles, and *ſimilar* figures, inſcribed in them, are, to each other, as the ſquares of the diameters. See FIGURE.

SIMILAR *arches*, are ſuch as contain like, or equal parts of their reſpective circumferences. See ARCH.

SIMILAR *ſegments of circles*, are ſuch as contain equal angles. See SEGMENT.

SIMILAR *conic-ſections*, are thoſe where the ordinates to a diameter in one are proportional to the correſpondent ordinates to the *ſimilar* diameter in the other; and where the parts of *ſimilar* diameters between the vertices and ordinates in each ſection are *ſimilar*. See CONIC.

The ſame definition alſo agrees to *ſimilar* ſegments of conic ſections. See SEGMENT.

SIMILAR *plain numbers*, are thoſe which may be ranged into *ſimilar* rectangles; *i. e.* into rectangles, whoſe ſides are proportional: as 6 multiplied by 2, and 12 by 4; the product of one whereof is 12, and the other 48, are *ſimilar numbers*.

SIMILAR *ſolid numbers*, are thoſe whoſe little cubes may be ſo ranged, as to make *ſimilar* and rectangular parallelepipeds.

SIMILAR *diſeaſe*, in medicine, denotes a diſeaſe of ſome ſimple, ſolid part of the body.—As of a fibre, with regard to its tenſion, or flaccidity; of a membrane; a nervous canal, or the like. See DISEASE.

SIMILAR *parts*, in anatomy, are thoſe parts of the body which, at firſt ſight, appear to conſiſt of like parts, or parts of the ſame nature, texture and formation. See PART.

Of theſe we uſually reckon ten, *viz.* the bones, cartilages, ligaments, membranes, fibres, nerves, arteries, veins, fleſh, and ſkin: each of which ſee under its proper article.

Dr. Grew, in his anatomy of plants, obſerves, that theſe have, likewiſe, their *ſimilar*, and organical parts. See PLANT, *&c.*

SIMILE, or SIMILITUDE, in rhetoric, a compariſon of two things, which, though different in other reſpects, yet agree in ſome one.—As, He ſhall be like a tree planted by the water-ſide, *&c.*

The difference between a *ſimile* and a *compariſon*, conſiſts in this; that the *ſimile* properly belongs to what we call the quality of the thing, and the compariſon to the quantity. See COMPARISON.

SIMILITUDE, in arithmetic, geometry, *&c.* denotes the relation of two things ſimilar to each other; or which are only diſtinguiſhable by com-preſence. See SIMILAR.

The notion of *ſimilitude*, which now makes ſome figure in geometry, *&c.* is owing to M. Leibnitz: it will be rendered eaſy by the following inſtance.—Suppoſe two watches perfectly alike; the one belonging to Caius, the other to Gracchus. If, now, Caius pull out his watch in preſence of Gracchus; the latter will be ſurprized, and fancy it his own; but he will perceive it different from his own, upon pulling out his own: that is, Gracchus diſtinguiſhes Caius's watch from his own, by their com-preſence; or, by applying the one immediately to the other.

Euclid, and after him moſt other authors, demonſtrate every thing in geometry from the ſole principle of congruity.—Wolfius, in lieu hereof, ſubſtitutes that of *ſimilitude*; which, he tells us, was communicated to him by M. Leibnitz, and which he finds of very notable uſe in geometry, as ſerving to demonſtrate many things directly, which are only demonſtrable from the principle of congruity, by an ambages. See CONGRUITY.

SIMONIACAL, is applied to a perſon guilty of ſimony; that is, of purchaſing a benefice, or other ſacred matter, with money. See SIMONY.

A *ſimoniacal* perſon convict, is infamous, and incapable of holding any benefice. See BENEFICE, DISABILITY, *&c.*

SIMONIANS, a ſect of ancient hereticks, the firſt that ever diſturbed chriſtianity; if they might be ſaid to do ſo, who were little more than mere philoſophers, and chiefly made profeſſion of magic. See HERESY and MAGIC.

Simon Magus, ſo often mentioned in the Acts, was their leader, and died under the emperor Nero; St. Peter ſtill ſurviving: ſo that Clemens Alexandrinus is miſtaken, when he makes Simon poſterior to Marcion.

St. Epiphanius ſays expreſly, that the firſt hereſy was ſet on foot by Simon the magician, born in a little city of Samaria, who pretended to be the great virtue and power of God, ſent from heaven to earth. Among the Samaritans he made himſelf paſs for God the Father; and among the Jews, for the Son.—He patched up a kind of medley ſyſtem, out of the philoſophy of Plato, the religious fables of the heathens, and chriſtianity: particulary, from the Platoniſts he borrowed abundance of things relating to the worſhip of angels, which he perverted to magical uſes; pretending, there was no ſalvation, but by the invocation of angels, who were, as it were, the mediators between God and man: to which ſuperſtitious worſhip of angels it is that St. Paul ſeems to allude in his epiſtle to the Coloſſians.

The gnoſticks, whereof the ſame Simon was the father, adopted the ſame practice of worſhipping angels, and even improved on it. See GNOSTICKS.

SIMONY *, SIMONIA, the crime of trafficking with ſacred things; particularly of purchaſing a benefice with money. See BENEFICE.

* The word is borrowed from Simon Magus, who is mentioned in the Acts of the apoſtles, as offering to buy the power of working miracles with money.

By the Engliſh canons, Anno 1229, *ſimony* is not only committed by an agreement for money in hand, or to be paid yearly; but by any other profit or emolument; any reward, gift, or benefit, directly or indirectly; or by reaſon of any promiſe, grant, bond, *&c.* and this, either in the acceptance of a living, or in an exchange or reſignation.

The penalty, by our laws, is, that the corrupt patron ſhall forfeit the next preſentation to the king, and two years value of the living; and the corrupt incumbent, be for ever diſabled to hold the living.

SIMONY is alſo committed by buying, or ſelling the ſacrament, baptiſm, ordination, or abſolution; as well as by the nomination and collation to a benefice, a place in a monaſtery, or the like.

Some have pretended it to be ſufficient to avoid the charge of *ſimony*, if only the ordination were gratuitous, though the revenues were bought and ſold as a temporal thing.—But the canons of ſeveral councils have condemned this ſubtile diſtinction; ſince the revenues are attached to an eccleſiaſtical office purely ſpiritual.

Caſuiſts diſtinguiſh three kinds of *ſimony*, viz.

Mental SIMONY, is that which ſticks in the mere will, and inclination, without ever breaking forth into act. As when a preſent is made to a collator, without taking any notice that we expect a benefice from him.—This kind of *ſimony* is only puniſhable *in foro conſcientiæ*.

Conventional SIMONY is where there is an expreſs act, and a formal bargain, though it never come to an execution.

Real SIMONY, is where the convention is executed on both ſides; which laſt is the moſt criminal of all.—The canonical penalty of *ſimony* is depoſition in a clerk, and excommunication in a layman.

It is a maxim among the Romiſh canoniſts, that there is no *ſimony* in the court of Rome; in regard, the pope acts there as an abſolute ſovereign: they alſo ſay, that reſignations *in favorem*, are not to be admitted but by the pope, as favouring a little of *ſimony*. On theſe occaſions, however, the parties ſwear, that there has been no deceit, colluſion, *ſimony*, or other illegal covenant.

Peter Damain diſtinguiſhes three kinds of *ſimony*: that *of money*, that *of the tongue*, and that *of ſervices*.

SIMONY *of money*, or *per munus, a manu*, is where money is really paid down for a benefice: he adds, that the ſame is likewiſe committed, by expending money to live at court to obtain a benefice.

SIMONY *of the tongue*, or *per munus a lingua*, conſiſts in flattering the collator, or making one's ſelf agreeable by complaiſance and commendation.

SIMONY *of ſervices*, or *per munus ab obſequio*, conſiſts in the doing them good offices to obtain a benefice.

It was agreed, by all the Juſtices, *Trin. oct. Jac. primi*, that if the patron preſented any perſon to a benefice with cure, for money; ſuch preſentation, *&c.* is void, though the preſentee were not privy to it: and the ſtatute gives preſentation to the king; but this is now repealed.

SIMPLARY, SIMPLARIS, in antiquity, a Roman ſoldier, who had only ſingle pay.—Thus called, in oppoſition to the *duplares*, or ſuch as had double pay.

SIMPLE, SIMPLEX, ſomething not mixed, or compounded: in which ſenſe it ſtands oppoſed to *compound*. See COMPOUND.

The elements are *ſimple* bodies, from the compoſition whereof all mixed bodies reſult. See ELEMENT and BODY.—Hence alſo

SIMPLE *affection*,	See the articles	AFFECTION.
SIMPLE *form*,		FORM.
SIMPLE *modes*,		MODE.
SIMPLE *neceſſity*,		NECESSITY.
SIMPLE *oppoſition*,		OPPOSITION.
SIMPLE *taſte*,		TASTE.
SIMPLE *viſon*.		VISION.

In geometry we ſay, the moſt *ſimple* demonſtrations are the beſt: the *ſimpleſt* machines are the moſt eſteemed. See MACHINE, *&c.*

In pharmacy there are *ſimple* remedies, and compounds; the former of which are uſually preferable to the latter. See REMEDY and MEDICINE.

SIMPLE *diachylon*,	See the articles	DIACHYLON.
SIMPLE *diacodium*,		DIACODIUM.
SIMPLE *diamorum*,		DIAMORUM.
SIMPLE *diaprunum*,		DIAPRUNUM.
SIMPLE *dropax*,		DROPAX.
SIMPLE *fomentations*,		FOMENTATION.
SIMPLE *hydromel*,		HYDROMEL.
SIMPLE *oxymel*,		OXYMEL.
SIMPLE *waters*.		WATER.

In grammar, we have *ſimple* words, or primitives; and compounds, which have ſome particle added to them. See WORD, PRIMITIVE, *&c.* See alſo SENTENCE.

In juris-prudence, they ſay, a *ſimple* donation, in oppoſition to a mutual or reciprocal one: a *ſimple* ſale, in oppoſition to that made with a reſervation of the faculty of redemption: *ſimple* homage, in oppoſition to liege homage. See HOMAGE, *&c.*

SIMPLE *average*,	See the articles	AVERAGE.
SIMPLE *benefice*,		BENEFICE.
SIMPLE *charter*,		CHARTA.
SIMPLE *church*,		CHURCH.
SIMPLE *depoſit*,		DEPOSIT.
SIMPLE *eſtate*,		ESTATE.
SIMPLE *fee*,		FEE.
SIMPLE *force*,		FORCE.
SIMPLE *reſignation*,		RESIGNATION.
SIMPLE *vaſſalage*,		VASSALAGE.

SIMPLE, in botany, is a general name given to all herbs and plants; as having each its particular virtue, whereby it becomes a *ſimple* remedy.

The *ſimples* brought from the Levant, and the Eaſt-Indies, were not known among us till about the year 1200.

SIMPLE *flowers*. See the article FLOWER.

SIMPLE *anomaly*,	See the articles	ANOMALY.
SIMPLE *foſſils*		FOSSIL.
SIMPLE *glands*,		GLAND.
SIMPLE *ulcer*,		ULCER.

SIMPLE *equation* in algebra, is an equation where the unknown quantity is only of one dimenſion.—*E. gr.* $x = (a + b) : 2$. See EQUATION.

SIMPLE *flank*, SIMPLE *fraction*, SIMPLE *motion*, SIMPLE *pendulum*,	See the articles	FLANK. FRACTION MOTION. PENDULUM.

SIMPLE *quadratics*. See the article QUADRATIC.

SIMPLE *quantities*, in algebra, are ſuch as have but one ſign: as, 2*a*, or—2*b*.

By which they ſtand oppoſed to compound quantities, which have ſeveral ſigns: as, *a*+*b*; or *d*—*a*+b. See COMPOUND.

SIMPLE *ſurd*, SIMPLE *tenaille*, SIMPLE *wheel*,	See the articles	SURD. TENAILLE. WHEEL.

SIMPLE, in muſic, is chiefly uſed in oppoſition to *double*; ſometimes to a compound of ſeveral parts, or figures of different values, *&c.* See DOUBLE and COMPOUND.

SIMPLE *cadence*, is that where the notes are all equal through all the parts. See CADENCE.

SIMPLE *concords*, are thoſe, wherein we hear at leaſt two notes in conſonance; as a third and fifth; and of conſequence, at leaſt three parts. See CONCORD.—This is either done immediately, and called the *harmonical triad*; or in a more remote manner; that is, when the ſounds, that are not baſs, are one or two octaves higher.—This diſtance has no ill effect in the third; but in the fifth it has; and generally ſpeaking, the nearer or more immediate the concords are, the better.

They alſo ſay, C *ſimple* or plain, in oppoſition to c accented.

SIMPLE *counter-point*, is a harmonical compoſition, wherein note is ſet againſt note; in oppoſition to figurative counter-point. See COUNTER-POINT.

SIMPLE *dieſis*. See the article DIESIS.

SIMPLE *fugue*, or SIMPLE *imitation*, is, when one part imitates the ſinging of another for ſome meaſures. See IMITATION and FUGUE.

SIMPLE *harmony*, SIMPLE *interval*, SIMPLE *ſounds*, SIMPLE *triple*,	See the articles	HARMONY. INTERVAL. SOUND. TRIPLE.
SIMPLE *fencing*, SIMPLE *hiſtory*, SIMPLE *ſtyle*,	See the articles	FENCING. HISTORY. STYLE.

SIMPLIFYING, in eccleſiaſtical matters, is the taking away of a cure of ſouls from a benefice, and diſpenſing the beneficiary from reſidence. See BENEFICE and CURE.

Several benefices, which have been *ſimplified*, now require reſidence; and an infinity of others, which required reſidence, have been *ſimplified*.

Some uſe the word in a more extenſive ſignification, *viz.* for the ſhortening a relation, *&c.* or retrenching every thing not preciſely neceſſary: when the matter or fact ſhall be *ſimplified* and ſtripped of its vain circumſtances, the court will ſee, *&c.*

SIMPLUDIARIA*, in antiquity, a kind of funeral honours paid to the deceaſed at their obſequies. See FUNERAL.

* The word is formed from the Latin *ſimplex* and *ludus*, whence *ſimpludiaria* or *ſimpliludaria*, q. d. ſimple games.

Some will have *ſimpludiaria* to be the funerals, at which games were exhibited: ſuch is the ſentiment of Paulus Diaconus. Feſtus ſays, they were thoſe, in the games whereof nothing was ſeen but dancers, and leapers, called *corvitores*; who, according to M. Dacier, were perſons who run along the maſts and yards of veſſels or boats, called *corbes*.

In other reſpects, thoſe two authors agree as to the kind of funerals, called *ſimpludiaria*, *viz.* that they were oppoſite to thoſe call *indictiva*; wherein, beſides the dancers and leapers, obſerved in the *ſimpludiaria*, there were deſultores, or people who vaulted on horſes; or, perhaps, horſe-races, wherein the cavaliers leaped from horſe to horſe at full ſpeed. See GAME, DESULTER, *&c.*

SIN, a breach, or tranſgreſſion of ſome divine law, or command. See LAW and TRANSGRESSION.

Plato defines *ſin* to be ſomething void, both of number, and meaſure: by way of contradiction to *virtue*, which he makes to conſiſt in muſical numbers, *&c.* See VIRTUE, RHYTHMUS, NUMBER, MEASURE, *&c.*

Agreeably hereto, Suarez obſerves, that an action becomes ſinful, by its wanting a due commenſuration; for as every thing meaſured refers to ſome rule, from which if it deviate, it becomes incommenſurate; and as the rule, of man's will is the law of God: ſo, *&c.*—Suarez adds, that all evil actions are prohibited by ſome divine law; and that this is required to the perfection of the divine providence.

Simplicius, and, after him, the ſchoolmen aſſert, that evil is not any poſitive thing, contrary to good; but a mere defect and accident. See EVIL.

Sins are diſtinguiſhed into *original* and *actual*. See ORIGINAL and ACTUAL.

The Romiſh caſuiſts again diſtinguiſh *actual ſins* into *mortal*, which are ſuch as make us loſe the grace of God; and *venial*, which alone are pardoned, as being only *ſins* of infirmity, not of malice. See VENIAL.

Divines are not yet agreed what the *ſin* againſt the Holy Ghoſt is.

SINAI, *knights of*. See CATHARINE.

SINAPISM*, ΣΙΠΑΠΙΣΜΟΣ, in pharmacy, an external medicine, in form of a cataplaſm; compoſed chiefly of muſtard-ſeed pulverized, and mixed up with the pulp of figs; or with briony, garlick, onion, naſturtium, euphorbium, ranunculi, or the like.

* The word is formed from the Latin, *ſinapi*, or Greek σιναπι, muſtard-ſeed.

Sinapiſms excite a redneſs, heat, itching tumour, and ſometimes a bliſter on the place they are applied to.

They were anciently in great requeſt; and ſtill continue in uſe for inveterate diſeaſes of the head; long continued defluxions, *&c.*

SINCIPUT, or SYNCIPUT, is the fore part of the head, reaching from the fore-head to the coronal ſuture.—See *Tab. Anat.* (Oſteol.) *fig.* 2. *lit. a. fig.* 7. *n.* 1. See alſo BREGMA and CRANIUM.

SINDON, in chirurgery, a little round piece of linnen or ſilk, or lint, uſed in dreſſing the wound after trepanning. See TREPANNING.

The firſt thing uſually done after the operation of trepanning, is to pour a few drops of white balm on the dura mater: then a ſpoonful of mel-roſatum, being warmed with a little balſam, a *ſindon* is dipt in it, of fine linen cloth; this is immediately applied upon the dura mater; and, being greater than the hole in the ſkull, its circumference is thruſt all round between the cranium and the membrane: then pledgits of lint are applied, and the hole quite ſtopped therewith. The next morning, when the dreſſing is taken off, the brain is never left bare; but as ſoon as the former *ſindon* and lint are removed, new ones are clapped in their room.

SINE or *Right* SINE, in trigonometry, a right line drawn from one extremity of an arch, perpendicularly upon the radius drawn from the other extremity; or the *ſine* is half the chord of twice the arch. See ARCH.

Thus the line AD (*Tab. Trigonom. fig.* 1.) which is half the chord AB, of the double arch, AEB, is the right *ſine*; or, ſimply, the *ſine* of the arch AE.

Whole SINE, *ſinus totus*, is the *ſine* of the quadrant HE, or of 90 degrees; that is, the whole *ſine* is the ſame with the radius HC. See radius.

Verſed SINE, is a part ED of the whole *ſine* or radius, intercepted between the right *ſine* AD, and the arch AE. See VERSED and COVERSED.

It is demonſtrated, 1°. That the right *ſine* AD, being perpendicular to the radius EC; all *ſines* drawn to the ſame radius, are parallel to each other.

2°. Since the arch AE is the meaſure of the angle ACE, and AI the meaſure of the contiguous angle ACI; and the quadrant HE the meaſure of the right angle; AD is alſo the right *ſine*, and ED the verſed *ſine* of the angles ACE and ACI; and the whole *ſine* is the *ſine* of the right angle.

3°. Two angles contiguous, as ACE and ACI, have the ſame *ſine*.

4° The *ſines* of obtuſe angles are the ſame with thoſe of their complements to two right angles.

5°. All *ſines* of ſimilar arches have the ſame ratio to their radii.

SINE-*Complement*, or *Co*-SRNE, is the *ſine* of an arch AE, which is the complement of another arch AH, to a quadrant. See CO-SINE.

Thus alſo the *ſine* of the arch AH, is called the *ſine-complement*, of the arch AE.

In eſtimating the quantity of *ſines*, *&c.* we aſſume radius for unity; and determine the quantity of the *ſines*, tangents, and ſecants in fractions thereof.—From Ptolemy's Almageſt, we learn, that the ancients divided the radius into 60 parts, which they called degrees, and thence determined the chords in minutes, ſeconds, and thirds; that is, in ſexageſimal fractions of the radius, which they likewiſe uſed in the reſolution of triangles. See SEXAGESIMAL, DEGREE, *&c.*—The *ſines*, or half chords, for ought appears, were firſt uſed by the Saracens. See CHORD.

Regiomontanus, at firſt, with the ancients, divided the radius into 60 degrees; and determined the *ſines* of the ſeveral degrees in decimal fractions thereof. But he afterwards found it would be more commodious to aſſume radius for 1; and thus introduced the preſent method into trigonometry.

In the common tables of *ſines* and tangents, the radius is conceived, divided into 10000000 parts; beyond which we never go in determining the quantity of the *ſines* and tangents.—Hence, as the ſide of a hexagon ſubtends the ſixth part of a circle, and is equal to radius; the *ſine* of 30° is 5000000.

1°. *The* SINE AD *being given*; *to find the* ſine-complement.—From the ſquare of the radius AC ſubtract the ſquare of the *ſine* AD: the remainder will be the ſquare of the *ſine-complement* AG: whence, the ſquare root being extracted, gives the *ſine-complement*. *E. gr.* Suppoſing AC, 10000000, and AD 5000000, AG will be found 8660254, the *ſine* of 60°.

2°. *The* SINE AD *of the arch* AE *being given*; *to find the* ſine *of the half arch, or half of* AE.—Find the chord of the arch AE (ſee CHORD:) for half of this is its *ſine*. Thus, ſuppoſing DG and AD, as in the preceding problem; we ſhall find the *ſine* of the half arch AE, or the *ſine* of 15° = 2588190.

3°. *The* Sine DG, *of the arch* DF *being given*; *to find the* ſine DE, *of the double arch* DB (*fig.* 7.)—Since the angles at E and G are right angles; and the Angle B is common to each triangle BCG and DEB; we ſhall have BC : CG :: BD : DE : wherefore CG being found by the ſecond problem, and BD being double of DG; DE is found by the rule of proportion.

4° *The* Sines FG and DE (*fig.* 8.) *of the arches* FA *and* DA, *whoſe difference* DF *is greater than* 45 *minutes, being given*; *to find any intermediate* ſine, *as* IL.—To the difference FD of the arches, whoſe *ſines* are given: the difference of the arch IF, whoſe *ſine* is required, and the difference of the given *ſines* DH; find a fourth proportional: this added to the leſs given *ſine* FG; the aggregate will be the *ſine* required.

5°. *To find the* Sine *of* 45 *degrees*—Let HI (*fig.* 1.) be a quadrant of a circle; then will HCI be a right angle: conſequently the triangle, rectangular; therefore $HI^2 = HC^2 + CI = 2HC^2$; wherefore, ſince HC the whole *ſine*, is 10000000; if from $2HC^2$ ſquared, 200000000000000, be extracted the ſquare root 14142136; we ſhall have the chord HI, whoſe half 7071068 is the *ſine* of 45° required.

6°. *The* Sine *of a minute or* 60″ FG (*fig.* 8.) *being given*; *to find the* ſine *of one or more ſeconds* MN.—Since the arches AM and AF are very ſmall; AMF may be taken for a right line, without any ſenſible error in the decimal fraction of the radius wherein the *ſine* is expreſſed; that is, the arches AM and AF may be taken proportional to their chords. Wherefore, ſince MN is parallel to FG; we ſhall have AF : FG :: AM : MN : Therefore AF, FG and AM being given, MN is eaſily had.

To conſtruct a canon of Sines.—The *ſines* of 30° 15° 45° and 36° (which we have already ſhewn how to find) being had; we can thence conſtruct a canon of all the *ſines* to every minute, or every ſecond. For from the *ſine* of 36° we find thoſe of 18° 9° 4° 30′ and 2° 15′, by the ſecond problem: the *ſines* of 54° 72° 81° 85° 30′ and 87° 45′, *&c.* by the firſt problem. Again, from the *ſine* of 45°, and the *ſine* 22° 30′ 11° 15′, *&c.* From the *ſines* of 30°, find the *ſines* of 54°, find the *ſine* of 12°. From the *ſine* of 12°, find the *ſines* of 6° 3° 1° 30′ 35′ 78°, *&c.* From the *ſine* of 15°, find the *ſine* of 7° 30′ 45′, *&c.* 'till you have 120 *ſines* ſucceding each other orderly, at an interval of 45 minutes. Between theſe, find the intermediate *ſines* by the 5th problem: thus will the canon be compleat.

From the Sine of an arch given; to find the tangent and ſecant. See Tangent and Secant.

To find the logarithm of a given Sine, ſee Logarithm.

In every triangle, the ſides are as the *ſines* of the oppoſite angles. See Triangle.

The Sine BC (*fig.* 9.) *and the verſed* ſine AB, *being given in common meaſure, not in parts of the radius*; *to find the arch* FC *in degrees.*—Find the ſemi-diameter AD. Then in the triangle DBC, beſides the right angle B, by the ſides AC and DC, we find the angle ADC, which ſhews the number of degrees in the arch; the double whereof is the arch FC.—This problem is of uſe in finding the ſegment of a circle. See Segment.

Artificial Sine, denotes the logarithm of a *ſine*. See Logarithm.

Line of Sines, a line on the ſector, Gunter's ſcale, *&c.* the deſcription and uſe whereof ſee under the articles Sector and Gunter's *ſcale*.

SINE-CURES, are eccleſiaſtical benefices without cure of ſouls. See Benefice and Cure.

No church, where there is but one incumbent, can properly be a *ſine-cure*: and though the church being down, or the pariſh being become deſtitute of pariſhioners, the incumbent may be thereby neceſſarily acquitted from the actual performance of publick duty, yet he is ſtill under an obligation to do it, whenever a church ſhall be built, and there are a competent number of inhabitants; and in the mean while, if the church be preſentative, as moſt ſuch churches are, the incumbent is inſtituted into the cure of ſouls.—Such benefices are rather depopulations than *ſine-cures*, and it will be proper for the new incumbent to read the 39 articles, and the liturgy in the church-yard, *&c.* and to do what other incumbents uſually do.

But a rectory, or portion of it, may properly be a *ſine-cure*, if there be a vicar under him endowed and charged with the cure: in which caſe it does not come within the ſtatute of pluralities, 21 Hen. VIII. c. 13.

Here therefore no diſpenſation is neceſſary to hold the *ſine-cure* with a former living: nor need the incumbent read the articles or divine ſervice, as required by 13 Eliz. c. 12. which extends only to a benefice with cure.

A *ſine-cure* donative wants no inſtitution and induction; but one preſentative muſt have both; eſpecially if it conſiſt in glebe and tythes, and not in a portion of money; but inſtitution muſt not run *in curam animarum*, but *in rectoriam, ſive portionem rectoriæ de* AB, *&c.*

By the above-mentioned ſtatute 21 Hen. VIII. not only prebends, and rectories with vicarages endowed, but deaneries and archdeaconries, are declared to be benefices *without cure*.

SINE-DIE, in law.—When judgment is given againſt the plaintiff, he is ſaid to be *in miſericordia pro falſo clamore ſuo*; and for the defendant, it is ſaid, *eat inde ſine die*, i. e. he is diſmiſſed the court.

The phraſe is alſo uſed in parliament, for the adjournment of any debate, without fixing the day when it ſhall come on again; which is looked upon as a genteeler diſmiſſion of the thing in queſtion.

SINEW, properly denotes what we call a *nerve*; though in common ſpeech it is rather uſed for a *tendon*. See Nerve, Tendon, *&c.*

SINGING, the act of making divers inflexions of the voice, agreeable to the ear, and even correſpondent to the notes of a ſong or piece of melody. See Song and Music.

The firſt thing done in learning to *ſing*, is to raiſe a ſcale of notes by tones and ſemi-tones, to an octave; and deſcend again by the ſame notes; and then to riſe and fall by greater intervals, as a 3d, 4th, and 5th; and to do all this by notes of different pitch. See Note, Scale and Gammut.

Then theſe notes are repreſented by lines and ſpaces, to which the ſyllables *fa*, *ſol*, *la*, *mi*, are applied, and the pupil taught to name each line and ſpace thereby; whence this practice is uſually called *ſol-fa-ing*. The nature, reaſon, defects, *&c.* whereof, ſee under the article Sol-fa-ing.

SINGLE *echo*,	See the articles	Echo.
Single *ſine*,		Fine.
Single *poſition*,		Position.
Single *propoſition*,		Proposition.
Single *rafters*,		Rafter.
Single *tenaille*,		Tenaille.

SINGLES. See the article Petty *ſingles*.

SINGULAR *number*, in grammar, the firſt manner of declining nouns, and conjugating verbs; uſed when we only ſpeak of a ſingle perſon, or thing. See Number.

The Latins, French, Engliſh, *&c.* have no number but the *ſingular*, and plural; the Greeks and Hebrews have likewiſe a dual. See Plural, Dual, *&c.*

Singular *hiſtory*. See the article History.

SINGULTUS, in medicine, a convulſive motion of the midriff, commonly called *hickup*. See Hickup.

SINICAL *quadrant*, a kind of quadrant furniſhed with an index, and two ſights to take altitudes, *&c.* by; and, beſides, its ſide, or face, covered over with ſines, drawn from each ſide, interſecting each other; whereby the ſeamen can ſolve, by inſpection, any problem in plain ſailing. See Sailing.—Its conſtruction and uſe, ſee under the article Quadrant.

SINISTER*, ſomething on, or towards, the left-hand. See Hand and Dexter.

* Hence ſome derive the word *ſiniſter*, *a ſinendo*; becauſe the gods, by ſuch auguries, permit us to proceed in our deſigns. See Augury.

Sinister is ordinarily uſed among us for unlucky.—Though in the ſacred rites of divination, the Romans uſed it in an oppoſite ſenſe.—Thus *avis ſiniſtra*, or a bird on the left-hand, was eſteemed a happy omen: whence in the law of the twelve tables, *Ave ſiniſtra populi magiſter eſto.*

Sinister, in heraldry. The *ſiniſter* ſide of an eſcutcheon is the left-hand ſide. See Escutcheon and Point.

Sinister *chief*, is the left angle of the chief. See Chief.

Sinister *baſe*, is the left-hand part of the baſe. See Base.

Sinister *bend*. See the article Bend.

Sinister *aſpect*, among aſtrologers, is an appearance of two planets, happening according to the ſucceſſion of the ſigns: as, Saturn in Aries, and Mars in the ſame degree of Gemini. See Aspect.

SINISTRI, a ſect of ancient hereticks; thus called, becauſe they held the left hand in abhorrence, and made it a point of religion, not to receive any thing therewith.

What in us, is a piece of civility; in them was a ſuperſtition.—Balſamon obſerves, that they were likewiſe called *ſabbathians* and *novatians*. See Sabbathians and Novatians, *&c.*

SI NON OMNES, a writ of aſſociation, whereby, if all in commiſſion cannot meet at the day aſſigned; it is permitted, that two, or more of them may finiſh the buſineſs. See Association.

SINOPER, Sinopis, in natural hiſtory, a native red ſtone or ruddle. See Ruddle.

SINOPLE*, or Senople, in heraldry, denotes *vert*, or the green colour in armories.—Thus called by the ancient heralds; though Pliny and Iſidore, by *color praſinus*, or *ſinople*, mean a browniſh red, ſuch as that of our ruddle. See Vert.

* F. Meneſtrier derives the word from the Greek, *praſina hopla*, green armories; by corruptedly retrenching the firſt ſyallable, *pra*; which is no new thing among oriental words, witneſs Salonica for Theſſalonica.

Sinople is ſuppoſed to ſignify love, youth, beauty, rejoicing and liberty; whence it is, that letters of grace, abolition, legitimation, &c. are uſed to be ſealed with green wax. See Green.

SINOVIA. See the Article Synovia.

SINUOSITY, a ſeries of bends and turns in arches or other irregular figures; ſometimes jetting out, and ſometimes falling in.—Such is the motion of a ſerpent, &c.

It is the *ſinuoſity* of the ſea-coaſts that forms bays, ports, capes, &c. Du Loir obſerves, that the courſe of the river Meander, creeping in a thouſand agreeable *ſinuoſities*, ſerved Dædalus as a model to form his labyrinth by. See Labyrinth.

SINUOUS *ulcers*. See the article Ulcer.

SINUS, in chirurgery, a little cavity or ſacculus, frequently formed by the ſide of a wound, or ulcer; wherein pus is collected. See Pus.

A *ſinus* is properly a cavity in the middle of a fleſhy part, formed by the ſtagnation and putrefaction of the blood or humours, and which has wrought itſelf ſome vent or exit.

Deep *ſinus's* that ſlope downwards, Scultetus obſerves, are difficult to heal: yet that ſurgeon undertakes to cure any *ſinus* in a week, by the medicaments he deſcribes, page 338, and an agglutinative bandage. He adds, thrt he never comes to the inciſion, till he finds that the pharmaceutic applications are ineffectual; and that for the dilatation of *ſinus's*, he does not uſe the deceitful ſcapel; as being more apt to deceive the operator than the patient.

Sinus, in anatomy, denotes a cavity in certain bones, and other parts, the entrance whereof is very narrow, and the bottom wider and more ſpacious. See Bone.

Of theſe *ſinus's*, we find ſeveral in the divers parts of the body; particularly in the baſis of the ſkull, on the oſſa petroſa, where the ancients imagined their uſe was to render the bones more light.—In ſeveral of the joints of the body, they ſerve to receive the epiphyſes of the other bones.

Sinus is alſo an appellation given to the duplicatures of the dura mater. See Dura *mater*.

Theſe *ſinus's*, Dr. Drake obſerves, are venous channels, formed for the re-conveyance of the blood. There are four chiefly conſiderable, *viz.* the *ſinus longitudinalis*, which running along the middle of the convex part of the brain, ſends out a branch on each ſide, between the brain and cerebellum, called the *lateral ſinus's*, and the torcular herophili, formed out of a concourſe of the *lateral ſinus's*, and pineal gland.—They are all formed of the ſeveral venous branches, which return the blood from the brain and cerebellum, and deliver their contents into the jugular veins; whereof they are, as it were, the roots. Their coats are furniſhed with ſtrong fibres, by means whereof they are dilated by the influx of the venal blood, and again contracted with a reciprocal motion, like the pulſe of an artery.—See *Tab. Anat.* (Oſteol.) *fig.* 4. *lit. b b. cc.* See alſo the article Brain.

SION COLLEGE. See the Article College.

SIPHON, or Syhon, in hydraulicks, a crooked tube, one leg or branch whereof is longer than the other; uſed in the raiſing of fluids, emptying of veſſels, and in various hydroſtatical experiments.

The word in the original Greek, σιφων, ſignifies, ſimply, *tube*; whence ſome apply it to common tubes or pipes.—Wolfius, particularly deſcribes two veſſels under the name of *ſiphons*; the one cylindrical in the middle, and conical at the two extremes, the other globular in the middle, with two narrow tubes fitted to it, axis-wiſe; both ſerving to take up a quantity of water, &c. and to retain it when up.

But the moſt uſeful and celebrated *ſiphon* is that which follows. A crooked tube ABC (*Tab. Hydraulicks*, *fig.* 2.) is provided, of ſuch a length, and with ſuch an angle, as that when the orifice A, is placed on an horizontal plane, the height of AB, may not exceed 30 foot. For common uſes, a foot, or half a foot high, ſuffices.—If, now, the leſs arm AB, be immerged in water, or any other liquid, and the air be ſucked out of it by the aperture C, till the liquor follow; the liquor will continue to flow out of the veſſel, through the tube BC; as long as the aperture A is under the ſurface of the liquor.

Note, inſtead of ſucking out the air, the event will be the ſame, if the *ſiphon* be at firſt filled with the fluid, und the aperture C ſtopped with the finger, till the aperture A be immerged.

The truth of the phænomenon is known by abundance of experiments: nor is the reaſon of part of it far to ſeek. In ſucking, the air in the tube is rarified, and the equilibrium deſtroyed; conſequently the water muſt be raiſed into the leſſer leg AB, by the preponderating preſſure of the atmoſphere.

The *ſiphon* being thus filled, the atmoſphere preſſes equally on each extremity thereof; ſo as to ſuſtain an equal quantity of Water in each leg: but the air not being able to ſuſtain all the water in the longer leg, unleſs it exceed 32 feet in height; it will be more than able to ſuſtain that in the ſhorter leg; with the exceſs of force, therefore it will raiſe new water into the ſhorter leg; which new water cannot make its way, but by protruding the firſt before it. By this means is the water continually driven out at the longer leg, as it is continually raiſed by the ſhorter. See Fluid.

But Wolfius, and ſome other authors aſſert, that the water continues to flow through the *ſiphon*, even when placed under a receiver, and the air exhauſted from it. The reaſon of this, if it be true, is very difficult to account for.

Some will have it, that there is ſtill air enough left in the evacuated receiver, to raiſe the water to an inch or two. But as both mercury and water are found to fall entirely out of the Torricellian tube, *in vacuo*; the preſſure of the thin remaining air, can never be the cauſe of the aſcent, both of mercury and water, in the leſs leg of the *ſiphon*.

Hence, as the height of the *ſiphon* is limited to 31 foot; for this only reaſon, that air cannot raiſe water higher; it does not appear, whether or no we are in the right in rejecting Hero's method of carrying water, by means of a *ſiphon*, over the tops of mountains, into an oppoſite valley.—For Hero only orders the apertures of the *ſiphon* to be ſtopped, and water to be poured through a funnel into the angle or meeting of the legs, till the *ſiphon* be full; when, ſhutting the aperture in the angle, and opening the other two, the water will continue to flow.—Now, if there only need air for the firſt riſe of the water into the leſs leg, not for the continuation of the motion; it were poſſible to raiſe the water much higher than the height of the atmoſphere would carry it.

The real cauſe, therefore, of this extraordinary, though well-known phænomenon, needs ſome further diſquiſition: this is certain, that a *ſiphon* once ſet a running, will perſiſt in its motion, though removed into the moſt perfect vacuum our air-pumps will make: or, if the lower orifice of a full *ſiphon* be ſhut, and the whole be thus placed in a receiver, with a contrivance for opening the orifice when the air is exhauſted; the water will be all emptied out of the veſſel, as if it had been in open air. See Vacuum, Air-*pump*, &c.

This, too, is remarkable enough, that the figure of the *ſiphon* may be varied at pleaſure (ſee *fig.* 3. &c.) provided only the orifice C be below the level of the ſurface of the water to be drawn up; but, ſtill, the further it is diſtant from it, the faſter will the fluid be carried off.—And if, in the courſe of the flux, the orifice A be drawn out of the fluid; all the liquor in the *ſiphon* will go out at the lower orifice C: that in the leg CB, dragging, as it were, that in the ſhorter leg AB after it.

If a filled *ſiphon* be ſo diſpoſed, as that both orifices A and C be in the ſame horizontal line: the fluid will remain pendant in each leg; how unequal ſoever the length of the legs may be.—Fluids, therefore in *ſiphons*, ſeem, as it were, to form one continued body; ſo that the heavier part deſcending, like a chain, pulls the lighter after it.

Laſtly, it muſt be obſerved, that the water will flow out, even through a *ſiphon* that is interrupted, by having the legs AD and FC joined (*fig.* 4.) together, by a much bigger tube full of air.

The Siphon *Wurtembergicus*, is a very extraordinary machine of this kind, performing divers things which the common *ſiphon* will not reach.—*E. gr.* In this, though the legs be in the ſame level, yet the water riſes up the one, and deſcends through the other: the water riſes, even though the aperture of the leſs leg be only half immerged in water: the *ſiphon* has its effect after continuing dry a long time: either of the apertures being opened, the other remaining ſhut for a whole day, and then opened, the water flows out as uſually. Laſtly, the water riſes and falls indifferently through either leg.

The project of this *ſiphon*, was laid by Jordanus Pelletier, and executed at the expence of prince Frederick Charles, adminiſtrator of Wirtemberg, by his mathematician, Schahackard, who made each branch 20 feet long, and 18 feet apart: the deſcription thereof was publiſhed by Reiſelius, the duke's phyſician.

This gave occaſion to M. Papin to invent another, that did the ſame things, deſcribed in the philoſophical Tranſactions; and which Reiſelius, in another paper in the Tranſactions, ingenuouſly owns to be the very ſame with that of Wirtemberg.—Its ſtructure will appear from its figure; which is repreſented, *Tab. Hydraulicks*, *fig.* 5.

SIRE*, a title of honour in France, now given to the king only, as a mark of ſovereignty.—In all placets and petitions, epiſtles, diſcourſes, &c. to the king, he is addreſſed under the title of *ſire*.

* Some derive the word from the Latin, *herus*, maſter: of which opinion ſeems Budæus, who, in ſpeaking to king Francis I. always calls him *here*, q. d. maſter, or *ſire*: others derive it from the Greek, κυριος, lord; of which opinion is Paſquier, who adds, that the ancient Franks gave the ſame title to God, calling him *beau ſire diex*: others fetch the word from the Syriac, and maintain, it was firſt given to the merchants who traded to Syria: Menage will have it come from *ſenior*, elder; whence *ſeigneur*, then *ſeignor*, and *ſire*.

Sire was likewiſe anciently uſed in the ſame ſenſe with *ſieur* and *ſeigneur*; and applied to barons, gentlemen and citizens. See Sieur.

The *ſire* de Joinville has wrote the hiſtory of St. Louis.

SIREN, ΣΕΙΡΗΝ, in antiquity, *mermaid*; a name given to a kind of fabulous beings repreſented by Ovid, &c. as ſea-monſters, with womens faces and fiſhes tails; and by others decked with a plumage of various colours. See MERMAID.

They are ſuppoſed to have been the three daughters of the river Achelous; and called *Parthenope*, *Ligea*, and *Leucoſia*. Homer only makes mention of two *ſirens*; but others reckon five. Virgil places them on rocks, where veſſels are in danger of ſplitting. Pliny makes them inhabit the promontory of Minerva, near the iſland Capreæ. Others fix them in Sicily, near Cape Pelorus. Claudian ſays, they inhabited harmonious rocks; that they were charming monſters; and that ſailors were wrecked on their rocks without regret, and even expired in rapture: *dulce malum pelago ſiren.*

This deſcription is, doubtleſs, founded on a literal explication of the fable, that the *ſirens* were women who inhabited the ſhores of Sicily, and who, by all the allurements of pleaſure, ſtopped paſſengers, and made them forget their courſe. Some interpreters of the ancient fables, will have the number and the names of the three *ſirens*, to have been taken from the triple pleaſure of the ſenſes; wine, love and muſick; which are the three moſt powerful means of ſeducing men: and hence ſo many exhortations to avoid the *ſirens* fatal ſong.

Probably it was hence, that the Greeks fetched their etymology of *ſiren*, *viz.* from σειρα, a chain, as if there was no getting free of their enticement.

Others, who do not look for ſo much myſtery in the fable, maintain, that the *ſirens* were nothing but certain ſtreights in the ſea, where the waves whirling furiouſly around, ſeized and ſwallowed up veſſels that approached them too near.

Laſtly, others hold the *ſirens* to have been certain ſhores and promontories, where the winds, by the various reverberations and echo's, cauſe a kind of harmony that ſurprizes and ſtops paſſengers.—This, probably, might be the origin of the *ſirens* ſong; and the occaſion of giving the name of *ſirens* to theſe rocks.

Sculptors and painters uſually follow Ovid's deſcription of the *ſirens*; but on ſome medals, we find them repreſented with the upper parts of women, and the lower of birds.

SIRIUS, ΣΕΡΙΟΣ, in aſtronomy, the *dog-ſtar*; a very bright ſtar of the firſt magnitude in the mouth of the conſtellation *canis major*, or the great dog. See CANIS.

The Arabs call it *aſchere*, *elſchecre*, *ſcera*; the Greeks, *ſirius*; and the Latins, *canicula*, or *canis candens*. See CANICULA and CANICULAR.

Its longitude, according to Mr. Flamſteed, is 9° 49′ 1″; its latitude 39° 32′ 8″ ſouth.

SIRNAME. See the article SURNAME.

SISTROID *angle*. See the article ANGLE.

SISTRUM, or CISTRUM, an ancient kind of muſical inſtrument uſed by the prieſts of Iſis, and Oſiris. See MUSIC. Spon deſcribes it as of an oval form, in manner of a racket, with three ſticks traverſing it breadth-wiſe, which playing freely, by the agitation or beating of the inſtrument, yielded a kind of ſound, which to the ancients ſeemed melodious. Mr. Malcolm takes the *ſiſtrum* to have been no better than a kind of rattle. Jer. Boſius has an expreſs treatiſe on the *ſiſtrum*, intitled, *Iſicus de ſiſtro*.

Oiſelius obſerves, that the *ſiſtrum* is found repreſented on ſeveral medals; and alſo on Taliſmans.—Oſiris on ſome medals, is painted with a dog's head and a *ſiſtrum* in his hand.

SITE, or SCITE, SITUS, denotes the ſitutation of a houſe, meſſuage, &c.—And ſometimes the ground-plot, or ſpot of earth it ſtands on.

SITE, SITUS, in logic, one of the predicaments, declaring a ſubject to be ſo and ſo placed. See PLACE and SITUS.

SITOPHYLAX*, ΣΙΤΟΦΛΑΞ, in antiquity, an Athenian magiſtrate, who had the ſuper-intendance of the corn, and was to take care that no body bought more than was neceſſary for the proviſion of his family.

* The word is formed from Greek, σιτος, corn, and φυλαξ, keeper.

By the attic laws, particular perſons were prohibited buying more than fifty meaſures of wheat a man; of thoſe meaſures, we mean, called φορμοι: and the *ſitophylax* was to look to the obſervation of this law.—It was a capital crime to prevaricate in it.

There were fifteen of theſe *ſitophylax's*; ten for the city, and five for the Pyræus.

SITUS, in geometry and algebra, denotes the ſituation of lines, ſurfaces, &c.—See POSITION, &c.

Wolfius gives us ſome things in geometry, which are not deduced from the common analyſis; particularly matters depending on the *ſitus* of lines, and figures.—M. Leibnitz has even invented a particular kind of analyſis, called *analyſis ſitus*, and built a peculiar kind of calculus thereon, called *calculus ſitus*. See ANALYSIS and CALCULUS.

SIXAIN*, SIXTH, SEXAGENA, in war, an ancient order of battle, wherein ſix battalions being ranged in one line, the ſecond and fifth are made to advance, to form the vanguard; the firſt and ſixth to retire, to form the rear-guard; the third and the fourth remaining on the ſpot, to form the corps, or body of the battle.

* The word is French, where it ſignifies the ſame thing.

SIX-CLERKS, officers in chancery of great account, next in degree below the twelve maſters; whoſe buſineſs is to enrol commiſſions, pardons, patents, warrants, &c. which paſs the great ſeal. See CLERK and CHANCERY.

They were anciently *clerici*, and forfeited their places if they married: they are alſo attornies for parties in ſuits depending in the court of chancery.

Under them were formerly 60 clerks, who with the underclerks, did the buſineſs of the office; which number was afterwards increaſed to 90.—At preſent the number is indefinite; an order having been made, for reducing them to their ancient number of 60; by not filling up the vacancies that may happen by death, &c. till they are fallen to that ſtandard.

SIXHINDEMEN. See the article SYXHINDEMEN.

SIXTH, SEXTA, in muſic, one of the ſimple original concords, or harmonical intervals. See CONCORD.

The *ſixth* is of two kinds; *greater* and *leſſer*; and hence it is eſteemed one of the imperfect concords; though each of the two ſpecies ariſes from a diviſion of the octave. See OCTAVE and SCALE.

The *greater* SIXTH, called by the Greeks *hexachordon majus*, is the concord reſulting from a mixture of the ſounds of two ſtrings that are to each other as 5 to 3.

The *leſſer* SIXTH, *hexachordon minus*, reſults from two ſtrings, which are to each other as 8 to 5. See SCALE.

The *leſſer ſixth* is compoſed diatonically of ſix degrees, whence its name; and of five intervals, three whereof are tones, and two ſemi-tones; chromatically of eight ſemi-tones; five whereof are greater, and three leſs.—It has its form or origin from the *ratio ſuper-tri-partiens quintas*; as of 8 to 5.

The *greater ſixth* is compoſed diatonically, like the *leſs*, of ſix degrees and five intervals; among which are four tones, and a ſemi-tone: and chromatically of nine ſemi-tones; five whereof are greater, and four leſs; of conſequence it has a leſſer ſemi-tone more than the former.—It has its origin from the *ratio ſuper-bi-partiens tertias*; as 5 to 3.

Anciently the *ſixth* had only one repetition, which was the 13th; but in the modern ſyſtem, it has ſeveral, as the 20th, 27th, &c. all marked indifferently in the thorough baſs, by the figure 6. And even the *ſixth* itſelf, both greater and leſſer, when natural, is not expreſſed any otherwiſe than by a ſimple 6. But when it is greater or leſs by accident; to the 6 is added the mark of a ſharp, or a flat: as may be ſeen in M. Broſſard.

Beſides the two kinds of *ſixths* here deſcribed, which are both good concords; there are two others that are vicious and diſſonant.

The firſt is the *defective* SIXTH, compoſed of two tones and three ſemi-tones, or of ſeven ſemi-tones, five whereof are greater, and two leſs.

The ſecond is the *redundant* SIXTH, compoſed of four tones, a greater ſemi-tone, and a leſs. Whence ſome call it *pentatonon*, as comprehending five tones.

Theſe two being both diſcords, ſhould never be uſed in melody, and very rarely in harmony.

As to the two conſonant *ſixths*, they were anciently uſed very ſparingly: at preſent they are allowed to be uſed as often as one pleaſes; as is the caſe with thirds; the *ſixths* being in reality, no other than inverted thirds: but care is uſually taken, that the firſt *ſixth* that occurs be a leſſer, and the laſt a greater; and that from the greater, we riſe to the octave, and from the leſs, fall to the fifth.

SIXTH, in the military art. See the article SIXAIN.

SIXTH *pair of nerves*, } See the articles { NERVE.
SIXTH *rates*, } { RATE.

SIZE, an inſtrument uſed to find the weight of fine round pearls withal. See PEARL.

It conſiſts of five thin pieces or leaves, about two inches long, and half an inch broad; faſtned together at one end by a rivet. In each of theſe, are ſeveral round holes drilled, of different diameters. Thoſe in the firſt leaf ſerve for weighing pearls from $\frac{1}{2}$ a grain to ſeven grains. Thoſe of the ſecond, for pearls from eight grains or two carats, to five carats, &c. and thoſe of the fifth, for pearls from $6\frac{1}{2}$ to $8\frac{1}{2}$.

SKELETON*, ΣΚΕΛΕΤΟΝ, in anatomy, an aſſemblage or arrangement of all the bones of a dead animal, dried, cleaned, and diſpoſed in their natural ſituation: and kept in that diſpoſition by means of wiars, &c.—See *Tab. Anat.* (Oſteol.) *fig.* 3, 7.

* The word is formed from the Greek, σκελλω, I dry.

Skeletons ſerve to good purpoſe, in learning the oſteology. See OSTEOLOGY.—For the ſeveral bones a *skeleton* conſiſts of, ſee BONE.

SKIFF, or SQUIFF, the leſs of two ſhip-boats; ſerving chiefly to go aſhore in, when the ſhip is in harbour. See BOAT.

SKIN, in anatomy, a large thick membrane, ſpread over the whole body, ſerving as the external organ of feeling, and as a cover and ornament of the parts underneath.

The *skin* conſiſts of three parts; the external one, called the *cuticle*, *epidermis*, or *skarf-skin*. See CUTICLE.—The middle-moſt is called the *corpus reticulare*, becauſe pierced through with a great number of holes, like a net or ſieve. See RETICULARE *corpus*.—The innermoſt, called the *cutis*, is a fibrous ſubſtance, wove out of the extremities of arteries, veins, nerves, tendons, &c. Whence alſo ariſe abundance of little eminences, called *papillæ pyramidales*,—See *Tab. Anat.* (Myol.) *fig.* 8. See alſo CUTIS and PAPILLÆ.

It is likewiſe ſet with an infinity of glands, called *miliary glands*, each whereof has its excretory duct paſſing along with the pyramidal papillæ, through the holes of the corpus reticulare, and terminating at the cuticle.

The papillæ are held by the moderns to be the organ of feeling; and the excretory veſſels ſerve to carry off the matter of perſpiration, which is ſeparated from the blood in the miliary glands. See MILIARY *glands*, PERSPIRATION and FEELING.

Nutrition, M. Perrault obſerves, is ſometimes taken in throughout the whole body of animals, at the pores of the *ſkin*. The ſubtle ſubſtances of nutritious matters applied externally to thoſe bodies, are found to penetrate them, to mix with the blood and juices, and are there aſſimilated. On this account, he adds, it is, that butchers dogs, turnſpit-dogs, &c. are generally very fat, and even butchers, cooks, &c. themſelves. M Dodart takes it, that plants receive a great part of their food by the external bark, not all by the root. See ROOT.

SKIN, in commerce, is particularly uſed for this membrane ſtripped off the animal, to be prepared by the tanner, ſkinner, currier, parchment-maker, &c. and converted into leather, &c. See TANNING, CURRYING, &c.

The uſe of *ſkins* is very ancient; the firſt garments in the world being made thereof. The Danes and other northern nations, have a long time dreſſed in *ſkins*.—Morocco's are made of the *ſkins* of a kind of goats. See MOROCCO.

Parchment is uſually made of ſheep *ſkins*; ſometimes of goat *ſkins*. See PARCHMENT.—Velom is a kind of parchment made of the *ſkin* of an abortive calf, or at leaſt of a ſucking calf. See VELOM.

The true ſhammy, is made of the *ſkin* of an animal of the ſame name; though frequently counterfeited with common goats and ſheep *ſkins*. See SHAMMY.

Shagreen is prepared at Conſtantinople, of the hind-part of the *ſkin* of a mule, or rather aſs of that country, prepared and tanned, and when ſoft and manageable, ſtretched on a frame, and expoſed to the ſun.—This done, they ſprinkle muſtard-ſeed on the *ſkin*; taking care to rub it ſeveral times over with the hand. By means hereof, and the heat of the ſun, the grain of the leather is raiſed up, and there hardened. See SHAGREEN,

SKINKER, a cup-bearer or butler. See ARCH-*butler*.

SKIPPER. See the article SCHIPPER.

SKIRMISH *, in war, a diſorderly kind of combat, or encounter, in preſence of two armies between ſmall parties, or perſons who advance from the body for that purpoſe, and introduce, or invite to a general, regular fight.

* The word ſeems formed from the French, *eſcarmouche*, which ſignifies the ſame, and which Nicod derives from the Greek χαρμη, which ſignifies at the ſame time, both light, combat and joy: Menage derives it from the German, *ſchirmen* or *ſkermen*, to fence or defend: De Cange, from *ſcaramuccia*, a light engagement, of *ſcara* and *muccia*, a body of ſoldiers hid in ambuſh; in regard moſt *ſkirmiſhes* are performed by perſons in ambuſcade.

SKULL, in anatomy. See the article CRANIUM.

SKY, the blue expanſe of air or atmoſphere. See AIR, ATMOSPHERE, and HEAVEN.

The azure colour of the *ſky*, Sir Iſaac Newton attributes to vapours beginning to condenſe therein, which have got conſiſtence enough to reflect the moſt reflexible rays, *viz.* the violet ones; but not enough to reflect any of the leſs reflexible ones. See REFLEXIBILITY.

M. de la Hire attributes it to our viewing a black object, *viz.* the dark ſpace beyond the regions of the atmoſphere, through a white or lucid one, *viz.* the air illumined by the ſun: a mixture of black and white always appearing blue. See BLUE.—But this account is not originally his; it is as old as Leonardo da Vinci. See COLOUR, &c.

SKY *rocket*. See the article ROCKET.

SLAB, an outſide ſappy plank or board ſawed off from the ſides of a timber-tree.

SLATE, a blue fiſſile ſtone, very ſoft when dug out of the quarry, and on that account eaſily cut or ſawed into thin long ſquares or eſcallops, to ſerve in lieu of tiles for the covering of houſes: ſometimes alſo to make tables of, and to pave withal. See COVERING, &c.

The ancients were unacquainted with the uſe of *ſlate*, and inſtead thereof covered their houſes with ſhingle, as we read in Pliny. Beſides the blue *ſlate*, we have in England a greyiſh *ſlate*, called alſo *Horſham ſtone*, from a town in Suſſex of that name, where the greateſt quantities of it are found.

The blue *ſlate* is a very light, laſting, and beautiful covering, but chargeable withal, in regard the roof muſt be firſt boarded over, the *ſlates* hung on tacks, and laid with finer mortar than tiles. The grey *ſlate* is chiefly uſed in the covering of churches, chapels, chancels, &c.

It is dearer than tiles, but far more durable. The timber of the roof needs to be very ſtrong for theſe grey *ſlates*, it being almoſt double the weight of tiles. TYLE.

To judge of the goodneſs of *ſlate*, Mr. Colepreſs, in the Philoſophical Tranſactions, orders it to be knocked againſt any hard body, to make it yield a ſound; if the ſound be good and clear, the ſtone is firm and good; otherwiſe, it is crazy.

Another method of proving its goodneſs, is, by weighing it exactly, then letting it lie ſix or eight hours under water, and wiping it very clean; if it weights now more than it did before, it is of that kind that ſoaks in water, and therefore will not long endure, without rotting the lath or timber.

Another method of trial is, by placing a *ſlate* half a day perpendicularly in a veſſel of water, ſo as to reach a conſiderable height above the level thereof: if the *ſlate* be firm and cloſe, then it will not draw water, that is, the water will not have aſcended above half an inch above the level of that in the veſſel, nor that perhaps any where but at the edges, the texture whereof might be looſened by hewing; but a bad ſtone will have drawn the water to the very top, be it as high as it will.

There are *ſlates* in ſeveral places, which the moſt experienced *ſlaters*, or coverers, conjecture to have continued on houſes ſeveral hundreds of years, and are yet as firm as when firſt put up.

M. Leibnitz informs us, in the hiſtory of the French academy, that in ſeveral parts of the dutchy of Brunſwick, particularly about Oſteroda, &c. there are horizontal veins of *ſlate*, wherein are found very exact and finiſhed repreſentations of various kinds of fiſhes and plants, appearing in their natural breadth and length, but without any thickneſs.—The ſame impreſſions are alſo frequently found even in a mixture of copper and ſilver.

M. Leibnitz accounts for this appearance, by ſuppoſing the lakes and meadows of theſe places to have been covered over with a kind of earth, which has buried the fiſhes and plants; or that ſome very muddy water, much impregnated with earth, has covered them up, or carried them away.—This earth he takes to have ſince hardened into *ſlate*; and length of time, or ſome other cauſe, to have conſumed the delicate matter of the fiſh, &c. much as the bodies of flies or ants, which are found encloſed in amber, are quite diſſipated, and nothing left but a mere delineation.

The matter of the fiſh, or plant, thus conſumed, has left its form impreſſed in the *ſlate*, by means of the cavity remaining therein; which cavity has been at length filled up with a metallic matter: whether by reaſon that the ſubterranean fire, in baking the earth into *ſlate*, has ſeparated a metal therefrom; or that a metallic vapour penetrating the *ſlate* has become fixed in theſe cavities.

SLAVE *, a perſon in the abſolute power of a maſter, either by war or conqueſt. See SERVANT.

* Menage, and Voſſius derive the word from *Sclavus*, the name of a Scythian people, whom Charlemagne condemned to perpetual impriſonment; whence the Italians made their *ſchlavo*, the Germans their *ſchlave*, the French their *eſclave*, and we *ſlave*: the Italians, and other nations uſed to buy theſe *Sclavi* or *Sclavonians* to make drudges of; whence the proper name of a nation, in time, became the name of a ſtate or condition. See SCLAVONIC.

The Romans called their *ſlaves*, *ſervi*, from *ſervare*, to keep, ſave; as being ſuch as were not killed, but ſaved, to yield money either by ſale, or by their work. Though other authors are of opinion, that the Roman name *ſervi* might come from that of *Serbi*; as that of *ſlaves*, from *Sclavi*, a people.

We find no mention of *ſlaves* before the deluge; but immediately after, *viz.* in the curſe of Canaan, Gen, ix. 25. whence it is eaſily inferred, that ſervitude commenced ſoon after that time: for in Abraham's days we find it generally eſtabliſhed.—Some will have it to have commenced under Nimrod, becauſe it was he who firſt began to make war, and of conſequence to make captives; and to bring ſuch as he took either in his battles, or irruptions, into ſlavery.

Among the Romans, when a *ſlave* was ſet at liberty, he changed his name into a ſurname; took the nomen or prænomen of his maſter; to which he added the cognomen or nick-name he had been called by when a *ſlave*. See NAME.

By the civil law, the power of making *ſlaves* is eſteemed a right of nations, and follows as a natural conſequence of captivity in war. The Lacedæmonians, ſay ſome, or as others ſay, the Aſſyrians, firſt introduced the practice; which the Romans not only approved of, but even invented new manners of making *ſlaves*: for inſtance, a man born free, among them, might ſell his freedom, and become a *ſlave*.—This voluntary *ſlavery* was firſt introduced by a decree of the ſenate, in the time of the emperor Claudius, and at length abrogated by Leo.

The Romans had power of life and death over their *ſlaves*, which no other nations had: but this ſeverity was afterwards moderated by the laws of the emperors; and by one of Adrian, it was made capital to kill a *ſlave* without a cauſe.—The *ſlaves* were eſteemed the proper goods of their maſters, and all they got belonged to them: but, if the maſters were too cruel in his domeſtick corrections, he was obliged to ſell his *ſlave* at a moderate price.

decked with a plumage of various colours. See MERMAID.

They are ſuppoſed to have been the three daughters of the river Achelous; and called *Parthenope*, *Ligea*, and *Leucoſia*. Homer only makes mention of two *ſirens*; but others reckon five. Virgil places them on rocks, where veſſels are in danger of ſplitting. Pliny makes them inhabit the promontory of Minerva, near the iſland Capreæ. Others fix them in Sicily, near Cape Pelorus. Claudian ſays, they inhabited harmonious rocks; that they were charming monſters; and that ſailors were wrecked on their rocks without regret, and even expired in rapture: *dulce malum pelago ſiren.*

This deſcription is, doubtleſs, founded on a literal explication of the fable, that the *ſirens* were women who inhabited the ſhores of Sicily, and who, by all the allurements of pleaſure, ſtopped paſſengers, and made them forget their courſe. Some interpreters of the ancient fables, will have the number and the names of the three *ſirens*, to have been taken from the triple pleaſure of the ſenſes; wine, love and muſick; which are the three moſt powerful means of ſeducing men: and hence ſo many exhortations to avoid the *ſirens* fatal ſong.

Probably it was hence, that the Greeks fetched their etymology of *ſiren*, *viz.* from σειρα, a chain, as if there was no getting free of their enticement.

Others, who do not look for ſo much myſtery in the fable, maintain, that the *ſirens* were nothing but certain ſtreights in the ſea, where the waves whirling furiouſly around, ſeized and ſwallowed up veſſels that approached them too near.

Laſtly, others hold the *ſirens* to have been certain ſhores and promontories, where the winds, by the various reverberations and echo's, cauſe a kind of harmony that ſurprizes and ſtops paſſengers.—This, probably, might be the origin of the *ſirens* ſong; and the occaſion of giving the name of *ſirens* to theſe rocks.

Sculptors and painters uſually follow Ovid's deſcription of the *ſirens*; but on ſome medals, we find them repreſented with the upper parts of women, and the lower of birds.

SIRIUS, ΣΕΡΙΟΣ, in aſtronomy, the *dog-ſtar*; a very bright ſtar of the firſt magnitude in the mouth of the conſtellation *canis major*, or the great dog. See CANIS.

The Arabs call it *aſchere*, *elſchecre*, *ſcera*; the Greeks, *ſirius*; and the Latins, *canicula*, or *canis candens*. See CANICULA and CANICULAR.

Its longitude, according to Mr. Flamſteed, is 9° 49′ 1″; its latitude 39° 32′ 8″ ſouth.

SIRNAME. See the article SURNAME.

SISTROID *angle*. See the article ANGLE.

SISTRUM, or CISTRUM, an ancient kind of muſical inſtrument uſed by the prieſts of Iſis, and Oſiris. See MUSIC.

Spon deſcribes it as of an oval form, in manner of a racket, with three ſticks traverſing it breadth-wiſe, which playing freely, by the agitation or beating of the inſtrument, yielded a kind of ſound, which to the ancients ſeemed melodious. Mr. Malcolm takes the *ſiſtrum* to have been no better than a kind of rattle. Jer. Boſius has an expreſs treatiſe on the *ſiſtrum*, intitled, *Iſicus de ſiſtro.*

Oiſelius obſerves, that the *ſiſtrum* is found repreſented on ſeveral medals; and alſo on Taliſmans.—Oſiris on ſome medals, is painted with a dog's head and a *ſiſtrum* in his hand.

SITE, or SCITE, SITUS, denotes the ſitutation of a houſe, meſſuage, &c.—And ſometimes the ground-plot, or ſpot of earth it ſtands on.

SITE, SITUS, in logic, one of the predicaments, declaring a ſubject to be ſo and ſo placed. See PLACE and SITUS.

SITOPHYLAX*, ΣΙΤΟΦΛΑΞ, in antiquity, an Athenian magiſtrate, who had the ſuper-intendance of the corn, and was to take care that no body bought more than was neceſſary for the proviſion of his family.

* The word is formed from Greek, σιτος, corn, and φυλαξ, keeper.

By the attic laws, particular perſons were prohibited buying more than fifty meaſures of wheat a man; of thoſe meaſures, we mean, called φορμοι: and the *ſitophylax* was to look to the obſervation of this law.—It was a capital crime to prevaricate in it.

There were fifteen of theſe *ſitophylax's*; ten for the city, and five for the Pyræus.

SITUS, in geometry and algebra, denotes the ſituation of lines, ſurfaces, &c.—See POSITION, &c.

Wolfius gives us ſome things in geometry, which are not deduced from the common analyſis; particularly matters depending on the *ſitus* of lines, and figures.—M. Leibnitz has even invented a particular kind of analyſis, called *analyſis ſitus*, and built a peculiar kind of calculus thereon, called *calculus ſitus.* See ANALYSIS and CALCULUS.

SIXAIN*, SIXTH, SEXAGENA, in war, an ancient order of battle, wherein ſix battalions being ranged in one line, the ſecond and fifth are made to advance, to form the van-guard; the firſt and ſixth to retire, to form the rear-guard; the third and the fourth remaining on the ſpot, to form the corps, or body of the battle.

* The word is French, where it ſignifies the ſame thing.

SIX-CLERKS, officers in chancery of great account, next in degree below the twelve maſters; whoſe buſineſs is to enrol commiſſions, pardons, patents, warrants, &c. which paſs the great ſeal. See CLERK and CHANCERY.

They were anciently *clerici*, and forfeited their places if they married: they are alſo attornies for parties in ſuits depending in the court of chancery.

Under them were formerly 60 clerks, who with the under-clerks, did the buſineſs of the office; which number was afterwards increaſed to 90.—At preſent the number is indefinite; an order having been made, for reducing them to their ancient number of 60; by not filling up the vacancies that may happen by death, &c. till they are fallen to that ſtandard.

SIXHINDEMEN. See the article SYXHINDEMEN.

SIXTH, SEXTA, in muſic, one of the ſimple original concords, or harmonical intervals. See CONCORD.

The *ſixth* is of two kinds; *greater* and *leſſer*; and hence it is eſteemed one of the imperfect concords; though each of the two ſpecies ariſes from a diviſion of the octave. See OCTAVE and SCALE.

The *greater* SIXTH, called by the Greeks *hexachordon majus*, is the concord reſulting from a mixture of the ſounds of two ſtrings that are to each other as 5 to 3.

The *leſſer* SIXTH, *hexachordon minus*, reſults from two ſtrings, which are to each other as 8 to 5. See SCALE.

The *leſſer ſixth* is compoſed diatonically of ſix degrees, whence its name; and of five intervals, three whereof are tones, and two ſemi-tones; chromatically of eight ſemi-tones; five whereof are greater, and three leſs.—It has its form or origin from the *ratio ſuper-tri-partiens quintas*; as of 8 to 5.

The *greater ſixth* is compoſed diatonically, like the *leſs*, of ſix degrees and five intervals; among which are four tones, and a ſemi-tone: and chromatically of nine ſemi-tones; five whereof are greater, and four leſs; of conſequence it has a leſſer ſemi-tone more than the former.—It has its origin from the *ratio ſuper-bi-partiens tertias*; as 5 to 3.

Anciently the *ſixth* had only one repetition, which was the 13th; but in the modern ſyſtem, it has ſeveral, as the 20th, 27th, &c. all marked indifferently in the thorough baſs, by the figure 6. And even the *ſixth* itſelf, both greater and leſſer, when natural, is not expreſſed any otherwiſe than by a ſimple 6. But when it is greater or leſs by accident; to the 6 is added the mark of a ſharp, or a flat: as may be ſeen in M. Broſſard.

Beſides the two kinds of *ſixths* here deſcribed, which are both good concords; there are two others that are vicious and diſſonant.

The firſt is the *defective* SIXTH, compoſed of two tones and three ſemi-tones, or of ſeven ſemi-tones, five whereof are greater, and two leſs.

The ſecond is the *redundant* SIXTH, compoſed of four tones, a greater ſemi-tone, and a leſs. Whence ſome call it *pentatonon*, as comprehending five tones.

Theſe two being both diſcords, ſhould never be uſed in melody, and very rarely in harmony.

As to the two conſonant *ſixths*, they were anciently uſed very ſparingly: at preſent they are allowed to be uſed as often as one pleaſes; as is the caſe with thirds; the *ſixths* being in reality, no other than inverted thirds: but care is uſually taken, that the firſt *ſixth* that occurs be a leſſer, and the laſt a greater; and that from the greater, we riſe to the octave, and from the leſs, fall to the fifth.

SIXTH, in the military art. See the article SIXAIN.

SIXTH *pair of nerves*, } See the articles { NERVE.
SIXTH *rates*, } { RATE.

SIZE, an inſtrument uſed to find the weight of fine round pearls withal. See PEARL.

It conſiſts of five thin pieces or leaves, about two inches long, and half an inch broad; faſtned together at one end by a rivet. In each of theſe, are ſeveral round holes drilled, of different diameters. Thoſe in the firſt leaf ſerve for weighing pearls from $\frac{1}{2}$ a grain to ſeven grains. Thoſe of the ſecond, for pearls from eight grains or two carats, to five carats, &c. and thoſe of the fifth, for pearls from $6\frac{1}{2}$ to $8\frac{1}{2}$.

SKELETON*, ΣΚΕΛΕΤΟΝ, in anatomy, an aſſemblage or arrangement of all the bones of a dead animal, dried, cleaned, and diſpoſed in their natural ſituation: and kept in that diſpoſition by means of wiars, &c.—See *Tab. Anat.* (Oſteol.) *fig.* 3, 7.

* The word is formed from the Greek, σκελλω, I dry.

Skeletons ſerve to good purpoſe, in learning the oſteology. See OSTEOLOGY.—For the ſeveral bones a *skeleton* conſiſts of, ſee BONE.

SKIFF, or SQUIFF, the leſs of two ſhip-boats; ſerving chiefly to go aſhore in, when the ſhip is in harbour. See BOAT.

SKIN, in anatomy, a large thick membrane, ſpread over the whole body, ſerving as the external organ of feeling, and as a cover and ornament of the parts underneath.

The *skin* conſiſts of three parts; the external one, called the *cuticle*, *epidermis*, or *skarf-skin*. See CUTICLE.—The middle-moſt is called the *corpus reticulare*, becauſe pierced through with a great number of holes, like a net or ſieve. See RETICULARE *corpus*.—The innermoſt, called the *cutis*, is a fibrous ſubſtance, wove out of the extremities of arteries, veins, nerves, tendons, *&c.* Whence alſo ariſe abundance of little eminences, called *papillæ pyramidales*,—See *Tab. Anat.* (Myol.) *fig.* 8. See alſo Cutis and Papillæ.

It is likewiſe ſet with an infinity of glands, called *miliary glands*, each whereof has its excretory duct paſſing along with the pyramidal papillæ, through the holes of the corpus reticulare, and terminating at the cuticle.

The papillæ are held by the moderns to be the organ of feeling; and the excretory veſſels ſerve to carry off the matter of perſpiration, which is ſeparated from the blood in the miliary glands. See Miliary *glands*, Perspiration and Feeling.

Nutrition, M. Perrault obſerves, is ſometimes taken in throughout the whole body of animals, at the pores of the *skin.* The ſubtle ſubſtances of nutritious matters applied externally to thoſe bodies, are found to penetrate them, to mix with the blood and juices, and are there aſſimilated. On this account, he adds, it is, that butchers dogs, turnſpit-dogs, *&c.* are generally very fat, and even butchers, cooks, *&c.* themſelves. M Dodart takes it, that plants receive a great part of their food by the external bark, not all by the root. See Root.

Skin, in commerce, is particularly uſed for this membrane ſtripped off the animal, to be prepared by the tanner, ſkinner, currier, parchment-maker, *&c.* and converted into leather, *&c.* See Tanning, Currying, *&c.*

The uſe of *skins* is very ancient; the firſt garments in the world being made thereof. The Danes and other northern nations, have a long time dreſſed in *skins.*—Morocco's are made of the *skins* of a kind of goats. See Morocco.

Parchment is uſually made of ſheep *skins*; ſometimes of goat *skins.* See Parchment.—Velom is a kind of parchment made of the *skin* of an abortive calf, or at leaſt of a ſucking calf. See Velom.

The true ſhammy, is made of the *skin* of an animal of the ſame name; though frequently counterfeited with common goats and ſheep *skins.* See Shammy.

Shagreen is prepared at Conſtantinople, of the hind-part of the *skin* of a mule, or rather aſs of that country, prepared and tanned, and when ſoft and manageable, ſtretched on a frame, and expoſed to the ſun.—This done, they ſprinkle muſtard-ſeed on the *skin*; taking care to rub it ſeveral times over with the hand. By means hereof, and the heat of the ſun, the grain of the leather is raiſed up, and there hardened. See Shagreen,

SKINKER, a cup-bearer or butler. See Arch-*butler*.

SKIPPER. See the article Schipper.

SKIRMISH*, in war, a diſorderly kind of combat, or encounter, in preſence of two armies between ſmall parties, or perſons who advance from the body for that purpoſe, and introduce, or invite to a general, regular fight.

* The word ſeems formed from the French, *eſcarmouche*, which ſignifies the ſame, and which Nicod derives from the Greek χαρμων, which ſignifies at the ſame time, both light, combat and joy: Menage derives it from the German, *ſchirmen* or *ſkermen*, to fence or defend: De Cange, from *ſcaramuccia*, a light engagement, of *ſcara* and *muccia*, a body of ſoldiers hid in ambuſh; in regard moſt *ſkirmiſhes* are performed by perſons in ambuſcade.

SKULL, in anatomy. See the article Cranium.

SKY, the blue expanſe of air or atmoſphere. See Air, Atmosphere, and Heaven.

The azure colour of the *sky*, Sir Iſaac Newton attributes to vapours beginning to condenſe therein, which have got conſiſtence enough to reflect the moſt reflexible rays, *viz.* the violet ones; but not enough to reflect any of the leſs reflexible ones. See Reflexibility.

M. de la Hire attributes it to our viewing a black object, *viz.* the dark ſpace beyond the regions of the atmoſphere, through a white or lucid one, *viz.* the air illumined by the ſun: a mixture of black and white always appearing blue. See Blue.—But this account is not originally his; it is as old as Leonardo da Vinci. See Colour, *&c.*

Sky *rocket*. See the article Rocket.

SLAB, an outſide ſappy plank or board ſawed off from the ſides of a timber-tree.

SLATE, a blue fiſſile ſtone, very ſoft when dug out of the quarry, and on that account eaſily cut or ſawed into thin long ſquares or eſcallops, to ſerve in lieu of tiles for the covering of houſes: ſometimes alſo to make tables of, and to pave withal. See Covering, *&c.*

The ancients were unacquainted with the uſe of *ſlate*, and inſtead thereof covered their houſes with ſhingle, as we read in Pliny. Beſides the blue *ſlate*, we have in England a greyiſh *ſlate*, called alſo *Horſham ſtone*, from a town in Suſſex of that name, where the greateſt quantities of it are found.

The blue *ſlate* is a very light, laſting, and beautiful covering, but chargeable withal, in regard the roof muſt be firſt boarded over, the *ſlates* hung on tacks, and laid with finer mortar than tiles. The grey *ſlate* is chiefly uſed in the covering of churches, chapels, chancels, *&c.*

It is dearer than tiles, but far more durable. The timber of the roof needs to be very ſtrong for theſe grey *ſlates*, it being almoſt double the weight of tiles. Tyle.

To judge of the goodneſs of *ſlate*, Mr. Colepreſs, in the Philoſopical Tranſactions, orders it to be knocked againſt any hard body, to make it yield a ſound; if the ſound be good and clear, the ſtone is firm and good; otherwiſe, it is crazy.

Another method of proving its goodneſs, is, by weighing it exactly, then letting it lie ſix or eight hours under water, and wiping it very clean; if it weights now more than it did before, it is of that kind that ſoaks in water, and therefore will not long endure, without rotting the lath or timber.

Another method of trial is, by placing a *ſlate* half a day perpendicularly in a veſſel of water, ſo as to reach a conſiderable height above the level thereof: if the *ſlate* be firm and cloſe, then it will not draw water, that is, the water will not have aſcended above half an inch above the level of that in the veſſel, nor that perhaps any where but at the edges, the texture whereof might be looſened by hewing; but a bad ſtone will have drawn the water to the very top, be it as high as it will.

There are *ſlates* in ſeveral places, which the moſt experienced *ſlaters*, or coverers, conjecture to have continued on houſes ſeveral hundreds of years, and are yet as firm as when firſt put up.

M. Leibnitz informs us, in the hiſtory of the French academy, that in ſeveral parts of the dutchy of Brunſwick, particularly about Oſteroda, *&c.* there are horizontal veins of *ſlate*, wherein are found very exact and finiſhed repreſentations of various kinds of fiſhes and plants, appearing in their natural breadth and length, but without any thickneſs.—The ſame impreſſions are alſo frequently found even in a mixture of copper and ſilver.

M. Leibnitz accounts for this appearance, by ſuppoſing the lakes and meadows of theſe places to have been covered over with a kind of earth, which has buried the fiſhes and plants; or that ſome very muddy water, much impregnated with earth, has covered them up, or carried them away.—This earth he takes to have ſince hardened into *ſlate*; and length of time, or ſome other cauſe, to have conſumed the delicate matter of the fiſh, *&c.* much as the bodies of flies or ants, which are found encloſed in amber, are quite diſſipated, and nothing left but a mere delineation.

The matter of the fiſh, or plant, thus conſumed, has left its form impreſſed in the *ſlate*, by means of the cavity remainin therein; which cavity has been at length filled up with a metallic matter: whether by reaſon that the ſubterranean fire, in baking the earth into *ſlate*, has ſeparated a metal therefrom; or that a metallic vapour penetrating the *ſlate* has become fixed in theſe cavities.

SLAVE*, a perſon in the abſolute power of a maſter, either by war or conqueſt. See Servant.

* Menage, and Voſſius derive the word from *Sclavus*, the name of a Scythian people, whom Charlemagne condemned to perpetual impriſonment; whence the Italians made their *ſchlavo*, the Germans their *ſchlave*, the French their *eſclave*, and we *ſlave*: the Italians, and other nations uſed to buy theſe *Sclavi* or *Sclavonians* to make drudges of; whence the proper name of a nation, in time, became the name of a ſtate or condition. See Sclavonic.

The Romans called their *ſlaves*, *ſervi*, from *ſervare*, to keep, ſave; as being ſuch as were not killed, but ſaved, to yield money either by ſale, or by their work. Though other authors are of opinion, that the Roman name *ſervi* might come from that of *Serbi*; as that of *ſlaves*, from *Sclavi*, a people.

We find no mention of *ſlaves* before the deluge; but immediately after, *viz.* in the curſe of Canaan, Gen, ix. 25. whence it is eaſily inferred, that ſervitude commenced ſoon after that time: for in Abraham's days we find it generally eſtabliſhed.—Some will have it to have commenced under Nimrod, becauſe it was he who firſt began to make war, and of conſequence to make captives; and to bring ſuch as he took either in his battles, or irruptions, into ſlavery.

Among the Romans, when a *ſlave* was ſet at liberty, he changed his name into a ſurname; took the nomen or prænomen of his maſter; to which he added the cognomen or nick-name he had been called by when a *ſlave*. See Name.

By the civil law, the power of making *ſlaves* is eſteemed a right of nations, and follows as a natural conſequence of captivity in war. The Lacedæmonians, ſay ſome, or as others ſay, the Aſſyrians, firſt introduced the practice; which the Romans not only approved of, but even invented new manners of making *ſlaves*: for inſtance, a man born free, among them, might ſell his freedom, and become a *ſlave.*—This voluntary *ſlavery* was firſt introduced by a decree of the ſenate, in the time of the emperor Claudius, and at length abrogated by Leo.

The Romans had power of life and death over their *ſlaves*, which no other nations had: but this ſeverity was afterwards moderated by the laws of the emperors; and by one of Adrian, it was made capital to kill a *ſlave* without a cauſe.—The *ſlaves* were eſteemed the proper goods of their maſters, and all they got belonged to them: but, if the maſters were too cruel in his domeſtick corrections, he was obliged to ſell his *ſlave* at a moderate price.

As *ſlavery* was not aboliſhed by the goſpel, the cuſtom of keeping *ſlaves* laſted a long time in Chriſtendom.—In the time of Louis the Groſs they were ſo numerous in Egypt, that it was found a difficult matter to quell a body of them who had made head againſt their maſters: yet Bartolus, who lived in 1300, obſerves, there were none left in his days.

Slavery is abſolutely aboliſhed in England, and France, as to perſonal ſervitude: our ſervants are not *ſlaves*, but only ſubject to certain determinate ſervices. It is ſaid, that the moment a *ſlave* ſteps on Engliſh ground, he becomes free. See SERVANT.

SLAVES make a very conſiderable article of the traffick in America. The Engliſh South-Sea company have the ſole privilege of furniſhing the Spaniſh Weſt-Indies with *ſlaves*, by treaty. See NEGRO.

SLAUGHTER. See MANSLAUGHTER, HOMICIDE, MURTHER, BUTCHER, &c.

SLEASY *holland*, a kind of holland thus called, becauſe made in Sileſia in Germany; and which, from its ſlightneſs, occaſions all thin, ſlight, ill-wrought hollands to be called *ſleaſy*. See HOLLAND.

SLEDGE, a kind of carriage, without wheels, for the conveyance of very weighty things, as huge ſtones, bells, &c. See CARRIAGE.

The Dutch have a kind of *ſledge*, whereon they can carry a veſſel of any burthen by land. It conſiſts of a plank a foot and a half broad, and the length of the keel of a moderate ſhip, raiſed a little behind, and hollow in the middle; ſo that the ſides go a little aſlope, and are furniſhed with holes to receive pins, &c. The reſt is quite even.

SLEEP, that ſtate wherein the body appearing perfectly at reſt, external objects move the organs of ſenſe as uſually, without exciting the uſual ſenſations. See WAKEFULNESS.

Sleep, according to Rohault, conſiſts in a ſcarcity of ſpirits; which occaſions that the orifices or pores of the nerves in the brain, whereby the ſpirits uſed to flow into the nerves, being no longer kept open by the frequency of the ſpirits, ſhut of themſelves. For this being ſuppoſed, as ſoon as the ſpirits, now in the nerves, ſhall be diſſipated, the capillaments of thoſe nerves, having no ſupplement of new ſpirits, will become lax, and cohere as if cemented together; and ſo be unfit to convey any impreſſion to the brain: beſides, the muſcles being now void of ſpirits, will be unable to move, or even ſuſtain the members: thus will ſenſation, and motion, be both deſtroyed. See SENSATION, MUSCULAR *motion*, SPIRITS, &c.

Sleep is broke off unnaturally, when any of the organs of ſenſe are ſo briſkly acted on, that the action is propagated to the brain: for upon this, the few ſpirits remaining in the brain, are all called together, and unite their forces to unlock the pores of the nerves, &c. But if no object ſhould thus affect the organ, yet *ſleep* would in ſome time be broke off naturally; for the quantiy of ſpirits generated in *ſleep* would at length be ſo great, that, ſtretching out the orifices of the nerves, they would open themſelves a paſſage.

With regard to medicine, *ſleep* is defined, by Boerhaave, to be that ſtate of the medulla of the brain, wherein the nerves, do not receive ſo copious, nor ſo forcible an influx of ſpirits, from the brain as is required to enable the organs of ſenſe, and voluntary motion, to perform their offices.

The immediate cauſe hereof appears to be the ſcarcity of animal ſpirits, which being ſpent, and requiring ſome time to be recruited, the minute veſſels, before inflated, become flaccid and collapſe: or elſe, it is owing to ſuch a preſſure of the thicker blood againſt the cortex of the brain, as that the medulla, becoming likewiſe compreſſed by its contiguity with the cortex, the paſſage of the ſpirits is obſtructed.

The natural cauſe of *ſleep*, then, is any thing that may contribute to theſe two.—And hence its effects may be underſtood: for in *ſleep* ſeveral functions are ſuſpended, their organs and muſcles are at reſt, the ſpirits ſcarce flow through them, therefore there is a leſs conſumption of them; but the ſolid villi and fibres of the nerves are but little changed, and an equilibrium obtains throughout; there is no difference of preſſure on the veſſels, nor of velocity in the humours: the motion of the heart, lungs, arteries, viſcera, &c. is increaſed. The effects of which are, that the vital humours circulate more ſtrongly and equably through the canals, which are now freer, laxer, and opener, as not being compreſſed by the muſcles. Hence the blood is driven leſs forcibly, indeed, into the lateral veſſels, but more equably; through the greater veſſels, both more ſtrongly, and more equably. Thus are the lateral fibres ſenſibly filled, as being leſs traverſed, and at length remain at reſt, with the juices they have collected: hence the lateral adipoſe cells become filled and diſtended with an oily matter.

By this means the circulation, being almoſt wholly performed in the larger blood-veſſels, becomes gradually ſlower, and at length ſcarce ſenſible, if the *ſleep* be too long continued: thus, in moderate *ſleep*, is the matter of the chyle beſt converted into ſerum; that, into thinner humours; and thoſe into nouriſhment. The attrition of the ſolid parts is leſs conſiderable; the cutaneous ſecretion is increaſed, and all the reſt diminiſhed. The parts wore off are now beſt ſupplied, as an equable, continual repletion, reſtores the humours, and repairs the ſolids, the preventing and diſturbing cauſes being then at reſt. In the mean time, while the nutritious matter is beſt prepared; there is an aptitude in the veſſels to receive, and in the humours to enter, and the means of application, and conſolidation, are at liberty: hence, a new production, and accumulation of animal ſpirits, in all the humours, as to matter, and in the minuteſt veſſels as to repletion: the conſequence of which is, an aptitude for waking, and an in-aptitude for *ſleep*; ſo that upon the firſt occaſion the man awakes. See NUTRITION, &c.

Some of the more extraordinary phænomena of *ſleep* yet to be accounted for, are: that when the head is hot, and the feet cold, *ſleep* is impracticable: that ſpirituous liquors firſt bring on drunkenneſs, then *ſleep*: that perſpiration, during the time of *ſleep*, is twice as great as at other times: that upon *ſleeping* too long, the head grows heavy, the ſenſes dull, the memory weak, with coldneſs, pituitouſneſs, an indiſpoſition of the muſcles for motion, and a want of perſpiration. That much *ſleeping* will ſuſtain life a long time, without either meat or drink: that upon a laudable *ſleep*, there always follows an expanſion of all the muſcles, frequently a repeated yawning, and the muſcles and nerves acquire a new agility; that fœtus's always *ſleep*; children often; youth more than grown perſons, and they more than old men; and that people, recovering from violent diſtempers, *ſleep* much more than when perfectly at health.

SLEEVE *Hippocrates's*. See the article HIPPOCRATES.

SLIDING, in mechanicks, *ſuperinceſſus radens*, is, when the ſame point of a Body, moving along a ſurface, deſcribes a line on that ſurface. See MOTION, FRICTION, &c. Such is the motion of a parallelpiped, protruded along a plane. See ROLLING, RESISTANCE, &c.

SLIDING *rule*, a mathematical inſtrument, ſerving to work queſtions in gauging, meaſuring, &c without the uſe of compaſſes; merely by the *ſliding* of the parts of the inſtrument one by another, the lines and diviſions whereof give the anſwer, by inſpection. See RULE.

This inſtrument is variouſly contrived, and applied by various authors; particularly Everard, Coggeſhal, Gunter, Hunt, and Partridge; but the moſt uſual and uſeful ones, are thoſe of Everard and Coggeſhal; the deſcription, and uſes whereof, are as follow.

Everard's SLIDING *rule* is principally uſed in gauging; being ordinarily made of box, a foot long, an inch broad, and $\frac{6}{10}$ of an inch thick.—In conſiſts of three parts: a rule, on each ſide whereof, *ab*, and *cd* (*Tab. Surveying*, *fig.* 18.) is a groove; and two ſmall ſcales, or *ſliding* pieces, *m*, *n*, *ſlide* in the grooves.—When both theſe pieces are drawn out to their full extent, the inſtrument is three foot long.

On the firſt broad face of the inſtrument *ab*, are four lines of numbers; for the properties, &c. whereof, ſee GUNTER's line. The firſt marked A, conſiſting of two radius's numbered 1, 2, 3, 4, 5, 6, 7, 8, 9, 10; and then 2, 3, 4, 5, &c. to 10. On this line are four braſs centre-pins, two in each radius; one in each whereof is marked MB, to ſignify that the number it is ſet againſt, 2150.42 is the cubic inches in a malt-buſhel; the other two are marked with A, to ſignify that the numbers they are ſet againſt, *viz.* 282, are the cubic inches in an ale-gallon.—The ſecond and third lines of numbers, are on the *ſliding* pieces, and are exactly the ſame with the firſt. Cloſe to the figure 7, in the firſt radius, is a dot marked *S i*, ſet exactly over .707. denoting .707 to be the ſide of a ſquare inſcribed in a circle, whoſe diameter is unity. Cloſe to 9 is another dot, marked *S e*, ſet over .886, which is the ſide of a ſquare, equal to the area of a circle, whoſe diameter is unity. Another dot, nigh W, is ſet over 231, the number of cubic inches in a wine-gallon: and another near C, is ſet over 3.14 the circumference of a circle, whoſe diameter is unity.—The fourth line of numbers, marked MD, to ſignify *malt depth*, is a broken line of two radius's numbered 2, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, 9, 8, 7, &c. the number 1 being ſet directly againſt MB on the firſt radius.

On the ſecond broad face, marked *c d*, are 1°. A line of numbers of one radius, numbered 1, 2, 3, &c. to 10. noted by the letter D. On this are four centre-pins; the firſt, marked WG, is the gauge-point for a wine-gallon, *i. e.* the diameter of a cylinder, whoſe height is an inch, and content 231 cubic inches, or a wine-gallon, which is 17.15 inches: the ſecond centre-pin AG ſtands at the gauge-point for an ale-gallon, which is 18.95 inches. The third MS ſtands at 46.3 the ſide of a ſquare, whoſe content is equal to the inches in a ſolid buſhel. The fourth MR is the gauge-point for a malt-buſhel, which is 52.32 inches.—2°. Two lines of numbers on the *ſliding* piece, which are exactly the ſame as thoſe on the *ſliding* piece on the other ſide. Cloſe to the diviſion 8 is a dot marked *c*, which is ſet to .795, the area of a circle whoſe diameter is unity; and another marked *d*, ſtands at .785, the area of a circle, whoſe diameter is unity.—3°. Two lines of ſegments, each numbered 1, 2, 3, to 100; the firſt, for finding the ullage of a caſk, taken as the middle fruſtum of a ſpheroid, lying with its axis parallel to the horizon; and the other, for finding the ullage of a caſk ſtanding.

Again, on one of the narrow ſides, noted *e*, are 1°. A line of inches, numbered 1, 2, 3, *&c.* to 12, each ſub-divided into ten equal parts. 2°. A line, by which, with that of inches, we find a mean diameter for a caſk, in the figure of a middle fruſtum of a ſpheroid: it is numbered 1, 2, 3, *&c.* to 7, and marked *ſpheroid.* 3°. A line for finding the mean diameter of a caſk, in the figure of the middle fruſtum of a parabolic ſpindle, which gaugers call the *ſecond variety of casks*; it is numbered 1, 2, 3, *&c.* and noted *ſecond variety.* 4°. A line, by which we find the mean diameter of a caſk of the third variety, *i. e.* of a caſk in the figure of two parabolic conoids, abutting on a common baſe; it is numbered 1, 2, 3, *&c.* and noted *third variety.*

On the other narrow face, marked *f*, are 1°. A foot divided into 100 equal parts, marked FM. 2°. A line of inches, like that before-mentioned, noted IM. 3°. A line for finding the mean diameter for the fourth variety of caſks, which is the middle fruſtum of two cones, abutting on a common baſe. It is numbered 1, 2, 3, *&c.* and noted FC, ſignifying fruſtum of a cone.

On the backſide of the two *ſliding* pieces are a line of inches, from 13 to 36, when the two pieces are put endwiſe; and againſt that, the correſpondent gallons, or hundred parts, that any ſmall tub, or the like open veſſel (from 13 to 36 inches diameter) will contain at one inch deep.

Uſe of Everard's Sliding *rule.*—1°. To multiply one number by another. Suppoſe 4 required to be multiplied by 6: ſet 1 on the line of numbers B, to 4 on the line A; then, againſt 6 upon B is 24, the product ſought upon A. Again, to multiply 26 by 68, ſet 1 on B to 26 on A; then, againſt 68 on B is 1768 on A, the product ſought.

2°. To divide one number by another. Suppoſe 24 to be divided by 4: ſet 4 on B to 1 on A; then againſt 24 on B is 6 on A, which is the quotient. Again to divide 952 by 14; ſet 14 on A to 1 on B, and againſt 952 on A you have on B, 68, which is the quotient.

3°. To work the rule of three. If 8 give 20, what wlll 22 give? ſet 8 on B, to 20 on A, then againſt 22 on B ſtands 55 on A; the number ſought.

4°. To find a mean proportional between two numbers, ſuppoſe between 50 and 72: ſet 50 on C to 72 on D; then againſt 72 on C you have 60 on D. which is the mean required.

5°. To extract the ſquare root of a number. Apply the lines C and D to one another, ſo as 10 at the end of D be even with 10 at the end of C; then are theſe two lines a table, ſhewing the ſquare root of any number leſs than 1000000 by inſpection: for againſt any number on C, the number anſwering to it on D, is the ſquare root thereof. Note, If the given number conſiſt of 1, 3, 5, or 7 places, ſeek it on the firſt radius, on the line C, and againſt it is the root required at D.

6°. Either the diameter, or circumference of a circle, being given; to find the other. Set 1 on the line A againſt 3, 141 (to which is writ C) on the line B; and againſt any diameter on the line A, you have the circumference on B; and contrariwiſe: thus, the diameter being 20 inches, the circumference will be 62.831 inches; and the circumference being 94,247, the diameter will be 30.

7°. The diameter of a circle given, to find the area in inches, or in ale or wine-gallons. Suppoſe the diameter 20 inches, what is the area? ſet 1 upon D, to .785 (noted *d*) on C; then againſt 20 on D is 314.159 the area required. Now to find that circle's area in ale-gallons, ſet 18.95 (marked AG) upon D, to 1 on C; then againſt the diameter 20 upon D, is the number of ale gallons on C, *viz.* 1.11. The ſame may ſerve for wine-gallons, regard only had to the proper gauge-point.

8°. The two diameters of an ellipſis being given, to find the area in ale-gallons. Suppoſe the tranſverſe diameter 72 inches, and the conjugate 50; ſet 359.05 the ſquare of the gauge-point on B, to one of the diameters (ſuppoſe 50) on A; then againſt the other diameter 72 on B, you will have the area on A, *viz.* 10.02 gallons, the content of this ellipſis at one inch deep. The like may be done for wine-gallons, if inſtead of 359.05 you uſe 249.11 the ſquare of the gauge-point for wine-gallons.

9°. To find the area of a triangular ſurface in ale gallons. Suppoſe the baſe of the triangle 260 inches, and the perpendicular let fall from the oppoſite angle 110 inches: ſet 282 (marked A) upon B to 130, half the baſe on A: then againſt 110 on B is 50.7 gallons on A.

10°. To find the content of an oblong in ale-gallons. Suppoſe one ſide 130 inches, and the other 180; ſet 282 on B to 180 on A; then againſt 130 upon B is 82.97 ale-gallons, the area required.

11°. To find the content of a regular polygon in ale-gallons, one of the ſides being given. Find the length of the perpendicular let fall from the centre to one of the ſides: this multiplied by half the ſum of the ſides, gives the area. For an inſtance: ſuppoſe a pentagon, whoſe ſide is 1 inch; here, the perpendicular will be found .837, by ſaying, as the ſine of half the angle at the centre, which in this polygon is 36°; is to half the given ſide .5, ſo is the ſine of the complement of 36°, *viz.* 54° to the perpendicular aforeſaid. Whence the area of a pentagon, whoſe ſide is unity, will be found 1.72 inches, which divided by 282, give .0061, the ale-gallons in that polygon.

12°. To find the content of a cylinder in ale-gallons. Suppoſe the diameter of the baſe of the cylinder 120 inches, the perpendicular height 36 inches: ſet therefore the gauge-point (AG) to the height, 36 on C; then againſt 120, the diameter on D, is found 1443.6, the content in ale-gallons.

13°. The bung and head-diameters, of any caſk, together with its length, being given; to find its content in ale, or wine-gallons.—1°. Suppoſe the length of a caſk taken (as the middle fruſtum of a ſpheroid, which is the firſt caſe or variety) be 40 inches, its head-diameter 24 inches, and bung-diameter 32 inches: ſubtract the head-diameter from that of the bung; the difference is 8. Look, then, for 8 inches on the line of inches, on the firſt narrow face of the rule; and againſt it, on the line *ſpheroid* ſtands 5.6 inches, which added to the head-diameter 24, gives 29.6 inches for that caſk's mean diameter: ſet therefore the gauge-point for ale (marked AG) on D, to 40 on C; and againſt 29.6 on D, is 97.45, the content of the caſk in ale-gallons. If the gauge-point for wine (marked WG) be uſed inſtead of that for ale; you will have the veſſel's content in wine-gallons.—2°. If a caſk, of the ſame dimenſions as the former be taken (as the middle fruſtum of a parabolic ſpindle, which is the ſecond variety) ſee what inches, and parts, on the line marked ſecond variety, ſtand againſt the difference of the bung and head-diameters, which in this example is 8; and you will find 5.1 inches, which added to 24, the head-diameter makes 29.1 inches, the mean-diameter of the caſk: ſet therefore the rule, as before, and againſt 29.1 inches, you will have 94.12 ale-gallons, for the content of the caſk.—3°. If the caſk taken be the middle fruſtum of two parabolic conoids, which is the third variety; againſt 8 inches, the difference of the head and bung-diameters, on the line of inches, you will find 4.57 inches on the line called *third variety*; this added as before to 24, gives 28.57 for the caſk's mean diameter: proceeding as before you will find the content 90.8 gallons.—4°. If the caſk taken be the fruſtums of two cones, which is the *fourth variety*, againſt 8 inches on the line of inches, you will find on the line marked FC, 4.1 inches to be added to 24 inches: the reſt, carried on as before, gives the content of the caſk 87.93 ale-gallons.

14°. A caſk partly empty, lying with its axis parallel to the horizon; to find the quantity of liquor therein. Find its whole content, as above; which ſuppoſe 97.455 gallons, and ſuppoſe the inches left dry, 8, and the bung-diameter 32: then, as the bung-diameter on C is to 100 on the line of ſegments L, ſo are the dry inches on C to a fourth number on the line of ſegments: and as 100 upon B is to the caſk's whole content on A, ſo is that fourth number to the liquor wanting to fill up the caſk; which, ſubtracted from the whole contents of the caſk, gives the liquor remaining therein. *E. gr.* Set 32, the bung-diameter on C, to 100 on the ſegment line L; then againſt 8, the dry inches on C, ſtands 17.6 on the ſegment line: ſet therefore 100 on B, to the caſk's whole content on A; and againſt 17.6 on B, you have 16.5 gallons on A; ſubtracting therefore the ſaid gallons from 97.45, the veſſel's whole content; the liquor in the caſk will be 80.95 gallons.

15°. A caſk ſtanding upright, or with its axis perpendicular to the horizon, to find the liquor therein. Suppoſe the length of the caſk 40 inches, and 10 of them dry; ſet 40 inches, on the line C, to 100 on the ſegment line S; and againſt 10, the dry inches, on the line C, ſtands 24.2 on S the ſegment line. Set, then, 100 on B, to 97.455, the caſk's whole content on A; and againſt 24.2 on B, you will have 23.5 gallons, which is what is wanting to fill up the caſk: this therefore, ſubtracted from the whole content 97.455, gives 73.955 gallons, for the quantity of liquor remaining in the caſk.

16°. To find the content of any right-angled parallelepiped (*e. gr.* a ciſtern, uting-fat, or the like) in malt-buſhels. Suppoſe the length of the baſe 80 inches, the breadth 50, and depth 9 inches: ſet the breadth 50 on B, to the depth 9 on C; then againſt the length 80 on A, ſtand 16.8 buſhels on B, the number required.

Coggeſhal's Sliding *rule* is principally uſed in meaſuring of the ſuperficies, and ſolidity of timber, *&c.* See Measuring *&c.*

It conſiſts of two rulers, each a foot long, which are framed or put together, various ways; ſometimes they are made to *ſlide* by one another, like glazier's rules: ſometimes a groove is made in the ſide of a common two-foot joint-rule, and a thin *ſliding* piece put in, and Coggeſhal's lines added on that ſide: but the moſt uſual and commodious way, is to have one of the rulers *ſlide* along the groove made along the middle of the other, as it is repreſented in *Table Surveying, fig.* 18.

On the *ſliding* ſide of the rule are four lines of numbers, three whereof are double, that is, are lines to two radius's, and one, a ſingle broken line of numbers: the three firſt, marked A,B,C, are figured 1, 2, 3, &c. to 9; then 1, 2, 3, &c. to 10. Their conſtruction, uſe, &c. are the ſame as thoſe on Everard's *ſliding* rule. The ſingle line, called the *girt-line*, and noted D, whoſe radius is equal to the two radius's of any of the other lines, is broke for the eaſier meaſuring of timber, and figured 4, 5, 6, 7, 8, 9, 10, 20, 30, &c. from 4, to 5. It is divided into ten parts, and each 10th ſubdivided into 2, and ſo on from 5 to 10, &c.

On the back-ſide of the rule, are, 1°. A line of inch-meaſure, from 1 to 12; each inch being divided and ſubdivided. 2°. A line of foot-meaſure; conſiſting of one foot, divided into 100 equal parts, and figured 10, 20, 30, &c, The back-ſide of the ſliding piece is divided into inches, halves, &c. and figured from 12 to 24; ſo that when ſlid out, there may be a meaſure of two foot.

Uſe of Coggeſhall's SLIDING *rule, in meaſuring plain ſuperficies.*—1. To meaſure a ſquare. Suppoſe, *e. gr.* the ſides be each 5 feet: ſet 1 on the line B, to 5 on the line A; then againſt 5 on the line B, is 25 feet; the content of the ſquare on the line A.

2. To meaſure a long ſquare. Suppoſe the longeſt ſide 18 foot, and the ſhorteſt 10: ſet 1 on the line B, to 10 on the line A; then againſt 18 foot, on the line B, is 180 feet, the contents on the line A.

3. To meaſure a rhombus. Suppoſe the ſide 12 feet, and the length of a perpendicular let fall from one of the obtuſe angles, to the oppoſite ſide, 9 feet: ſet 1, on the line B, to 12, the length of the ſide, on the line A; then againſt 9, the length of the perpendicular on the line B, is 108 feet, the content.

4. To meaſure a triangle. Suppoſe the baſe ſeven feet, and the length of the perpendicular let fall from the oppoſite angle to the baſe, 4 feet: ſet 1 on the line B, to 7 on the line A: then againſt half the perpendicular, which is 2, on the line B, is 14 on the line A, for the content of the triangle.

5. To find the content of a circle, its diameter being given. Suppoſe the diameter 3.5 feet: ſet 11 on the girt-line D, to 95 on the line C; then againſt 3.5 feet on D is 9.6 on C, which is the content of the circle in feet.

6. To find the content of an oval or ellipſis. Suppoſe the longeſt diameter 9 feet, and the ſhorteſt 4. Find a mean proportional between the two, by ſetting the greater 9 on the girt-line, to 9 on the line C; then againſt the leſs number 4, on the line C, is 6; the mean proportional ſought. This done, find the content of a circle, whoſe diameter is 6 feet; this, when found, by the laſt article, will be equal to the content of the ellipſis ſought.

Uſe of Coggeſhall's SLIDING *rule, in meaſuring timber.*—1°. To meaſure timber the uſual way. Take the length in feet, half feet, and, if required, quarters; then meaſure half way back again; there girt the tree with a ſmall cord or line; double this line twice, very evenly, and meaſure this fourth part of the girt or perimeter, in inches, halves, and quarters. The dimenſions thus taken, the timber is to be meaſured as if ſquare, and the fourth of the girt taken for the ſide of the ſquare, thus; ſet 12 on the girt-line D, to the length in feet on the line C, then againſt the ſide of the ſquare, on the girt-line D, taken in inches, you have, on the line C, the content of the tree in feet.

For an inſtance: ſuppoſe the girt of a tree, in the middle, be 60 inches, and the length 30 feet, to find the content: ſet 12 on the girt-line D, to 30 feet on the line C; then againſt 15, one fourth of 60, on the girt-line D, is 46.8 feet; the content on the line C. If the length ſhould be 9 inches, and the quarter of the girt 35 inches; here, as the length is beneath a foot, meaſure it on the line of foot-meaſure, and ſee what decimal part of a foot it makes, which you will find .75. Set 12, therefore, on the girt-line to 75 on the firſt radius of the line C, and againſt 35 on the girt-line is 6.4 feet on C, for the content.

2°. To meaſure round timber the true way. The former method, though that generally in uſe, is not quite juſt. To meaſure timber accurately, inſtead of the point 12 on the girt-line, uſe another, *viz.* 10.635; at which there ſhould be placed a centre-pin. This 10.635 is the ſide of a ſquare equal to a circle, whoſe diameter is 12 inches. For an inſtance: ſuppoſe the length 15 feet, and ¼ of the girt 42 inches: ſet the point 10.635 to 15 the length; then againſt 42 on the girt-line is 233 feet for the content ſought; whereas by the common way, there ariſes only 184 feet. In effect, the common meaſure is only to the true meaſure, as 11 to 14. See TIMBER.

3°. To meaſure a cube. Suppoſe the ſides to be 6 feet each; ſet 12 on the girt-line D, to 6 on C; then againſt 72 inches (the inches 6 feet) on the girt-line, is 216 feet on, C, which is the content required.

4°. To meaſure unequally-ſquared timber; that is, where the breadth and depth are not equal. Meaſure the length of the piece, and the breadth and depth (at the end) in inches: then find a mean proportional between the breadth and depth of the piece. This mean proportional is the ſide of a ſquare, equal to the end of the piece; which found, the piece may be meaſured as ſquare timber. For an inſtance: let the length of the piece of timber be 13 feet; the breadth 23 inches, and the depth 13 inches: ſet 23 on the girt-line D, to 23 on C; then againſt 13 on C is 17.35 on the girt-line D, for the mean proportional. Again, ſetting 12 on the girt-line D, to 13 feet, the length on the line C; againſt 17.35 on the girt-line, is 27 feet, the content.

5°. To meaſure taper timber. The length being meaſured in feet, note one third of it; which is found thus: ſet 3 on the line A, to the length on the line B; then againſt 1 on A, is the third part on B: then if the ſolid be round, meaſure the diameter at each end in inches, and ſubtract the leſs diameter from the greater; add half the difference to the leſs diameter; the ſum is the diameter in the middle of the piece. Then ſet 13.54 on the girt to the length of the line C, and againſt the diameter in the middle, on the girt-line, is fourth number on the line C. Again, ſet 13.54 on the girt-line to the third part of the length on the line C; then againſt half the difference on the girt-line, is another fourth number on the line C, theſe two fourth numbers added together, give the content. For an inſtance: let the length be 27 feet (one third whereof is 9) the greater diameter 22 inches, and the leſſer 18; the ſum of the two will be 40, their difference 4, and half the difference two, which added to the leſs diameter, gives 20 inches for the diameter in the middle of the piece. Now ſet 13.54 on the girt-line, to 27 on the line C, and againſt 20 on D, is 58.9 feet. Again, ſet 13.54 of the girt-line to 9 on the line C; and againſt 2 on the girt-line (repreſented by 20) is .196 parts; therefore, by adding 58.9 feet to .196 feet, the ſum is 59.096 feet the content.

If the timber be ſquare, and have the ſame dimenſions; that is, the length 27 feet, the ſide of the greater end 22 inches and that of the leſſer 18 inches, to find the content: ſet 12 on the girt-line to 27, the length on the line C, and againſt 20 inches, the ſide of the mean ſquare on the girt-line, is 75.4 feet. Again, ſet 12 on the girt-line to 9 feet, one third of the length, on the line C, and againſt 2 inches, half the difference of the ſides of the ſquares of the ends on the girt-line, is .25 parts of a foot, both together make 75.65 feet, the content of the ſolid.

The girt or circumference of a tree, or round piece of timber given; to find the ſide of the ſquare within, or the number of inches of a ſide, when the round timber is ſquared. Set 10 on A to 9 on B, then againſt the girt on A, are the inches for the ſide of a ſquare on the line B.

SLING, *funda*, a ſtring-inſtrument, ſerving for the caſting ſtones with the greater violence.

Pliny, *l.* 76. *c.* 5. attributes the invention of the *ſling* to the Phœnicians: Vegetius aſcribes it to the inhabitants of the Balearic iſlands, who were famous in antiquity, for the dextrous management thereof. Florus and Strabo ſay thoſe people bore three kinds of *ſlings*; ſome longer, others ſhorter, which they uſed according as their enemies were nearer or more remote. Diodorus adds, that the firſt ſerved them for a head-band, the ſecond for a girdle, and that the third they conſtantly carried with them in the hand.

SLINGING, is uſed variouſly at ſea; but chiefly for the hoiſting up caſks, or other heavy things, with ſlings, *i. e.* contrivances of ropes ſpliced into themſelves at either end, with one eye big enough to receive the caſk, or other thing to be ſlung.

SLIPPING, among gardeners, the pulling off a ſprig from a branch, or a branch from an arm of the tree.—And ſo a *ſlip* may have its rents double and treble *ſlipped*, or its ſtalk ragged.

SLIT *grafting*. See the article ENGRAFTING.

SLOOP, a ſort of floating veſſel, otherwiſe called *ſhallop*. See VESSEL and SHALLOP.

In our navy, *ſloops* are tenders on the men of war; and are uſually about 60 ton, and carry about 30 men. See NAVY.

SLOPING *alley*. See the article ALLEY.

SLOT.—*Drawing on the* SLOT. See DRAWING.

SLOUGH, a deep muddy place.—The caſt ſkin of a ſnake, the damp of a coal-pit, and the ſcar of a wound, are alſo called by the ſame appellation.

SLOUGH *of a wild boar*, is the bed, ſoil, or mire, wherein he wallows, or in which he lies in the day-time.

SLOUTH, or SLOUGHT, in hunting, is uſed for a company of ſome ſorts of wild-beaſts.—As a *ſlout* of bears.

SLOW *fevers*, } See the articles { FEVER.
SLOW *pulſe*, } { PULSE.

SLUICE, a frame of timber, ſtone, or other matter, ſerving to retain and raiſe the water of a river, &c. and, on occaſion, to let it paſs.

Such is the *ſluice* of a mill, which ſtops and collects the water of a rivulet, &c. to let it fall at length, in the greater plenty upon the mill-wheel: ſuch alſo are thoſe uſed as vents or drains to diſcharge water off land.—And ſuch are the *ſlucies* of Flanders, &c. which ſerve to prevent the waters of the ſea overflowing the lower lands, except when there is occaſion to drown them.

Sometimes there is a kind of canal incloſed between two gates or *ſluices*, in artificial navigations, to ſave the water, and render the paſſage of boats equally eaſy, and ſafe, upwards and downwards; as in the *ſluices* of Briare in France, which are a kind of maſſive walls built parallel to each other, at the diſtance of 20 or 24 feet, cloſed with ſtrong gates, at each end, between which is a kind of canal or chamber, inconſiderably longer than broad, wherein a veſſel being incloſed, the water is let out at the firſt gate, by which the veſſel is raiſed 15 or 16 foot, and paſſed out of this canal into another much higher. By ſuch means a boat is conveyed out of the Loire into the Seyne, though the ground between them riſe above 150 feet higher than either of thoſe rivers.

The word *ſluice* is formed of the French, *eſcluſe*, which Menage derives from the Latin, *excluſa*, found in the Salic law in the ſame ſenſe.—But this is to be reſtrained to the *ſluices* of mills, *&c.* for as to thoſe ſerving to raiſe veſſels, they were unknown to the ancients.

SMACK, is a ſmall veſſel with but one maſt. See VESSEL and MAST.

Sometimes they are employed as tenders on a man of war; and are alſo uſed for fiſhing upon the coaſts, *&c.*

SMALL *apparatus*, } See the articles { APPARATUS,
SMALL *inteſtine*, } { INTESTINE.

SMALL-POX, *variolæ*. See POX and VARIOLÆ.

SMALL *repeat*. See the article REPEAT.

SMALT, a kind of mineral matter, prepared and purified abroad, and brought hither, ſometimes in form of a blue powder, and ſometimes in cakes; chiefly uſed along with ſtarch, to give linens the finer and clearer caſt; and beſt known by the name of *ſtone* or *powder-blue*. See BLUE.

The preparation of *ſmalt*, as practiſed in Hermanduria, we find deſcribed in the Philoſophical Tranſactions by Dr. Krieg; who tells us, that the matter it is made of, is the mineral ſtone, called cobalt or cadmia, which being pulverized, and the lighter ſtuff waſhed away, the remainder is laid on a furnace, and by a fire, underneath and aſide it, the flames whereof are reverberated over it, a matter is ſeparated from it in form of a ſmoak, which ſticking to the walls, makes what we call *arſenic*. See ARSENIC.

When the cobalt has done ſmoaking, it is cooled, mixed with pot-aſhes and powder of white flint-ſtones, the mixture put in pots, and melted for five or ſix hours in a furnace. By this means, the matter is formed into a blue glaſs, which being put in cold water, cracks and grows tender, and is at length powdered by an engine, the fineſt part ſeparated by a ſieve, put into a mill, and ground in water, into the fineſt powder, which by waſhing is ſtill further ſeparated from the coarſer, then dried in warm chambers, barrelled up, and ſent away.

SMARAGD, ΣΜΑΡΑΓΔΟΣ, a precious ſtone of a green colour, very beautiful and brilliant, but brittle: called alſo *emerald*. See EMERALD.

The oriental *ſmaragds* are the moſt in eſteem, as being the hardeſt, and their ſplendor the moſt vigorous; ſo as even to tinge the ambient air with their greenneſs.

Great virtues are aſcribed to the *ſmaragd*, or emerald: Cardan and others ſay, it reſiſts plagues, poiſons and dyſenteries; that it refreſhes the ſpirits, *&c.* See GEM.

SMECTYMNUUS, a term that made ſome figure in the time of the civil wars, and during the inter-regnum.—It was formed of the initial letters of the names of five eminent preſbyterian miniſters of that time, *viz.* Stephen Marſhal, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Spurſtow, who, together, wrote a book againſt epiſcopacy, in the year 1641; whence they and their retainers, were called *ſmectymnuans*.

SMELL, *odor*, with regard to the organ, is an impreſſion made on the noſe, by little particles continually exhaling from odorous bodies. See NOSE, *&c.*

SMELL, with regard to the object, is the figure and diſpoſition of odorous effluvia, which ſticking on the organ, excite the ſenſe of *ſmelling*. See SMELLING.

SMELL, with regard to the ſoul, is the perception of the impreſſion of the object on the organ; or the affection in the ſoul reſulting therefrom. See SENSE.

The chymiſts teach, that ſulphur is the principle of all *ſmells*, and that theſe are more or leſs ſtrong, as the ſulphur in the odorous body, is more or leſs dried and exalted. Sulphur, they ſay, is the foundation of odours, as ſalt is of ſavours, and mercury of colours. See SMELLING.

Smell, like taſte, conſiſts altogether in the arangement, compoſition and figure of the parts; as appears from the following experiments of Mr. Boyle:

1°. From a mixture of two bodies, each whereof is, of itſelf, void of all *ſmell*; a very urinous *ſmell* may be drawn: that is, by the grinding of quick-lime with ſal-ammoniac.

2°. By the admixture of common water, which of itſelf is void of *ſmell*, or inodorous; another inodorous body may be made to emit a very rank *ſmell*.—Thus camphor diſſolved in oil of vitriol, is inodorous; yet mixed with water, immediately exhales a very ſtrong *ſmell*.

3°. Compound bodies may emit *ſmells*, which have no ſimilitude to the *ſmells* of the ſimples they conſiſt of.—Thus oil of turpentine, mixt with a double quantity of oil of vitriol, and diſtilled; after diſtillation, there is no *ſmell* but of ſulphur; and what is left behind in the retort, being again urged by a more violent fire, yields a *ſmell* like oil of wax.

4°. Several *ſmells* are only to be drawn forth by motion, and agitation.—Thus glaſs, ſtones, *&c.* which even when heated, yield no *ſmell*, yet when rubbed and agitated in a peculiar manner, emit a ſtrong *ſmell*; particularly beechwood in turning, yields a kind of roſy *ſmell*.

5°. A body that has a ſtrong *ſmell*, by being mixed with an inodorous one, may ceaſe to have any *ſmell* at all.—Thus if aqua-fortis, not well dephlegmated, be poured on ſalt of tartar, till it ceaſe to ferment; the liquor, when evaporated, will yield inodorous cryſtals, much reſembling ſalt of nitre: yet when burnt, will yield a moſt noiſom *ſmell*.

6°. From a mixture of two bodies, one whereof *ſmells* extremely ill, and the other not well; a very pleaſant aromatic odor may be gained, *viz.* by a mixture of aqua-fortis, or ſpirit of nitre, with an inflammable ſpirit of wine.

7°. Spirits of wine, by mixing with an almoſt inodorous body, may gain a very pleaſant, aromatic *ſmell*.—Thus inflammable ſpirits of wine, and oil of Dantzic vitriol, mixed in equal portions, then digeſted, and at laſt diſtilled, yield a ſpirit of a very fragrant *ſmell*.

8°. A moſt fragrant body may degenerate into a fœtid one, without the admixture of any other body.—Thus, if the ſpirit, mentioned in the former experiment, be kept in a well-cloſed receiver, it will ſoon turn to the rankneſs of garlic.

9°. From two bodies, one whereof is inodorous, and the other fœtid; a very pleaſant *ſmell* may ariſe, much reſembling muſk, *viz.* by putting pearls into ſpirit of vitriol: for when diſſolved, they yield a very agreeable *ſmell*.

SMELLING, the act whereby we perceive *ſmells*, or whereby we become ſenſible of odorous bodies, by means of certain effluvia thereof, which ſtriking on the olfactory organ, briſkly enough to have their impulſe propagated to the brain, excite a ſenſation in the ſoul. See SENSE, SENSATION, and SMELL.

The principal organs of *ſmelling*, are the noſtrils, and the olfactory nerves; the minute ramifications of which latter are diſtributed throughout the whole concave of the former: their deſcriptions, ſee under their proper heads.

Smelling is performed by the odorous effluvia floating in the air, being drawn into the noſtrils, in inſpiration, and ſtruck with ſuch force againſt the fibrillæ of the olfactory nerves, which the figure of the noſe, and the ſituation of the little bones, render oppoſite thereto, as to ſhake them, and give them a vibratory motion; which action being communicated thence to the common ſenſory, occaſions an idea of a ſweet, or fœtid, or ſour, or an aromatic, or a putrified object, *&c.*

The matter in animals, vegetables, foſſils, *&c.* which chiefly affects the ſenſe of *ſmelling*, Boerhaave obſerves, is that ſubtile ſubſtance inherent in the oily parts thereof, called *ſpirit*: for that when this is taken away from the moſt fragrant bodies, what remains has ſcarce any *ſmell* at all; but this poured on the moſt inodorous bodies, gives them a fragrancy. *Inſtit cap. de Olfac.*

Willis obſerves, that brutes have, generally, the ſenſe of *ſmelling* in much greater perfection than man; as by this, alone, they diſtinguiſh the virtues and qualities of bodies unknown before; hunt out their food at a great diſtance, as hounds, and birds of prey; or hid among other matters, as ducks, *&c.*

Man having other means of judging of his food, *&c.* did not need ſo much ſagacity in his noſe: yet have we inſtances of a great deal, even in man.—In the *Hiſtoire des Antilles*, we are aſſured, there are negroes who, by the *ſmelling* alone, can diſtinguiſh between the footſteps of a Frenchman and a negro.

It is found that the laminæ, wherewith the upper part of the noſtrils is fenced, and which ſerve to receive the divarications of the olfactory nerves, are always longer, and folded up together in greater number, as the animal has this ſenſe more accurate: the various windings and turnings of theſe laminæ, detain and fetter the more of the odoriferous particles.

SMELTING, among metalliſts, the melting of a metal in the ore, in a *ſmelting* furnace; in order to ſeparate the metallic from the earthy and other parts. See METAL, FURNACE, *&c.*

Smelting, in propriety, is reſtrained to large works, wherein ores from the mines are melted down and ſeparated.—In ſpeaking of works in a leſſer way, we do not ſay *ſmelting*, but melting. See FUSION, REFINING, *&c.*

SMINTHEAN, SMINTHEUS, ΣΜΙΝΘΕΥΣ, in antiquity, an epithet given to Apollo, from the Greek, σμινθος, a rat. There are two different accounts of the origin of this appellation: the firſt, that in the city of Chryſa in Myſia, was a prieſt of Apollo, called *Crinis*, with whom that God being offended, ſent a herd of rats to ſpoil all his lands. But Crinis appeaſing the deity, he came in perſon to his aſſiſtance, took up his lodgings with Crinis's ſhepherd, told him who he was, and deſtroyed all the rats with his arrows: in memory whereof, Crinis built a temple to his deliverer, under the name of *Apollo Smintheus*.

Clemens Alexandrinus, in his exhortation to the Greeks, gives us a different ſtory: the Cretans, ſays he, intending to ſend out a Colony, conſulted the Oracle of Apollo as to the place: the anſwer was, that they ſhould fix their colony where thoſe born of the earth ſhould oppoſe them.—Upon their arrival in the Helleſpont, the rats, in the night-time, gnawed aſunder all the ſtrings of their bows: this they deemed an accompliſhment of the oracle, and built a city called *Smintha*.

SMOKE, or SMOAK, *fumus*, a humid matter, exhaled in form of vapour, by the action of heat, either external or internal. See FIRE, VAPOUR, *&c.*

Smoke, Sir Iſaac Newton obſerves, aſcends in the chimney by the impulſe of the air it floats in: for that air being rarified by the fire underneath, has its ſpecific gravity diminiſhed; thus, being determined to aſcend itſelf, it carries up the *ſmoke* along with it.—The tail of a comet, that great author takes to aſcend from the nucleus after the ſame manner. See COMET.

Smoke of fat unctuous woods, as fir, Beech, *&c.* makes what we call *lamp-black*. See BLACK.

There are various inventions for preventing, and curing *ſmoking* chimneys; as the æolipiles of Vitruvius, the ventiducts of Cardan, the wind-mills of Bernard, the capitals of Serlio, the little drums of Paduanus, and ſeveral artifices of de Lorme, *&c.* See CHIMNEY.

In the Philoſophical Tranſactions, we have the deſcription of an engine invented by Monſieur Daleſme, which conſumes the *ſmoke* of all ſorts of wood, and that ſo totally as the moſt curious eye cannot diſcover it in the room, nor the niceſt noſe ſmell it, though the fire be made in the middle of the room.—It conſiſts of ſeveral iron hoops, four or five inches diameter, which ſhut into one another; and is placed on a trevet.—A brand taken out of the fire *ſmokes* inſtantly; but ceaſes as ſoon as returned. The moſt fœtid things, as a coal ſteeped in cat's-piſs, which ſtinks abominably when taken out of the fire, yet in it makes not the leaſt ill ſcent; no more than red herrings broiled, *&c.*

SMOKE *farthings*, were the pentecoſtal or cuſtomary oblations offered by the inhabitants within any dioceſs, when they made their proceſſions to the cathedral church; which came by degrees into an annual, ſtanding rent, called *ſmoke-farthings*. See PENTECOSTAL, *&c.*

SMOOTHING *plane*. See the Article PLANE.

SMUGGLING, a cant term for the running of goods; or the clandeſtine landing them without paying cuſtom. See CUSTOM, DUTY, *&c.*

SMUT, a diſeaſe in corn, whereby the pulp or meal thereof is damaged, and its natural taſte, colour, *&c.* altered. See DISEASES *of plants*.

The *ſmut* is uſually aſcribed by the huſbandmen to the exceſſive fatneſs and rankneſs of the ſoil; to the manuring the land with rotten vegetables, as ſtraw, hawm and fern; and to the ſowing *ſmutty* ſeed.

Mr. Bradley makes no doubt to call the *ſmut* a *blight*, and to account for it on the ſame principle as the blights befalling other plants, particularly fruit trees, *viz.* from innumerable inſects, brought, or at leaſt hatched by the eaſtern winds, which prey on and devour the native juices of the corn, and poiſon them with a mixture of their own. See BLIGHT.

An approved method to prevent the *ſmut*, the ſame Mr. Bradley gives us, as follows: the wheat, for ſeed, to be waſhed in three or four waters, ſtirring it well round, and with great force, each time, and ſkimming off all the light wheat ſwimming a-top. This done, it is to be ſteeped in a liquor thus prepared: into a ſufficient quantity of water, put as much ſalt, as, when ſtirred about, will make an egg ſwim; and to this add as much more ſalt; ſtir the whole well, and to the brine, put two or three pound of alum beaten fine. In this mixture, lay the wheat to ſteep, at leaſt, thirty or forty hours. Take it out the night before it is to be ſown, and ſift ſome ſlacked lime on it; this dries and fits it for ſowing.

Note, many ſteep their wheat in brine, yet have plenty of *ſmutty* corn: the reaſon is, that they do not either make their brine ſtrong enough, or do not let the wheat ſtay long enough therein. It is a common notion among them, that ſteeping it ſo long, rots the grain; but experience ſhews the contrary.

SNAKE *root*. See SERPENTARIA *radix*.

SNEEZING, *ſternutation*, a convulſive motion of the muſcles of the breaſt uſed in expiration; wherein, after ſuſpending the inſpiration begun, the air is repelled from the mouth and noſe with a momentary violence and noiſe. See RESPIRATION.

The cauſe, is an irritation of the upper membrane of the noſe, which communicates with the intercoſtal nerve by means of the twigs that it detaches to it.

This irritation is performed either externally, by ſtrong ſmells, as marjoram, roſes, *&c.* or by duſt floating in the air, and taken in by inſpiration; or by ſharp, pungent medicines, as creſſes and other ſternutatories, which vellicate the membrane of the noſe; or internally, by the acrimony of the lympha or mucus, which naturally moiſtens that membrane. See STERNUTATIVE, PTARMIC, ERRHINE, *&c.*

The matters caſt forth in *ſneezing*, come primarily from the noſe and throat; the pituitary membrane continually exuding a mucus thither; and, ſecondarily, from the breaſt, the trachea, and the bronchia of the lungs.

F. Strada, in an expreſs treatiſe on *ſneezing*, has diſcovered the original of the cuſtom of ſaluting thoſe who *ſneeze*. He ſhews it to be a relick of paganiſm; though he owns it was in uſe among the Jews as well as among the Romans.—From an epigram in the anthology, it appears, that among the ancients, a perſon after *ſneezing*, made a ſhort prayer to the gods; as *Ζευ σωζε*, *Jupiter ſave me*.

SNOW, *nix*, a meteor formed in the middle region of the air, of vapour raiſed by the action of the ſun or ſubterraneous fire; there congealed, its parts conſtipated, its ſpecifick gravity increaſed, and thus returned to the earth in form of little white villi, or flakes. See METEOR and VAPOUR.

The *ſnow* we receive, may properly enough be aſcribed to the coldneſs of the atmoſphere, through which it falls. When the atmoſphere is warm enough to diſſolve the *ſnow* before it arrives at us, we call it *rain*: if it preſerve itſelf undiſſolved, it makes what we call *ſnow*. See RAIN.

Dr. Grew, in a Diſcourſe of the nature of *ſnow*, obſerves, that many parts thereof are of a regular figure, for the moſt part ſo many little rowels or ſtars of ſix points, and are perfect and tranſparent ice, as any we ſee on a pond, *&c.* Upon each of theſe points are other collateral points, ſet at the ſame angles, as the main points themſelves: among which there are divers other irregular, which are chiefly broken points, and fragments of the regular ones. Others alſo, by various winds, ſeem to have been thawed, and froze again into irregular cluſters; ſo that it ſeems as if the whole body of *ſnow* were an infinite maſs of icicles irregularly figured.—That is, a cloud of vapours being gathered into drops, the ſaid drops forthwith deſcend; upon which deſcent, meeting with a freezing air as they paſs through a colder region, each drop is immediately froze into an icicle, ſhooting itſelf forth into ſeveral points; but theſe ſtill continuing their deſcent, and meeting with ſome intermitting gales of warmer air, or in their continual waftage to and fro, touching upon each other, ſome of them are a little thawed, blunted, and again froze into cluſters, or intangled ſo as to fall down in what we call flakes.

The lightneſs of *ſnow*, although it is firm ice, is owing to the exceſs of its ſurface, in compariſon to the matter contained under it; as gold itſelf may be extended in ſurface, till it will ride upon the leaſt breath of air. See ICE and FREEZING.

The uſes of *ſnow* muſt be very great, if all be true Bartholin has ſaid in its behalf, in an expreſs treatiſe, *de nivis uſu medico*: he there ſhews, that it fructifies the earth, (which, indeed, is a very old and general opinion) preſerves from the plague, cures fevers, cholicks, tooth-aches, ſore eyes, and pleuriſies (for which laſt uſe, his countrymen of Denmark uſe to keep *ſnow-water* gathered in March.) He adds, that it contributes to the prolongation of life; giving inſtances of people in the Alpine mountains that live to great ages: and to the preſerving of dead bodies; inſtances whereof, he gives in perſons buried under the *ſnow* in paſſing the Alps, which are found uncorrupted in the ſummer when the *ſnow* is melted.

He obſerves, that in Norway, *ſnow-water* is not only their ſole drink in the winter; but *ſnow* even ſerves for food; people having been known to live ſeveral days, without any other ſuſtenance.

Indeed the generality of theſe medicinal effects of *ſnow*, are not to be aſcribed to any ſpecific virtue in *ſnow*; but to other cauſes. It fructifies the ground, for inſtance, by guarding the corn or other vegetables, from the intenſer cold of the air, eſpecially the cold, piercing winds. And it preſerves dead bodies, by conſtipating and binding up the parts, and thus preventing all ſuch fermentations or internal conflicts of their particles, as would produce putrefaction. See COLD.

It is a popular error, that the firſt *ſnow* that falls in the year, has particular virtues. In Italy, they cool their wines all the ſummer with *ſnow-water*.

Signior Sarotti, in his Philoſophical Tranſactions, mentions a *red* or *bloody ſnow*, which fell on the mountains la Langhe, near Genoa, on St. Joſeph's day.—This *ſnow*, when ſqueezed, yielded a liquor of the ſame red colour.

SNUFF, a preparation of tobacco, made by reducing it into a powder, fit to be taken at the noſe; in order to purge or clear the head of pituita. See TOBACCO, STERNUTATIVE, ERRHINE, *&c.*

Ordinarily, tobacco is the baſis of *ſnuff*; other matters being only added to give it a more agreeable ſcent, *&c.* The kinds of *ſnuff*, and their ſeveral names, are infinite; and new ones are daily invented; ſo that it would be difficult, nor to ſay impoſſible, to give a detail of them. We ſhall only ſay, that there are three grand ſorts; the firſt granulated; the ſecond an impalpable powder; and the third the bran or coarſe part remaining after ſifting the ſecond ſort.

SOAP, or Sope, a kind of paſte, ſometimes hard and dry, and ſometimes ſoft and liquid; much uſed in waſhing, and whitening linens, and for various other purpoſes, by the dyers, perfumers, hatters, fullers, &c. See Bleaching, Hat, Fulling, &c.

The principal *ſoaps* of our manufacture, are the *ſoft*, the *hard*, and the *ball-ſoap*.—The *ſoft ſoap*, again, is either *white* or *green*: the proceſs of making each kind, is as follows.

Green ſoft Soap.—The chief ingredients uſed in making this, are lyes drawn from pot-aſh and lime, boiled up with tallow and oil,—Firſt, the lye and tallow are put into the copper together, and when melted, the oil is put to it, and the copper made to boil; then the fire is dampt or ſtopt up, while the ingredients lie in the copper to knit or incorporate; which done, the copper is ſet on boiling, being fed or filled with lyes as it boils, till there be a ſufficient quantity put therein: then it is boiled off with all convenient ſpeed, and put into caſks.

White ſoft Soap.—One ſort of white *ſoap* is made after the ſame manner as *green ſoft ſoap* is, oil excepted, which is not uſed in white.—The other ſort of *white ſoft ſoap*, is made from lyes of aſhes of lime boiled up at twice with tallow.

Firſt, a quantity of lyes and tallow are put into the copper together, and kept boiling; being fed with lyes as it boils, until it grains, or is boiled enough; then the lyes are ſeparated or diſcharged from the tallowiſh part, which part is removed into a tub, and the lyes thrown away: this is called the firſt *half boil*.—Then the copper is charged again with freſh tallow and lyes, and the firſt half boil put out of the tub into the copper a ſecond time; where it is kept boiling with freſh lyes and tallow, till it comes to perfection.—It is then put out of the copper into the ſame ſort of caſks as are uſed in green ſoft *ſoap*.

Hard Soap is made with lyes from aſhes and tallow, and moſt commonly boiled at twice: the firſt, called a *half-boiling*, hath the ſame operation as the firſt half-boil of ſoft white *ſoap*.—Then the copper is charged with freſh lyes again, and the firſt half-boil put into it, where it is kept boiling, and fed with lyes as it boils, till it grains, or is boiled enough; then the lye is diſcharged from it, and the *ſoap* put into a frame to cool and harden.

Note, There is no certain time for bringing off a boiling of any of theſe ſorts of *ſoap*: it frequently takes up part of two days.

Ball Soap, commonly uſed in the north, is made with lyes from aſhes and tallow.—The lyes are put into the copper, and boiled till the watery part is quite gone, and there remains nothing in the copper but a ſort of nitrous matter (the very ſtrength or eſſence of the lye) to this the tallow is put, and the copper kept boiling and ſtirring for above half an hour, in which time the *ſoap* is made; and then it is put out of the copper into tubs or baſkets with ſheets in them, and immediately (whilſt ſoft) made into balls.—Note, it requires near twenty-four hours to boil away the watery part of the lye.

Soaps, both *dry* and *liquid*, are held of ſome uſe in medicine: the *liquid* againſt fevers; to be applied by rubbing the ſoals of the patient's feet therewith: and the *dry*, diſſolved with ſpirit of wine, in the cure of cold humours.—Beſides its being uſed in ſuppoſitories, and in the compoſition of a kind of plaiſter, commonly called *emplaſt. de ſapone*.

SOAP-EARTH, *ſteatites*, a ſmooth unctuous kind of earth, found in the Levant, and uſed as a *ſoap*. See Earth.

The *ſoap-earth*, Dr. Smith tells us, is only had in two places near Duraclea, ſix leagues to the eaſt of Smyrna. It is, in effect, of itſelf, a fine *ſoap*, boiling and ſhooting up out of the earth.

It is gathered always before ſun-riſe, and in mornings when there falls no dew; ſo that a ſtock muſt be laid up in the ſummer months, to ſerve all the year.

In ſome places, it comes up an inch or two above the ſurface of the ground: but the ſun riſing on it, makes it fall again. Every morning there returns a freſh crop.

SOC, or Sok, Soka, in law, denotes juriſdiction; or a power or privilege to adminiſter juſtice, and execute laws.

The word is alſo uſed for the ſhire, circuit, or territory wherein ſuch power is exerciſed by him endued with ſuch juriſdiction. See Jurisdiction.

Hence alſo the law Latin *ſoca*, uſed for a ſeignory or lordſhip, infranchiſed by the king, with liberty of holding a court of his *ſoc-men* or *ſocagers*, that is, his tenants, whoſe tenure is hence called *ſocage*. See Socage.

This kind of liberty ſtill ſubſiſts in ſeveral parts of England, under the name of *ſoke*, or *ſoken*.—Skene defines *ſok* to be *ſecta de hominibus ſuis in curia ſecundum conſuetudinem regni*.—Brady makes mention of theſe liberties: *ſoc*, *ſac*, *tol*, *team*, *infangthef* and *utfangthef*. See Sac, &c.

In the laws of Henry I. *ſoca* is alſo uſed as ſynonymous with franchiſe, for a privileged place, refuge, aſylum or ſanctuary, &c. From the Saxon, *ſocn* or *ſocne*. See Franchise, Sanctuary, Asylum, &c.

SOCAGE*, or Soccage, a tenure, by which men held their lands on condition of ploughing thoſe of their reſpective lords, with their own ploughs, and doing other inferior offices of huſbandry at their own charges. See Service, Vassal, Tenure, &c.

This ſlaviſh tenure was afterwards, by the mutual agreement of lord and tenant, turned into the payment of a certain ſum of money, which is hence called *liberum ſocagium*, free or common *ſocage*. Whereas the other was *villanum ſocagium*, or *baſe ſocage*: inaſmuch as thoſe who held lands by this tenure, were not only bound to plough their lords lands, but took the oath of fealty to them, *ſicut villani*. See Fealty and Villain.

Socage was a tenure of that extent, that Littleton tells us, all the lands in England, which were not held by knight's-ſervice, were held in *ſocage*: ſo that it ſeems the land was divided between the two tenures, which, as they were of different natures, ſo the deſcent of the land was in a different manner. For the lands held in knight's-ſervice, deſcended to the eldeſt ſon; but thoſe held in *villano ſocagio*, equally among all the ſons. Yet if there was but one meſſuage, the eldeſt ſon was to have it; but ſo, as that he was to pay the reſt the value of their ſhares.

Skene defines *ſocage*, a tenure of lands, whereby a man is infeoffed freely, without wardſhip and marriage, paying to his lord ſome ſmall rents, &c. which is called *free ſocage*, &c. Several diviſions of *ſocage* we meet withal in law-writers, as *ſocage in capite*, &c.—But by ſtat. 12. *Car.* II. all tenures from and after the 24th of February, 1645, ſhall be adjudged and taken for ever, to be turned into *free* and *common ſocage*. See Tenure.

SOCCUS, Sock, in antiquity, a kind of high ſhoe, reaching above the ankle, worn by the actors in the ancient drama, in repreſenting of comic perſons. See Comedy.

The *ſoccus* was much lower than the cothurnus; and was the diſtinguiſhing wear of the comedians; as the cothurnus was of the tragedians: hence *ſoccus* is frequently uſed for comedy itſelf. Comedy, ſays M. Fenelon, muſt talk in an humbler ſtile than tragedy; the *ſock* is lower than the buſkin. See Buskin.

SOCIETY, Societas, an aſſemblage, or union of ſeveral perſons in the ſame place, for their mutual aſſiſtance, ſecurity, intereſt, or entertainment. See Community, Corporation, College, Company, Academy, &c.

Of *ſocieties* we have a great many kinds, diſtinguiſhed by the different ends propoſed by them: *civil ſocieties*, *trading ſocieties*, *religious ſocieties*, *literary ſocieties*, &c.

Society, in trade, is a contract or agreement between two or more perſons, whereby they bind themſelves together for a certain time, and agree to ſhare equally in the profits or loſſes which ſhall accrue in the affairs for which the *ſociety* or co-partnerſhip is contracted.

We have ſeveral very conſiderable *ſocieties* of this kind; as the Merchant Adventurers, the Turkey, Eaſt-India, Muſcovy, Eaſtland, Greenland, Spaniſh, African, South-Sea and Hudſon's Bay companies. The inſtitutions, policies, &c. whereof, ſee under the article Company.

By the Roman law, the ſocial contract needs no other ſolemnity, but the ſole conſent of parties, without any writing at all: but among us, articles of co-partnerſhip are required.—There is no contract wherein probity is more required than in *ſociety*; inaſmuch as the laws pronounce thoſe null, that are made contrary to equity, and with deſign to deceive.

The French diſtinguiſh three kinds of mercantile *ſociety*: *ordinary ſociety*, called alſo *collective* and *general*: *ſociety* in *commendam* or *commandity*: and *anonymous ſociety*, called alſo *momentary* and *inconnue*.

The firſt is, where ſeveral merchants act alike in the affairs of the *ſociety*, and do all under their collective names, which are public and known to every body.

Society in *commendam*, &c. is that between two perſons, one of whom only puts his money into ſtock, without doing any other office of a co-partner; the other, who is called the *complementary* of the *ſociety*, diſpatching all the buſineſs under his own name.—This *ſociety* is very uſeful to the ſtate; inaſmuch as all kinds of perſons, even nobles and men of the robe, may contract it; and thus make their money of ſervice to the public: and thoſe who have no fortune of their own to trade withal, hereby find means of eſtabliſhing themſelves in the world, and of making their induſtry and addreſs ſerviceable.

Anonymous Society, is that, where all the members are employed, each particularly, in the common intereſt, and each accountable for profits, &c. to the reſt; but without the public's being informed thereof; ſo that the ſeller has only an action againſt the particular buyer, no other name appearing.

It is alſo called *momentary*, becauſe frequently made on particular occaſions, and ceaſing with them; as in the making a purchaſe, the ſelling any commodity, &c.

Of this they diſtinguiſh four kinds: *ſociety by participation*, which

---

* Bracton thus deſcribes it: *dici poterit ſocagium a ſocco & inde tenentes* ſockmanni, *eo quod deputati ſunt, ut videtur, tantummodo ad culturam, & quorum cuſtodia & maritagia ad propinquiores parentes jure ſanguinis pertinebunt*, &c.

which is uſually formed by letters from one city to another, where a merchandiſe is to be bought or ſold.—The ſecond is, when two or three perſons go together to fairs to buy goods.—The third, when two or three perſons agree to buy up the whole of ſome commodity, in any country; to ſell it again at their own price.—And the fourth is, when three or four perſons make a journey together, to buy and ſell the ſame commodity. Beſide merchants, people of quality, *&c.* are admitted into theſe anonymous *ſocieties.*

Religious SOCIETIES, are parties of perſons formed, either to live regularly together; or to promote the intereſt of religion; or to cultivate it in themſelves.

Of the firſt kind, are all congregations of religious; particularly the Jeſuits, who are called the *ſociety* of Jeſus; though they more uſually call themſelves the *company* of Jeſus. See JESUITS.—The *ſociety* of the Sorbonne. See SORBONNE.—The *ſociety* of St. Thomas de Villeneuve, inſtituted in 1660, by F. Ange le Prouſt.—The *ſociety* of St. Joſeph, inſtituted in 1638.—The *ſociety* of Bretagne, a reform of Benedictins in 1606.—And the *ſociety* of Jeſus, a religious military order, inſtituted by Pius II.

Of the ſecond kind are, the

SOCIETY *for reformation of manners,* and putting in execution the laws againſt immorality and prophaneneſs.—It was ſet on foot above forty years ago, by five or ſix private perſons in London; but is ſince exceedingly increaſed, by numbers of members of all denominations: a particular body of the moſt conſiderable hereof, bear the expences of proſecutions, *&c.* without any contribution from the reſt: theſe chiefly apply themſelves to the proſecuting perſons for ſwearing, drunkenneſs, and prophaning the ſabbath.—Another body of about 50 perſons, apply themſelves to the ſuppreſſing lewdneſs; and by them above 500 lewd houſes have been actually ſuppreſſed.—A third body conſiſts of conſtables.—A fourth, of informers.

Beſides theſe, are eight other regular, mixed bodies of houſekeepers, and officers, who inſpect the behaviour of conſtables and other officers, aſſiſt in ſearching diſorderly houſes, *&c.* ſeizing offenders, giving information, *&c.*

There are ſeveral other *ſocieties* of this kind at Briſtol, Canterbury, Nottingham, *&c.*

SOCIETY *for propagating the goſpel in foreign parts,* was inſtituted by king William, in 1701, for ſecuring a maintenance for an orthodox clergy, and making other proviſions for the propagation of the goſpel in the plantations, colonies, factories, *&c.*—To that end, he incorporated the archbiſhops, ſeveral biſhops, and other of the nobility, gentry and clergy, to the number of 90, into a body, with privilege to purchaſe two thouſand pounds a year inheritance, and eſtates for lives or years, with other goods, to any value.

They meet yearly on the third Friday in February, to chuſe a preſident, vice-preſident, and other officers; and the third Friday in every month to tranſact buſineſs, depute fit perſons to take ſubſcriptions for the ſaid uſes; and of all monies ſo received, to give account to the lord chancellor, *&c.*—They have a ſtanding committee at the Chapter-houſe, to prepare matters for the monthly meeting, which is held at St. Martin's library.

SOCIETY *for propagating chriſtian knowledge,* was begun in 1699 by ſome perſons of worth, *&c.* Its original deſign was to propagate religion in the plantations, to ſecure the pious education of the poor at home, and to reclaim thoſe that err in the fundamentals of chriſtianity.

In the year 1701, they had procured conſiderable charities, and had tranſmitted the ſame to the plantations, in libraries, bibles, catechiſms, *&c.* with a voluntary maintenance for ſeveral miniſters, to be employed in the plantations.—But the *ſociety* for propagating the goſpel in foreign parts, being then inſtituted, they were incorporated by charter into the ſame; and thus diſcharged, as a particular *ſociety,* from the further purſuit of that branch of their original deſign; whereupon they wholly turned themſelves to the other; and are now very conſiderable, by great acceſſions from among the clergy and laity.

They meet weekly, to concert meaſures for raiſing charity for education of poor children, and ſetting up ſchools for that purpoſe; as alſo for the more regular diſpoſal of pious books and catechiſms; for inſtruction of the ignorant, erroneous, *&c.*—By the aſſiſtance of members of other religious *ſocieties,* they have procured ſubſcriptions for the education of above three thouſand children, who are placed out in ſchools about London, and taught reading, writing, pſalmody, *&c.*—They have diſperſed great numbers of books among the poor, in the fleet, army, *&c.* and have procured ſeveral to be tranſlated into Welch and other foreign languages, and diſperſed accordingly. See CHARITY *ſchool.*

Of the third kind, are divers religious *ſocieties,* properly thus called; firſt ſet on foot in London about the year 1678, by a few young men, who agreed to meet weekly, for prayer, pſalmody and ſpiritual conference.—They are now increaſed to forty diſtinct bodies, who have ſet up public prayers in many churches where it was not, procured frequent adminiſtrations of the ſacrament; and maintain lectures on that ſubject, in one church or another almoſt on every Sunday-evening.

SOCIETY *of the cord.* See the article CORD.

Royal SOCIETY. See the article ROYAL *ſociety.*

SOCINIANS, a modern ſect of antitrinitarians, who, in theſe ages, have revived ſome of the errors of Paulus Samoſatenus, Photinus and Arius; whence they are alſo occaſionally called *Arians, Photinians,* &c. though in many reſpects different from them all. See ARIAN, PHOTINIAN, ANTITRINITARIAN, *&c.*

Fauſtus *Socinus,* a gentleman of Sienna, whence they take their name, was not the firſt author of the ſect: he himſelf affirms, in his letter to Martin Vodau, wrote in 1548, that he advances no dogma but what had been publiſhed by others before him, even in Poland, ere he came to ſettle there. The truth is, he may be rather ſaid to have refined, by his ſubtilties, on the notions that already prevailed there in his time, than to have invented a new ſyſtem.

In his life, wrote by a Poliſh knight, we read, that he had not applied himſelf to the ſtudy of philoſophy and divinity, nor had ſtudied any thing but logic, till 35 years of age: but had ſpent the greateſt part of his life at the court of the great duke of Tuſcany. Upon his retiring thence, he began to think of religion; and, prepoſſeſſed as he was with the writings of his uncle Lælius Socinus, he formed a ſyſtem thereon.—Lælius had explained the firſt words in the goſpel of St. John, *in principio erat ſermo;* by theſe, *in principio evangeli erat ſermo;* as if the beginning, there ſpoke of, were only the beginning of the goſpel.

This interpretation, never heard of in all antiquity, is followed by Fauſtus, in his comment on the fourteen firſt verſes of that goſpel.—He adds, that he who is called *Word,* had not been from all eternity, nor even before the creation of the world; but that by Word, muſt be meant the man Jeſus Chriſt, God born of the virgin, under the emperor Auguſtus. But this is a paradox, which all his followers do not equally come into.—However, they all deny, not only the divinity of Jeſus Chriſt, but the exiſtence of the Holy Ghoſt, the myſtery of the incarnation, original ſin, and grace.

Their ſentiments are explained at large, in their catechiſm, printed ſeveral times, under the title of *Catecheſis eccleſiarum Polonicarum, unum Deum patrem illiuſque filium unigenitum, una cum ſancto ſpiritu ex ſacra ſcriptura confitentium.* See UNITARIAN.

The *Socinians* are divided on ſeveral articles: ſome of them leave Socinus, as to what regards the worſhip offered to Jeſus Chriſt; not being able to conceive how divine worſhip ſhould be given a mere man.

The hereſy of the *Socinians* ſpread exceedingly in Poland, Lithuania, Tranſilvania, and the neighbouring places. Racow was their chief ſchool; and there all their firſt books were publiſhed.—But they were exterminated out of Poland in 1655: ſince which time they have chiefly ſheltered in Holland; where, however, their public meetings have been prohibited: but they find means to conceal themſelves under the names of Arminians and Anabaptiſts. See ARMINIAN, ANABAPTIST, *&c.*

SOCK. See the article SOCCUS.

SOCKET.—Ball and *ſocket.* See the article BALL.

SOCLE*, or ZOCLE, in architecture, a flat, ſquare member under the baſes of pedeſtals, of ſtatues, vaſes, *&c.* which it ſerves as a foot, or ſtand. See PEDESTAL, STATUE, ZOCLE, *&c.*

* The word is French, formed from the Italian *zoccolo,* or the Latin *ſoccus,* the ſhoe of the ancient comic actors.—Vitruvius calls it *quadra;* we frequently *plinth.* See PLINTH.

Continued SOCLE, is a kind of continued ſtand, or pedeſtal, without either baſe, or cornice, ranging round the whole building; called by Vitruvius, *ſtereobata,* and the French, *ſoubaſſement.* See STEREOBATA.

SOCOME, in our law-books, *&c.* a cuſtom of grinding corn at the lord's mill. See MILL.

There is *bond ſocome,* where the tenants are bound to it; and *love ſocome,* where they do it freely, out of affection to the lord. See MOLTA.

SOCRATIC *philoſophy,* the doctrines and opinions, with regard to morality and religion, maintained, and taught by Socrates. See PHILOSOPHY and PHILOSOPHER.

By the character of Socrates, left us by the ancients, partilarly his ſcholar Plato, Laertius, *&c.* he appears to have been one of the beſt, and the wiſeſt perſons in all the heathen world.—To him is aſcribed the firſt introducing of moral philoſophy; which is what is meant by that popular ſaying, *Socrates firſt called philoſophy down from heaven to earth;* that is, from the contemplation of the heavens and heavenly bodies, he led men to conſider themſelves, their own paſſions, opinions, faculties, duties, actions, *&c.* See MORALITY, ETHICKS, *&c.*

While young, he was exceedingly fond of natural knowledge, as he witneſſes of himſelf in Plato: but in his older age, he caſt aſide this part of philoſophy as obſcure, uncertain, impracticable, and even uſeleſs and impertinent; and applied himſelf wholly to moral or active philoſophy.

It was he, firſt, who when all the other philoſophers boaſted they knew all things, owned, ingenuouſly, he knew nothing, but this, that he knew nothing. Which Pyrrho, the father of the ſceptic philoſophy, improved on, when he ſaid he knew nothing; not even this, that he knew nothing. Yet in an anſwer of the oracle, it was pronounced; Ανδρων απαντων Σωκρατης σοφωτατος. That Socrates was the wiſeſt of all men. See PYRRHONIAN, ACADEMY, and SCEPTIC.

He was accuſed by Anytus, Melitus and Lycon, three perſons, whoſe hatred he had incurred, by his ſevere declamations againſt the poets, of which number two of the firſt were, and the third an actor. His accuſation was, that he corrupted the Athenian youth, and broached new ſuperſtitions. He was condemned to drink cicuta, by 281 votes, as we are told by Quintilian.

After his death, his fellow-citizens repented to that degree, that the gymnaſia, courts of Juſtice, *&c.* were all ſhut up; Melitus put to death, Anytus baniſhed, and a ſtatue erected to Socrates.

He wrote nothing himſelf; yet almoſt all the Grecian ſects of philoſophers refer their origin to his diſcipline; particularly the Platoniſts, Peripateticks, Academicks, Cyrenaicks, Stoicks, *&c.*—But the greateſt part of his philoſophy, we have in the works of Plato. See PLATONISM; ſee alſo ACADEMIC, PERIPATETIC, STOIC, *&c.*

SODALES *Auguſtales.* See the article AUGUSTALES.

SODDER, or SODER, } See the articles { SOLDER.
SODDERING, } { SOLDERING.

SODOMY, the unnatural crime of buggery; thus called from the city of *Sodom*, which was deſtroyed by fire for the ſame. See BUGGERY.

The Levitical laws adjudged thoſe guilty of this execrable evil to death, Lev. xviii. 22, 23. xx. 15, 16; and the civil law aſſigns the ſame puniſhment. Our laws alſo make it felony.

SOFA, in the eaſt, a kind of alcove, raiſed half a foot above the floor of a chamber, or other apartment; and eſteemed the place of ſtate, where viſitors of diſtinction are received.

Among the Turks, the whole floor of their ſtate-rooms is covered with a kind of tapeſtry, and on the window-ſide is raiſed a *ſofa* or *ſopha*, laid with a kind of matraſs, covered with a carpet much richer than the other.—On this carpet the Turks are ſeated, both men and women, like the taylors in England, croſs-legged, leaning againſt the wall which is bolſtered with velvet, ſattin, or other ſtuff, ſuitable to the ſeaſon. Here they eat their meals; only laying a ſkin over the carpet, to ſerve as a table-cloath, and a round wooden board over all, covered with plates, *&c.*

The ambaſſadors of France ſtood out a long while, and refuſed to viſit the grand vizier, unleſs he would receive them on the *ſofa*: at length he granted them the *ſofa*.

SOFEE. See the article SOPHI.

SOFFITA *, SOFFIT, or SOFIT, in architecture, any timber cieling, formed of croſs beams, or flying cornices; the ſquare compartiments, or pannels whereof are inriched with ſculpture, painting, or gilding.

* The word is Italian, and ſignifies the ſame with the Latin, *lacunar* and *laquear*; with this difference, that *lacunar* is uſed for any cieling with ſquare, hollow pannels, called *lacus*; and *laquear* for compartiments interlaced with platbands, after the manner of knots or *laquei*.

Such are thoſe we ſee in the baſilics and palaces of Italy, in the apartments at Luxembourg, at Paris, *&c.*—See *Tab. Archit. fig.* 10. See alſo CIELING.

SOFFITA, or SOFFIT, is alſo uſed for the under ſide or face of an architrave; and more particularly for that of the corona or larmier, which the ancients called *lacunar*, the French *plafond*, and we uſually, *drip*. See PLAFOND, LARMIER, *&c.*

It is inriched with compartiments of roſes; and in the Doric order has 18 drops, diſpoſed in three ranks, ſix in each, placed to the right of the guttæ, at the bottom of the triglyphs. See GUTTÆ, DORIC, ARCHITRAVE, *&c.*

SOFI, or SOPHI. See the article SOPHI.

SOFIT. See the article SOFFIT.

SOFT *pulſe*, } See the articles { PULSE.
SOFT *roe*, } { ROE.
SOFT *ſoap*, } { SOAP.

SOFTENING, in painting, the mixing and diluting of colours with the bruſh, or pencil. See COLOUR.

To *ſoften* deſigns in black and white, made with the pen, *&c.* ſignifies to weaken the teint.

To *ſoften* a portrait, according to Felibien, is to change ſome of the ſtroaks, and give a greater degree of ſweetneſs and *ſoftneſs* to the air thereof, which before had ſomething rough and harſh in it.

SOIL, SOLUM, in agriculture and gardening, denotes earth, or ground, conſidered with regard to the quality of its mould, for the production and growth of vegetables. See EARTH, MOULD, VEGETABLE, *&c.*

Mr. Bradley reduces all *ſoils* to three heads, or kinds, *viz. ſand*, *loam*, or *mother-earth*, and *clay*.

Gravels and all the open *ſoils*, till we come at loam, are of the ſandy race; and the binding earths, from loam down to the ſtiffneſs of chalk, may be ranged under the clay kind. See SAND and CLAY.

Loam or mother-earth, is the medium between the two, and includes all the intermediate kinds. See LOAM.

Each of theſe *ſoils* tends alike to vegetation; and each has its ſalts proper thereto; but in different proportions; a peck of clay having twice as much ſalts in it as the ſame quantity of loam; and four times as much ſand.

Now, it is found to be the ſalts or juices of the *ſoil*, not the earth itſelf, that plants are fed and ſubſiſted by. For in many experiments of vegetation, where plants of fifteen or twenty pound weight have been produced, there has been no ſenſible diminution in the weight of the earth. See VEGETATION.

Hence, at firſt ſight, it might ſeem, that clay were the moſt proper, and ſand the lead proper *ſoil* to promote the growth of plants; which is contrary to experience. The reaſon is, that the parts of clay being cloſe wrought together, do not ſo eaſily give out their ſalts; nor can the tender fibres of many plants make their way through it, in ſearch of their food. But if its parts be well opened, by digging and breaking it into very ſmall pieces, and thoſe parts be kept open by a mixture of ſome ſharp ſand, or other like matter, that author adds, we ſhall ſee the effects of its vigour. Sand, on the other hand, giving its ſalts readily, puts forth its plants very early, and will make them germinate a full month ſooner than clay; but as it is haſty, it is ſoon ſpent. The ſun's warmth calls up all its ſalts early in the ſpring, and there is but little left for them to ſubſiſt long on, if the heat continue.

Each kind has its peculiar plants, which will not grow in the other; but the peculiar plants of both the other two will grow in loam, as partaking equally of the qualities of both. Loam, then, muſt be allowed the beſt and moſt beneficial *ſoil*, where it can be had: and where it cannot, if, by a mixture of other earths, we can make a compoſt to reſemble it; we have more to expect from it, eſpecially in plantations of durable trees, than from a compoſition of dung or other forcing ingredients, which, like exceſs of high, intemperate foods and liquors, though they give a haſty growth, yet make the thing ſhort-lived. The compoſition or *ſoil* here meant, is equal quantities of ſand and clay well mixed. See COMPOST; ſee alſo HOT-BED.

Generally, a mixture of two or three *ſoils*, is better than any ſimple *ſoil*; eſpecially where the hot and dry are mixed with the cold and moiſt. Clay laid on ſand or gravel, or ſand on clay, is the better manure. See MANURING.

But it is not the nature of the *ſoil* alone; but its depth is alſo to be regarded, and what *ſoil* is underneath. For the beſt *ſoil*, if it be not above a foot deep, and lie on a ſtiff clay, or hard cold ſtone, is not ſo fertile as a leaner *ſoil* of greater depth, or lying on a warm lime-ſtone, ſand or gravel, through which the ſuperfluous moiſture may deſcend, and not ſtagnate on the clay or ſtone, to chill the roots of plants. Indeed, regard is to be had to the climate; for even in England, cold, moiſt clays are more fruitful in the ſouth than the north.

Some general rules with reſpect to *ſoils*, are as follow.

1°. All land that moulders to duſt with froſt, with all ſorts of warm lands, black mould, yellow clay, (if not too wet) and that turns black after rain, are good for corn.

2°. Lands bringing forth large trees and weeds, black-thorn, thiſtles, rank graſs, *&c.* generally prove fruitful.

3°. Straw-berries, betony, thyme, *&c.* give indication to wood, and camomile to a mould diſpoſed for corn.

4°. All land that binds after froſt and rain, and turns white and full of worms, that is extreamly moiſt, bears holly, yew, box, broom, heath, moſs, *&c.* is of a cold temperature.

5°. Black, dun and yellow ſand, and hot, ſtony gravel, are generally unfruitful. See GARDEN, ORCHARD, *&c.*

SOIT *fait comme il eſt deſiré*, be it done as it is deſired: a form uſed when the king gives the royal aſſent to a private bill preferred in parliament. See ASSENT and PARLIAMENT.

SOK, SOKE, SOC, in ancient cuſtoms. See SOC.

The word is ſometimes alſo uſed for the privilege of tenants excuſed from cuſtomary impoſitions.

Alſo, for a quit-rent, or payment made to the lord by his tenant, for acting in quality of *ſoc-man* or freeholder. See SOCAGE.

The rent-gatherer in the *ſok*, or *ſoken*, was called *ſoke-reeve*. See REEVE.

SOL, in muſic, the fifth note of the gammut: ut, re, mi, fa, *ſol*, la. See NOTE, GAMMUT and MUSIC.

SOL *, or SOU, *ſhilling*, a French coin, of billon, *i. e.* copper with a little ſilver mixed; equal to twelve deniers, or French pence; and the 20th part of the livre, or pound. See SHILLING; ſee alſo DENIER and LIVRE.

* The word is formed from the Latin, *ſolidus*, ſhilling. Bodin is miſtaken, when he derives it *à ſole*, by reaſon of the ſun ſtruck on it.

The French *ſol* is now worth upwards of an Engliſh halfpenny, or the 23d part of an Engliſh ſhilling. See COIN, PENNY, *&c.*

The *ſol* was firſt ſtruck on the foot of 12 deniers tournois, whence it was alſo called *douzain*, a name it ſtill retains, though its ancient value be changed; the *ſol* having been ſince augmented by three deniers, and ſtruck with a punchion of a flower de lys, to make it current for 15 deniers. —Soon after, the old *ſols* were coined over again, and both old and new indifferently made current for 15 deniers.—In 1709, the value of the ſame *ſols* was raiſed to 18 deniers. —Towards the latter end of the reign of Louis XIV. the *ſols* of 18 deniers were again lowered to 15, where they now ſtand.

The Dutch have alſo two kinds of *ſols*: the one of ſilver, called *ſols de gros*, and likewiſe *ſchelling*: the other of copper, called alſo *ſtuyver*.

In old authors we read of gold *ſols*, which were different at different times. In the time of the Salic law, the gold *ſol* was forty deniers; and thus it continued till the time of king Pepin, when it was reduced to twelve.—Some have alſo imagined, that the French had anciently ſilver *ſols*.

Sol, in aſtrology, &c. ſignifies the ſun.—*Sol* in aries, &c. See Sun.

Sol, *ſun*, in chymiſtry, is gold; thus called from an opinion, that this metal is, in a particular manner, under the influence of that luminary. See Gold.

What ſhould have been the principal inducement of torturing this metal, with ſo much violence, to obtain from it ſome medicinal virtues, Dr. Quincy obſerves, is not eaſy to be gueſſed; unleſs it was to keep up the authority of an ill-deſerved regard, and a Jealouſy that they could not be well in the common opinion for phyſicians, who could not do extraordinary things in their profeſſion with a metal, which had ſuch a prodigious influence on other accounts. Many, indeed, there have been, who have honeſtly oppoſed this artifice; but the contrary ſide has a long time prevailed, and to ſuch a degree, that this metal itſelf has not only been transformed into all the ſhapes imaginable for medicinal purpoſes; but even its name has been transferred to do honour to, and enhance the price of many other worthleſs preparations, that bore any reſemblance to its ſenſible qualities.

Hence many tinctures of a yellow colour, are preſently the golden tincture of ſomething or other.

Moſt, indeed, acknowledge, that gold in ſubſtance, or reduced into the ſmalleſt particles by the hammer, as in the leaf-gold, is not digeſtible in the ſtomach, ſo as to be tranſmitted into the blood, and be of any efficacy there. But there are nevertheleſs, many, who are confident of its doing extraordinary matters, if reduced into a powder, by amalgamation with mercury, and by evaporating the mercury afterwards.

Zacutus Luſitanus, is one of the ſmarteſt pleaders on this ſide the controverſy, againſt Muſa, Picus Mirandola and Platerus; who, beſides many inſtances of its efficacy, urges the authority of Avicen, Serapion, Geber, and many of the Arabian phyſicians, with thoſe of other countries, and of later date. Quercetan, Schroder, Zwelfer and Etmuller, with many other more modern, practical phyſicians, fell into the ſame opinion. But which ſide ſoever is in the right, the preſent practice rejects all pretenſions to medicine from it.

Sol, in the hermetical philoſophy ſignifies *ſulphur*. See Sulphur.

Sol, in heraldry, denotes *or*; the golden colour in the arms of ſovereign princes. See Or and Metal.

SOLAR, ſomething belonging to the ſun. See Sun.

Thus we ſay, Solar *fire*, in contradiſtinction to *culinary fire*. See Fire.

Solar *civil month*,	See the articles	Month.
Solar *cycle*,		Cycle.

Solar *eclipſe*, is a privation of the light of the ſun, by the interpoſition of the opake body of the moon. See Eclipse.

Solar *month*,	See the articles	Month.
Solar *riſing*,		Rising.
Solar *ſpots*,		Spots.

Solar *ſyſtem*, the order and diſpoſition of the ſeveral heavenly bodies, which revolve round the ſun as the centre of their motion, *viz.* the planets, primary and ſecundary, and the comets.—For a ſcheme of the *ſolar ſyſtem*, ſee System.

The Solar *year*, conſiſts of 365 days, 5 hours, 49 minutes; in oppoſition to the *lunar year*, which only conſiſts of 354 days. See Year.

The *ſolar year*, is either *tropical*, or *ſiderial*.

Solar *tropical year*, is the ſpace of time, wherein the ſun returns again to the ſame equinoctial or ſolſtitial point: which is always equal to 365 days, 5 hours, and about 49 minutes.

Solar *ſiderial year*, is the ſpace wherein the ſun comes back to any particular, fixed ſtar; which is about 365 days, 8 hours, and 9 minutes. See Siderial, &c.

SOLDAN. See the article Sultan.

SOLDER*, Sodder, or Soder, a metallic or mineral compoſition, uſed in *ſoldering* or joining together other metals. See Soldering.

* The word is formed from the *French*, *ſoudure*, of the Latin, *ſolidare*, to ſtrengthen.

Solders are made of gold, ſilver, copper, tin, biſmuth, and lead; always obſerving, that in the compoſition, there be ſome of the metal to be *ſoldered*, mixed with ſome higher and finer metals.

Goldſmiths uſually make four kinds of *ſolder*, viz. *ſolder* of eight; where, to ſeven parts of ſilver there is one of braſs or copper. *Solder* of ſix, where only a ſixth part is copper. *Solder* of four: and *ſolder* of three.—It is the mixture of copper in the *ſolder* that makes raiſed plate always come cheaper than flat.

The *ſolder* uſed by plumbers, is made of two pounds of lead to one of block-tin. Its goodneſs is tried by melting it, and pouring the bigneſs of a crown-piece on a table; for, if good, there will ariſe little, bright, ſhining ſtars therein. See Plumbery.

The *ſolder* for copper is made like that of the plumbers; only, with copper and tin: for very nice works, inſtead of tin, they ſometimes uſe a quantity of ſilver. See Copper.

Solder for tin, is made of two thirds of tin, and one of lead; but where the work is any thing delicate, as in organ-pipes, where the juncture is ſcarce diſcernible, it is made of one part of tin glaſs, and three parts of pewter. See Tin.

The duke of Florence's nail, anciently ſo much admired, as being half iron and half gold, when as thoſe two metals were deemed irreconcileable; was joined by a kind of *ſolder*, made by Turneiſſer, an ingenious chymiſt of Venice: the ſecret whereof, was never diſcovered till publiſhed by Tachenius. The *ſolder* is nothing but a little copper or cyprus vitriol put between the gold and the iron. For, naturally, the great acidity of the gold, reduces the iron into a ſcoria or ruſt, when the two are applied immediately over one another; but this inconvenience is removed, by the interpoſition of a little copper, be it in the ſmalleſt quantity imaginable.

SOLDERING, or Soddering, among mechanicks, the joining and faſtening together of two pieces of the ſame metal, or of two different metals, by the fuſion and application of ſome metallic compoſition on the extremities of the metals to be joined. See Solder.

Goldſmiths *ſolder* with gold, ſilver and braſs or copper mixed together: plumbers with lead and tin. See Plumbery, &c. Copper is uſually *ſoldered* with tin; ſometimes, according to the work, with a mixture of copper and ſilver.—In the *ſoldering* of all theſe metals, they generally uſe borax in powder, and ſometimes roſin.

As to iron, it is ſufficient that it be heated red-hot; and the two extremities, in this ſtate, hammered together.—By this means they become incorporated together. See Brazing.

SOLDIER*, a military man, liſted to ſerve a prince or ſtate, in conſideration of a certain daily pay. See Military.

* The word is formed from the Italian, *ſoldato*, and that from the Latin, *ſolida*, or *ſolidata*, of *ſolidus*, the ſolde, or pay: though Paſquier chuſes to derive it from the old Gauliſh *ſouldoyer*, a *ſoldier*; and Nicod from *ſoldurius*. See Soldurii.

The *ſoldier* is he who takes pay; the vaſſal he who is obliged to ſerve at his own expences; the volunteer he who ſerves at his own expence, and of his own accord. See Vassal, Cadet, &c.

Du Cange obſerves, that the ancient *ſoldiers* were not to be ſhort of five foot and a half; and that this meaſure was called *incoma*, or *incomma*.

Band of Soldiers. See the article Band.

SOLDURII, in antiquity, a kind of military clients, or retainers to the great men in Gaul, particularly Aquitania; mentioned by Cæſar. See Soldier.

The *ſoldurii* were people, who ſhared all the good and ill fortune of their patrons; to whom, if any diſaſter happened, they either underwent the very ſame, or killed themſelves: and Cæſar aſſures us, that no one had ever been known to refuſe the alternative, *Lib.* III. *de Bel. Gal.*

Vegenere takes them to have been more than common ſoldiers; and even Gentlemen in penſion, or appointment.—Athenæus calls them συναποθνησκοντες, *q. d.* dying together, or with their maſters.

SOLECISM*, Soloecismus, in grammar, a groſs impropriety in ſpeech, contrary to the uſe of language, and the rules of grammar, either in reſpect of declenſion, conjugation, or ſyntax.

* The word is Greek, σολοικισμος, derived from the *Soli*, a people of Attica, who being tranſplanted to Cilicia, loſt the purity of their ancient tongue, and became ridiculous to the Athenians for their improprieties therein.

An actor on the Roman theatre having made a wrong geſture, the audience immediately cried out, he had committed a *ſoleciſm* with his hand. Ablanc.

Soleciſms, on ſome occaſions, are pardonable: *impetratum eſt a ratione ut peccare ſuavitatis cauſa liceret*: Vaugelas is frequently repeating that of Quintilian; *aliud eſt Latine, aliud grammaticè loqui.*—Balthaſar Stolberg has a Latin treatiſe of the *ſoleciſms* and barbariſms falſely attributed to the New Teſtament. See Barbarism.

SOLEIL.—*Ombre de* Soleil. See the article Ombre.

SOLEMN, Solennis, ſomething performed with much pomp, ceremony and expence.—Thus we ſay, *ſolemn feaſts*, *ſolemn funerals*, *ſolemn games*, &c. See Feast, Game, Funeral, &c.

SOLEMN, in law, ſignifies ſomething authentic, or that is cloathed in all its formalities. See AUTHENTIC.

SOLEMN *teſtament*, in the civil law, is to be atteſted by ſeven perſons, and ſealed with their ſeals. See TESTAMENT.

SOLEMN *marriage*, is that performed in one's own pariſh-church, after publication of the bans, and in preſence of witneſſes. See MARRIAGE.

SOLEMN *acceptance*. See the article ACCEPTANCE.

SOLE-TENANT, in law, he or ſhe, who holds lands only in his or her own right, without any other perſon joined. See TENANT.

E. gr. If a man and his wife hold land for their lives, the remainder to their ſon; here, the man dying, the lord ſhall not have heriot, becauſe he dies not *ſole-tenant*.

SOLEUS, in anatomy, a muſcle called alſo *gaſtrocnemius internus*.—See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 67. *fig.* 2. *n.* 49. *fig.* 6. *n.* 42. See alſo GASTROCNEMIUS.

SOL-FA-ING, in muſick, the naming and pronouncing of the ſeveral notes of a ſong, by the ſyllables *ſol*, *fa*, *la*, &c. in learning to ſing it. See NOTE and MUSICK.

Of the ſeven notes in the ſcale, *ut*, *re*, *mi*, *fa*, *ſol*, *la*, *ſi*; only four are in uſe among us, *viz.* *fa*, *ſol*, *la*, *mi*. Their office is principally in ſinging; that by applying them to every note of the ſcale, it may not only be pronounced more eaſily; but chiefly, that by them, the tones and ſemitones of the natural ſcale, may be better marked out and diſtinguiſhed. See SCALE and GAMMUT.

This deſign is obtained by the four ſyllables, *fa*, *ſol*, *la*, *mi*; thus, from *fa* to *ſol* is a tone; alſo from *ſol* to *la*, and from *la* to *mi*, without diſtinguiſhing the greater or leſſer tone; but from *la* to *fa*, alſo from *mi* to *fa*, is a ſemi-tone.

If, then, theſe be applied in this order, *fa*, *ſol*, *la*, *fa*, *ſol*, *la*, *mi*, *fa*, &c. they expreſs the natural ſeries from *c*; and if that be to be repeated to a ſecond or third octave, we ſee by them how to expreſs all the different orders of tones and ſemi-tones in the diatonic ſcale; and ſtill above *mi*, will ſtand *fa*, *ſol*, *la*; and below it, the ſame reverſed, *la*, *ſol*, *fa*; and one *mi* is always diſtant from another by an octave; which cannot be ſaid of any of the reſt, becauſe after *mi* aſcending, comes always *fa*, *ſol*, *la*, *fa*, which are repeated invertedly, deſcending.

To conceive the uſe of this: it is to be remembered, that the firſt thing in teaching to ſing, is to make one raiſe a ſcale of notes by tones and ſemi-tones to an octave, and deſcend again by the ſame notes, and then to riſe and fall by greater intervals, at a leap, as a third, fourth, fifth, &c. And to do all this, by beginning at notes of different pitch.—Then, theſe notes are repreſented by lines and ſpaces, to which thoſe ſyllables are applied, and the learner taught to name each line and ſpace, by its reſpective ſyllable; which makes what we call *ſol-fa-ing*; the uſe whereof is, that while they are learning to tune the degrees and intervals of ſound, expreſſed by notes ſet on lines and ſpaces; or learning a ſong, to which no Words are applied; they may do it the better, by means of an articulate ſound: but, chiefly, that by knowing the degrees and intervals expreſſed by theſe ſyllables, they may more readily know the true diſtance of notes. See SINGING.

Mr. Malcolm obſerves, that the practice of *ſol-fa-ing*, common as it is, is very uſeleſs and inſignificant, either as to the underſtanding or practiſing of muſic; yet exceedingly perplexing: the various applications of the ſeveral names, according to the various ſignatures of the clef, are enough to perplex any learner: there being no leſs than 72 different ways of applying the names *ſol*, *fa*, &c. to the lines and ſpaces of a particular ſyſtem. See SCALE.

SOLID, in phyſicks, a body whoſe minute parts are connected together, ſo, as not to give way, or ſlip from each other upon the ſmalleſt impreſſion. See SOLIDITY.

The word is uſed in this ſenſe, in contradiſtinction to *fluid*. See FLUID, FLUIDITY, and FIRMNESS.

Atmoſphere of SOLID *bodies*. See ATMOSPHERE.

For the laws of gravitation of SOLIDS immerged in fluids ſpecifically either lighter or heavier than the *ſolids*; ſee GRAVITY and FLUID.

To find the ſpecific gravity of SOLIDS, and its ratio to that of fluids; ſee SPECIFIC *gravity*.

For the laws of the reſiſtance of SOLIDS moving in fluids; ſee RESISTANCE.

SOLID, in geometry, is a magnitude endued with three dimenſions; or extended in length, breadth and depth. See DIMENSION.

Hence, as all bodies have theſe three dimenſions, and nothing but bodies; *ſolid* and body are frequently uſed indiſcriminately. See BODY.

A *ſolid* is terminated, or contained under one or more planes or ſurfaces; as a ſurface is under one or more lines. See SURFACE and LINE.

From the circumſtances of the terminating lines, *ſolids* become divided into *regular* and *irregular*.

Regular SOLIDS, are thoſe terminated by regular and equal planes. See REGULAR.

Under this claſs comes the tetraëdron, hexaëdron or cube, octaëdron, dodecaëdron and icoſiëdron. See TETRAEDRON, CUBE, &c.

Irregular SOLIDS, are all ſuch as do not come under the definition of regular ones.—Such are the ſphere, cylinder, cone, parallelogram, priſm, pyramid, parallelepiped, &c. See SPHERE, CYLINDER, CONE, &c.

The geneſes, properties, ratios, conſtructions, dimenſions, &c. of the ſeveral *ſolids*, regular and irregular, ſpherical, elliptical, conical, &c. ſee under each reſpective article.

Meaſure of a SOLID. See the article MEASURE.

Cubature, or *cubing of a* SOLID, is the meaſuring of the Space comprehended under a *ſolid*, i. e. the ſolidity or *ſolid* content thereof. See CUBATURE and SOLIDITY.

SOLID *of the leaſt reſiſtance*. See RESISTANCE.

SOLID *angle*, is that formed by three or more plain angles meeting in a point. See ANGLE.—Or more ſtrictly, a *ſolid angle*, as B, (*Tab. Geometry*, *fig.* 30.) is the inclination of more than two lines, A B, B C, B F, which concur in the ſame point B, and are in different planes.

Hence, for *ſolid angles* to be equal, it is neceſſary they be contained under an equal number of equal planes, diſpoſed in the ſame manner.

And as *ſolid angles* are only diſtinguiſhable by the planes under which they are contained; and as planes thus equal, are only diſtinguiſhable by compreſence, they are ſimilar; and conſequently ſimilar *ſolid* angles are equal, and *vice verſa*. See SIMILAR.

The ſum of all the plain angles conſtituting a *ſolid angle*, is always leſs than 360°; otherwiſe they would conſtitute the plane of a circle, and not a *ſolid*. See ANGLE.

Like SOLID *figures*. See the article LIKE.

SOLID *baſtion*, } See the articles { BASTION.
SOLID *place*, } { LOCUS.

SOLID *foot*. See the article FOOT.

SOLID *numbers*, are thoſe which ariſe from the multiplication of a plain number, by any other whatſoever.

Thus 18 is a *ſolid number* made of 6 (which is plain) multiplied by 3; or of 9 muliplied by 2. See NUMBER and SIMILAR.

SOLID *problem*, in mathematicks, is one which cannot be geometrically ſolved, but by the interſection of a circle, and a conic ſection; or by the interſection of two other conic ſections, beſides the circle.

Thus, to deſcribe an iſoſceles triangle on a given right line, whoſe angle at the baſe, ſhall be triple to that at the vertex; is a *ſolid problem*, reſolved by the interſection of a parabola and a circle. See PROBLEM.

SOLID *theorem*. See the article THEOREM.

SOLID *phoſphorus*, } See the articles { PHOSPHORUS.
SOLID *ſulphur*, } { SULPHUR.

SOLIDITY, in phyſicks, a property of matter or body, whereby it excludes every other body from the place itſelf poſſeſſes. See SOLID.

Solidity is a property common to all bodies, whether ſolid, or fluid. See MATTER.—It is uſually called *impenetrability*; but *ſolidity* expreſſes it beſt; as carrying ſomewhat more of poſitive with it than the other, which is a negative idea. See IMPENETRABILITY.

The idea of *ſolidity*, Mr. Locke obſerves, ariſes from the reſiſtance we find one body make to the entrance of another into its own place.—*Solidity*, he adds, ſeems the moſt extenſive property of body; as being that whereby we conceive it to fill ſpace: it is diſtinguiſhed from mere *ſpace*, by this latter not being capable of reſiſtance or motion. See SPACE. It is diſtinguiſhed from *hardneſs*, which is only a firm coheſion of the ſolid parts, ſo as they may not eaſily change their ſituation. See HARDNESS.

The difficulty of changing ſituation, gives no more *ſolidity* to the hardeſt body than the ſofteſt; nor is a diamond a jot more ſolid than water.—By this we diſtinguiſh the idea of the extenſion of body, from that of the extenſion of ſpace: that of body, is the continuity or coheſion of ſolid, ſeparable, moveable parts; that of ſpace, the continuity of unſolid, inſeparable, immoveable parts. See EXTENSION.

The Carteſians however, will, by all means, deduce *ſolidity*, or, as they call it, *impenetrability*, from the nature of extenſion; and contend, that the idea of the former, is contained in that of the latter; and hence argue againſt a vacuum.—Thus, ſay they, one cubic foot of extenſion cannot be added to another, without having two cubic feet of extenſion; for each has in itſelf, all that is required to conſtitute that magnitude. And hence they conclude, that every part of ſpace is ſolid, or impenetrable; inaſmuch as of its own nature it excludes all others. But the concluſion is falſe, and the inſtance they give follows from this, that the parts of ſpace are immoveable; not from their being impenetrable or ſolid. See VACUUM, PLENUM, &c.

SOLIDITY, in geometry, the quantity of ſpace contained in a ſolid body; called alſo the *ſolid content*, and the cube thereof. See CUBATURE.

The *ſolidity* of a cube, priſm, cylinder, or parallelepiped, is had by multiplying its baſis into its height. See CUBE, PRISM, CYLINDER, &c.

The *ſolidity* of a pyramid or cone, is had by multiplying either the whole baſe into a third part of the height; or the whole height into a third part of the baſe. See Pyramid and Cone.

To find the Solidity *of any irregular body.*—Put the body in a hollow parallelepiped, and pour water or ſand upon it, and note the height of the water or ſand A B (*Tab. Geometry, fig.* 32.) then, taking out the body, obſerve at what height the water (or ſand when levelled) ſtands, as A C. Subtract A C from A B; the remainder will be B C. Thus is the irregular body reduced to a parallelepiped, whoſe baſe is F C G E; and altitude B C. To find the *ſolidity* whereof, ſee Parallelepiped.

Suppoſe, *e. gr.* A B to be 8, and A C, 5; then will B C be 3: ſuppoſe again, D B, 12, D E, 4; then will the *ſolidity* of the irregular body be found 144.

If the body be ſuch, as that it cannot be well laid in ſuch a kind of channel; *e. gr.* if it be required to meaſure the *ſolidity* of a ſtatue, as it ſtands; a quadrangular priſm or parallelepiped is to framed over it: the reſt as before.

To find the Solidity *of a hollow body.*—If the body be not comprized in the number of regular bodies; its *ſolidity* is found as in the preceding problem. If it be a parallelepiped, priſm, cylinder, ſphere, pyramid or cone; the *ſolidity*, firſt of the whole body, including the cavity, then that of the cavity, which is ſuppoſed to have the ſame figure with the body itſelf, is to be found, according to the reſpective methods delivered under Parallelepiped, Prism, *&c.*—For the latter being ſubtracted out of the former, the remainder is the *ſolidity* of the hollow body required.

Solidity, in architecture, is applied both to the conſiſtence of the ground whereon the foundation of a building is laid; and to a maſſive of maſonary, of extraordinary thickneſs, without any cavity within.—The *ſolidity* of the Egyptian pyramids is inconceivable. See Pyramid.

SOLIDS, in anatomy, *&c.* denote all the continuous, and continent parts of the body; thus called, in oppoſition to the *fluids* or parts contained therein. See Body, Part and Fluid.

Of the *ſolid* kind, are the bones, cartilages, ligaments, membranes, fibres, muſcles, tendons, arteries, veins, nerves, glands, lymphæducts and lacteals. See Bone, Cartilage, Ligament, *&c.*

Notwithſtanding the great number and appearance of the *ſolids* of the body; we find from the microſcope, injections, veſicatories, atrophies, *&c.* that the *ſolid* parts are exceedingly ſmall and inconſiderable, in compariſon of the fluids. Nay, it is almoſt demonſtrable, from a conſideration of the riſe and generation of the veſſels, and the reſolution of the greateſt veſſels into their ſmalleſt conſtituent ones, that the whole maſs of *ſolids* in the body, conſiſts merely of fibres, as their common elements. See Fibre and Stamina.

In effect, the whole maſs of *ſolids* as well as fluids, a minute ſtamen or animalcule only excepted, aroſe from a very ſubtile fluid colliquament, not unlike the nervous juice; as is ſhewn by Malpighi, in his treatiſe *de Ovo Incubato.* See Egg.

The white of the egg never nouriſhes, till, from its natural thickneſs, it have been brought, by incubation, through innumerable degrees of fluidity, to become ſubtile enough to enter the minute veſicles of the ſtamen or ſeed. The firſt, ſoft, tender *ſolids* ariſing from this ſubtile humour paſs through infinite, intermediate degrees, ere they arrive at their utmoſt *ſolidity.* See Generation.

All the *ſolids*, therefore, in our bodies (unleſs any one will be ſo nice as to except the firſt ſtamen) only differ from the fluids, out of which they ariſe, by their reſt, coheſion and figure; and a fluid particle will become fit to form a part of a *ſolid*, as ſoon as there is a force ſufficient to effect its coheſion with the other *ſolid* parts. See Nutrition.

SOLIDUS. See the article Aureus.

SOLILOQUY, Soliloquium, a reaſoning or diſcourſe, which a man holds with himſelf. See Monologue.

Papias ſays, that *ſoliloquy* is properly a diſcourſe by way of anſwer to a queſtion that a man has propoſed to himſelf.

Soliloquies are become very common things on the modern ſtage; yet can nothing be more inartificial or more unnatural, than an actor's making long ſpeeches to himſelf, to convey his intentions, *&c.* to the audience.

Where ſuch diſcoveries are neceſſary to be made, the Poet ſhould rather take care to give the dramatic perſons ſuch confidants, as may neceſſarily ſhare their inmoſt thoughts; by which means, they will be more naturally conveyed to the audience.—Yet is even this a ſhift, an accurate poet would not be found to have occaſion for.

The uſe and abuſe of *ſoliloquies*, is well delivered by the duke of Buckingham, in the following lines:

> Soliloquies *had need be very few,*
> *Extremely ſhort, and ſpoke in paſſion too.*
> *Our lovers talking to themſelves, for want*
> *Of others, make the pit their confidant:*
> *Nor is the matter mended yet, if thus*
> *They truſt a friend, only to tell it us.*—

SOLIS *via.* See the article Via.

SOLITARY, Solitarius, ſomething retired, or in private; remote from the company, or commerce of others of the ſame ſpecies. See Monk, Hermit, Anachoret, Recluse, *&c.*

Solitaty *column*, is a column that ſtands alone in any publick place; as the Trajan column. See Column.

Solitary *worm*, Solium, *tænia*, or *lumbricus latus*, is a worm ſometimes found in the inteſtines, and which is always the only one of the kind; as commencing from the pylorus, and extending thence, the whole length of the inteſtines; ſo that there is no room for another. See Worm.

Solitaries, is alſo a denomination of the nuns of St. Peter of Alcantara, inſtituted in 1676, by cardinal Barberini, when abbot of Notre dam de Farſa, in that city.

The deſign of their inſtitute is to imitate the ſevere, penitent liſe of St. Peter of Alcantara; keep a continual ſilence, never open their mouths to any body but themſelves; employ their time wholly in ſpiritual exerciſes, and leave the temporal concerns to a number of maids, who have a particular ſuperior in a ſeparate part of the monaſtery.—They always go bare-footed, without ſandals, gird themſelves with a thick cord, and wear no linen.

SOLITAURILIA, in antiquity. See Suovetaurilia.

SOLICITOR, or Sollicitor, Sollicitator, a perſon employed to follow, and take care of other perſons ſuits depending in courts of law, or equity; formerly allowed only to nobility, whoſe menial ſervants they were; but now frequently uſed to others, to the great increaſe of champarty, and maintenance. See Attorney.

The king has a Solicitor *general*, who holds his office by patent, during the king's pleaſure.—The attorney general, and he, had anciently a right to their writs of ſummons, to ſit in the lords houſe on ſpecial occaſions, till the 13 Car. II. ſince which, they have almoſt conſtantly been choſen members of the houſe of commons.

The *ſolicitor* general has the care and concern of managing the king's affairs, and hath fees for pleading, beſides other fees ariſing by patents, *&c.* He hath his attendance on the privy council; and the attorney general, and he, were anciently reckoned among the officers of the exchequer: they have audience, and come within the bar in all other courts.

SOLICITATION *of gravity*, } See { Paracentric.
Solicitation *of levity*, }

SOLSTICE, Solstitium, in aſtronomy, the time when the ſun is one of the *ſolſtitial* points; that is, when he is at his greateſt diſtance from the equator, which is 23 degrees and a half: thus called, becauſe he then appears to *ſtand ſtill*, and not to change his place in the degrees of the zodiac, any way: an appearance owing to the obliquity of our ſphere, and which thoſe who live under the equator are ſtrangers to. See Solstitial and Points.

The *ſolſtices* are two, in each year; the *æſtival* or *ſummer ſolſtice*, and the *hyemal* or *winter ſolſtice*.

The *ſummer* Solstice, is when the ſun is in the tropic of cancer; which is on the 11th of June; when he makes the longeſt day. See Tropic and Day.

The *winter* Solstice, is when he enters the firſt degree of capricorn; which is on the 11th of December; when he begins to return towards us, and makes the ſhorteſt day.

This is to be underſtood, as in our northern hemiſphere; for in the ſouthern, the ſun's entrance into capricorn, makes the *ſummer ſolſtice*, and that into cancer, the *winter ſolſtice.* See Ecliptic, Summer, Winter, *&c.*

SOLSTITIAL *points*, are thoſe points of the ecliptic, whereby the ſun's aſcent above the equator, and his deſcent below it, are terminated. See Ecliptic, Sun, *&c.*

The firſt point, which is in the beginning of the firſt degree of cancer, is called the *æſtival* or *ſummer point*; and the later, which is in the beginning of the firſt point of capricorn, the *winter point.* See Solstice.—The *ſolſtitial points* are diametrically oppoſite to each other. See Point.

Solstitial *colure*, is that which paſſes through the *ſolſtitial* points. See Colure.

SOLUBLE, in medicine, *looſe*, or apt to go to ſtool. See Laxative, Stool, *&c.*

Soluble *tartar*, is a kind of ſalt chymically prepared, by boiling eight ounces of cream of tartar, with four of fixed ſalt of tartar. See Tartar.

SOLVENT, the ſame with *diſſolvent*. See Dissolvent.

SOLUTIO *continui*, or Solution *of continuity*, a term uſed by phyſicians, *&c.* to expreſs a diſorder common to the ſolid parts of the body, wherein their natural coheſion is ſeparated: as by a wound, or other cauſe. See Continuum, *&c.*

If this happen to a ſimple, ſimilar part of the body; it is called, ſimply, *ſolutio continui.*—If to a compound, or organical part, it acquires a particular denomination, from the nature of the part, the difference of the cauſe, or the manner of application; as, a *wound*, *rupture*, *fracture*, *puncture*, *fiſſure*, *contuſion*, *ulcer*, *corroſion*, *dilaceration*, *exfoliation*, *caries*, &c. See Wound, Rapture, Fracture, *&c.*

SOLUTION, Solutio, in algebra and geometry, is the anſwering of a queſtion; or reſolving any problem propoſed. See Resolution, Problem, *&c.*

The *ſolution* of the problem of the quadrature of the circle, and that of the duplicature of the cube, by right lines, are held impoſſible. See Quadrature and Duplicature.

SOLUTION *of continuity*, in chirurgery. See SOLUTIO *continui*.

SOLUTION, in phyſicks, the reduction of a ſolid, or firm body, into a fluid ſtate, by means of ſome menſtruum. See MENSTRUUM.

Solution is frequently confounded with what we otherwiſe call *diſſolution*; but there is a difference. See DISSOLUTION.

SOLUTION, in chymiſtry, is ſometimes uſed for the analyſis, or reduction of a natural body into its chymical principles. See PRINCIPLE and ANALYSIS.

In this ſenſe, *ſolution* is the ſame with what we otherwiſe call *reſolution*. See RESOLUTION.

SOLUTIVE, *looſening*, or *laxative*. See LAXATIVE.

SOLUTIVE *diaprunum*. See the article DIAPRUNUM.

SOMNAMBULI*, or SOMNAMBULONES, an appellation given to people, who walk in their ſleep; more uſually called *noctambuli*. See NOCTAMBULI.

* The word is formed from the Latin, *ſomnus*, ſleep, and *ambulo*, I walk.

SOMNIFEROUS. See the article SOPORIFEROUS.

SOMNOLENTUM *coma*. See the article COMA.

SON, a relative term, applied to a male child, conſidered in the relation he bears to his parents. See FATHER.

The children of the king of England, are called *ſons* and *daughters* of *England*. See KING. The eldeſt *ſon* is born duke of Cornwal, and created prince of Wales. See PRINCE.

The younger *ſons* are called *cadets*. See CADET.

The king of France's children were anciently called *fils*, and *filles de France*, *ſons* and daughters of France; and the grand-children, *petits fils*, and *petites filles de France*. At preſent, the daughters are called *mes-dames*, and the grand-daughters, *mes-demoiſelles de France*.

Natural SON, } See the articles { BASTARD.
Adoptive SON, } { ADOPTIVE.

SON *of God*, is a term uſed in various ſenſes, in holy ſcripture, as 1°. For the Word, or ſecond perſon in the bleſſed trinity; who is thus called, with reſpect to the manner of his generation: as being begotten of the Father. See GENERATION, &c.

Him, the orthodox believe to be co-eternal, and co-equal with the Father; and to have been with him, the eternal principle and ſource of the Holy Spirit. See TRINITY, &c.

The appellation *Son*, is applied to him, both before and after his incarnation.—Thus we ſay, The *Son* of God created the world; the *Son* of God was incarnate, and lived 33 years on earth, &c.

2°. Several creatures are alſo called SONS *of God*; not as being ſo by nature and generation, but on divers other accounts.—Thus the angels are called *ſons of God* by Job; in reſpect of their creation, adoption, &c. And great men are called *ſons of God* in the pſalms; as being his lieutenants; or, the depoſitaries of his authority. Good men, and particularly the elect, are alſo called *ſons of God*, in various places of the ſacred writings.

SON *of man*, is frequently uſed in ſcripture, to ſignify *man*; as expreſſing not only the nature of man, but his frailty.

The expreſſion is very uſual among the Hebrews and Chaldeans: Daniel, Ezekiel, and Jeſus Chriſt, are particularly thus called; the firſt once, and the two latter frequently.

Sometimes, the phraſe *ſon of man*, is alſo uſed for the wicked and reprobate: in contradiſtinction to thoſe called *ſons of God*.

SONATA, SUONATA, in muſic, a piece or compoſition of muſic, wholly executed by inſtruments; and which is, with regard to the ſeveral kinds of inſtruments, what the *cantata* is in reſpect of voices. See CANTATA.

The *ſonata*, then, is properly a grand, free, humorous compoſition, diverſified with a great variety of motions and expreſſions, extraordinary and bold ſtrokes, figures, &c. And all this purely according to the fancy of the compoſer; who, without confining himſelf to any general rules of counterpoint, or to any fixed number or meaſure, gives a looſe to his genius, runs from one mode, meaſure, &c. to another, as he thinks fit.

We have *ſonatas* of 1, 2, 3, 4, 5, 6, 7, and even 8 parts; but uſually they are performed by a ſingle violin, or with two violins and a thorough baſs for the harpſicord, and frequently a more figured baſs for the baſs-viol, &c.

There are a thouſand different ſpecies of *ſonatas*: but the Italians uſually reduce them to three kinds.

Suonate da chieſa, that is, *ſonatas* proper for church-muſic, which uſually begin with a grave, ſolemn motion, ſuitable to the dignity and ſanctity of the place and the ſervice; after which they ſtrike into a briſker, gayer and richer manner.—Theſe are what they more peculiarly call *ſonatas*.

Suonate da camera, or *ſonatas* for the chamber, are properly ſeries's of ſeveral little pieces, for dancing; only compoſed to the ſame tune.—They uſually begin with a prelude, or little *ſonata*, ſerving as an introduction to all the reſt: afterwards come the allemand, pavane, courant, and other ſerious dances; then jigs, gavots, minuets, chacons, paſſecailles and other gayer airs: the whole compoſed in the ſame tone or mode.

SONG, in poetry, a little compoſition, conſiſting of ſimple, eaſy, natural verſes, ſet to a tune, in order to be ſung. See SINGING.

Each ſtanza of a *ſong*, is called a *couplet*. See STANZA and COUPLET.

The *ſong* bears a deal of reſemblance to the madrigal; and more to the ode, which is nothing but a *ſong* according to the ancient rules. See MADRIGAL and ODE.

Its object is uſually either wine or love; whence M. le Brun defines a modern *ſong*, to be either a ſoft and amorous, or a briſk and bacchic thought, expreſſed in a few words.

Indeed, this is to reſtrain it to too narrow bounds; for we have devout *ſongs*, ſatyrical *ſongs*, and panegyrical *ſongs*.

But, be the *ſong* what it will, the verſes are to be eaſy, natural, flowing, and to contain a certain harmony, which neither ſhocks the reaſon nor the ear; and which unites poetry and muſic agreeably together.

Anciently, the only way of preſerving the memory of great and noble actions, was, by recording them in *ſongs*; and in America there are ſtill people, who keep their whole hiſtory in *ſongs*. See DRUID.

SONG, in muſic, is applied in the general, to any ſingle piece of muſic, whether contrived for a voice, or inſtrument. See MUSIC and COMPOSITION.

A *ſong*, Mr. Malcolm obſerves, may be compared to an oration: for, as in this latter, there is a ſubject, *viz.* ſome perſon or thing the diſcourſe is referred to, and which is always to be kept in view throughout the whole; ſo, in every truly regular and melodious *ſong*, there is one note which regulates all the reſt; wherein the *ſong* begins, and at laſt ends, and which is, as it were, the principal matter, or muſical ſubject, to be regarded in the whole courſe of the *ſong*.—And, as in the oration, there may be ſeveral diſtinct parts, which refer to particular ſubjects, yet muſt they have an evident connection with the principal ſubject, which regulates the whole; ſo in melody, there may be ſeveral ſub-principal ſubjects, to which the different parts of the *ſong* may belong: but theſe are, themſelves, under the influence of the principal ſubject, and muſt have a ſenſible connection with it.—This principal or fundamental note, is called the *key of the ſong*. See KEY.

Reſponſary SONG. See the article RESPONSARY.

SONNA*, a book of Mahometan traditions, wherein all the orthodox muſſulmen are required to believe. See MAHOMETANISM, TRADITION, &c.

* The word ſignifies, in Arabic, the ſame with *miſhna* in the Hebrew, that is, *ſecond law*, or, as the Jews call it, *oral law*. See MISHNA.

The adherents to the *ſonna* are called *ſonnites*: and as among the Jews, there is a ſect of Caraites, who reject the traditions as fables invented by the rabbins; there are alſo ſectaries among the Mahometans, called *Shiites*, who reject the traditions of the *Sonnites*; as being only founded on the authority of an apocryphal book, and not derived to them from their legiſlator. See CARAITE, RABBINIST, &c.

There is the ſame enmity between the *Sonnites* and Shiites, as between the rabbiniſt Jews and the Caraites. The Shiites reproach the *Sonnites* with obtruding the dreams of their doctors, for the word of God: and the *Sonnites*, in their turn, treat the Shiites as hereticks, who refuſe to admit the divine precepts, have corrupted the Alcoran, &c.

SONNET, SONETTO, in poetry, a kind of compoſition, contained in fourteen verſes, *viz.* two ſtanzas or meaſures of four verſes each, and two of three; the eight firſt verſes being all in two rhymes.

The *ſonnet* is of Italian origin, and Petrarch is allowed to be the father: it is held the moſt difficult and artful of all poetical compoſitions; as requiring the laſt accuracy and exactneſs. It is to end with ſome pretty, ingenious thought: the cloſe to be particularly beautiful, or the *ſonnet* is naught.

In Malherb, and ſome other French poets, we meet with *ſonnets*, where the two firſt ſtanzas are not in the ſame rhyme; but they are held irregular; and, in effect, great part of the merit of theſe pieces, conſiſts in a ſcrupulous obſervation of the rules.

Ronſard, Malherb, Maynard and Gombaut, have compoſed abundance of *ſonnets*; but among two or three thouſand, there are ſcarce two or three worth much.

Paſquier obſerves, that du Bellai was the firſt who introduced *ſonnets* into France. But du Bellai himſelf ſays, that Melin de S. Gelais, firſt converted the Italian *ſonnets* into French.

SOOP. See the article SOUP.

SOOT, an earthy, volatile matter, ariſing from wood, coals, and other fuel, along with the ſmoak, by the action of fire; or rather, it is the ſmoak itſelf, fixed and gathered on the ſides of the chimney. See Smoak and fire.

Soot is found an excellent manure for corn lands, eſpecially where the ſoil is cold. See MANURING.

The dyers make conſiderable uſe of *ſoot*, for a kind of dun colour, which, it is true, has no agreeable ſmell; but, in return has the property of ſaving cloaths and other ſtuffs, from moths. See DYING.

SOOT *of frankincenſe*, is the ſmalleſt and fineſt part of the incenſe, called *olibanum*, or *male incenſe*; burnt after the manner of roſin to make lamp-black. See FRANKINCENSE.

Dioſcorides ſhews how to make a *ſoot* of butter, which has ſeveral uſes in medicine.—The *ſoot* found in the furnaces of glaſs-houſes, is uſed by painters.

SOPE. See the article Soap.

SOPHI*, or Sofi, a title or quality given to the emperor of Perſia; importing as much as wiſe, ſage or philoſopher.

* The title is by ſome ſaid to have taken its riſe from a young ſhepherd thus named, who attained to the crown of Perſia in 1370; others derive it from the *ſopboi* or ſages, anciently called *magi.*—Voſſius gives a different account of the word: *ſophi*, in Arabic, he obſerves, ſignifies *wool*; and adds, that it was applied by the Turks out of deriſion to the kings of Perſia, ever ſince Iſhmael's time, becauſe, according to their ſcheme of religion, he is to wear no other covering on his head, but an ordinary, red, woollen ſtuff; whence the Perſians are alſo called *kezelbaſchs*, q. d. *red-heads.*--But Bochart aſſures us, that *ſophi*, in the original Perſian language, ſignifies one that is pure in his religion, and who prefers the ſervice of God in all things; and derives it from an order of religious, called by the ſame name. See Sophi's.

The *ſophi's* value themſelves, and with ſome reaſon, of their illuſtrious extraction; the race being ſecond to none in the eaſt. They are deſcended in a right line from Houſſein, ſecond ſon of Ali, Mahomet's couſin, and Fathima, Mahomet's daughter.

There is no prince in the world, whoſe authority is more abſolute than that of the *ſophi* of Perſia: his power is not even limited by any laws he himſelf can make; but he ſuſpends, changes, and annuls them at pleaſure.

Sophi's*, or Sofees, a kind of order of religious among the Mahometans in Perſia, anſwering to what are otherwiſe called *derviſes*, and among the Arabs and Indians, *faquirs.* See Dervise and Faquir.

* Some will have them called *ſofi's*, from a kind of coarſe camblet which they wear, called *Souf*, from the city *Souf* in Syria, where it is principally manufactured.

The more eminent of thoſe *ſophi's* are complemented with the title *ſcheik*, that is reverend; much as in Romiſh countries, religious are called *reverend fathers.*

Scheic *ſophi*, who laid the firſt foundation of the grandeur of the royal houſe of Perſia, was the founder, or rather the reſtorer of this order: Iſhmael, who conquered Perſia, was, himſelf, a *ſophi*, and valued himſelf on his being ſo. He choſe all the guards of his perſon from among the religious of this order; and would have all the great lords of his court *ſophi's.* The king of Perſia is ſtill grand maſter of the order; and the lords continue to enter into it, though it be now fallen under great contempt.

The vulgar *ſophi's* are now chiefly employed as uſhers, and attendants of the court; and even as executioners of juſtice; the emperor laſt reigning, would not allow them, according to cuſtom, to gird the ſword on him.

This neglect, into which the *ſophi's* are ſunk, has occaſioned the late emperors to diſuſe the title of *ſophi*, or *ſofi:* however, M. de la Croix is miſtaken, when he ſays, that they never bore it.

SOPHISM, ΣΟΦΙΣΜΑ, in logic, a captious, and fallacious reaſoning; or an argument, which with ſome ſubtilty, carries much appearance of truth, but little ſolidity. See Fallacy.

A *ſophiſm* is, properly, an argument falſe at bottom, and only invented to amuſe and embarraſs the perſon to whom it is uſed. See Sophist and Elenchus.

Sophisms, or Sophistical *arguments*, among logicians, are more particularly ſuch as are not in form, or are founded on equivocals.

As: *You have every thing you have not loſt; but you have not loſt horns: therefore you have horns.*

SOPHIST*, ΣΟΦΙΣΤΗΣ, a perſon who frames ſophiſms; that is, uſes ſubtile arguments, with deſign to deceive thoſe he would perſuade or convince. See Sophism and Gymnosophist.

* The word is formed from the Greek, σοφος, wiſe; or rather from σοφιστης, impoſtor, deceiver.

The term *ſophiſt*, which is now reproachful, was anciently honourable; and carried a very innocent idea. St. Auguſtin obſerves, it ſignified a rhetor, or profeſſor of eloquence: ſuch as were Lucian, Athenæus, Libanius, *&c.*

Suidas, and after him, Olar, Celſius, in an expreſs diſſertation on the Greek *ſophiſts*, tells us, that the appellation was applied indifferently to all who excelled in any art, or ſcience; whether divines, lawyers, phyſicians, poets, orators, or muſicians.—But this ſeems to be ſtretching the ſenſe of the word without all meaſure: it is poſſible a rhetor might have made verſes, *&c.* but that it was on account of his poetical talent, that he was denominated *ſophiſt*, is what we ſee no reaſon to apprehend,—However, Solon is the firſt who appears to have ever bore the appellation; which is given him by Iſocrates: afterwards, it was ſcarce ever given, but to philoſophers, and declaimers.

The title *ſophiſta* was in great credit among the Latins in the XIIth century, and in the time of St. Bernard; but it began to loſe ground in Greece, as early as Plato's time; on account of Protagoras and Gorgias, who made a ſordid traffic thereof, by ſelling eloquence for money.—Hence Seneca calls the *ſophiſts*, *quacks* or *empirics.* Cicero ſays, that the title *ſophiſta* was given to ſuch as profeſſed philoſophy with too much oſtentation, in order to make a trade of it, by running from town to town, to retail their deceitful ſcience.—A *ſophiſt*, therefore, was then, as now, a rhetor, or logician, who makes it his buſineſs to enſnare and perplex people, by frivolous diſtinctions, vain reaſonings and captious diſcourſes.

Nothing has conduced more to the increaſing of the number of *ſophiſts*, than the contentious ſchool philoſophy: people are there taught to puzzle and obſcure the truth, by barbarous, unintelligible terms; as antipredicaments, great and little logicals, quiddities, *&c.*

The title *ſophiſt* was given to Rabanus Maurus, by way of eminence.—John Hinton, a modern Engliſh ſcholaſtic writer, endeavoured alſo to procure the ſplendid title of *ſophiſt.*

SOPHISTICATION, in chymiſtry, alchymy, *&c.* a term particularly applied to the counterfeit works of fraudulent alchymiſts, who uſe indirect means of whitening copper, gilding ſilver, and giving other ſuperficial tinctures; as alſo of making augmentations by divers mixtures, and other illegal operations, to delude thoſe, at whoſe expence they are employed. See Alchymy, Alchymist, Transmutation, Projection, Philosopher's *ſtone*, &c.

Hence the term is alſo applied to merchandizes, and other goods adulterated, mixed or altered by the deceit of the ſeller. See Adulteration.

Muſc, at preſent, is almoſt all *ſophiſticated*, as well as Bezoard, balm of Gilead, lapis lazuli, and other valuable drugs. —Canary wines are *ſophiſticated* on the place, before ever they come near our ports.

SOPORIFIC*, or Soporiferous, a medicine that has the faculty of procuring ſleep. See Sleep.—Such are opium, laudanum, *&c.* See Opium, Laudanum, *&c.*

* The word is formed from the Latin, *ſopor*, ſleep.—The Greeks, in lieu hereof, uſe the word *hypnotic.* See Hypnotic.

SOPOROUS, *ſleepy* or *drowſy diſeaſes*, are the coma or cataphora, lethargy and carus, which rather appear to differ in reſpect of more or leſs, than as to their eſſence.—In this they all agree, that they induce a morbific ſweat. See Coma, Carus, Lethargy, *&c.*

SORBON, or Sorbonne, the houſe or college of the faculty of theology, eſtabliſhed in the univerſity of Paris. See University, Faculty, *&c.*

It was founded in 1252, by St. Louis, or rather by Robert de *Sorbon* his confeſſor and almoner; firſt, canon of Cambray, and afterwards of the church of Paris; who gave his own name to it; which he himſelf took from the village of *Sorbon*, or *Serbon*, near Sens, where he was born.

The foundation was laid in 1250; queen Blanche, in the abſence of her huſband, furniſhing him with a houſe which had formerly been the palace of Julian the apoſtate, whereof ſome remains are ſtill ſeen.—Afterwards, the king gave him all the houſes he had in the ſame place, in exchange for ſome others in another.

The college has been, ſince, magnificently rebuilt by the cardinal de Richelieu. The deſign of its inſtitution, was for the uſe of poor ſtudents in divinity.

There are lodgings in it for 36 doctors, who are ſaid to be of the *ſociety of the Sorbonne.* Thoſe admitted into it without being doctors, are ſaid to be of the *hoſpitality of the Sorbonne.* —Six regent doctors hold lectures every day, for an hour and half each: three in the morning, and three in the afternoon. See Doctor.

Sorbon is alſo uſed in the general, for the whole faculty of theology at Paris; in regard the aſſemblies of the whole body are held in the houſe of the *Sorbon:* and that the bachelors of the other houſes of the faculty, as the houſe of Navarre, *&c.* come here to hold their *ſorbonnique*, or act, for being admitted doctor in divinity. See Faculty.

SORCERY, the crime of witchcraft, or divination by the aſſiſtance of evil ſpirits. See Magic, Witchcraft and Divination.

Some hold *ſorcery* to be properly what the ancients call *ſortilegium*, or divination by means of *ſortes* or *lots.* See Sortes.

My lord Coke, 3d *Inſt. fol.* 44. deſcribes a *ſorcerer*, *qui utitur ſortibus & incantationibus dæmonum.* *Sorcery* is felony, by ſtat. 1° Jac. In the mirror, *ſorcery* is ſaid to be a branch of hereſy; and by ſtat. 12. Car. II. it is excepted out of the general pardons.

Sorcery was a thing formerly very common; at leaſt the credulity of thoſe ages made it paſs for ſuch; and people ſuffered frequently for it. In a more knowing and leſs believing age, it is out of doors.

In effect, the moſt probable opinion is, that the ſeveral glaring inſtances of *ſorcery* we meet withal, in our old lawbooks and hiſtorians, if well enquired into, would be found, at bottom, no other than artful poiſonings. See Fascination.

SORDID *ulcers.* See the article Ulcer.

SORITES*, ΣΩΡΕΙΤΗΣ, in rhetoric, *&c.* a kind of argument, wherein a number of propoſitions are gradually, and minutely laid together; and ſomething inferred from the whole.—Whence Cicero calls it *ſyllogiſmus acervatus*, an accumulative ſyllogiſm.

* The word is formed from the Greek σωρος, cumulus, heap.

Such was that merry argument of Themiſtocles, to prove, that his little ſon, under ten years old, governed the whole world.—Thus: my ſon governs his mother; his mother me; I the Athenians; the Athenians the Greeks; Greece commands Europe; Europe the whole world: therefore my ſon commands the whole world.

This method of diſputing prevailed much among the ſtoicks; eſpecially with Zeno, and Chryſippus. But it is very captious, and ſophiſtical.

SORRANCES, among farriers, ſignify two things, *viz.* either an ill ſtate or habit of a horſe's body, ariſing from ſome part diſeaſed: or, a looſening and ſolution of the continuity of the parts, which according to the various circumſtances thereof, acquires various names, as *fracture*, *wound*, *ulcer*, *rupture*, *convulſion*, *cramp*, *excoriation*, &c.

SORTES, in antiquity, *lots*; a method of deciding dubious caſes, where there appears no ground for a preference, by referring the deciſion to chance: as in caſting of dice, drawing of tickets, *&c.* See CHANCE.

The ancient *ſortes* or *lots*, were inſtituted by God himſelf; and in the books of the Old Teſtament, we meet with divers ſtanding and perpetual laws, and divers particular commands, preſcribing and regulating the uſe thereof. Thus the ſcripture informs us, that the *lot* fell on St. Matthias, when a ſucceſſor to Judas in the apoſtolate was to be choſen. And our Saviour's garment itſelf, was caſt *lots* for. *Sortiti ſunt Chriſti veſtem.*

The SORTES *Prænestinæ*, were famous among the Greeks. The method of theſe was to put a great number of letters, or even whole words into an urn; to ſhake them together, and throw them out; and whatever ſhould chance to be made out in the arrangement of letters, *&c.* compoſed the anſwer of this oracle.

In what repute ſoever, this method of divination might, anciently, have been, M. Dacier obſerves, that in Cicero's time its credit was low; inſomuch that none but the credulous populace had recourſe to it.

In lieu of this, another kind of *ſortes* was introduced into Greece and Italy, which was to take ſome celebrated poet, as Homer, or Euripides, or Virgil, to open the book, and whatever firſt preſented itſelf to the eye upon opening, was taken for the ordinance of heaven. This made what they called the *ſortes Homericæ*, and *ſortes Virgilianæ*; which ſucceeded to the uſe of the *ſortes Prænestinæ*.

This ſuperſtition paſſed hence into chriſtianity; and the Chriſtians took their *ſortes* out of the books of the Old and New Teſtament. The firſt paſſage that preſented itſelf, upon opening a book of ſcripture, was eſteemed the anſwer of God himſelf.

If the firſt paſſage did not happen to be any thing to the purpoſe for which the *ſortes* were conſulted, another book was opened; till a paſſage were met withal, that might be taken for an anſwer. This was called *ſortes ſanctorum*.

St. Auguſtin does not diſapprove of this method of learning futurity, provided it be not uſed for worldly purpoſes; and owns he has practiſed it himſelf.

Gregory of Tours adds, that the cuſtom was, firſt to lay the Bible on the altar, and to pray the Lord, that he would diſcover by it what was to come to paſs.

Inſtances of the uſe of the *ſortes ſanctorum* are very frequent in hiſtory. Heraclius, Mr. Fleury tells us, in his war againſt Coſroes, to learn where he ſhould take up his winter-quarters, purified his army for three days, and then opened the goſpels, and found the place appointed for his winter-quarters, was in Albania.

Gilbert of Nogent, informs us, that in his time, that is, about the beginning of the XIIth century, the cuſtom was at the conſecration of biſhops, to conſult the *ſortes ſanctorum*, to learn the ſucceſs, fate, *&c.* of their epiſcopate.

The practice is founded on a ſuppoſition, that God preſides over the *ſortes*; and on *Prov.* xvi. 33. *The lot is caſt into the lap; but the diſpoſing thereof is of the Lord.*

In effect, many divines hold, that the *lot* is conducted in a particular manner by providence; that it is an extraordinary manner wherein God declares his will by a kind of immediate revelation.—The *ſortes ſanctorum*, however, were condemned by the council of Agda in 506, at the time they were beginning to take footing in France, *&c.*

SORTILEGE, SORTILEGIUM, a kind of divination by ſortes, or lots. See SORCERY and SORTES.

SOTERIA *, in antiquity, ſacrifices offered to the gods, in gratitude for their having delivered a perſon from danger. See SACRIFICE.

* The word is formed from the Greek, σωτηρ, ſaviour.

The term is alſo applied to poetical pieces compoſed for the ſame end. Orpheus is the firſt, who appears to have compoſed *ſoteria*.

Our Latin poets give the ſame name to poems in Latin verſe, wrote to give thanks to God or the ſaints, for having preſerved them on any occaſion: F. Petavius being delivered from a dangerous diſeaſe, by the interceſſion, as he ſuppoſed, of St. Genevieve, compoſed that fine piece in honour of that ſaint, ſtill extant under the title of *ſoteria*.

SOU. See the article SOL.

SOVERAIGN, *ſupreme*; the chief and higheſt Being; or the Almighty: a term, in ſtrictneſs, only applicable to God.

The word is French *ſcuverain*, which Paſquier derives further from the Latin, *ſuperior*, the firſt in any thing, or he who is ſuperior to the reſt.—Hence

In the ancient French cuſtoms, we meet with *ſoveraign* maſter of the houſhold; *ſoveraign* maſter of the foreſts; *ſoveraign* maſter of the treaſury.—Under Charles VI. the title *ſoveraign* was given to bailiffs and ſeneſchals, with regard to their ſuperiority over prevots, and chatelains.

SOVERAIGN, with regard to men, is applied to kings, and princes who are ſupreme and independent, and hold of none but God, and their ſword. See KING, PRINCE, *&c.*

The authority of a *ſoveraign* is only bounded by the laws of God, of nature, and the fundamental laws of the ſtate.

SOVERAIGN is alſo a title given to ſuch as are inveſted with certain rights and prerogatives, which belong only to *ſoveraigns*: as, the power of coining money; ſending agents to diets, to treat of war and peace, *&c.*

In which ſenſe, the feudatories of the empire, and the tributaries of the grand ſeignior, are called *ſoveraigns*.

SOVERAIGN is alſo applied to courts and judges, who have a power from a prince, to decide the proceſſes of his ſubjects without appeal, or in the laſt reſort.

At Paris there are five *ſoveraign* companies; the parliament, the chamber of accompts, the court of aids, the grand council, and the court of monies.

In England, we have but one *ſoveraign* court; the houſe of lords. See COURT, PEER, *&c.*

SOUL, *anima*, a ſpirit incloſed in an organized body. See SPIRIT and BODY.

Many of the ancient philoſophers aſſerted an *anima mundi*, a *ſoul* which moved and animated the machine of the univerſe, and gave action to all natural cauſes. This doctrine, Plato handles very fully in his Timæus. See ANIMA MUNDI.

Others have given particular *ſouls* to all the heavenly bodies, the ſun, ſtars, earth, *&c.* to regulate their motions. See ANIMAL, SUN, STAR, PLANET, EARTH, *&c.*

The philoſophers, many of them, allow of two, and others of three kinds of *ſouls*, viz. a

Rational SOUL, which they hold to be divine, and infuſed by the breath of God. See REASON.

Irrational or *ſenſitive* SOUL, which man has in common with brutes, and which is formed out of the elements. See SENSITIVE.

Vegetative SOUL, which we have in common with plants; and which, as the firſt is the principal of reaſon and underſtanding, or that in us which thinks and underſtands; and the ſecond, the principle of life; ſo this third is the principle of growth, nutrition and vegetation. See VEGETATIVE, *&c.*

The Epicureans took the ſubſtance of the *ſoul*, we mean of the rational *ſoul*, to be a ſubtile air, compoſed of their atoms, or primitive corpuſcles. See ATOM.

The ſtoicks held it to be a flame or portion of heavenly light. See FIRE, LIGHT, FLAME, HEAT, *&c.*

Spinoſa and his followers, allowing only of one kind of ſubſtance, *viz.* matter, maintain the *ſoul* to be of the ſame ſubſtance with the body, *viz.* material. See SUBSTANCE and SPINOSISM.

The Carteſians make thinking the eſſence of the *ſoul*; and from this principle, deduce its immateriality and immortality.—But the principle is falſe; nor is there any need to define the *ſoul* a ſubſtance that thinks, to prove it immortal. It is enough, that the *ſoul* be capable of thinking; and that it produce its own thoughts, without making thinking its eſſence. It is no more eſſential to the *ſoul* to think than to will: for a thing I can conceive the *ſoul* without, cannot be its eſſence. See THOUGHT, *&c.*

Again, if thought be the eſſence of the *ſoul*; as a thing cannot produce itſelf, its own being, or eſſence; the *ſoul* does not produce its own thought, nor its own will: and thus is it brought to the condition of brutes, or even of inanimate bodies, without any action, any liberty, *&c.*

If the Carteſians only mean this of the faculty of thinking; they do wrong even to call this the eſſence of the *ſoul*. It is no more its eſſence, than the faculty of willing is. And we conceive ſomething in the *ſoul*, prior to both thoſe faculties. See THINKING and CARTESIAN.

The *ſoul* is a ſpiritual ſubſtance, proper to inform, or animate a human body, and by its union with this body, to conſtitute a reaſonable animal, or man. This is its eſſence; and this its definition.

It muſt be owned, the Carteſians prove the ſpirituality and immortality of the *ſoul*, from its thinking exceedingly well: but they are not to have the honour of this proof, as their own invention. All the great philoſophers uſed it before them, and uſe it ſtill. See IMMORTALITY.

The philoſophers are not at all agreed, as to the manner wherein the *ſoul* reſides in the body. Some hold it equally diffuſed throughout every part thereof. Others ſay it influences, and acts on every part of the body, though it has its principal reſidence in ſome particular part, called the *ſenſory*. See Sensory.

This principal part, Des Cartes maintains, is the pineal gland of the brain, where all the nerves terminate, *&c.* See Pineal *gland*.

Borri, a milaneſe phyſician, in a letter to Bartholine, *de ortu cerebri & uſu medico*, aſſerts, that in the brain is found a certain, very ſubtile, fragrant juice, which is the principal ſeat or reſidence of the reaſonable *ſoul*; and adds, that the ſubtilty and fineneſs of the *ſoul*, depends on the temperature of this liquor, rather than on the ſtructure of the brain, to which it is uſually aſcribed. This liquor, we conceive, muſt be the ſame with what is uſually called the *nervous juice*, or *animal ſpirits*. The conſtitution whereof, is, doubtleſs, of great importance, with regard to the faculties of the *ſoul*. See Spirit.

Mr. Locke diſtinguiſhes two principal faculties or powers of the rational or human *ſoul*, viz. *perception* and *willing*. See Power and Faculty.

To theſe, other philoſophers add others; as *ſenſation*, *liberty*, *memory*, *imagination*, and *habit*. See Understanding, Will, Sensation, Liberty, *&c.*

The myſtic divines diſtinguiſh two principal parts in the *ſoul*: the *ſuperior part*, which comprehends the underſtanding and the will; and the *inferior part*, which comprehends imagination and ſenſation. Thus, ſay they, Jeſus Chriſt was happy on the croſs in his *upper part*, and ſuffered in his *lower part*. The lower part did not communicate to the upper, either its troubles, or its failings; nor the upper to the lower, its peace or beatitude. From this diſtinction, the quietiſts take in hand to maintain, that whatever paſſes contrary to good morals, in the lower part of the *ſoul*, is not contrary to the purity of the upper part, inaſmuch as the will has no ſhare therein.

As to the *ſoul* of brutes, the Carteſians, and ſome others, deny its exiſtence, in the common ſenſe of the word *ſoul*; that is, they ſtrip it of all the properties or faculties of the human *ſoul*: and the Peripateticks, on the contrary, inveſt it with the greateſt part of them.

In man, a particular agitation of the fibres of the brain is accompanied with a ſenſation of heat; and a certain flux of animal ſpirits towards the heart, and viſcera, is followed by love or hatred.

Now the Peripateticks maintain, that brutes feel the ſame heat, and the ſame paſſions, on the ſame occaſions: that they have the ſame averſion for what incommodes them, and, in the general, are capable of all the paſſions, and all the ſenſations we feel.

The Carteſians deny they have any perceptions or notices at all; that they feel any pain or pleaſure; or love or hate any thing. The ground of their opinion is, that they allow of nothing in brutes, but what is material, and that they deny ſenſations, and paſſions to be any properties of matter. Some of the Peripateticks, on the other hand, maintain matter, when ſubtilized, framed, ranged and moved in a certain manner, to be capable of ſenſation and paſſion; that beaſts may feel and perceive, by means of the animal ſpirits, which are a matter thus modified; and that the human *ſoul* itſelf, only becomes capable of ſenſation and paſſion, by means means thereof. See Sensation and Passion.

But we muſt own it very difficult, to reconcile the idea we have of matter, with what we have of thought; to conceive that matter figured in any manner, whether in a ſquare, a ſphere, or an oval, ſhould be pleaſure, pain, heat, colour or ſmell; or to conceive that matter, however agitated, whether in a circle, a ſpiral, parabola or ellipſis, ſhould be love, hatred or joy,—ſurpaſſes our endeavours.

The maintainers of the contrary opinion, urge that appearance of ſenſe, of fear, caution, love for their young, admirable ſagacity, both for their own preſervation and that of their ſpecies, viſible through the whole brute creation. And, it is true, all the actions of beaſts plainly expreſs an underſtanding; for every thing that is regular, expreſſes it; even a machine or watch expreſſes it: and a plant much more; the radicle of the ſeed turning downwards, and the ſtem upwards, whatever ſituation the ſeed is ſown in: the young plant, knitting from ſpace to ſpace, to ſtrengthen it; its putting forth prickles, *&c.* to defend it, *&c.* mark a great underſtanding. All the motions of plants and brutes plainly diſcover an intelligence; but the intelligence does not reſide in the matter thereof: it is as diſtinct from the beaſt or plant, as that which ranged the wheels of the watch, is diſtinct from the watch itſelf. See Understanding, *&c.*

For, in effect, this intelligence appears infinitely great, infinitely wiſe, infinitely powerful; and the ſame which formed us in our mother's womb, which gave us our growth, *&c.* Thus, in brutes, there is not either underſtanding or *ſoul*, in the ſenſe we generally uſe the word: they eat without pleaſure, cry without pain, grow without knowing it. They fear nothing; know nothing; and if they act in ſuch manner, as ſhews underſtanding; it is becauſe God having made them, to preſerve them, has formed their bodies ſo as to avoid whatever might hurt them, mechanically.

Otherwiſe it might be ſaid, that there is more underſtanding in the vileſt inſect, nay, in the ſmalleſt grain, than in the moſt knowing of men; for it is evident, either of them contains more parts, and produces more regular motions and actions, than we are capable of underſtanding. Thus does the great F. Malebranche argue againſt the *ſouls* of brutes. *Recherche de la verite, liv.* 6.

Cure of Souls, } See the articles { Cure.
Migration of Souls, } { Migration.

Soul's *cheat*, a legacy anciently bequeathed at their deaths, by our ſcrupulouſly pious anceſtors, to the pariſh prieſt, to compenſate for any tithes that might have been forgot in their lives. See Tithe.

SOUND, Sonus, a perception of the ſoul, communicated by means of the ear; or, the effect of a colliſion of bodies, and a tremulous motion conſequent thereon, communicated thence to the circumambient fluid, and propagated through it to the organs of hearing. See Ear and Hearing.

To illuſtrate the cauſe of *ſound*; we obſerve, firſt, that a motion is neceſſary in the ſonorous body, for the production of *ſound*. Secondly, that this motion exiſts, firſt, in the ſmall and inſenſible parts of the ſonorous bodies, and is excited in them by their mutual colliſion, and percuſſion againſt each other, which produces that tremulous motion ſo obſervable in bodies that have a clear *ſound*, as bells, muſical chords, *&c.* Thirdly, that this motion is communicated to, or produces a like motion in the air, or ſuch parts of it, as are fit to receive and propagate it; inaſmuch as no motion of bodies at a diſtance, can affect our ſenſes, without the mediation of other bodies which receive thoſe motions from the ſonorous body, and communicate them immediately to the organ. Laſtly, that this motion muſt be communicated to thoſe parts that are the proper and immediate inſtruments of hearing.

Further, that motion of a ſonorous body, which is the immediate cauſe of *ſound*, may be owing to two different cauſes; either the percuſſion between it and other hard bodies: as in drums, bells, chords, *&c.* or the beating and daſhing of the ſonorous body and the air, immediately againſt each other: as in wind inſtruments, as in flutes, trumpets, *&c.*

But in both caſes, the motion, which is the conſequence of the mutual action, and the immediate cauſe of the ſonorous motion which the air conveys to the ear, is an inviſible, tremulous or undulating motion in the ſmall and inſenſible parts of the body.

To explain this; all ſenſible bodies are ſuppoſed to conſiſt of a number of ſmall and inſenſible parts or corpuſcles, which are of the ſame nature in all bodies, perfectly hard and incompreſſible. See Corpuscle.

Of theſe, are compoſed others, ſomewhat greater, but ſtill inſenſible; and theſe different, according to the different figures and union of their component parts. Theſe, again, conſtitute other maſſes bigger and more different than the former; and of the various combinations of theſe laſt, are thoſe groſs bodies compoſed, that are viſible, tangible, *&c.* The firſt and ſmalleſt parts, we have obſerved, are abſolutely hard; the others are compreſſible, and united in ſuch manner, that being compreſſed by an external impulſe, they have an elaſtic or reſtitutive power, whereby they reſtore themſelves to their natural ſtate. See Elasticity.

A ſhock, then, being made by one body upon another, the ſmall particles, by their elaſtic principle, move to and again with a very great velocity, in a tremulous, undulating manner, ſomewhat like the viſible motions of groſſer ſprings; as we eaſily obſerve in the chords of muſical inſtruments. And this is what we may call the *ſonorous motion*, which is propagated to the ear: but obſerve, that it is the inſenſible motion of thoſe particles next the ſmalleſt, which is ſuppoſed to be the immediate cauſe of *ſound*; and of theſe, only thoſe next the ſurface, communicate with the air: the motion of the whole, or of the greater parts, being no further concerned, than as they contribute to the other.

To apply this theory; ſtrike a bell with any hard body, and you eaſily perceive a ſenſible tremor in the ſurface, ſpreading itſelf over the whole; and that more ſenſibly, as the ſhock is greater. Upon touching it in any other part, the motion and the *ſound* too, are ſtopped. Now this is apparently a motion of the ſmall and inſenſible parts, changing their ſituations, with reſpect to one another, which being ſo many, and ſo cloſely united, we cannot perceive their motions ſeparately and diſtinctly; but only a trembling, which we reckon to be the effect of the confuſion of an infinite number of little particles, cloſely joined, and only moving in infinitely little lines.

Mr. Perrault adds, that the viſible motion of the parts, contributes no otherwiſe to *ſound*, than as it cauſes the inviſible motion of the ſmaller parts, which he calls *particles*, to diſtinguiſh them from the ſenſible ones, which he calls *parts*, and from the ſmalleſt of all, which we call *corpuſcles*.

This he ſupports from the inſtance of a chord, which being ſtruck, and the *ſound*, and ſenſible undulations at reſt again, if you approach the chord ſoftly with the finger, you will find a ſmall tremulous motion, which is the remains of the vibrations of the whole chord, and the parts. Now the parts vibrate without any *ſound*; but no ſooner is the vibration felt by the finger, than the *ſound* is heard again; which he aſcribes to this, that the motion of the parts being inſufficient to move the particles, whoſe motion is the firſt that ceaſes, requires ſome aſſiſtance from daſhing againſt the finger, whereby to become enabled to give the particles the motion neceſſary for the producing of *ſound*. He finiſhes his proof, by the inſtance of flutes; which when made of different matters, as wood, metal, &c. whoſe parts are very different, but their particles nearly the ſame, if their lengths and bores be the ſame; there is very little ſenſible difference in their *ſounds*.

The ſonorous body having made its impreſſion on the contiguous air, that impreſſion is propagated from one particle to another, according to the laws of pneumaticks.

A few particles, for inſtance, driven from the ſurface of the body, drive their neighbouring particles into a leſs ſpace; and the medium, as it is thus rarified in one place, becomes condenſed in the other: but the air thus compreſſed, in the ſecond place, is, by its elaſticity, returned back again, both to its former place, and its former ſtate; and the air, contiguous to that, is compreſſed: and the like obtains, when the air leſs compreſſed expanding itſelf, a new compreſſion is generated. From each agitation of the air, therefore, there ariſes a motion of the air, analogous to the motion of a wave on the ſurface of the water; which we call a *wave* or *undulation* of air. See UNDULATION.

In each wave, the particles go and return back again through very ſhort, but equal ſpaces; the motion of each particle is analogous to the motion of a vibrating pendulum, while it performs two oſcillations; and moſt of the laws of the pendulum, with very little alteration, are applicable thereto. See PENDULUM.

Sounds are as various, as are the means that concur to their production.—The principal varieties reſult from the figure, conſtitution, quantity, &c. of the ſonorous body, the manner of percuſſion, with the velocity, &c. of the vibrations conſequent thereon; the ſtate and conſtitution of the medium; the diſpoſition, diſtance, &c. of the organ; the obſtacles between the organ and the ſonorous object, and the adjacent bodies.—The moſt notable diſtinctions of *ſounds*, ariſing from the various degrees and combinations of the conditions mentioned, are into *loud* and *low* (or ſtrong and weak) into *grave* and *acute* (or ſharp and flat, or high and low) and into *long* and *ſhort*. The management whereof, makes the office of muſic. See SOUND *in muſic*.

The velocity of *ſound* is the ſame, with that of the aerial waves; and does not differ much, whether it go with the wind or againſt it. By the wind, indeed, a certain quantity of air is carried from one place to another; and the *ſound* is accelerated, while its waves move through that part of the air, if their direction be the ſame as that of the wind. But as *ſound* moves vaſtly ſwifter than wind, the acceleration it will hereby receive, is inconſiderable. In effect, the moſt violent winds we know of, have their celerity to that of *ſound*, only as 1 to 33; and all the effect we can perceive from the wind, is, that it increaſes and diminiſhes the ſpace of the waves; ſo that by help thereof the *ſound* may be heard to a greater diſtance than otherwiſe it would.

That the air is the ordinary medium of *ſound*, appears from various experiments, in rarified and condenſed air.—In an unexhauſted receiver, a ſmall bell may be heard ſome diſtance; but when exhauſted, it can ſcarce be heard at the ſmalleſt diſtance. If the air be condenſed, the *ſound* will be louder proportionably to the condenſation, or quantity of air crouded in: of which we have many inſtances in Mr. Hauksbee's experiments; and this does not only ſucceed in forced rarefactions, &c. but in ſuch alſo, as are natural; as is evident from Fredlicius's ſtory of his journey to the top of mount Carpates in Hungary.

But it is not the air alone, that is capable of the impreſſions of *ſound*; but water alſo; as is manifeſt, by ſtriking a bell under water, the *ſound* of which may plainly enough be heard, only not ſo loud, and alſo a fourth deeper, by the ear of ſome good judges in muſical notes. Indeed Merſenne ſays, a *ſound* made under water, is of the ſame tone or note, as if made in air, and heard under water.

The velocity of *ſound* is variouſly reported by various authors.—Sir Iſaac Newton makes its progreſs, in a ſecond of time, to be 968 feet; the honourable Mr. Francis Roberts 1300 feet; Mr. Boyle 1200 feet; Dr. Walker 1338 feet; Merſenne 1474 feet; Mr. Flamſteed and Dr. Halley 1142 feet; the Florentine academy 1148 feet; the royal academy of Paris, 1172. The reaſon of which variety, Mr. Derham aſcribes partly to ſome of thoſe gentlemen uſing ſtrings and plummets inſtead of regular pendulums; partly to there not being diſtance enough between the ſonorous body and the place of obſervation; and partly, to there being no regard had to the winds.

Some of the moſt conſiderable queries, relating to the laws of *ſounds*, the ſame author propoſes; and anſwers ſeveral of them accurately, from experiments made for that purpoſe by himſelf, as follows:

How far does a *ſound* move in a ſecond of time?—*Sound* moves 1142 ſeconds in a ſecond, which is juſt an Engliſh mile in 9¼ or 9.25 half ſeconds; two miles in 18½; three miles in 27¾, &c.

Does the report of a gun, diſcharged with its mouth towards us, come ſooner than when the muzzle is from the obſerver?—By repeated experiments, it appears, there is no difference in the *ſound*, from this different direction.

Do *ſounds* move in the ſame time, the ſame ſpaces, in all ſtates of the atmoſphere, and heights of the barometer, by day and by night, in ſummer and in winter, in ſnowy and in clear weather, in this or that climate?—By repeated experiments, it does not appear there ariſes any difference from any of theſe different circumſtances.

Do the winds affect the motion of *ſounds*?—By repeated experiments, it appears, there is ſome, though a very ſmall difference in the velocity of *ſounds*, with or againſt the wind; which is alſo augmented, or diminiſhed, by the ſtrength or weakneſs of the wind.

Do a great and intenſe *ſound*, and a ſmall or languid one, move with the ſame velocity?—It appears that they do.

Does the *ſound* of a gun move equally ſwift at all elevations of the gun?—It does.

Do different quantities or ſtrength of gun-powder, occaſion any difference, as to the velocity of the *ſound*?—None.

Does *ſound* move in a right line, the neareſt way; or does it ſweep along the earth's ſurface? And is there any difference in the time, if the piece be diſcharged in an acclive and a declive poſition?—*Sound* moves the neareſt way; and the velocity appears to be the ſame in acclivities as in declivities.

Have all kinds of *ſounds*, as thoſe of guns, bells, &c. the ſame velocity? And are *ſounds* equally ſwift in the beginning of their motion, and in the end?—There appears no inequality in either of theſe reſpects.

For the *reflection*, *refraction*, &c. of ſound; ſee ECHO and PHONICKS.

Articulate SOUNDS. See the article ARTICULATE.

SOUND, in muſic, denotes a quality in the ſeveral agitations of the air, conſidered as their diſpoſition, meaſure, &c. may make muſic or harmony. See MUSIC and HARMONY.

Sound is the object of muſic; which is nothing but the art of applying *ſounds*, under ſuch circumſtances of tone and time, as to raiſe agreeable ſenſations. See TUNE, &c.

The principal affection of *ſound*, whereby it becomes fitted to have this end; is that, whereby it is diſtinguiſhed into *acute*, and *grave*. See GRAVITY, &c.

This difference depends on the nature of the ſonorous body; the particular figure and quantity thereof; and even, in ſome caſes, on the part of the body where it is ſtruck; and is that which conſtitutes what we call *different tones*. See TONE.

The cauſe of this difference appears to be no other than the different velocities of the vibrations of the *ſounding* body. In effect, the tone of a *ſound*, is found, by abundance of experiments, to depend on the nature of thoſe vibrations, whoſe differences we can conceive no otherwiſe, than as having different velocities: and ſince it is proved, that the ſmall vibrations of the ſame chord, are all performed in equal time; and that the tone of a *ſound*, which continues for ſome time after the ſtroak, is the ſame from firſt to laſt: it follows, that the tone is neceſſarily connected with a certain quantity of time in making each vibration, or each wave; or that a certain number of vibrations or waves, accompliſhed in a given time, conſtitute a certain and determinate tone.—From this principle, are all the phænomena of *tune* deduced. See TUNE.

From the ſame principle, ariſe what we call *concords*, &c. which are nothing but the reſults of frequent unions and coincidences of the vibrations of two ſonorous bodies, and conſequently of the waves and undulating motions of the air, occaſioned thereby. See CONCORD.

On the contrary, the reſult of leſs frequent coincidences of thoſe vibrations, is what we call a *diſcord*. See DISCORD.

Another conſiderable diſtinction of SOUNDS, with regard to muſic, is that, whereby they are denominated *long* and *ſhort*; not with regard to the ſonorous body's retaining a motion once received, a longer or a leſs time, though gradually growing weaker, but to the continuation of the impulſe of the efficient cauſe on the ſonorous body, for a longer or a ſhorter time, as in the notes of a violin, &c. which are made longer and ſhorter, by ſtrokes of different length or quickneſs.

This continuity, is, properly, a ſucceſſion of ſeveral *ſounds*, or the effect of ſeveral diſtinct ſtrokes, or repeated impulſes on the ſonorous body, ſo quick, that we judge it one continued *ſound*; eſpecially if it be continued in the ſame degree of ſtrength; and hence ariſes the doctrine of *meaſure* and *time*. See TIME.

Sounds, again, are diſtinguiſhed, with regard to muſic, into *ſimple* and *compound*; and that two ways.—In the firſt, a *ſound*

ſound is ſaid to be *compound*, when a number of ſucceſſive vibrations of the ſonorous body and the air, come ſo faſt upon the ear, that we judge them the ſame continued *ſound*; as in the phænomenon of the circle of fire, cauſed by putting the fired end of a ſtick in a quick, circular motion: where, ſuppoſing the end of the ſtick in any point of the circle, the idea we receive of it there, continues till the impreſſion is renewed by a ſudden return.

A *ſimple* SOUND, then, with regard to this compoſition, ſhould be the effect of a ſingle vibration, or of ſo many vibrations as are neceſſary to raiſe in us the idea of *ſound*.—In the ſecond ſenſe of compoſition, a *ſimple ſound* is the product of one voice, or one inſtrument, *&c.*

A *compound* SOUND, conſiſts of the *ſounds* of ſeveral diſtinct voices or inſtruments all united in the ſame individual time and meaſure of duration, that is, all ſtriking the ear together, whatever their other differences may be.—But in this ſenſe, again, there is a two-fold compoſition; a natural and artificial one.

The natural compoſition, is that proceeding from the manifold reflexions of the firſt *ſound* from adjacent bodies, where the reflexions are not ſo ſudden, as to occaſion echo's; but are all in the ſame tune with the firſt note. See RESONANCE.

The artificial compoſition, which alone comes under the muſician's province, is, that mixture of ſeveral *ſounds*, which being made by art, the ingredient *ſounds* are ſeparable, and diſtinguiſhable from one another.—In this ſenſe, the diſtinct *ſounds* of ſeveral voices or inſtruments, or ſeveral notes of the ſame inſtrument, are called *ſimple ſounds*; in contradiſtinction to the *compound* ones, wherein, to anſwer the end of muſic, the ſimples muſt have ſuch an agreement in all relations, chiefly as to acuteneſs and gravity, as that the ear may receive the mixture with pleaſure. See COMPOSITION.

Another diſtinction of SOUNDS, with regard to muſic, is that, whereby they are ſaid to be *ſmooth* and *even*, or *rough* and *harſh*, alſo *clear* and *hoarſe*; the cauſe of which differences, depends on the diſpoſition and ſtate of the ſonorous body, or the circumſtances of the place: but the ideas of the differences muſt be ſought from obſervation.

Smooth and *rough ſounds* depend, principally, on the *ſounding* body; of theſe we have a notable inſtance in ſtrings that are uneven, and not of the ſame dimenſion or conſtitution throughout.

M. Perrault, to account for roughneſs and ſmoothneſs, maintains, there is no ſuch thing as a ſimple *ſound*; but that the *ſound* of the ſame chord or bell, is a compound of the *ſounds* of the ſeveral parts of it; ſo that where the parts are homogeneous, and the dimenſions, or figure uniform, there is always ſuch a perfect mixture and union of all the *ſounds*, as makes one uniform and ſmooth *ſound*: contrary conditions, produce harſhneſs. In effect, a likeneſs of parts and figure, makes an uniformity of vibrations, whereby a great number of ſimilar and coincident motions conſpire to fortify and improve each other, and unite, for the more effectual producing of the ſame effect.

This account he confirms, from the phænomenon of a bell, which differs in tone, according to the part it is ſtruck in; and yet ſtrike it any where, there is a motion over all the parts. Hence, he conſiders the bell as compoſed of an infinite number of rings, which, according to their different dimenſions, have different tones; as chords of different lengths have; and when ſtruck, the vibrations of the parts immediately ſtruck, ſpecify the tone, being ſupported by a ſufficient number of conſonant tones in other parts. This muſt be allowed, that every note of a ſtringed inſtrument, is the effect of ſeveral ſimple *ſounds*: for there is not only the *ſound* reſulting from the motion of the ſtring; but that from the motion of the parts of the inſtrument, which has a conſiderable effect in the total *ſound*, as is evident from hence, that the ſame ſtring on different violins, *ſounds* very differently.

But Perrault affirms the ſame of every ſtring in itſelf, and without conſidering the inſtrument. Every part of the ſtring, he ſays, has its particular vibrations, different from the groſs and ſenſible vibrations of the whole; and theſe are the cauſes of different motions and *ſounds* in the particles, which uniting, compoſe the whole *ſound* of the ſtring, and make an uniform compoſition, wherein the tone of the particular part ſtruck, prevails; and all the others mix under a due ſubordination with it, ſo as to make the compoſition ſmooth and agreeable. If the parts be unevenly, or irregularly conſtituted, the *ſound* is harſh; which is the caſe in what we call *falſe ſtrings*, and various other bodies; which, for this reaſon, have no certain and diſtinct tone, but a compoſition of ſeveral tones, which do not unite and mix, ſo as to have one predominant, to ſpecify the total one.

As to clear and *hoarſe ſounds*, they depend on circumſtances that are accidental to the ſonorous body: thus a voice or inſtrument will be hollow and hoarſe, if raiſed within an empty hogſhead; that yet is clear and bright out of it: the effect is owing to the mixture of other and different *ſounds*, raiſed by reflexion, which corrupt and change the ſpecies of the primitive *ſound*.

For *ſounds* to be fit to obtain the end of muſic, they ought to be ſmooth and clear, eſpecially the firſt; ſince without this, they cannot have one certain and diſcernible tone, capable of being compared to others, in a certain relation of acuteneſs, of which the ear may judge; and of conſequence can be no part of the object of muſic.

Upon the whole, then, with Mr. Malcolm, we call that an *harmonic* or *muſical ſound*, which being clear and even, is agreeable to the ear, and gives a certain and diſcernible tune; (hence called *tunable ſound*) which is the ſubject of the whole theory of harmony. See HARMONY.

Harmonical SOUND. See the article HARMONY.

SOUND, in geography, denotes a ſtreight, or inlet of the ſea, between two capes or head-lands. See STREIGHT.

The SOUND is uſed, by way of eminence, for that famous ſtreight, which joins the German ſea to the Baltic.

It is ſituate between the iſland of Zealand and the coaſt of Schonen. It is about ſixteen leagues long, and generally five broad, excepting againſt the caſtle of Cronenberg, where it is but one: ſo that there is no paſſage for veſſels, but under the cannon of the fortreſs.

This has given occaſion to the Danes to ſettle a toll on all veſſels, which is ſaid to be one of the beſt revenues of the crown of Denmark; and to forbid all pilots from paſſing through the great and little belt, which are two other inlets into the Baltic, though ſomewhat leſs commodious than the former.

All nations who traffic into this part of the North, are ſubject to this right; the Swedes, indeed, were exempted from it by the treaty of 1644; but by the treaty of 1720, they are excluded the privilege; and put on the ſame footing with their neighbours.

By the treaty of Spire made between the Danes and Charles V. the toll for this paſſage was fixed at two roſe nobles for a ſhip of 200 tuns: yet in the year 1640 the ſame was riſen to upwards of 500 rix dollars.

The connivance of our King James I. who had married a daughter of Denmark, and the wars which the Hollanders had been long engaged in for their liberty, furniſhed the occaſion for ſo grievous an exaction.—Of late years the toll has been reduced to an eaſier footing.

Cromwell was bent on extorting this paſſage from the Danes; and had, probably, effected it, but that ere the fleet he ſent for the purpoſe arrived there, he died.

The origin and progreſs of this impoſition (which from an eaſy contribution voluntarily paid by merchants for maintaining lights on certain places of the coaſt, and whereof the K. of Denmark was only treaſurer or truſtee, grew at length to be a heavy burthen on trade, as well as a kind of ſervile acknowledgment of his ſovereignty of theſe ſeas) is given in the account of Denmark, c. 3. p. 11. *ſeqq.*

SOUND-BOARD, the principal part of an organ, and that which makes the whole machine play. See ORGAN.

The *ſound-board* or *ſummer*, is a reſervoir, into which the wind drawn in by the bellows, is conducted by a port-vent, and hence diſtributed into the pipes placed over the holes of its upper part. This wind enters them by valves, which open by preſſing upon the ſtops or keys, after drawing the regiſters, which prevent the air from going into any of the other pipes, but thoſe it is required in.

Organs, whoſe longeſt blind pipes are four foot, have their *ſound-board* from five to ſix feet. Organs of 16 feet have two *ſound-boards*, which communicate the wind from one to the other, by a pewter port-vent.

SOUNDING, in navigation, the act of trying the depth of the water, and the quality of the bottom, by a line and plummet, or other artifice.

There are two kinds of lines occaſionally uſed in *ſounding* the ſea; the *ſounding line* and the *deep ſea line*. See DEEP *ſea line*.

The SOUNDING *line*, is the thickeſt and ſhorteſt, as not exceeding 20 fathom in length; and marked at two, three, and four fathoms, with a piece of black leather between the ſtrands; and at five, with a piece of white leather.

The *ſounding line* may be uſed when the ſhip is under ſail, which the deep ſea-line cannot.—The plummet is uſually in form of a nine-pin, and weighs 18 pounds; the end is frequently greaſed, to try whether the ground be ſandy or rocky, *&c.*—Near banks, ſhores, *&c.* they are to be *ſounding* continually.

Dr. Hook has invented a manner of *ſounding* the depth of the deepeſt ſea, without any line; only by a wooden globe, lighter than water, to which, at a little diſtance is a piece of lead or ſtone fixed, by means of a ſpringing wire in the firſt, fitted into a ſtaple in the ſecond. The whole being let gently down, with the ſtone or lead foremoſt, as ſoon as that arrives at the bottom, it will ſtop; but the ball, by the impetus it has acquired in deſcending, will be carried a little lower after the weight is ſtopped; by which means the ſpringing wire will be enabled to fly back, and diſengaging itſelf, will re-aſcend.—By obſerving, then, the time of the ball's ſtay under water by a watch or pendulum, and the help of ſome tables, the depth of the ſea is found.

In ſome experiments made in the Thames with a maple globe, $5\frac{11}{15}$ inches in diameter, and weighing 4 pound and a half, lined with pitch; and a conical weight 11 inches long, the ſharp and downwards; at the depth of 19 feet, there paſſed ſix ſeconds; and at the depth of 10 feet $3\frac{1}{2}$ ſeconds between the immerſion and emerſion of the ball. From theſe numbers given, the depths, at any other ſtays, may be computed by the rule of three.

SOUP*, or SOOP, a kind of pottage made of bread, and broth, or the juice of fleſh, or other matters; uſually ſerved at the beginning of a meal.

[*] The word is French, formed from the Italian *zuppa* or *ſuppa*, of the Latin, *ſapa*, wine boiled away to a third part. Others derive it from the Celtic, *ſuben*, which ſignifies the ſame.

Soup is deemed eſſential to a French dinner. Sometimes they heighten the reliſh by the addition of onions, or leeks, or cabbage, or turnips, *&c.*

SOWING, See SEMINATION and SEMBRADOR.

SOWNE, a term uſed in the exchequer; ſeeming to be a corruption from the French *ſouvenu*, remembred.

Such eſtreats and caſualties as the ſheriff by his induſtry cannot get or levy, are ſaid to be eſtreats that *ſowne* not, that is, are not to be remembred, or are not in demand.—On the contrary, eſtreats that *ſowne*, are ſuch as he may gather. See ESTREAT.

SPA, a town in the biſhoprick of Liege in Germany, famous for its mineral waters. Thoſe of the Pouhon ſpring in *Spa* are preferred, by our chief phyſicians*, to any others in or near the country of Liege; particularly to the waters of Bru; which they complain have been impoſed on the public, to their and their patients frequent diſappointment.

[*] Broxholme, Burton, Hawys, Hollings, Lee, Mead, Pellet, Robinſon, Shadwell, Sloane, Stuart, Weſt: who were pleaſed to recommend Mr. Eyre, for his integrity, as a proper perſon to be entruſted with the patent granted him by the prince and biſhop of Liege, impowering him to impreſs his highneſs's arms in glaſs on the neck of each flaſk, which he ſhould fill with the true Pouhon water.

SPAAD, or SPALT, SPATUM, a ſpecies of Engliſh talc or gypſum; being a white, fibrous, ſcaly, ſhining ſtone, ſometimes uſed to promote the fuſion of metals. See TALC.

It is found pretty frequently in England and Germany; and ſometimes brought from the Levant: the beſt is in long ſcales, very ſoft, and eaſily pulverized.—The Engliſh *ſpalt* is generally very hard.

SPACE, SPATIUM, a ſimple idea, the modes whereof, are diſtance, capacity, extenſion, duration, *&c.* See MODE, EXTENSION, DURATION, *&c.*

Space, conſidered barely in length between any two bodies, is the ſame idea which we have of diſtance. See DISTANCE.

If it be conſidered in length, breadth, and thickneſs, it is properly called *capacity*. See CAPACITY.

When conſidered between the extremities of matter, which fills the capacity of *ſpace* with ſomething ſolid, tangible and moveable, it is then called *extenſion*. See EXTENSION.

So that extenſion is an idea belonging to body only; but *ſpace*, it is plain, may be conſidered without it. See BODY and VACUUM.

Space, therefore, in the general ſignification, is the ſame thing with diſtance conſidered every way, whether there be any ſolid matter in it, or not.

Each different diſtance is a different modification of *ſpace*; and each idea of any different *ſpace*, is a ſimple mode of this idea. Such are an inch, foot, yard, *&c.* which are the ideas of certain ſtated lengths, which men ſettle in their minds for the uſe, and by the cuſtom of meaſuring.—When theſe ideas are made familiar to mens thoughts, they can in their minds repeat them as often as they will, without joining to them the idea of body, and frame to themſelves the ideas of feet, yards, and fathoms, beyond the utmoſt bounds of all bodies; and by adding theſe ſtill to one another, enlarge their idea of *ſpace*, as much as they pleaſe.

From this power of repeating any idea of diſtance, without being ever able to come to an end, we come by the idea of immenſity. See IMMENSE and INFINITE.

Another mode, or modification of *ſpace*, is taken from the relation of the parts of the termination of extenſion, or circumſcribed *ſpace* amongſt themſelves; and this is what we call *figure*.—This, the touch diſcovers in ſenſible bodies, whoſe extremities come within our reach; and the eye takes, both from bodies and colours whoſe boundaries are within its view; where, obſerving how the extremities terminate, either in ſtreight lines, which meet at diſcernible angles; or in crooked lines, wherein no angles can be perceived; by conſidering theſe as they relate to one another in all parts of the extremities of any body or *ſpace*, it acquires the idea we call *figure*: which affords to the mind infinite variety. See FIGURE.

Another mode belonging to this head, is that of *place*. Our idea of is nothing but the relative poſition of any thing, with reference to its diſtance from ſome fixed and certain points: whence we ſay, that a thing has, or has not changed place, when its diſtance either is, or is not altered with reſpect to thoſe bodies, with which we have occaſion to compare it. That this is ſo, we may eaſily gather from hence; that we can have no idea of the place of the univerſe: we can of all its parts. See PLACE.

Another mode of *ſpace*, is the idea which we get from the fleeting, and perpetually periſhing parts of ſucceſſion, which we call *duration*. The ſimple modes of it are any different lengths of it, whereof we have diſtinct ideas, as hours, days, years, *&c.* time, and eternity. The idea of ſucceſſion is got by reflecting on that train of ideas, which conſtantly follow one another in our minds, as long as we are awake. See SUCCESSION.

The diſtance between any parts of this ſucceſſion is what we call *duration*: and the continuation of the exiſtence of ourſelves, or any thing elſe commenſurate to the ſucceſſion of any ideas in our minds, is what we call *our own duration*, or that of another thing co-exiſting with our thinking.

A man having once got this idea of duration, can apply it to things which exiſt while he does not think: and thus we meaſure the time of our ſleep, as well as that wherein we are awake. See DURATION.

Space is uſually divided into *abſolute* and *relative*.

Abſolute SPACE, is that conſidered in its own nature, without regard to any thing external; which always remains the ſame, and is infinite and immoveable.

Relative SPACE, is that moveable dimenſion, or meaſure of the former, which our ſenſes define by its poſitions to bodies within it; and this the vulgar uſe for immoveable *ſpace*.

Relative *ſpace*, in magnitude and figure, is always the ſame with abſolute; but it is not neceſſary it ſhould be ſo numerically: as if you ſuppoſe a ſhip to be, indeed, in abſolute reſt, then the places of all things within her, will be the ſame abſolutely and relatively, and nothing will change its place: but, ſuppoſe the ſhip under ſail, or in motion, and ſhe will continually paſs through new parts of abſolute *ſpace*: but all things on board, conſidered relatively, in reſpect to the ſhip, may be, notwithſtanding, in the ſame places, or have the ſame ſituation and poſition, in regard to one another.

Proper and abſolute motion, is defined to be the application of a body to different parts of abſolute, that is, of infinite and immoveable *ſpace*. See PLACE, MOTION and REST.

The Carteſians, who make extenſion the eſſence of matter, aſſert, that the *ſpace* any body takes up, is the ſame thing with the body itſelf; and that there is no ſuch thing as mere *ſpace*, void of all matter, in the univerſe: but this ſee diſproved under the article VACUUM.

SPACE, in geometry, denotes the area of any figure; or that which fills the interval or diſtance between the lines that terminate it. See AREA and FIGURE.

The *parabolic ſpace*, is that included in the whole parabola. See PARABOLA and PARABOLIC.

The *conchoidal ſpace*, and the *ciſſoidal ſpace*, are what are included within the cavities of the conchoid and ciſſoid.

By the new methods now introduced, of applying algebra to geometry, it is demonſtrated, that the conchoidal and ciſſoidal *ſpaces*, though infinitely extended, are yet finite magnitudes. See CONCHOID and CISSOID.

Cycloidal SPACE, } See the articles { CYCLOIDAL.
Elliptical SPACE, } { ELLIPTICAL.

SPACE, in mechanicks, the line a moveable body, conſidered as a point, is conceived to deſcribe by its motion. See MOTION.

SPADE.—*Turfing* SPADE, } See the articles { TURFING.
SPADING, } { SPAYING.

SPARGYRIC*, an epithet given to chymiſtry; which is called the *ſpagyric art*, or *medicina ſpagyrica*; and to chymical phyſicians, who are alſo called *ſpagyriſts*. See CHYMISTRY and CHYMIST.

[*] Voſſius derives the word from the Greek, σπαν, to extract and αγειρειν, *congregare*, to collect; which are the two principal offices of chymiſts.——Paracelſus firſt introduced the word.

SPAGYRICAL *phyſicians*. See the article PHYSICIAN.

SPAHI'S, horſe-men in the Ottoman army; chiefly raiſed in Aſia.

The great ſtrength of the grand ſeignior's army conſiſts in the janizaries, who are the foot, and the *ſpahi's*, who are the horſe. See JANIZARY, *&c.*

The aga or commander of the *ſpahi's*, is called *ſpahi agaſi*. See AGA.

SPAN, a meaſure taken from the ſpace between the thumb's end, and the tip of the little finger, when both are ſtretched out. See PALM.

The *ſpan* is eſtimated at three hand's-breadths, or nine inches. See MEASURE.

SPANISH, or Spaniſh *language*. See Language.

Spaniſh *black*,	See the articles	Black.
Spaniſh *coinage*,		Coinage.
Spaniſh *coins*,		Coin.
Spaniſh *epocha*,		Epocha.
Spaniſh *flies*,		Cantharides.
Spaniſh *inquiſition*,		Inquisition.
Spaniſh *meaſures*,		Measure.
Spaniſh *money*,		Money.
Spaniſh *order*,		Order.
Spaniſh *plough*,		Plough.
Spaniſh *academy*,		Academy.
Spaniſh *ſilks*,		Silk.
Spaniſh *wax*,		Wax.
Spaniſh *white*,		White.

SPAR, in natural hiſtory, a ſhining, ſtony, mixt ſubſtance, compounded of cryſtal, incorporated with lac lunæ, or other mineral, earthy, ſtony, or metallic matter; frequently found in caves and grotto's, and in the clefts of rocks, lead-mines, *&c.* See Stone, Grotto, Mineral, Crystal, *&c.*

Mr. Beaumont, in the Philoſophical Tranſactions, endeavours to account for the origin and growth of *ſpar*; which he makes to be a kind of rock-plant.

Spar, he obſerves, may be formed three ways; either from ſteams alone; or from ſteams coagulating dew, as it falls on the ground, or waters iſſuing from the joints of rocks: or, it may grow from earths and clays. To ſay nothing of the account we have from Switzerland, *viz.* that ſnow, by long lying and continual froſts, becomes hardened into *ſpar*.

We have inſtances of the firſt kind in many grotto's where *ſpars* produced from ſteams, hang like icicles; lead ore being often found to grow in the ſame manner. And as this *ſpar* grows downwards; ſo in many places, from the ſides of it, iſſue little plants of *ſpar*, ſhooting upwards, contrary to the tendency of the others. An inſtance of the ſecond, we have in a certain place in Italy, where cryſtals (which are a ſort of *ſpars*) are produced in clear evenings, from a coagulation of dew falling on nitrous ſtones. But hereof we have inſtances enough nearer home. See Stalactites.

For the third kind of generation of *ſpar*, never before taken notice of by naturaliſts; Mr. Beaumont gives us inſtances of it in Mendip hills, and other mines, wherein are ſubterraneous vaults or grotto's. In the bottoms of ſome of theſe, is a ſteam incumbent thereon. From this earth, ſhoot up ſpires of various heights, *&c.* from the firſt buddings out of it, till it become as high as a man's finger; the biggeſt ordinarily an inch in diameter. Theſe ſpires have all irregular ridges and furrows; and ſome ſooner, ſome later, begin on the tops to be congealed into *ſpar*; and ſo gathering a cruſt downwards by degrees, are all at laſt, turned into an abſolute white *ſpar* or ſtone. See Petrifaction.

SPARADRAP, Sparadrapum, in pharmacy, *&c.* an ancient name for a kind of ſear-cloth; or a linen cloth ſmeared on both ſides with ſome kind of plaiſter, or unguent. See Sear-cloth and Cerate.

The *ſparadrap* is ſometimes alſo called *tela Gualteriana*, or *tela Gualteri*; ſometimes, *tela implaſtica*.

It is prepared by melting a ſufficient quantity of ſome plaiſter or unguent, and dipping a linen cloth therein, till ſuch time as it have imbibed its fill. It is then taken out, cooled and poliſhed on a marble.

There are as many different kinds of *ſparadraps*, as there are of plaiſters for the cloth to be dipped in.

SPARRING, among cock-fighters, is the fighting a cock with another to breathe him.—In *ſparring*, they put hots on their ſpurs, that they may not hurt one another.—To *ſpar the cock*, imports in general, to breathe him, in order to embolden him to fight.

SPASM, Spasma, or Spasmus, ΣΠΑΣΜΑ, or ΣΠΑΣΜΟΣ, a Greek term, of equal import with the Latin, *convulſio*, and Engliſh, *convulſion*. See Convulsion.

A *ſpaſmus* happening after the taking of hellebore, or any other violent purgative, is mortal.—There are *ſpaſms* peculiar to certain members, and diſtinguiſhed by particular names: that of the mouth is called *ſpaſmus cynicus*; that of the penis, *ſatyriaſis*, &c. See Priapismus, Cynicus, *&c.*

Cardan diſtinguiſhes two kinds of *ſpaſms:* the firſt conſiſting in a conſtant contraction of the muſcles, which render the members rigid, and inflexible. The ſecond, in ſudden, unnatural motions and palpitations, frequently intermitting and beginning again.

Accidental *ſpaſms* are of ſhort continuance: there are ſome ariſing from flatulencies; others from bites of venomous beaſts, from the puncture of a nerve, the acrimony of the humours vellicating the ſtomach, exceſſive cold, hyſteric vapours, *&c.*

SPASMODIC, ſomething belonging to a *ſpaſm*, or convulſion; as a *ſpaſmodic medicine*, *ſpaſmodic diſeaſe*, &c. See Spasm and Convulsive.

Hunger, according to M. Hecquet, is a *ſpaſmodic* affection of the fibres of the ſtomach; unleſs it ariſe from the fibres being too much moiſtened by the liquor thereof, ſo as to incapacitate them for their office. See Hunger.

SPATULA*, or Spathula, an inſtrument uſed by ſurgeons, and apothecaries; made flat at one end, and round at the other: ſerving to ſpread their plaiſters, and unguents withal.

* The word is formed from the Latin, *ſpatha*, of the Greek, σπαθιον, which ſignifies the ſame.

The ſurgeons have little ſteel *ſpatula's*.—The apothecaries have alſo large ones of wood, to ſtir their drugs in diluting, tempering, or boiling them.

SPAVIN*, a diſeaſe in a horſe; being a ſwelling, or ſtiffneſs uſually in the ham, which cauſes him to halt.

* The word is formed from the French, *eſparvin*, which ſignifies the ſame.

There are two kinds of *ſpavins*, viz. the

Ox-Spavin, which is a callous tumour, at the bottom of the ham, on the inſide; hard as a bone, and very painful.—While it is yet young, ſome horſes only halt with it, at the firſt coming out of the ſtable.

Dry-Spavin, which is more eaſily perceived by the horſe's raiſing one of his hind-legs, with a twitch, higher than the other: ſometimes it is found on both legs.

This kind, which ſome alſo call *ſtring-halt*, frequently degenerates into the *ox-ſpavin*; for which there is no remedy, but to apply the fire; which, however, is not always ſucceſsful. See Stringhalt.

There are two other kinds of *ſpavin*, which have their ſeat in the hoof, *viz.* the

Blood Spavin, a ſoft tumour which grows through a horſe's hoof, and is uſually full of blood.

Bone Spavin, a cruſty ſubſtance growing on the inſide of the hoof under the joint.

SPAWS, mineral waters ariſing out of the earth; tinged with nitre, ſulphur, allum, bitumen, copperas, or other mineral matter in paſſing through the ſtrata thereof; and hence endued with ſome medicinal qualities, cathartic, diuretic, emetic, alterant, or the like. See Spa, Water, Spring, Mineral, *&c.*

SPAYING, or Spading, the operation of caſtrating the females of ſeveral kinds of animals, as ſows, bitches, *&c.* to prevent any further conception, and promote their fattening. See Castration.

It is performed, by cutting them in the mid flank, on the left ſide, with a ſharp knife or lancet, taking out the uterus and cutting it off, and ſo ſtitching up the wound, anointing the ſore with tar, and keeping the animal warm for two or three days.

The uſual way, is to make the inciſion a-ſlope, two inches and a half long, that the fore-finger may be put in towards the back, to ſeel for the ovaries, which are two kernels as big as acorns on both ſides the uterus, one of which is drawn to the wound, the ſtring thereof cut, and thus both taken out.

SPEAKER *of the houſe of commons*, a member of the houſe elected by a majority of the votes thereof, to act as chairman, or preſident, in putting queſtions, reading briefs or bills, keeping order, reprimanding the refractory, adjourning the houſe, *&c.* See Commons.

The firſt thing done by the commons upon the firſt meeting of a parliament, is to chuſe a *ſpeaker*; who is to be approved of by the king; and who upon his admiſſion, begs his majeſty, that the commons, during their ſitting, may have *free acceſs to his majeſty*; *freedom of ſpeech in their own houſe*, and *ſecurity from arreſts*.

The *ſpeaker* is not allowed to perſuade or diſſuade, in paſſing of a bill; but only to make a ſhort and plain narrative; nor to vote, unleſs the houſe be equally divided. See Parliament.

The lord chancellor, or keeper, is uſually *ſpeaker of the houſe of lords*. See Chancellor.—The *ſpeaker of the convocation*, is called the *prolocutor*. See Prolocutor.

SPEAKING, the art or act of expreſſing one's thoughts in articulate ſounds or words. See Word and Voice; ſee alſo Speech and Grammar.

Pliny, Ælian, Plutarch and other authors, make mention of ſeveral beaſts that have *ſpoke:* and Pliny himſelf, ſpeaks with aſſurance, in his hiſtory, of an ox that *ſpoke*. Philoſtratus, in his life of Apollonius, gives the like privilege to an elm, and even to ſhips. Homer makes Xanthos, one of Achilles's horſes, ſpeak; wherein he has been followed by Oppian. But theſe are all fabulous: we have much better authority for a ſerpent, and an aſs's *ſpeaking*. See Language.

Speaking-*trumpet*. See Trumpet and Stentorophonic.

SPECIAL, ſomething that is particular, or has a particular deſignation; from the Latin, *ſpecies*.—In oppoſition to *general*, of *genus*. See General, Particular, Species and Genus.

The king in his letters, frequently ſays, of our *ſpecial grace*, full power and royal authority.

Special *aſſiſe*,	See the articles	Assise.
Special *attorney*,		Attorney.
Special *fee tail*,		Fee *tail*.
Special *iſſue*,		Issue.

SPECIAL *tail*. See the article TAIL.

SPECIAL *verdict*, &c. See the article VERDICT.

SPECIALTY, in law, is moſt commonly taken for a bond, bill, or other the like inſtrument in writing. See DEED, WRITING, &c.

Sometimes it is alſo uſed for a ſpecial or particular acquaintance.

SPECIES, an idea, which relates to ſome other more general one; or is comprized under a more univerſal diviſion of a genus. See GENUS.

The word is Latin, formed from the ancient verb, *ſpecio*, I ſee; as if a *ſpecies* of things were a collection of all the things ſeen at one view.

Species is a mere term of relation: and the ſame idea may be a *ſpecies*, when compared to another more general one; and a genus, with regard to a more particular one.—Thus body is a genus, with regard to an animate and inanimate body; and a *ſpecies*, with regard to ſubſtance.

The laſt *ſpecies*, is that which can only be divided into individuals. See INDIVIDUAL.

Animal is a *ſpecies*, with regard to body; and man is a *ſpecies* with regard to animal. God deſtroyed mankind by the deluge; but he preſerved the *ſpecies*. See DELUGE.

SPECIES, in logic, is one of the five words, called by Porphyry, *univerſals*. See UNIVERSAL.

SPECIES, in rhetoric, is a particular thing, contained under a more univerſal one.

The orators alſo call it *hypotheſis*: *E. gr.* virtue is to be loved, is the *genus* or *theſis*. Temperance is to be preſerved here, at this time, is the *ſpecies* or *hypotheſis*. See THESIS.

SPECIES, in the ancient muſic, denotes a ſub-diviſion of one of the genera. See GENUS.

The genera of muſic were three, the *enharmonic*, *chromatic*, and *diatonic*: the two laſt of which were variouſly ſubdivided into *ſpecies*: nor was the firſt without *ſpecies*, though thoſe had not particular names as the *ſpecies* of the other two had.—Theſe *ſpecies* were alſo called the *chroai*, colours of the genera.

SPECIES, in opticks, the image painted on the retina by the rays of light reflected from the ſeveral points of the ſurface of an object, received in at the pupilla, and collected, in their paſſage through the cryſtallin, &c. See VISION.

Philoſophers have been in great doubt, whether the *ſpecies* of objects, which give the ſoul an occaſion of ſeeing, are an effuſion of the ſubſtance of the body; or a mere impreſſion which they make on all ambient bodies, and which theſe all reflect, when in a proper diſtance and diſpoſition; or, laſtly, whether they are not ſome other more ſubtile body, as light, which receives all theſe impreſſions from bodies, and is continually ſent and returned from one to another, with the different figures and impreſſions it has taken.—But the moderns have decided this point by their invention of artificial eyes, wherein the *ſpecies* of objects are received on a paper or linen cloth in the ſame manner as they are received in the natural eye. See EYE.

The ancients have diſtinguiſhed the *ſpecies*, whereby objects become viſible, into *impreſſæ* and *expreſſæ*.

Impreſſed SPECIES, are ſuch, as come from without; or are ſent from the object to the organ: ſuch are thoſe we have already been ſpeaking of.

Expreſſed SPECIES, are thoſe, on the contrary, which proceed from within; or that are ſent from the organ to the object.

Le Clerc, in his ſyſtem of viſion, by one of thoſe revolutions very frequent in philoſophical opinions, has called upon the ſtage again the *ſpecies expreſſæ*, of the ancient philoſophers. For, according to him, it is not by *ſpecies* or images impreſſed on the optic nerve, that the ſoul ſees objects; but by rays, which ſhe herſelf directs to them, and which ſhe uſes as a blind man does his ſtaff, to grope out objects.

The Peripateticks account for viſion, from a kind of *intentional* SPECIES, thus: every object, ſay they, expreſſes a perfect image of itſelf on the air next to it. This expreſſes another leſſer one on the air next to that; and this a third ſtill leſs. Thus are the images continued from the object to the cryſtallin, which theſe philoſophers hold the principal organ of ſeeing. Theſe they call *ſpecies intentionales*; and to account the better for their generation, affirm, that objects exhibit them in the ſame manner, as mirrors do a man's face. See VISION.

SPECIES, in theology, denotes the appearances of the bread and wine in the ſacrament, after conſecration.—Or, as the Romaniſts define them, the accidents remaining in the bread and wine, whereby they become ſenſible to us, after their ſubſtance is deſtroyed. See TRANSUBSTANTIATION.

The *ſpecies* of the bread, &c. are its whiteneſs, quantity, figure, friableneſs, &c.—Of wine, its flavour, quickneſs, ſpecific gravity, &c.

The generality of Romiſh divines, hold, that the *ſpecies* are abſolute accidents.—And the Carteſians, who are bound to deny any ſuch things as abſolute accidents, are greatly puzzled to explain the *ſpecies*, without incurring the cenſure of hereſy. F. Magnan is forced to aſſert, that the *ſpecies* are mere deluſions and appearances, which God impreſſes on our ſenſes. See *abſolute* ACCIDENT.

SPECIES, in commerce, are the ſeveral pieces of gold, ſilver, copper, &c. which having paſſed their full preparation, and coinage, are current in public. See COIN.

SPECIES *decried*, or *cried down*, are ſuch as the ſovereign has forbidden to be received in payment.

Light SPECIES, are thoſe which fall ſhort of the weight preſcribed by law.

Falſe SPECIES, are thoſe of different metal or alloy from what they ſhould be, &c.

SPECIES, in algebra, are the ſymbols, or characters, whereby quantities are repreſented. See CHARACTER.

SPECIFIC, in philoſophy, that which is proper and peculiar to any thing; or that characterizes it, and diſtinguiſhes it from every other thing. See PROPER, &c.

Thus the attracting of iron is *ſpecific* to the load-ſtone, or a *ſpecific* property of the load-ſtone: a juſt definition ſhould contain the *ſpecific* notion of the thing defined, or that which ſpecifies and diſtinguiſhes it from every thing elſe. See DEFINITION.

SPECIFIC, in medicine, a remedy, whoſe virtue and effect is peculiarly adapted to ſome certain diſeaſe; is adequate thereto; and exerts its whole force immediately thereon.

Thus quinquina, or the Jeſuits bark, is held a *ſpecific* for intermitting fevers or agues; mercury for the venereal diſeaſe, &c. See QUINQUINA.

Authors make mention of three kinds of *ſpecific* medicines.—1°. Such as are eminently and particularly friendly to this or that part; as to the heart, the lungs, the brain, the ſtomach, &c.

2°. Such as ſeem to attract, expel, or evacuate ſome determinate humour, by a kind of ſpecific power they are endowed withal; as jalap is ſuppoſed to purge watery humours; rhubarb, bile, &c. See PURGATIVE.

3°. Such as remove the cauſe of a diſeaſe, by ſome ſudden property, without our knowing how or why; or the manner of whoſe operations we are intirely ignorant of, and have only learnt their effects by experience.

In the uſe of theſe laſt, there is no enquiry into the nature of the diſeaſe; no regard had to the ſymptoms or phænomena: nor is the medicine to be at all adapted to the particular circumſtances thereof. All that we regard, is the name of the diſeaſe, and that of the remedy: as, immediately, upon finding an intermitting fever, we preſcribe the bark; to aſſuage pain, opium; to expel poiſon, ſome particular antidote.

On this footing, a *ſpecific* medicine ſeems to ſtand in oppoſition to a *ſcientific*, or *methodic* medicine. See MEDICINE.

The mild operation of ſome alterant medicines by inſenſible perſpiration, ſweat and urine, may have led ſome men into this notion of *ſpecific* alteratives, or the tranſmutation of poiſonous into innocent juices. Phyſicians are apt to think they cure diſeaſes ſpecifically, when they do not bleed, purge, vomit, or ſalivate. But it is certain, mercury when it cures the lues without ſalivation, does not act ſpecifically any more than when the higheſt ſalivation is raiſed by it; when it does not ſalivate, it infallibly and ſenſibly paſſes off by the cutaneous and venal glands.

Several mineral and metalline ſubſtances, eſpecially the compoſitions of ſulphur and mercury, as the æthiops and cinnabar, may indeed cure many diſeaſes; but then they do it by acting as evacuants, by attenuating, diſſolving, and carrying off the viſcid concretions and foulneſſes of the ſtomach and inteſtines, and thus cleanſing the foul paſſages, and reſtoring them to their natural action: not by any alterative or *ſpecific* operation.

SPECIFIC *waters*. See the article WATER.

SPECIFIC *gravity*, in hydroſtaticks, denotes that gravity, or weight peculiar to each ſpecies, or kind of natural body; and whereby it is diſtinguiſhed from all other kinds. See WEIGHT.

In this ſenſe, a body is ſaid to be *ſpecifically heavier* than another, when under the ſame bulk it contains a greater weight than that other; and that other, is ſaid to be *ſpecifically lighter* than the firſt.—Thus, if there be two equal ſpheres, each a foot in diameter; only the one wood, the other lead: ſince the leaden one is found heavier than the wooden one, it is ſaid to be *ſpecifically* or in *ſpecie*, *heavier*; and the wooden one, *ſpecifically lighter*.

This kind of gravity, ſome call *relative*; in oppoſition to *abſolute gravity*, which increaſes in proportion to the quantity or maſs of the body. See GRAVITY.

Laws of the SPECIFIC *gravity and levity of bodies*.—1. If two bodies be equal in bulk, their *ſpecific gravities* are, to each other, as their abſolute gravities. Thus a body is ſaid to be twice as heavy, *ſpecifically*, as another, if it have twice its gravity under the ſame bulk.

Hence, the *ſpecific* gravities of equal bodies, are as their denſities. See DENSITY.

2. The *ſpecific* gravities of bodies of the ſame weight, are in the reciprocal ratio of their bulks. Hence, the maſſes of two bodies of the ſame weight, are in a reciprocal ratio of their bulks.

3. The *ſpecific* gravities of two bodies are, in a ratio, compounded of the direct ratio of the abſolute gravities, and the

reciprocal one of their bulks.—Hence, again, the *ſpecific* gravities are as the denſities.

4. A body *ſpecifically* heavier than a fluid, loſes ſo much of its weight therein, as is equal to a quantity of the fluid of the ſame bulk.

For, ſuppoſe a cubic inch of lead immerged in water: a cubic inch of water will, thereby, be expelled from its place: but the weight of this water was ſuſtained by the reſiſtance of the ambient water. Therefore, ſuch a part of the weight of the leaden cube, muſt be ſuſtained by the reſiſtance of the ambient water, as is equal to the weight of the water expelled. The gravity of the body immerged, therefore, muſt be diminiſhed by ſo much.

Hence, 1°. Since a fluid *ſpecifically* heavier, has a greater weight, in the ſame bulk, than a lighter; the ſame body will loſe a greater part of its weight in a fluid, *ſpecifically* heavier, than in the lighter: and therefore it weighs more in a lighter than a heavier.

2°. Equal homogeneous bodies weighing equally in air, loſe their equilibrium if one of them be immerged in a heavier fluid; the other in a lighter.

3°. Since the *ſpecific* gravities are as the abſolute gravities under the ſame bulk; the *ſpecific* gravity of the fluid, will be to the gravity of the body immerged, as the part of the weight loſt by the ſolid, to the whole weight.

4°. Two ſolids equal in bulk, loſe the ſame weight in the ſame fluid: but the weight of the *ſpecifically* heavier body, is greater than that of the *ſpecifically* lighter; therefore, the *ſpecifically* lighter, loſes a greater part of its weight, than the *ſpecifically* heavier.

5°. Since the bulks of bodies equal in weight, are reciprocally as the *ſpecific* gravities; the *ſpecifically* lighter, loſes more weight in the ſame fluid than the heavier; wherefore, if they be in *equilibrio* in one fluid, they will not be ſo in another; but the *ſpecifically* heavier, will preponderate, and that the more, as the fluid is denſer.

6°. The *ſpecific* gravities of fluids, are as the weights loſt by the ſame ſolid immerged in the ſame.

To find the SPECIFIC *gravity of a fluid.*—On one arm of a balance ſuſpend a leaden globe; and to the other, faſten a weight, which is in *equilibrium* therewith in the air. Immerge the globe ſucceſſively in the ſeveral fluids, whoſe *ſpecific* gravities are to be determined, and obſerve the weight which balances it in each. Theſe ſeveral weights, ſubtracted, ſeverally, from the firſt weight, the remainders are the parts of the weight loſt in each fluid. Whence the ratio of the *ſpecific* gravity of the fluids is ſeen. See HYDROSTATICAL *balance.*

Hence, as the denſities are as the *ſpecific* gravities; we find the ratio of the denſities of the fluids at the ſame time.

This problem is of the utmoſt uſe; as by it, the degree of purity or goodneſs of fluids, is eaſily found; a thing, not only of ſervice in natural philoſophy; but alſo in common life, and in the practice of phyſic.

At different ſeaſons of the year, the *ſpecific* gravities of the ſame fluids, are found different. *Joan. Caſp. Eiſenſchmidius*, in his *diſquiſitio nova de ponderibus*, &c. gives us variety of experiments relating hereto: the principal whereof, to ſave the trouble of too frequent experiments, we ſhall here ſubjoin.

Table of SPECIFIC *gravities of ſeveral fluids.*

A cubic inch Paris meaſure.	In ſummer			In winter		
	O.	*D.*	*G.*	*O.*	*D.*	*G.*
Of mercury	7	1	66	7	2	14
Oil of vitriol		7	59		7	71

Spring water		5	11		5	14
Diſtilled water		5	8		5	11

That the *ſpecific* gravity may be found the more accurately; the weight of the thread not immerged in the fluid, is to be ſubtracted from the weight of the ſolid in the air; and the force neceſſary to make the thread ſubſide (if it be *ſpecifically* lighter) is to be added to the weight loſt. But if the thread that ſuſtains the ſolid be heavier than the fluid; the whole weight of the thread in the air is to be ſubtracted from the weight of the ſolid in air; and the weight the thread loſes from the weight loſt in the fluid. Indeed, this precaution may be ſpared, if in examining the *ſpecific* gravity of ſeveral fluids, care be taken that the ſame thread be immerged to the ſame depth in each.

6. To determine the ratio which the *ſpecific* gravity of a fluid has to the *ſpecific* gravity of a ſolid that is ſpecifically heavier than the fluid.

Weigh any maſs of the ſolid in a fluid, and note the juſt weight therein: the *ſpecific* gravity of the fluid will be to that of the ſolid, as the part of the weight loſt by the ſolid, is to its whole weight.

7. The *ſpecific* gravities of equally heavy bodies, are reciprocally as the quantities of weight loſt in the ſame fluid.

Hence we find the ratio of the *ſpecific* gravities of ſolids, by weighing maſſes thereof, that are equal in air, in the ſame fluid; and noting the weights loſt by each.

The *ſpecific* gravities of various ſolids, have been determined by many authors. Marin Ghetaldus, particularly tried the *ſpecific* gravities various bodies had, eſpecially metallic ones; which were borrowed thence by Oughtred. In the Philoſophical Tranſactions, we have ample tables of *ſpecific* gravities, by various authors.

It will be ſufficient for us to give thoſe of ſome of the more uſual bodies, as determined with great care and accuracy by M. Petit; and publiſhed by F. Merſenne; and from him by ſeveral others.

Table of the SPECIFIC *gravities of ſeveral ſolids.*

An hundred pound weight of gold is equal in bulk to

71 $\frac{1}{2}$	of mercury	38 $\frac{1}{4}$	of fine tin
60 $\frac{1}{2}$	of lead	26	of load-ſtone
54 $\frac{1}{2}$	of ſilver	21	of marble
47 $\frac{1}{3}$	of copper	14	of ſtone
45	of braſs	12 $\frac{1}{2}$	of ſulphur
42	of iron	5	of wax
39	of tin	5 $\frac{1}{3}$	of water.

8. A body *ſpecifically* heavier, deſcends in a fluid *ſpecifically* lighter, with a force equal to the exceſs of its weight, over that of an equal quantity of the fluid.

Hence, 1°. The force which ſuſtains a *ſpecifically* heavier body in a fluid, is equal to the exceſs of the abſolute gravity of the body, above that of the fluid, under the ſame bulk: *e. gr.* 47 $\frac{1}{3}$ pound of copper loſſes 5 $\frac{1}{3}$ pounds of its weight in water; therefore a power of 42 pounds is able to ſuſtain it.

2°. Since the exceſs of the weight of a ſolid over the weight of a fluid ſpecifically heavier, is leſs than that over the weight of a ſpecifically lighter fluid under the ſame bulk; it will deſcend with leſs force in a ſpecifically heavier fluid than in a lighter; and, conſequently, will deſcend more ſlowly in the former than in the latter.

9. A ſpecifically lighter body, ſinks in a heavier fluid, till the weight of a quantity of the fluid, equal in bulk to the part immerſed, be equal to the weight of the whole body.

Hence, 1°. Since the *ſpecific* gravities of bodies of the ſame weight, are reciprocally as their bulks; and the bulks of fluids equal in weight, are as the parts of the ſame ſolid immerged therein; the *ſpecific* gravities of fluids are reciprocally as the parts of the ſame body immerged therein.

2°. A ſolid, therefore, immerges deeper in a lighter fluid than a heavier; and deeper as the proportion of the *ſpecific* gravity of the ſolid to that of the fluid is greater.

3°. If a body be of the ſame *ſpecific* gravity with a fluid; the whole body will be immerged; and it will remain in any given place of the fluid.

4°. If a *ſpecifically* lighter body be wholly immerged in a fluid; it will be urged by the collateral columns of the fluid, to aſcend with a force equal to the exceſs of the weight of the fluid, bulk for bulk, over the weight of the ſolid.

5°. A body, therefore, *ſpecifically* lighter, lying on the bottom of a veſſel, will not be raiſed up, unleſs the heavier fluid riſe above ſuch a part, as is equal in bulk to a quantity of the fluid of the ſame weight with the whole ſolid.

10. The *ſpecific* gravity of a ſolid is to the *ſpecific* gravity of a lighter fluid, wherein it is immerged, as the bulk of the part immerged, is to the whole bulk.

11. The *ſpecific* gravities of equal ſolids, are as their parts immerged in the ſame fluid.

12. The weight and bulk of a *ſpecifically* lighter body, and the weight of the *ſpecifically* heavier fluid, being given, to find the force required, to keep the ſolid wholly immerged under the fluid.

As this force is equal to the exceſs of the weight of the fluid, beyond that of an equal bulk of the ſolid; from the given bulk of the ſolid, and the weight of a cubic foot of water, find, by the rule of three, the weight of a bulk of water, equal to that of the body. From this, ſubtract the weight of the ſolid; the remainder is the force required. *E. gr.* Suppoſe the force neceſſary to detain a ſolid eight feet in bulk, and 100 pounds in weight, under water, required: ſince a cubic foot of water is found to weigh 70 pound, the weight of water under the bulk of eight feet, is 560; whence, 100 pound, the weight of the ſolid, being ſubtracted; the remainder 460 pound, is the force neceſſary to detain the ſolid under water.

Hence, ſince a *ſpecifically* lighter body aſcends in a heavier fluid, with the ſame force that would prevent its aſcent: by the preſent problem, we can likewiſe find the force wherewith a *ſpecifically* lighter body aſcends in a heavier.

13. The weight of a veſſel, to be made of a *ſpecifically* heavier matter; and that of a *ſpecifically* lighter fluid, being given: to determine the cavity the veſſel muſt have, to ſwim on the fluid.

The weight of a cubic foot of the fluid being given; the bulk of the fluid equal to the weight of the veſſel, is found by the rule of three. If, then, the cavity be made a little bigger than this, the veſſel will have leſs weight under the ſame bulk, than the fluid, and will therefore be *ſpecifically* lighter than the ſame, and conſequently, will ſwim. *E. gr.* Suppoſe it required to make an iron ball of 30 pounds weight, ſo as ſhall ſwim upon water. Since the weight of a cubic foot of water is 70 pound, the quantity of water equal to 30 pounds, will be found $728'' \; 571'''$; and therefore the cube of the diameter of the ſphere $1392174'''$, whence the cube root being extracted $1' \; 1'' \; 1'''$ is the diameter of a ſphere of water of 30 pounds. If, therefore, the diameter of the cavity be made a little bigger, *e. gr.* $1\frac{1}{2}$ or 2 feet; ſo much leſs of the ball will be immerged as the diameter is increaſed.

14. The force employed to retain a *ſpecifically* lighter ſolid, under a heavier fluid; and the weight loſt by a heavier ſolid in a lighter fluid, are each added to the weight of the fluid, and weigh together with it.

The ſeveral theorems here delivered, are not only all demonſtrable from the principles of mechanicks; but are conformable to experiment. In effect, experience is here found to anſwer exactly to calculation, as is abundantly evident from the courſes of philoſophical experiments, now frequently exhibited; where the laws of *ſpecific* gravitation are well illuſtrated.

SPECILLUM, or SPECULUM, an inſtrument, wherewith ſurgeons ſearch and dilate wounds, *&c.* See SPECULUM.

SPECIOUS *arithmetic*, is that branch which is converſant in quantities denoted by *ſpecies*, that is, by the letters of the alphabet.—In contradiſtinction to that, where the quantities are expreſſed by numbers, which is called *numerous arithmetic*. See ARITHMETIC and CHARACTER.

Specious arithmetic, is what we more uſually call *algebra*. See ALGEBRA and CALCULUS.

SPECTACLE, SPECTACULUM, *ſhew*; ſome extraordinary object, which draws the view and attention; and is not beheld without ſome emotion, or paſſion of the mind.

The term is chiefly uſed by the ancients, for theatrical and amphitheatrical performances: for comedies, combats of gladiators, of beaſts, and even for ſolemn proceſſions, as thoſe of the circus, *&c.* See GAME, THEATRE, AMPHITHEATRE, SCENE, GLADIATOR, *&c.*

The people of Rome were extreamly fond of *ſpectacles*; and the Roman hiſtorians obſerve, there was no ſurer way of gaining their affections, and making parties to introduce tyranny and oppreſſion, than by the uſe of *ſpectacles*.

SPECTACLES, an optic machine, conſiſting of two lens's ſet in horn, or other matter; and applied on the noſe; to aſſiſt in defects of the organ of ſight. See LENS.

Old people and all preſbytæ, uſe *ſpectacles* of convex lens's, to make amends for the flatneſs of the eye, which does not make the rays converge enough to have them meet in the retina. See PRESBYTÆ.

Short-ſighted people, or myopes, uſe concave lens's, to keep the rays from converging ſo faſt, through the great roundneſs of the eye, as to make them meet ere they reach the retina. See MYOPS and MYOPIA.

In Spain, and at Venice eſpecially, *ſpectacles* are uſed with a different view: all the people of note and faſhion there, have them continually on their noſes; a folly, that has its ſource in the natural pride of thoſe people, who value themſelves on a profound wiſdom; and affect to ſtare very near at every thing; as if their eyes were weakned, and wore out with exceſs of attention. *Vign. de Marv.*

F. Cherubin, a capuchin, deſcribes a kind of *ſpectacle* teleſcopes, for the viewing of remote objects with both eyes; hence called *binoculi*. Though F. Rheita had mentioned the ſame before him, in his *Oculus Enoch* and *Eliæ*. See TELESCOPE.—The ſame author invented a kind of *ſpectacles*, with three or four glaſſes, which performed extraordinarily.

Spectacles were certainly unknown to the ancients; yet are they not of ſo late a date as the teleſcope. Franciſco Redi, in a very learned treatiſe on *ſpectacles*, will have them to have been invented in the 13th century, beween the years 1280 and 1311; and adds, that Alexander Deſpina, a monk of the order of Predicants of St. Catherine at Piſa, firſt communicated the ſecret, which was of his own invention; upon learning, that another perſon had it as well as himſelf. This hiſtory is wrote in the chronicles of that convent.

The ſame author tells us, that in an old manuſcript ſtill preſerved in his library, compoſed in 1299, *ſpectacles* are mentioned as a thing invented about that time: and that a famous Jacobin, one Jourdon de Rivalto, in a treatiſe compoſed in 1305, ſays, expreſly, that it was not yet 20 years, ſince the invention of *ſpectacles*. He likewiſe quotes Bernard Gordon in his *Lilium medicinæ*, wrote the ſame year, where he ſpeaks of a collyrium, good to enable an old man to read without *ſpectacles*.

Du Cange, however, carries the invention of *ſpectacles* farther back; aſſuring us, that there is a Greek poem in manuſcript in the French king's library, which ſhews, that *ſpectacles* were in uſe in the year 1150: nevertheleſs, the dictionary of the academy *della cruſca*, under the word *occhiale*, inclines to Redi's ſide; and quotes a paſſage from Jourdon's ſermons, which ſays, that *ſpectacles* had not been 20 years in uſe: now Salviati has obſerved, that thoſe ſermons were compoſed between the years 1330 and 1336.

SPECTATOR, a perſon preſent at a ſpectacle. See SPECTACLE.

Among the Romans, SPECTATORS, SPECTATORES, more particularly denoted a kind of gladiators, who had received their diſcharge; and were frequently hired to be preſent, as *ſpectators*, at the combats of gladiators, *&c.* the people were entertained withal. See GLADIATOR.

SPECULARIA, the art of preparing, and making *ſpecula*, or mirrours.—Or, the laws of mirrours, their phænomena, cauſes, *&c.* called alſo *catoptricks*. See CATOPTRICKS, MIRROUR, *&c.*

SPECULARIS *lapis*, in natural hiſtory, is a kind of fiſſile ſtone, clear as glaſs; whence it is alſo called *Muſcovy glaſs*; and uſed in ſeveral countries where it is found, for window-lights, *&c.* See GLASS.

The *lapis ſpecularis* is a ſpecies of talc; ſplits eaſily into thin laminæ or plates; and is ſometimes calcined to make a fine plaiſter. See TALC.

SPECULATION. — *Certitude of* SPECULATION. See CERTITUDE.

SPECULATIVE *geometry*,	See	GEOMETRY.
SPECULATIVE *mathematics*,		MATHEMATICS.
SPECULATIVE *muſic*,		MUSIC.
SPECULATIVE *philoſophy*,		PHILOSOPHY.

SPECULUM, *mirrour*, in opticks, any poliſhed body, impervious to the rays of light: ſuch as water in wells and deep rivers, poliſhed metals, and glaſſes lined with mercury or other opake matter, popularly called *looking-glaſſes*. See LOOKING-*glaſs*.

For the ſeveral kinds and forms of *ſpecula*, *plain*, *concave*, and *convex*, with their theory, and phænomena, and the methods of preparing, grinding them, *&c.* ſee MIRROUR, GRINDING, *&c.*

For the laws and effects of *ſpecula* of various forms, ſee REFLECTION, BURNING-*glaſs*, &c.

SPECULUM, among ſurgeons, the ſame with *ſpecillum*. See SPECILLUM.—More particularly,

SPECULUM *ani*, is an inſtrument, wherewith they dilate the fundament, examine ſores, extract bones, or let out any peccant matter that may be there lodged.

SPECULUM *matricis*, is an inſtrument uſed to examine and dreſs corrupted places in the privy parts of women.—Its form is the ſame with that of the *ſpeculum ani*.

SPECULUM *oris*, is an inſtrument ſerving to examine diſorders in the mouth.—There are two kinds: the one common; the other bigger and ſtronger, fit not only to keep down the tongue; but alſo the lower jaw; while the mouth is ſurveyed, to the very extremity of the throat, and the neceſſary remedies applied.

SPEECH, the act, or art of expreſſing a man's thoughts, by certain ſigns invented for that purpoſe. See SIGN.

Theſe ſigns are principally ſounds made by the voice, and letters. See VOICE, SOUND and LETTER.

SPEECH, in grammar, denotes an aſſemblage of ſeveral words ranged in order. See LANGUAGE.

The grammarians generally make *eight parts of ſpeech*; i. e. eight kinds of words uſed in diſcourſe, *viz.* *noun*, *pronoun*, *verb*, *participle*, *adverb*, *conjunction*, *prepoſition*, and *interjection*; each of which ſee under its proper article, ADVERB, NOUN, PRONOUN, *&c.* See alſo PART.

F. Buffier, one of the laſt and beſt writers on grammar, only admits of three parts of ſpeech, *viz.* *noun*, *verb* and *modificative*; which laſt includes the *adverb*, *conjunction* and *prepoſition*. See MODIFICATIVE.

SPELL, a kind of charm, to drive away a diſeaſe, by hanging a word or ſentence on a paper about the neck. See CHARM and PHYLACTERY.

SPELL, in the ſea language. To SPELL, is to let go the ſheat and bowlings of a ſail, and brace the weather-brace, that the ſail may lie looſe in the wind.

To do a SPELL, is to do any thing by turns, for a ſhort time, and then leave it.

To give a SPELL, is to be ready to work in ſuch a one's room.

Freſh SPELL, is when freſh men come to work; eſpecially when the rowers are relieved with another gang. See FRESH.

SPELLING, that part of grammar properly called *Orthography*. See ORTHOGRAPHY.

Dr. Jones gives the following rules, or maxims of *ſpelling*.

1°. That all words were originally pronounced, as *ſpelt*.

2°. That in all words, whoſe ſounds have been ſince altered (the origin of the difficulty of *ſpelling*) the alteration was made for the ſake of eaſe, and pleaſure.

And hence, 3°. All words that can be written ſeveral ways, muſt be *ſpelt* according to the hardeſt, harſheſt, and moſt unuſual ſound. See PRONUNCIATION.

SPELTER, or SPELTRE, *zink*; a kind of imperfect metal, which ſome miſtakenly confound with biſmuth, and others with ſpaat: others making it a ſort of antimony ore. See Bismuth, Spaat, &c.

Spelter is a kind of crude, mineral lead, very hard, white and brilliant; which though not perfectly malleable, yet ſtretches a little under the hammer: and is otherwiſe called *zink*, and ſometimes *tutanag*. See Zink.

It is found in great quantity in the mines of Goſſelaar in Saxony; and is ordinarily ſold in large, ſquare, thick cakes, whence one would judge it to have been melted as it came out of the mines, and caſt into that figure.

It is uſed to purge and whiten tin, in making of pewter; much as lead is uſed to purify gold and ſilver. See Tin and Pewter.

Thoſe who imagine that the *ſpelter* is put in to increaſe the weight, are miſtaken; ſince in melting five or ſix hundred weight of tin, they ſcarce put in a pound of *ſpelter*, and that mixed with turmeric. See Zink.

SPERM, Sperma, ΣΠΕΡΜΑ, the ſeed whereof an animal is formed. See Seed.

SPERMA-CETI, or *parma-ſitty*, in pharmacy, is a whitiſh, flaky ſubſtance, prepared from an oil found in the head of a cetaceous fiſh, called by ſome, the *male whale*, by others *cachelot*, and by the Latins *orca*; diſtinguiſhed from the common whale, by its having teeth, in lieu of whale-bone; and by a bunch on its back. See Whale.

The ancients were great ſtrangers to the nature of this preparation; inſomuch, that Schroder ſeems in doubt, whether to reckon it an animal, or mineral ſubſtance.

It had its name *ſperma-ceti*, ſeed or ſperm of whale, given it, no doubt, to raiſe its value, by a notion of its ſcarcity: the oil it is made from, is found in a large trunk four or five foot deep, and ten or twelve long, filling almoſt the whole cavity of the head, and ſeeming to ſupply the office of brain and cerebellum.

The method of preparing it, is a ſecret in the hands of a very few: the proceſs is ſaid to be thus.—The oil or brain being taken out of the animal, is melted over a gentle fire, and put into moulds, like thoſe wherein ſugar-loaves are formed. When cold, and drained, it is taken out and melted over again; and this they continue to do till it be well purified, and become white. It is then cut with a knife for the purpoſe, and reduced into flakes, ſuch as we have it from the druggiſts.

It muſt be choſen white, clear, and tranſparent, of a ſweetiſh ſmell, which ſome fancy to partake of that of the violet: ſome ſophiſticate it with wax; but the deceit is diſcovered, either by the ſmell of the wax, or by the dulneſs of the colour. Some alſo ſell a preparation of oil gained from the tail of the whale, inſtead of that from the brain; which laſt kind turns yellow, as ſoon as opened to the air. In the general, there is no merchandiſe that ſhould be kept cloſer from the air than *ſperma-ceti*.

Sperma-ceti is of great uſe in medicine. Dr. Quincy ſays, it is a noble remedy in the aſthma, &c. though chiefly uſed in bruiſes, inward hurts, and after delivery. But it is certain, its greateſt property, and that which makes it ſo much in vogue, is its ſoftning the ſkin, and reſolving tumours of the breaſt. Whence it comes to be uſed by the ladies in paſtes, waſhes, &c.

Sperma-ceti candles, are of modern manufacture: they are made ſmooth, with a fine gloſs, free from rings and ſcars, ſuperior to the fineſt wax-candles in colour and luſtre; and, when genuine, leave no ſpot or ſtain on the fineſt ſilk, cloth, or linen.

SPERMATIC, ΣΠΕΡΜΑΤΙΚΟΣ, in anatomy, ſomething belonging to the ſperm or ſeed. See Seminal.

The ancients made a general diviſion of the parts of the animal body into *ſpermatic*, and *ſanguineous*.—*Spermatic parts*, are thoſe, which by their colour, &c, bear ſome reſemblance to ſeed; and were ſuppoſed to be formed thereof: ſuch are the nerves, membranes, bones, &c.—*Sanguineous* are thoſe ſuppoſed to be formed of the blood, after conception.

But the moderns, with much better reaſon, hold all the parts to be *ſpermatic* in this ſenſe, and either formed of the ovum of the female, or of the ſemen of the male. See Generation.

M. Andry ſpeaks of *ſpermatic worms* in the human body. See Worms.

Spermatic *veſſels*, called alſo *vaſa præparantia*, are certain veſſels appointed for bringing the blood to the teſticles, &c. to be ſecreted and prepared into ſeed; and for carrying back again the blood, remaining after the ſecretion is effected. See Seed, Testicle, &c.

The *ſpermatic veſſels* are two arteries, and as many veins.

The Spermatic *arteries* ariſe from the fore-part of the trunk of the aorta, below the emulgents.—*V. Tab. Anat.* (Angeiol.) *fig.* 1. *n.* 51. (Splanch.) *fig.* 1. *lit. p. p.* &c.

Their ſtructure is very ſingular, in that, contrary to the fabric of all other arteries, which are largeſt at their exit from the trunk, theſe are ſmalleſt at their origin, and grow bigger in their progreſs towards the teſtes. By this means, the blood receives a check at its firſt going off for thoſe parts, which diſpoſes it for the future changes, &c. it is to paſs.—The ſame end is anſwered in quadrupeds, by having theſe arteries curled and contorted in their paſſage like a ſcrew. The reaſon why nature has taken another method in man, Mr. Cowper obſerves, is, that in that caſe, the abdominal muſcles muſt have been larger than they are; by which means, the inteſtines would have been frequently let down into the ſcrotum; an inconvenience which quadrupeds are ſecured from, by the horizontal poſition of their bodies.

The *ſpermatic arteries*, in their progreſs, meeting with the *ſpermatic veins*, enter together with them the inner lamella of the peritonæum, where, inſinuating into the duplicature of the proceſs, and being cloathed therewith, they paſs on to within three or four fingers breadth of the teſticles, where they divide into two unequal branches; the biggeſt of which goes to the teſticle, and is diſtributed therein (ſee Testicle.) And the leſs in the paraſtrata or epididymis. See Parastata.

The Spermatic *veins* take the ſame courſe with the arteries; only a little above the teſticles, they ſplit into ſeveral branches, which uniting, form a plexus, called *corpus varicoſum pampiniforme*, or *pyramidale*. The blood returned by the *ſpermatic veins*, is delivered on the right ſide to the cava, and on the left, into the emulgent vein.—See *Tab. Anat.* (Angeiol.) *fig.* 6. *n.* 2.

SPERMATOCELE, in medicine, a kind of rupture, occaſioned by a diſtention of the ſeminal veſſels, whereby they are let fall into the ſcrotum.

SPHACELUS*, or Sphacelismus, in medicine, a total corruption or mortification of any part, occaſioned by an interception of the blood, and ſpirits. See Mortification.

* The word is Greek, σφακελος, formed perhaps, of σφαττω, I kill.---It is ſometimes, alſo, called *necroſis*, and ſometimes *ſideratio*, See Necrosis and Sideratio.

Sphacelus is diſtinguiſhed from *gangrene*, which is only a mortification begun, and, as it were, the road to a *ſphacelus*, which is the ſtate and perfection thereof. See Gangrene.

The *ſphacelus* is diſtinguiſhed by the lividneſs or blackneſs of the part affected; its ſoftneſs, inſenſibility, and cadaverous ſmell.

Other cauſes of the *ſphacelus*, are cloſe ligatures, exceſſive colds, great inflammations, bites of mad dogs, &c.

A *ſphacelous* foot, according to Aquapendente, ought to be cut off in the mortified part, near the live part. When the foot is off, the dead fleſh left behind, is to be conſumed by the application of an actual cautery, repeated ſeveral times, till the patient feel the heat of the fire. Scultet.

SPHÆRISTERIUM, ΣΦΑΙΡΙΣΤΗΡΙΟΝ, in antiquity, the ſeventh part of the ancient gymnaſium; being that wherein the youth practiſed tennis-playing. See Gymnasium and Gymnasticks.

The *ſphæriſterium* or tennis-court, was between the place, named *palæſtra*, and that where they run races, which was between the portico's and the outer wall: though Vitruvius does not make mention of it in the deſcription he gives of the ancient gymnaſium.

The exerciſe here performed was called σφαιριστικη, *ſphæriſtica*, and σφαιρομαχια, *ſphæromachia*, which ſome will have to have differed from the modern tennis; but it is not known wherein the difference conſiſted.

The Mileſians were particularly averſe to this exerciſe; and the Athenians as remarkably fond of it.—Theſe latter frequently gave the freedom of their city to the *ſphæriſtæ*, or maſters in this art, by way of compliment.

SPHENOIDAL *ſuture*, in anatomy, a *ſuture* thus called, from its encompaſſing the os ſphenoides, which it ſeparates from the os frontis, the os petroſum and os occipitis. See Suture, Cranium, Sphenoides, &c.

SPHENOIDES, in anatomy, os cuneiforme; a bone of the head, common to the cranium, and upper jaw. See Cranium and Maxilla.

It is ſituate in the lower part of the ſkull, whereof it is, as it were, the baſis, and is connected to all the other members thereof, by the *ſphenoidal ſuture*.—See *Tab. Anat.* (Oſteol.) *fig.* 7. *n.* 5.

Its form is irregular, and not eaſy to be deſcribed; whence ſome have called it *multiforme*.

It has its name *ſphenoides*, from the Greek, σφην, *cuneus*, wedge; by reaſon of the manner of its inſertion into the other bones of the ſkull.

In adults, it is one continued bone; but in young children, ſometimes conſiſts of three, and ſometimes of four diſtinct pieces.

Sphenoides *ſella*. See the article Sella.

SPHENOPHARYNGÆUS, in anatomy, a pair of muſcles, called alſo *pterygopharyngæus*, *cephalopharyngæus*, &c. See Pterygopharyngæus.

SPHENOSTAPHYLINUS, in anatomy, a muſcle of the larynx. It deſcends from a round, fleſhy origination, near the root of a proceſs of the os ſphenoides, and is implanted into the poſterior part of the uvula, where it joins its partner.—It ſerves to draw the uvula upwards and backwards; and hinders the maſticated aliment from paſſing into the foramina narium in deglutition.

SPHERE, Sphæra, ΣΦΑΙΡΑ, in geometry, a ſolid body contained under one ſingle ſurface, and having a point in the middle, called the *centre*, whence all lines drawn to the ſurface, are equal. See SOLID, &c.

The *ſphere* is ſuppoſed to be generated by the revolution of a ſemi-circle, A B C (*Tab. Geometry, fig.* 34.) about its diameter A C, which is alſo called the *axis of the ſphere*, and the extream points of the axis, A and C, the *poles of the ſphere*. See CENTER, CIRCUMFERENCE, AXIS, POLE, &c. See alſo HEMISPHERE and PLANISPHERE.

Properties of the SPHERE.—1°. A *ſphere* is equal to a pyramid, whoſe baſe is equal to the ſurface, and its height to the radius of the *ſphere*.

Hence a *ſphere* being eſteemed ſuch a pyramid, its cube or ſolid content, is found like that of a pyramid. See PYRAMID.

2°. A *ſphere* is to a cylinder, ſtanding on an equal baſis, and of the ſame height, as 2 to 3. Hence, alſo, may the cube or content of the *ſphere* be found. See CYLINDER.

3°. The cube of the diameter of a *ſphere*, is to the ſolid content of the *ſphere*, nearly as 300 to 157: and thus, alſo, may the content of the *ſphere* be meaſured.

4°. The ſurface of a *ſphere* is quadruple the area of a circle deſcribed with the radius of the *ſphere*.—For ſince a *ſphere* is equal to a pyramid, whoſe baſe is the ſurface, and its altitude the radius of the *ſphere*: the ſurface of the *ſphere* is had, by dividing its ſolidity by a third part of its ſemi-diameter. If, now, the diameter of the circle be 100, the area will be 7850; conſequently, the ſolidity 1570000; which divided by a third of the ſemi-diameter, 100, the quotient is the ſurface of the *ſphere* 31400; which is manifeſtly quadruple the area of the circle.

The diameter of a SPHERE *being given, to find its ſurface and ſolidity.*—Find the periphery of the circle deſcribed by the radius of the *ſphere*. See PERIPHERY.

Multiply this, found, into the diameter; the product is the ſurface of the *ſphere*. Multiply the ſurface by a ſixth part of the diameter, the product is the ſolidity of the *ſphere*.

Thus, ſuppoſing the diameter of the *ſphere* 56, the periphery will be found 175; which multiplied by the diameter, the product 9800 is the ſurface of the *ſphere*; which multiplied by one ſixth part of the diameter, gives the ſolidity 919057. Or, thus;

Find the cube of the diameter 175616; then to 300157, and the cube found, find a fourth proportional, 919057. See PROPORTIONAL. This is the ſolidity of the *ſphere* required.

For ſegments and ſectors of *ſpheres*, ſee SEGMENT and SECTOR.

Doctrine of the SPHERE, } See the articles { SPHERICKS.
Projection of the SPHERE, } See the articles { PROJECTION.

SPHERE *of activity* of any body, is that determinate ſpace or extent, all round about it, to which, and no farther, the effluvia continually emitted from that body, do reach, and where they operate according to their nature. See EFFLUVIA, ATMOSPHERE, &c. See alſo ACTIVITY.

Thus we ſee the magnetical effluvia have certain bounds and limits, beyond which they will have no influence to turn, or attract the needle: but where-ever a needle is placed, ſo as it may be moved by a load-ſtone, it may be ſaid to be within the *ſphere* of activity of the ſtone. See MAGNET.

SPHERE, in aſtronomy, that concave orb or expanſe, which inveſts our globe, and in which the heavenly bodies, ſun, ſtars, planets and comets, appear to be fixed, at an equal diſtance from the eye. See HEAVENS.

This is alſo called the *ſphere of the world*; and is the ſubject of the ſpherical aſtronomy. See SPHERICAL *aſtronomy*.

This *ſphere*, as it includes the fixed ſtars, whence we alſo occaſionally call it, the *ſphere of the fixed ſtars*, is vaſtly great. The diameter of the earth's orbit is ſo ſmall, in reſpect of the diameter hereof, that the centre of the *ſphere* is not ſenſibly changed by any alteration of the ſpectator's place in the ſeveral parts of the orbit: but ſtill, in all the points of the earth's ſurface, and at all times, the inhabitants have the ſame appearance of the *ſphere*; that is, the fixed ſtars ſeem to poſſeſs the ſame points in the ſurface of the *ſphere*.—For our way of judging of the places, &c. of the ſtars, is to conceive right lines drawn from the eye or the centre of the earth, through the centres of the ſtars, and continued thence, till they cut the foreſaid *ſphere*; the points where theſe lines terminate therein, are the apparent places of thoſe ſtars. See PLACE and PARALLAX.

The better to determine the places of the heavenly bodies in the *ſphere*, ſeveral circles are imagined to be deſcribed in the ſurface thereof; hence called *circles of the ſphere*. See CIRCLE *of the ſphere*.

Of theſe, ſome are ſaid to be *greater*, as the ecliptic, meridian, equator, &c. others *leſs*, as the tropicks, parallels, &c. See GREAT, &c.

Of theſe, again, ſome are moveable, or owe their origin to the motion of the earth, &c. ſuch are the ecliptic, ſecondaries of the ecliptic, &c. See each circle under its proper head; as EQUATOR, ECLIPTIC, HORIZON, &c.

SPHERE, in geography, &c. denotes a certain diſpoſition of the circles on the ſurface of the earth, with regard to one another; which varies in various parts thereof. See EARTH.

The circles originally conceived on the ſurface of the *ſphere* of the world, are almoſt all transferred, by analogy, to the ſurface of the earth; where they are conceived to be drawn directly underneath thoſe of the *ſphere*, or in the ſame planes therewith; ſo that were the planes of thoſe of the earth continued to the *ſphere*, they would coincide with the reſpective circles thereon.—Thus it is we have a horizon, meridian, equator, &c. on the earth. See HORIZON, &c.

As the equator in the heavens divides the *ſphere* into two equal parts; the one north and the other ſouth; ſo does the equator on the ſurface of the earth, divide the globe in the ſame manner. See EQUATOR.

And as the meridians in the heavens, paſs through the poles of the horizon; ſo do thoſe on the earth, &c. See MERIDIAN.

With regard, then, to the poſition of ſome of theſe circles in reſpect of others, we have a *right*, a *parallel*, and an *oblique ſphere*.

Right SPHERE, is that where the equator cuts the horizon of the place at right angles: for the particular phænomena, &c. whereof, ſee RIGHT *ſphere*.

Parallel SPHERE, is where the equator is parallel to the ſenſible horizon, and in the plane of the rational. See PARALLEL *ſphere*.

Oblique SPHERE, is where the equator cuts the horizon obliquely. See OBLIQUE *ſphere*.

Armillary, or *artificial* SPHERE, is an aſtronomical inſtrument, repreſenting the ſeveral circles of the *ſphere*, in their natural order; ſerving to give an idea of the office and poſition of each thereof, and to ſolve various problems relating thereto.

It is thus called, as conſiſting of a number of faſciæ or rings of braſs, or other matter, called by the Latins, *armillæ*, from their reſembling of bracelets, or rings for the arm.

By this, it is diſtinguiſhed from the *globe*, which, though it have all the circles of the *ſphere* on its ſurface; yet is not cut into armillæ or rings, to repreſent the circles ſimply and alone; but exhibits alſo the intermediate ſpaces, between the circles. See GLOBE.

Armillary ſpheres, are of different kinds, with regard to the poſition of the earth therein; whence they become diſtinguiſhed into *Ptolemaic* and *Copernican ſpheres*: in the firſt whereof, the earth is in the centre; and in the latter near the circumference, according to the poſition which that planet obtains in thoſe ſyſtems. See SYSTEM.

The *Ptolemaic* SPHERE, is that commonly in uſe, and is repreſented (*Tab. Aſtronomy, fig.* 21.) with the names of the ſeveral circles, lines, &c. of the *ſphere*, inſcribed thereon. See PTOLEMAIC.

In the middle, upon the axis of the *ſphere*, is a ball, T, repreſenting the earth; on whoſe ſurface are the circles, &c. of the earth. The *ſphere* is made to revolve about the ſaid axis, which remains at reſt: by which means, the ſun's diurnal and annual courſe about the earth, are repreſented according to the Ptolemaic hypotheſis: and even by means hereof all problems relating to the phænomena of the ſun and earth, are ſolved, as upon the cœleſtial globe; and after the ſame manner; which ſee deſcribed under the article GLOBE.

The *Copernican* SPHERE, repreſented (*fig.* 22.) is very different from the Ptolemaic, both in its conſtitution and uſe; and more intricate in both. Indeed the inſtrument is in the hands of ſo few people, and its uſe ſo inconſiderable, except what we have in the other more common inſtruments, particularly the globe and Ptolemaic *ſphere*, that we ſhall be eaſily excuſed the not filling up room, with any deſcription thereof.

Harmony of the SPHERES, } See the articles { HARMONY.
Obliquity of the SPHERE, } See the articles { OBLIQUITY.
Rectifying of the SPHERE, } See the articles { RECTIFYING.

Dialling SPHERE. See the article DIALLING.

SPHERICAL *angle*, is the mutual inclination of two planes, whereby a ſphere is cut. See PLANE and ANGLE.

Thus the inclination of the two planes, C A F and C E F (*Tab. Trigonometry, fig.* 9.) forms the *ſpherical angle* A C E. See SPHERE.

The meaſure of a *ſpherical angle*, A C E, is an arch of a great circle A E, deſcribed from the vertex C, as from a pole, and intercepted between the legs C A and C E.

Hence, 1°. Since the inclination of the plane C E F, to the plane C A F, is every where the ſame; the angles in the oppoſite interſections C and F, are equal.

2°. Hence the meaſure of a *ſpherical angle* ACE, is deſcribed with the interval of a quadrant A C or E C, from the vertex C between the legs C A, C E.

If a circle of the ſphere, A E B F (*fig.* 8.) cut another C E D F, the adjacent angles, A E C and A E D are equal to two right ones; and the vertical angles A E C and D E B equal to one another. The former likewiſe holds of ſeveral angles formed on the ſame arch CED, at the ſame point E. Hence, any number of *ſpherical angles*, as A E C, A E D, D E B, B E C, &c. made on the ſame point E, are equal to four right angles. See SPHERICAL *triangle*.

SPHERICAL *triangle*, a triangle comprehended between three arches of great circles of a ſphere, interſecting each other in the ſurface thereof. See TRIANGLE.

Properties of SPHERICAL *triangles.* — 1. If in two *ſpherical triangles, (Tab. Trigonometry, fig.* 10.*)* ABC and abc, $A=a$, $BA=ba$ and $CA=ca$: then will B and the ſides, including the angles, be reſpectively equal, the whole triangles are equal: that is, $BC=bc$, $B=b$ and $C=c$.

Again, if in two *ſpherical triangles* $A=a$, $C=c$, and $AC=ac$; then will $B=b$, $AB=ab$ and $bc=BC$. Laſtly, if in two *ſpherical triangles* $AB=ab$, $AC=ac$, and $BC=bc$, then will $A=a$, $B=b$ and $C=c$; the demonſtrations whereof, coincide with thoſe of the like properties in plain triangles. The theorems of the congruency of rectilinear triangles, extending to all other curvilinear, circular, parabolical, *&c.* provided their ſides be ſimilar. See TRIANGLE.

2. In an equicrural triangle ABC *(fig.* 11.*)* the angles at the baſe, B and C, are equal; and if in any triangle, the angles B and C, at the baſe BC, are equal; the triangle is equicrural.

3. In every *ſpherical triangle*, each ſide is leſs than a ſemi-circle: any two ſides taken together are greater than the third; and all the three ſides together are leſs than the periphery of a great circle: and a greater ſide is always oppoſed to a greater angle, and a leſs ſide to a leſs angle.

4. If in a *ſpherical triangle* BAC *(fig.* 12.*)* two legs AB and BC taken together, be equal to a ſemi-circle; the baſe AC being continued to D; the external angle BCD will be equal to the internal oppoſite one BAC.

If the two legs together, be leſs than a ſemi-circle, the external angle BCD, will be greater than the internal oppoſite one A: and if the legs be greater than a ſemi-circle, the external angle BCD, will be leſs than the internal oppoſite one A; and the converſe of all theſe holds, *viz.* if the angle BCD be equal to, greater, or leſſer than A; the ſides AB and BC are equal to, greater, or leſſer than a ſemi-circle.

5. If in a *ſpherical* triangle ABC, two ſides AB and BC, be equal to a ſemi-circle; the angles at the baſe A and C, are equal to two right ones: if the ſides be greater than a ſemi-circle, the angles are greater than two right ones; and if leſs, leſs. And, converſely.

6. In every *ſpherical triangle*, each angle is leſs than two right ones; and the three together, leſs than ſix right angles, and greater than two.

7. If in a *ſpherical* triangle BAC *(fig.* 13.*)* the ſides AB and AC be quadrants; the angles at the baſe, B and C will be right angles. And, if the intercepted angle A be a right angle, BC will be a quadrant: if A be obtuſe, BC will be greater than a quadrant; and if acute, leſs. And, converſely.

8. If in a *ſpherical* rectangular triangle, the ſide BC *(fig.* 14.*)* adjacent to the right angle B, be a quadrant; the angle A will be a right angle; if BE be greater than a quadrant, the angle A will be obtuſe; and if BD be leſs than a quadrant, the angle A will be acute. And, converſely.

9. If in a *ſpherical* rectangular triangle, each leg be either greater or leſſer than a quadrant; the hypotenuſe will be leſs than a quadrant. And, converſely.

10. If in a *ſpherical triangle* ABC *(fig.* 15.*)* rectangular only at B, one ſide CB be greater than a quadrant, and the other ſide AB leſs; the hypotenuſe AC will be greater than a quadrant. And, converſely.

11. If in a *ſpherical* obliquangular triangle ACB *(fig.* 16.*)* both angles at the baſe, A and B, be either obtuſe or acute; the perpendicular CD let fall from the third angle C to the oppoſite ſide AB, falls within the triangle; if one of them, A, be obtuſe; and the other, B, acute; the perpendicular falls without the triangle.

12. If in a *ſpherical triangle* ACB, all the angles A, B and C be acute; the ſides are each leſs than a quadrant. Hence, if in an obliquangular *ſpherical triangle*, one ſide be greater than a quadrant, one angle is obtuſe, *viz.* that oppoſite to this ſide.

13. If in a *ſpherical triangle* ACB, two angles A and B, be obtuſe, and the third C acute; the ſides AC and CB oppoſite to the obtuſe ſides, are greater than a quadrant; and that oppoſite to the acute ſide AB, leſs than a quadrant. Hence, if the two ſides be leſs than a quadrant, the two angles are acute.

14. If in a *ſpherical triangle*, the ſeveral ſides be each greater than a quadrant; or only two of them greater, and the third equal to a quadrant; the ſeveral angles are obtuſe.

15. If in an obliquangular *ſpherical triangle*, two ſides be leſs than a quadrant, and the third greater; the angle oppoſite to the greateſt will be obtuſe, and the reſt acute.

Reſolution of SPHERICAL *triangles.* See TRIANGLE.

SPHERICAL *aſtronomy*, that part of aſtronomy which conſiders the univerſe, ſuch as it appears to the eye. See ASTRONOMY.

Under *ſpherical aſtronomy*, then, come all the phænomena and appearances of the heavens and heavenly bodies, ſuch as we perceive them; without any enquiry into the reaſon, the theory, or the truth thereof.—By which it is diſtinguiſhed from *theorical aſtronomy*, which conſiders the real ſtructure of the univerſe, and the cauſes of thoſe phænomena.

In the *ſpherical aſtronomy*, the world is conceived to be a concave, *ſpherical* ſurface, in whoſe centre is the earth, or rather the eye, about which the viſible frame revolves, with ſtars and planets fixed in the circumference thereof. And on this ſuppoſition all the other phænomena are determined.

The *theorical aſtronomy* teaches us, from the laws of opticks, *&c.* to correct this ſcheme, and reduce the whole to a juſter ſyſtem. See SYSTEM.

SPHERICAL *compaſſes.* See the article COMPASSES.

SPHERICAL *geometry*, the doctrine of the ſphere; particularly of the circles deſcribed on the ſurface thereof, with the method of projecting the ſame on a plane; and meaſuring their arches and angles when projected. See SPHERICKS and PROJECTION.

SPHERICAL *trigonometry*, the art of reſolving ſpherical triangles, *i. e.* from three parts of a ſpherical triangle given, to find the reſt.—*E. gr.* From two ſides and one angle; to find the other two angles, and the third ſide. See SPHERICAL *triangle* and TRIGONOMETRY.

SPHERICITY, the quality of a ſphere; or that whereby a thing becomes ſpherical or round. See SPHERE.

The *ſphericity* of pebbles, fruits, berries, *&c.* alſo of drops of water, quick-ſilver, *&c.* and of bubbles of air under water, *&c.* Dr. Hook takes to ariſe from the incongruity of their particles with thoſe of the ambient fluid, which prevents their coaleſcing; and by preſſing on them, and encompaſſing them all round equally, turns them into a round form. See DROP.

This, he thinks, appears evidently, from the manner of making ſmall round ſhot of ſeveral ſizes, without caſting the lead into any moulds; from drops of rain being formed, in their fall, into round hail-ſtones; and from drops of water falling on ſmall duſt, ſand, *&c.* which ſtrait produce an artificial round ſtone; and from the ſmall, round, red-hot balls, formed by the colliſion or fuſion of flint and ſteel, in ſtriking fire.

But all theſe caſes of *ſphericity* ſeem better accounted for, from the great principle of attraction; whereby the parts of the ſame fluid drop, *&c.* are all naturally ranged as near the centre as poſſible, which neceſſarily induces a ſpherical figure: and, perhaps, a repelling force between the particles of the drop, and of the medium, contribute not a little thereto. See ATTRACTION and REPULSION.

SPHERICKS, the *doctrine of the ſphere*, particularly of the ſeveral circles deſcribed on the ſurface thereof; with the method of projecting the ſame in plano. See SPHERE, GEOMETRY, CIRCLE, *&c.*

The principal matters ſhewn herein, are as follow:

1. If a ſphere be cut in any manner, the plane of the ſection will be a circle, whoſe centre is in the diameter of the ſphere.

Hence, 1°. The diameter HI *(Tab. Trigonometry, fig.* 17.*)* of a circle, paſſing through the centre C, is equal to the diameter AB of the generating circle; and the diameter of a circle, as FE, that does not paſs through the centre, is equal to ſome chord of the generating circle.

Hence, 2°. As the diameter is the greateſt of all chords, a circle paſſing through the centre, is the greateſt circle of the ſphere; and all the reſt are leſſer than the ſame.

Hence alſo, 3°. All great circles of the ſphere are equal to one another.

Hence alſo, 4°. If a great circle of the ſphere paſs through any given point of the ſphere, as A; it muſt alſo paſs through the point diametrically oppoſite thereto, as B.

Hence alſo, 5°. If two great circles mutually interſect each other, the line of ſection is the diameter of the ſphere, and therefore two great circles interſect each other in points diametrically oppoſite.

Hence alſo, 6°. A great circle of the ſphere, divides it into two equal parts or hemiſpheres.

2. All great circles of the ſphere, cut each other into two parts; and, converſely, all circles, that thus cut each other, are great circles of the ſphere.

3. An arch of a great circle of the ſphere, intercepted between another arch HIL *(fig.* 18.*)* and its poles A and B, is a quadrant.

That intercepted between a leſs circle DEF, and one of its poles A, is greater than a quadrant; and that between the ſame, and the other pole B, leſs than a quadrant; and, converſely.

4. If a great circle of the ſphere paſs through the poles of another, that other paſſes through the poles of this. And if a great circle paſs through the poles of another, the two cut each other at right angles; and, converſely.

5. If a great circle, as AFBD, paſs through the poles A and B of a leſſer circle DEF, it cuts it into equal parts; and at right angles.

6. If two great circles AEBF and CEDF *(fig.* 19.*)* interſect each other in the poles E and F of another great circle ACBD; that other will paſs through the poles H and h, I and i of the circles AEBF and CEDF.

7. If two great circles AEBF and CEDF, cut each other mutually; the angle of obliquity AEC, will be equal to the diſtance of the pole HI.

8. All circles of the ſphere, as G F and L K (*fig.* 20.) equally diſtant from its centre C, are equal; and the further they are removed from the centre, the leſs they are. Hence, ſince of all parallel chords, only two, D F and E K, are equally diſtant from the centre; of all the circles parallel to the ſame great circle, only two are equal.

9. If the arches F H and K H, and G I and I L, intercepted between a great circle I M H, and the leſſer circles G N F and L O K, be equal, the circles are equal.

10. If the arches F H and G I of the ſame great circle AIBH, intercepted between two circles G N F and I M H, be equal, the circles are parallel.

11. An arch of a parallel circle I G (*fig.* 9.) is ſimilar to an arch of a great circle A E; if each be intercepted between the ſame great circles C A F and C E F.

Hence, the arches A E and I G, have the ſame ratio to their peripheries; and, conſequently, contain the ſame number of degrees. And hence the arch I G is leſs than the arch A E.

12. The arch of a great circle, is the ſhorteſt line which can be drawn from one point of the ſurface of the ſphere to another: and the lines between any two points on the ſame ſurface, are the greater, as the circles whereof they are arches, are the leſs.

Hence, the proper meaſure, or diſtance of two places on the ſurface of the ſphere, is an arch of a great circle intercepted between the ſame.

SPHEROID*, SPHÆROIDES, ΣΦΑΙΡΟΕΙΔΗΣ, in geometry, a ſolid approaching to the figure of a ſphere, though not exactly round, but oblong; as having one of its diameters bigger than the other; and generated by the revolution of a ſemi-ellipſis about its axis.

* The word is formed from σφαιρα, *ſphæra*, and ειδος, ſhape.

When it is generated by the revolution of the ſemi-ellipſis about its greater axis, it is called an *oblong ſpheroid.*—And when generated by the revolution of an ellipſis about its leſs axis, an *oblate ſpheroid.*

The contour of a dome, Daviler obſerves, ſhould be half a *ſpheroid.* Half a ſphere, he ſays, is too low to have a good effect below. See DOME.

For the ſolid dimenſions of a *ſpheroid,* it is $\frac{2}{3}$ of its circumſcribing cylinder: or it is equal to a cone, whoſe altitude is equal to the great axis, and the diameter of the baſe to four times the leſs axis of the generating ellipſis.

Or a *ſpheroid* is to a ſphere deſcribed on its greater axis, as the ſquare of the leſs axis to the ſquare of the greater: or it is to a ſphere deſcribed on the leſſer axis, as the greater axis to the leſs.

SPHINCTER*, in anatomy, a term applied to a kind of circular muſcles, or muſcles in form of rings, which ſerve to cloſe and draw up ſeveral orifices of the body, and prevent the excretion of the contents. See MUSCLE.

* The word is formed from the Greek σφιγκτηρ, *ſtrictor*, or *conſtrictor*, ſomething that binds and conſtringes a thing very cloſely; theſe muſcles having an effect much like that of a purſe-ſtring.

SPHINCTER *ani*, is a circular muſcle, ſerving to ſhut the anus, and keep the excrements from coming away involuntarily. See ANUS and EXCREMENTS.

It is near two inches broad, and hangs down below the rectum, near an inch. It is faſtened on the ſides to the bones of the coxendix, and behind to the os ſacrum: before, in men, to the accelerator urinæ, and in women, to the vagina uteri. Some would have it to be two muſcles, and ſome three; but without much reaſon.

SPHINCTER *gulæ*, } See the articles { OESOPHAGÆUS.
SPHINCTER *labiorum*, } { CONSTRICTOR.

SPHINCTER *vaginæ*, a conſtructory muſcle, ſerving to hinder the reflux of the blood from the clitoris, *&c.* in coition. See VAGINA and CLITORIS.

SPHINCTER *veſicæ*, is a muſcle conſiſting of circular fibres, placed at the exit of the bladder, to prevent the perpetual dripping of the urine.—See *Tab. Anat.* (Splanch.) *fig.* 9. *lit. k.* See alſo URINE and BLADDER.

It keeps the bladder conſtantly ſhut; and is only opened, when by the contraction of the abdominal muſcles, the bladder is compreſſed, and the urine forced out.

SPHINX, ΣΦΙΓΞ, in ſculpture, *&c.* a figure or repreſentation of a monſter of that name, famed among the ancients; now moſtly uſed as an ornament in gardens, terraces, *&c.*

It is repreſented with the head and breaſts of a woman, the wings of a bird, the claws of a lion, and the reſt of the body like a dog.

It is ſuppoſed to have been engendered by Typhon, and ſent by Juno, to be revenged on the Thebans. Its office was to propoſe dark, enigmatical queſtions to all paſſers-by, and if they did not give the explication thereof, to devour them.

It made horrible ravages on a mountain near Thebes, and could not by any means be deſtroyed, till after Oedipus had ſolved the following riddle: What animal is it, that in the morning walks on four legs, at noon on two, and at night on three. See ÆNIGMA.

Among the Egyptians, the *ſphinx* was the ſymbol of religion, by reaſon of the obſcurity of its myſteries. And on the ſame account, the Romans placed a *ſphinx* in the pronaos or porch of their temples. See MYSTERY.

SPICA *virginis*, a ſtar of the firſt magnitude in the conſtellation virgo. See VIRGO.

Its place is in the more ſoutherly hand. Its longitude, according to Mr. Flamſteed, is 19° 31′ 22″; its latitude 2° 1′ 59″ ſouth.

SPICE, any kind of aromatic drug, that has hot and pungent qualities: ſuch are pepper, nutmeg, ginger, cinnamon and cloves. See AROMATIC, PEPPER, NUTMEG, *&c.*

Some alſo apply the word to divers medicinal drugs brought from the eaſt; as ſenna, caſſia, frankincenſe, *&c.* See each under its proper article, SENNA, CASSIA, *&c.*

Garbler of SPICES. See the article GARBLER.

SPIDERS *ſilk*, } See the articles { SILK.
SPIDERS *web*, } { WEB.

SPIKENARD, *nardus*, or SPICA *nardi*, a kind of vegetable ear growing even with the ground, and ſometimes in the ground; warm, ſpicy, cordial and alexipharmic; and as ſuch uſed in the compoſition of venice-treacle. See THERIACA.

The ear or *ſpica*, is about the length and thickneſs of a finger; very light, covered with long, reddiſh hairs, of a ſtrong ſmell, and a bitteriſh, ſharp taſte. There riſe ſeveral of theſe ears from the ſame root. The ſtem is ſmall, and the root the thickneſs of a quill.

The *ſpica-nardi*, is uſually reckoned in the number of roots. —It is alſo called *nardus Indica*; becauſe brought from the Eaſt-Indies.

It is accounted a ſtomachic, nephritic and carminative, proper to ſtrengthen the ſtomach, promote the diſcharge of urine, and diſperſe flatulencies.

There is alſo another kind, called *ſpica-celtica*, growing in the Pyreneans, and the mountains of Tirol: it has much the ſame virtues with valerian; and is by no means of equal eſteem with the former.

SPIKING *up the ordnance*, a ſea phraſe, uſed for faſtening a quoin with *ſpikes* to the deck, cloſe to the breech of the carriages of great guns; that they may keep cloſe and firm to the ſhip's ſides, and not get looſe when the ſhip rolls, and by that means endanger the breaking out of the butt-head of a plank. See QUOIN.

SPINA *ventoſa*, in medicine, *&c.* denotes a caries or rottenneſs of a bone. See CARIES.

SPINAL *marrow*. See the article MEDULLA *ſpinalis*.

In the hiſtory of the royal academy of ſciences, for the year 1714, we have an inſtance of a fœtus born without either brain, cerebel, or *ſpinal marrow*, though perfectly well formed in other reſpects. It had gone its natural time; lived two hours; and even gave ſigns of life, upon ſprinkling the baptiſmal water on its head.—Inſtances of this kind, as this is not the only one we meet withal, furniſh a terrible objection againſt the exiſtence of the animal ſpirits, which ſhould be generated in the brain, or at leaſt in the cerebel or *ſpinal marrow*; and which are generally allowed of ſuch abſolute neceſſity in the animal œconomy. See SPIRIT.

SPINAL *nerves*. See the article NERVE.

SPINALS, in anatomy, a muſcle on the ſide of the neck, ariſing from the five ſuperior proceſſes of the vertebræ of the thorax, and the inferior of the neck; and which in its aſcent, becoming more fleſhy, is inſerted into the inferior part of the vertebræ of the neck, laterally. It ſerves to draw the neck backwards.

Medulla SPINALIS. See the article MEDULLA.

SPINDLE, in the ſea language, is the ſmalleſt part of a ſhip's capſtan, which is betwixt the two decks.

The *ſpindle* of the jeer capſtan hath whelps to heave the viol. See CAPSTAN.

The axis of a wheel of a watch or clock, is alſo called the *ſpindle*, and its ends the *pevets*. See CLOCK, *&c.*

SPINE*, SPINA *dorſi*, in anatomy, the ſeries or aſſemblage of vertebræ, or bones of the back, which ſuſtain the reſt of the body, and to which are connected the ribs.—See *Tab. Anat.* (Oſteol.) *fig.* 3. *lit. A A. fig.* 7. *lit. A A.* See alſo the article VERTEBRÆ.

* It has its name *ſpine*, by reaſon the hind part thereof is edged, or *ſpiny*——Some call it the *canalis ſacer*.

The *ſpine* is uſually divided into four parts; the neck, which contains ſeven vertebræ; the back twelve; the loins five; and the os ſacrum four. See NECK, LOINS, *&c.*

The *ſpine* includes a kind of medulla, much reſembling that of the brain, hence called *medulla ſpinalis*, or *ſpinal marrow*. See MEDULLA.

SPINET, or SPINNET, a muſical inſtrument, ranked in the ſecond or third place among harmonious inſtruments. See MUSIC.

It conſiſts of a cheſt or belly, made of the moſt porous and reſinous wood to be found; and a table of fir glued on ſlips of wood called *ſummers*, which bear on the ſides. On the table is raiſed a little prominence, wherein are placed as many pins as there are ſtrings to the inſtrument.

The inſtrument is played by two ranges of keys, the foremoſt range being in the order of the diatonic ſcale; and the other range ſet backwards in the order of the artificial notes or ſemi-tones. See SCALE.

The keys are ſo many long, flat ſlips of wood, which when touched and preſſed down at one end, make the other raiſe a jack; which ſounds the ſtrings by means of the end of a crow's quill, wherewith it is armed. The thirty firſt ſtrings are of braſs, the other more delicate ones of ſteel or iron wiars. They are all ſtretched over two bridges glued to the table.

The figure of the *ſpinet* is a long ſquare, or parallelogram a foot and half broad.—Some call it a *harp couched*, and the harp, an *inverted ſpinet*.

The *ſpinet* is generally tuned by the ear; which method of the practical muſicians, is founded on this ſuppoſition, that the ear is a perfect judge of an octave and fifth. The general rule, is to begin at a certain note, as *c*, taken towards the middle of the inſtrument, and tuning all the octaves up and down, and alſo the fifths, reckoning ſeven ſemi-tones to each fifth, by which means the whole is tuned. Sometimes to the common or fundamental play of the *ſpinet*, which is the great octave, is added another ſimilar one in uniſon, and a third in octave to the firſt; to make the harmony the fuller. They are played either ſeparately or together, which is called the *double* or *triple ſpinet*. Sometimes a play of violins is added, by means of a bow, or a few wheels parallel to the keys, which preſs the ſtrings, and make the ſounds laſt as long as the muſician pleaſes; and heighten and ſoften them, as they are more or leſs preſſed. The harpſicord is a kind of *ſpinet*, only with another diſpoſition of the keys. See HARPSICORD.

The inſtrument takes its name from the little quills ends, wherewith the ſtrings are drawn, which are ſuppoſed to reſemble *ſpinæ*, thorns.

SPINIS.—*Attachiamenta de* SPINIS *& boſco*. See ATTACHIAMENTA.

SPINNING, in commerce, the act or art of reducing ſilk, flax, hemp, wool, hair, or other matter into thread. See FLAX, HEMP, WOOL, *&c.*

Spinning, is either performed on the wheel, or with a diſtaff and ſpindle, or with other machines proper for the ſeveral kinds of working.—Hemp, flax, nettles and other like plants are to be wet in *ſpinning:* ſilks, wools, cottons, *&c.* are *ſpun* dry, and do not need water; yet there is a way of *ſpinning* ſilk as it comes off the caſes or balls, where hot, and even boiling water is to be uſed. See SILK.

SPINOSISM. See the article SPINOZISM.

SPINOUS *fiſh*. See the article FISH.

SPINOZISM, or SPINOSISM, the doctrine of *Spinoza*; or, atheiſm and pantheiſm propoſed after the manner of *Spinoza*. See ATHEIST.

The great principle of *Spinoziſm* is, that there is nothing properly and abſolutely exiſting, but matter, and the modifications of matter; among which are even comprehended, thoughts, abſtract and general ideas, compariſons, relations, combinations of relations, *&c.* See MATTER, SUBSTANCE, *&c.*

Benedict *Spinoza*, or *Eſpinoza*, was a man well known in Holland. He was born a Jew at Amſterdam; but did not make profeſſion of any religion, either the Jewiſh or Chriſtian.—He compoſed ſeveral books in Latin; the moſt celebrated whereof, is his *Tractatus Theologico-Politicus*, wherein he overturns the foundation of all religion: the book, accordingly, was condemned by a publick decree of the ſtates; though it has ſince been ſold publickly, and even reprinted, both in Latin and French, in that country, and lately in Engliſh at London.

Spinoza, here, inſinuates, that all religions are only political engines, calculated for the publick good; to render the people obedient to magiſtrates, and to make them practiſe virtue and morality.

He does not here lay down his notion of the Deity openly; but contents himſelf with ſuggeſting it. — In his *Ethicks*, publiſhed among his poſthumous works, he is more open and expreſs; maintaining, that God is not, as we imagine him, an infinite, intelligent, happy and perfect Being; nor any thing, but that natural virtue, or faculty, which is diffuſed throughout all creatures. See NATURE.

Numbers have undertaken to refute *Spinoza*'s doctrine; but all very weakly, except what we have in Dr. Clarke's ſermons at Boyle's lecture.—Witſius in Holland, Majus in Germany, and de la Mothe in England, wrote againſt his *Tractatus:* but Bredenbourg, according to M. Bayle, ſucceeded beſt on the ſubject; who, however, is ſaid to have afterwards been a convert to *Spinoziſm*, and to have written a demonſtration of the truth of it.—The writers againſt *Spinoza*'s *Ethicks*, are Velthuyſius, in his *Tractatus de cultu naturali & origine moralitatis:* de Verſe, in *l' Impie convaincu, ou diſſertation contre Spinoza:* Poiret in *Fundamenta atheiſmi everſa:* Wittichius in *Anti-Spinoza*; Lami in *Nouvel atheiſme renverſe*; Jaquelot in *Diſſertations ſur l' exiſtence de Dieu:* Jens in *Examen Philoſophicum ſextæ definitionis partis primæ Ethicæ Bened. Spinozæ*. Beſides many others enumerated in Colerus's life of *Spinoza*, p. 132. Jenichen's *Hiſtor. Spinoziſmi Leenhofian*, p. 58. ſeqq. Buddeus's *Theſes de Atheiſmo & Superſtitione*, cap. 1. § 26. and Fabricius's *Syllab. Script. de veritate religionis chriſtianæ*, p. 357. ſeqq.

Spinoza, in his *Tractatus* above-mentioned, is very full on the ſubject of the authors of the ſcriptures; and endeavours to ſhew, that the Pentateuch is not the work of Moſes; contrary to the common opinion, both of the Jews, and Chriſtians. He has alſo his particular ſentiments, as to the authors of the other books.—This part of the work has been anſwered by M. Huet, in his *Demonſtratio Evangelica*; and by M. Simon, in his *Hiſt. Crit. du vieux Teſt.* See PENTATEUCH.

Spinoziſm is a ſpecies of naturaliſm, or pantheiſm, or hylotheiſm, as it is ſometimes called, *i. e.* of the dogma which allows of no other God but nature, or the univerſe; and therefore, makes matter to be God.—Accordingly, Buddeus, in a diſſertation *de Spinoziſmo ante Spinozam*, proves at large, that *Spinoza*'s doctrine of God and the world, is far from being his own invention, but that it had been held by many philoſophers of different ſects, both among the Chaldeans and Greeks.—It is certain, the opinion of the Stoicks, and thoſe who held an *anima mundi*, was not far from it. See ANIMA *mundi*. Lucan introduces Cato diſcourſing thus:

> *Eſtne Dei ſedes niſi terra, & pontus, & aër,*
> *Et cœlum, & virtus? ſuperos quid quærimus ultro!*
> *Jupiter eſt quodcunq; vides, quocunq; moveris.*
>
> Luc. Pharſ. l. 9. v. 578.

Strato likewiſe, and others among the Peripateticks, maintained ſomething very like it; and what is more, though no ancient ſect ſeems farther removed from *Spinoziſm* than the Platonic, as they attributed the greateſt freedom to God, and carefully diſtinguiſhed him from matter; yet Gundlingius has proved at large, that Plato gave matter much the ſame origin with *Spinoza*.—But the ſect that approached neareſt to *Spinoziſm*, was that which taught that all things were one, as Xenophanes the Colophonian, Parmenides Meliſſus, and eſpecially Zeno Eleates, whence it obtained the name of the *Eleatic ſyſtem of atheiſm*.—To the ſame may alſo be reduced the opinion of thoſe, who held the firſt matter for God, as Almaricus and David of Dinantum. Add that the ſect of Foe in China and Japan, that of the Soufi in Perſia, and that of the Zindikites in Turky, are found to philoſophize much after the manner of *Spinoza*.

The chief articles in *Spinoza*'s ſyſtem are reducible to theſe. —That there is but one ſubſtance in nature; and that this only ſubſtance is endued with an infinite number of attributes, among which are extenſion and cogitation.—That all the bodies in the univerſe are modifications of this ſubſtance conſidered as it is extended; and that all the ſouls of men are modifications of the ſame ſubſtance conſidered as cogitative.—That God is a neceſſary and infinitely perfect being, and is the cauſe of all things that exiſt, but is not a different being from them.—That there is but one being and one nature; and that this nature produces within itſelf, by an immanent Act, all thoſe which we call creatures.—And that this being is at the ſame time both agent and patient, efficient cauſe and ſubject; but that he produces nothing but modifications of himſelf.

Thus is the Deity made the ſole agent as well as patient in all evil, both phyſical and moral, that called *malum pœnæ*, as well as *malum culpæ:* a doctrine fraught with more impieties than all the heathen poets have publiſhed concerning their Jupiter, Venus, Bacchus, *&c.*—What ſeems to have led *Spinoza* to frame this ſyſtem, was the difficulty of conceiving either that matter is eternal, and different from God, or that it could be produced from nothing, or that an infinite and free being could have made a world ſuch as this is.—A matter that exiſts neceſſarily, and which nevertheleſs is void of activity, and ſubject to the power of another principle, is an object that ſtartles our underſtanding; as there ſeems no agreement between the three conditions.—A matter created out of nothing is no leſs inconceivable, whatever efforts we make to form an idea of an act of the will that can change what before was nothing, into real ſubſtance. Beſides its being contrary to that known maxim of philoſophers, *ex nihilo nihil fit*.—In fine, that an infinitely good, holy, free Being, who could have made his creatures good, and happy, ſhould rather chuſe to have them wicked, and eternally miſerable, is no leſs incomprehenſible; and the rather as it ſeems difficult to reconcile the freedom of man with the quality of a being made out of nothing.

Theſe appear to have been the difficulties which led *Spinoza* to ſearch for a new ſyſtem, wherein God ſhould not be diſtinct from matter, and wherein he ſhould act neceſſarily, and to the extent of all his power, not out of himſelf [*ad extra*] but within himſelf.—But it is certain, if the new ſyſtem reſcue us from ſome difficulties, it involves us in others much greater.—For,

1°. It is impoſſible the univerſe ſhould be but one ſubſtance; ſince every thing that is extended muſt neceſſarily have parts; and what has parts muſt be compounded. And as the parts of extenſion do not ſubſiſt in each other, it follows, either that extenſion in the general is not ſubſtance, or that every part of extenſion is a different ſubſtance. Now, according to *Spinoza*, extenſion in general is an attribute of ſubſtance. And he allows, with other philoſophers, that the attributes of ſubſtance do not differ really from the ſubſtance itſelf. He muſt therefore allow, that extenſion in general is ſubſtance: whence it will follow, that every part of extenſion is a particular ſubſtance: which overturns the whole ſyſtem.

If it be objected, that *Spinoza* does not conſider different bodies, as different parts of extenſion, but as different modifications of it: the diſtinction between *part* and *modification*, we doubt will hardly ſave him. For let him avoid the word *part* as much as he pleaſe, and ſubſtitute that of *modality* or *modification* for it, the doctrine will amount to much the ſame: the characters of diverſity are not leſs real and evident, when matter is divided into modifications, than when it is divided into parts. The idea of the univerſe will ſtill be that of a compound being, or an aggregate of ſeveral ſubſtances.

For proof of this, it may be obſerved, that modalities are beings which cannot exiſt without the ſubſtance which modifies them; whence it follows, that the ſubſtance muſt be found where-ever its modalities are found; and even that the ſubſtance muſt be multiplied in proportion as the number of incompatible modifications is multiplied: ſo that where-ever there are five or ſix of theſe modifications, there muſt be five or ſix ſubſtances. It is evident, that a ſquare figure, and a circular figure are incompatible in the ſame piece of wax. Whence it follows, that the ſubſtance modified by the ſquare figure cannot be the ſame ſubſtance with that modified by the round figure. So when I ſee a round and a ſquare table in a room, I may ſafely aſſert, that the extenſion which makes the ſubject of the round table is a diſtinct ſubſtance from the extenſion which is the ſubject of the ſquare table: ſince otherwiſe it would follow, that the ſquare and round figures might be found in the ſame ſubject at the ſame time. —The ſubject, therefore, that is modified by two figures, muſt be two ſubſtances.

2°. If it be abſurd to make God extended, as this robs him of his ſimplicity, and makes him be compoſed of parts; it is ſtill worſe to reduce him to the condition of matter, the loweſt of all beings, and that which moſt of the ancient philoſophers ranked immediately above nothing: matter! the theatre of all ſorts of changes, the field of battle of contrary cauſes, the ſubject of all corruptions and generations; in a word, the being moſt incompatible with the immutability of the Deity!

The *Spinoziſts*, indeed, maintain, that it is not ſuſceptible of any diviſion; but the argument they alledge in proof of it, we have elſewhere ſhewn to be falſe: it is, that for matter to be divided, it is neceſſary that one of the parts be ſeparated from the other by a void ſpace, which is impoſſible: ſince there is no vacuum in nature. See Vacuum.

3°. If *Spinoziſm* appear extravagant when we conſider God as the ſubject of all the mutations, corruptions and generations in bodies; it will be found ſtill worſe, when we conſider him as the ſubject of all the modifications of thinking. It is no ſmall difficulty, to unite extenſion and thinking in the ſame ſubſtance; ſince it is not an union like that of two metals, or of water and wine, that will ſerve the purpoſe: theſe laſt require only juxta-poſition; whereas to combine thinking and extenſion requires an identity; thinking and extended are two attributes identified with the ſubſtance; and conſequently are identified with each other, by the fundamental rule of all logic.

Again, when we ſay, that a man *denies this*, *affirms that*, *likes that*, &c. we make all thoſe attributes fall on the ſubſtance of his mind, not on his thoughts, which are only accidents or modifications of it. If therefore what *Spinoza* advances be true, that men are modalities of God; it would be falſe to ſay, *Peter denies*, *likes*, *wills*, &c. ſince in reality, on this ſyſtem, it is God that denies, wills, *&c.* and conſequently all the denominations which ariſe from the thoughts, deſires, *&c.* of men, fall properly and phyſically on the ſubſtance of God. From whence it alſo follows, that God affirms and denies, loves and hates, wills and nills the ſame thing, at the ſame time, and under the ſame conditions: contrary to the great principle of reaſoning: *oppoſita ſunt quæ & neq; de ſe invicem, neq; de eodem tertio ſecundum idem, ad idem, eodem modo atq; tempore verè affirmari poſſunt*; which muſt be falſe, if *Spinoziſm* be true: ſince it cannot be denied but ſome men love and affirm what others hate and deny, under all the conditions expreſſed in the rule.

4°. But if it be phyſically abſurd, to ſay the ſame ſubject is modified at the ſame time with all the different thoughts of all men; it is horrible when we conſider it in a moral light. Since it will follow, that the infinite, the all-perfect Being is not conſtant, is not the ſame one moment, but is eternally poſſeſſed even with contrary paſſions; all the uniformity in him in this reſpect, will be, that for one good and wiſe thought he will have twenty fooliſh and wicked ones. He will not only be the efficient cauſe of all the errors, iniquities and impurities of men, but alſo the paſſive ſubject of them, the *ſubjectum inhæſionis*. He muſt be united with them in the cloſeſt manner that can be conceived, even by a penetrative union, or rather an identity, ſince the mode is not really diſtinct from the ſubſtance modified.

SPINSTER, in law, an addition uſually given to all unmarried women, from the viſcount's daughter downwards. See Addition.

Yet Sir Edward Coke ſays, *generoſa* is a good addition for a gentlewoman; and that if ſuch a perſon be named *ſpinſter* in any original writ, appeal or indictment, ſhe may abate and quaſh the ſame. See Gentleman.

Spelman ſays, that anciently, even queens uſed the diſtaff and ſpindle; whence *ſpinſter* became a common appellation for all women. See Woman.

SPIRACLE. See the article Vent.

SPIRAL, in geometry, a curve line, of the circular kind, which in its progreſs recedes from its centre; as in winding from the vertex, down to the baſe of a cone. See Spire.

It is called from its inventor, *Archimedes's ſpire*, or *helix*; and is thus deſcribed.—Divide the periphery of a circle A P p A (*Tab. Geometry*, *fig* 39.) into any number of equal parts, by a continual biſſection in the points p. Into the ſame number of parts divide the radius C A, and make C M equal to one part, C *m* to two parts, *&c.*—Then will the points M *m*, *m*, *&c.* be points in the *ſpiral*, which connected, will give the *ſpiral* itſelf.

This is more particularly called the *firſt ſpiral*, and the *ſpace* included between its centre, and the point A, the *ſpiral ſpace*. This firſt *ſpiral* may be continued to a *ſecond ſpiral*, by deſcribing another circle with double the radius of the firſt; and the ſecond may be continued to a *third*, by a third circle, *&c.*

Hence, 1°. A P is to the periphery, as C *m* to the radius. Wherefore, if the periphery be called p, the radius $AC = r$, $AP = x$, $PM = y$; then will $CM = r - y$: conſequently as $p : r :: x : r - y$, we ſhall have $pr - py = rx$.

2°. If $CM = y$; then will $rx = py$. Which equation the *ſpiral* has in common with the quadratrix of Dinoſtrates, and that of Tſchirnhauſen; and therefore $r^n x^m = p^n y^n$ will ſerve for infinite *ſpirals* and quadratrices. See Quadratrix.

3°. The lines M *m*, M *m*, *&c.* are to one another as the arches of the circle, intercepted between M A and thoſe lines: and when continued, making equal angles with the firſt and ſecond *ſpiral*, are in arithmetical proportion.

4°. Lines drawn from M to the ſecond *ſpiral*, are to each other as the ſaid arches, together with the whole periphery added on both ſides.

Quadrature of Spirals, } See { Quadrature.
Logiſtic Spiral, } See { Logistic.

Spiral, in architecture and ſculpture, denotes a curve that aſcends, winding about a cone or ſpire; ſo as all the points thereof continually approach the axis. See Axis.

By this it is diſtinguiſhed from the *helix*, which winds after the ſame manner, around a cylinder.—Ignorant architects confound the two: but the more knowing diſtinguiſh them carefully. See Helix.

The *ſpiral* line may be conceived to be thus generated.—If a right line, as A B (*Tab. Geometry*, *fig.* 40.) having one end fixed at B, be equally moved round, ſo as with the other end A, to deſcribe the periphery of a circle; and at the ſame time, a point be conceived to move forward, equally from B towards A in the right line AB, ſo as that the point deſcribes that line, while the line generates the circle: Then will the point, with its two motions, deſcribe the curve B, 1, 2, 3, 4, 5, *&c.* which is called a *ſpiral line*, and the plain ſpace contained between the *ſpiral line*, and the right line B A, is called the *ſpiral ſpace*.

Again, if the point B be conceived to move twice as ſlow as the line AB; ſo that it ſhall get but half way along B A, when that line ſhall have formed the circle; and if then, you imagine a new revolution to be made of the line carrying the point, ſo that they ſhall end their motion at laſt together; there will be formed a double *ſpiral line*; as in the figure: from the manner of which, may be eaſily drawn theſe corollaries.

1. That the lines B 12, B 11, B 10, *&c.* making equal angles with the firſt and ſecond *ſpiral* (as alſo B 12, B 10, B 8, *&c.*) are in arithmetical proportion.
2. The lines B 7, B 10, *&c.* drawn any how to the firſt *ſpiral*, are to one another as the arches of the circle intercepted betwixt B A, and thoſe lines: becauſe whatever parts of the circumference the point A deſcribes, as ſuppoſe 7, the point B will alſo have run over 7 parts of the line A B.
3. Any lines drawn from B to the ſecond *ſpiral*, as B 18, B 22, *&c.* are to each other, as the aforeſaid arches, together with the whole periphery added on both ſides: for at the ſame time that the point A runs over 12, or the whole periphery, or perhaps 7 parts more, ſhall the point B have run over 12, and 7 parts of the line A B, which is now ſuppoſed to be divided into 24 equal parts.

Proportional Spirals, are ſuch *ſpiral* lines as the rhumb lines on the terreſtrial globe, which, becauſe they make equal angles with every meridian, muſt alſo make equal angles with the meridians in the ſtereographick projection on the plane of the equator; and therefore will be, (as Dr. Halley obſerves) *proportional ſpirals* about the polar point.—From whence he demonſtrates, that the meridian line, is a ſcale of log-tangents of the half meridian complements of the latitudes. See Rhumb and Loxodromic.

Spiral *ſtairs*, in building. See Stairs.

SPIRATION. See Expiration, Inspiration, Perspiration, Respiration and Transpiration.

SPIRE[*], Spira, in the ancient architecture, is ſometimes uſed for the baſe of a column; and ſometimes for the aſtragal or tore. See Base, Astragal and Tore.

[*] The word is formed from the Latin, *ſpiræ*, the folds of a ſerpent, which when laid, bear ſome reſemblance thereto; or from the Greek, σπειρα, the coil of a rope.

SPIRIT, Spiritus, in medicine, the moſt ſubtile and volatile part, or juice of the body; by means whereof, all the functions, and operations thereof are ſuppoſed to be performed. See Body, Part, Fluid, &c.

The ancients made a four-fold diviſion of *ſpirits*; into *vital*, *animal*, *natural* and *genital*: whereof, the firſt they placed in the heart; the ſecond in the brain; the third in the ſtomach and liver; and the laſt in the teſticles: but as this diviſion is founded on a falſe hypotheſis, it is now deſervedly ſet aſide.

The moderns uſually divide *ſpirits* into *vital* and *animal*.

Vital **Spirits**, are only the fineſt, and moſt agitated parts of the blood; whereon its motion, and heat depend. See Blood and Vital.

Animal **Spirits**, are an exceedingly thin, ſubtile, moveable fluid juice or humour ſeparated from the blood in the cortex of the brain, hence received into the minute fibres of the medulla, and by them diſcharged into the nerves, by which it is conveyed through every part of the body, to be the inſtrument of ſenſation, muſcular motion, &c. See Sensation, Muscular *motion*, &c. See alſo Animal.

The *animal ſpirits*, called alſo *nervous ſpirits* and *nervous juice*, only differ from the *vital ſpirits*, in that theſe laſt are ſtill mixed and blended with the groſſer parts of the blood, and circulate along with it: whereas, the *animal ſpirits* are ſecreted thence by the glands whereof the cortical ſubſtance is compoſed; and have a motion, circulation, &c. peculiar to themſelves. See Circulation.

Dr. Willis conceives, that the *animal ſpirits* are prepared by a proper diſtillation of the ſubtileſt part of the arterial blood, brought by the carotides into the cortex of the brain; and ſhews, that the blood contained in the ſinus's of the dura mater, acts in this diſtillation in the ſame manner as fire does in the chymical diſtillations performed by defluxion, where being placed over the matter to be diſtilled, it makes the ſubtileſt parts thereof deſcend.

The exiſtence of the *animal ſpirits* is controverted: but the infinite uſe they are of in the animal œconomy, and the exceedingly lame account we ſhould have of any of the animal functions without them, will ſtill keep the greateſt part of the world on their ſide. And, in effect, the learned Boerhaave has gone a good way towards a demonſtration of their reality.

The blood brought to the brain by the carotides, and vertebral arteries, he ſhews, is wonderfully prepared, ſecreted, elaborated and changed from its natural ſtate, ere it arrives there; inſomuch as, contrary to the nature of the reſt, inſtead of cohering by fire, it immediately reſolves wholly into a thin vapour, without any fæces behind. And is thus exceedingly well fitted for the formation of ſo extraordinary a fluid.

He ſhews further, that the *animal ſpirits* are not formed from the cruor, but the ſerum of the blood, which Malpighi's hiſtory of the growth of the fœtus in an incubated egg, ſhews to be diviſible into parts or corpuſcles inconceivably ſmaller than the cruor.

He adds, that the nature of this juice is ſuch, as that no ſalts or oils in the body can contribute any thing to it; and that in all appearance, it is only a moſt ſubtile, pure water; which liquor is found to reſemble theſe *ſpirits* in its extraordinary miſcibility, mobility, ſolidity, ſoftneſs, ſimplicity and want of elaſticity.

The ſame author ſhews further, from the magnitude of the carotides and vertebrals, their ſtreight uninterrupted courſe, the great quantity of blood they bring, the bulk of the cortex, &c. that there muſt be a very great quantity of this liquor; that there is freſh prepared every moment of life; and that it is driven, every moment, by the action of heat, &c. from the brain and cerebel, to all the parts of the body furniſhed with nerves; which motion, he ſhews from the exceeding fineneſs, crookedneſs, &c. of the ramifications, muſt be very gentle, equable and conſtant, one part continually driving before it another.

Upon the whole, it is no wonder this fluid eſcapes the notice of our ſenſes; and that no ligatures, wounds, punctures, injections or the like, make either it or the apertures of the nerves through which it flows, viſible: nor does it avail, what ſome who allow the exiſtence of the *animal ſpirits*, urge againſt their being any coherent juice or liquor, *viz.* that we ſhould find it ooze out and wet the adjacent parts, upon cutting a nerve, as we do in cutting a lymphatic, &c. or that upon binding a nerve, the upper-part would ſwell; that the agitations which objects make on the filaments, would be deadened, &c. that it is impoſſible a liquor ſhould have two oppoſite motions at the ſame time; and that the velocity of the ſenſations, and rapidity of the motions of man, prove, that the *animal ſpirits* are rather an aura or even light than a liquor. *Mem. de Trev.*

For the ſecretion of the *animal* Spirits from the blood, and the apparatus in order thereto. See Brain and Secretion.—For the courſe of the *animal* Spirits, and the veſſels through which they are carried, ſee Nerve and Circulation.—For the office of the *animal* Spirits in muſcular motion and ſenſation, ſee Muscular and Sensation.

Spirit, Spiritus, in the Newtonian phyſicks, denotes a moſt ſubtile, penetrative ſubſtance, which pervades all, even the denſeſt bodies, and lies hid therein; by the force and action whereof, the particles of bodies attract each other, at very ſmall diſtances, and when contiguous, cohere: and by which electrical bodies act at greater diſtances, both attracting and repelling the neighbouring corpuſcles; and light is emitted, reflected and inflected, and warms bodies; and all ſenſation is excited; and the members of animals moved at the inſtance of the will, *viz.* by vibrations of this *ſpirit*, propagated through the ſolid capillaments of the nerves, from the external organs of ſenſe to the brain, and from the brain to the muſcles. See Medium, Newtonian, Heat, Light, Vacuum, Attraction, Sensation, &c.

Spirit, in chymiſtry, is one of the principles of natural bodies; called alſo *mercury*. See Principle and Mercury.

The chymical principle *ſpirit*, is a fine, ſubtile, volatile, penetrating, pungent liquor, which riſes ordinarily before the phlegm or water, and ſometimes after it.

The great properties of this liquor are, that it penetrates and opens ſolid bodies, corrodes, breaks, and even diſſolves certain mixt bodies, coagulates others, and produces an infinity of other effects, many of them even contrary to one another.

In the general, the chymiſts give the denomination *ſpirits* to all the fine, ſubtile, not-aqueous particles, raiſed from bodies by heat, and reduced into liquors by diſtillation.—Such are *ſpirit* of vitriol, of nitre, of ſalt, &c.

They alſo apply the name *ſpirits*, to thoſe aqueous liquors which are drawn by liquefaction, when they are impregnated with ſalts, or other active principles, raiſed, together with them, by the violence of the fire.

Theſe, when they excite any ſenſation of heat on the tongue, are particularly called *acid*, or *ſharp ſpirits.* See Acid.

When they make any eroſion on the tongue, they are called *corroſive ſpirits.* See Corrosive.

Such as taſte ſomewhat like common ſalt, are called *ſaline ſpirits.* See Salt.

Such as partake of the taſte of common ſulphur, *ſulphurous ſpirits.* See Sulphur.

And when this taſte is very ſtrong, *urinous ſpirits.* See Urinous.

Such as take fire readily, *inflammable* or *ardent ſpirits.* See Inflammable and Ardent.

Such where the acid predominates, though qualified with a little ſulphur, &c. are called *mixt ſpirits.*

In this ſenſe, the chymiſts are ſaid to draw a *ſpirit* from ſulphur, ſalt and other bodies, when they extract the eſſence, or the ſubtileſt part thereof, by diſtillation or otherwiſe. See Distillation, &c.

Spirits, is alſo a general name among diſtillers, for all diſtilled liquors that are neither oil, nor phlegm. See Distillation, &c.

Spirit *of wine*, is only brandy rectified once or more times, by repeated diſtillations. See Brandy and Rectified.

One may likewiſe make a perfect rectification of brandy into *ſpirit of wine*, at one ſingle diſtillation, by uſing a chymical inſtrument conſiſting of ſeveral cucurbites, deſcribed by Glaſer. See Rectification.

Spirit of wine is uſed in dying, as a non-colouring drug, and though giving no colour itſelf, ſerving to prepare the ſtuffs to receive other colours. See Dying.—Its conſumption is alſo very conſiderable in ſeveral other works and manufactures; particularly the making of varniſh. See Varnish.

Ætherial **Spirit** *of wine*, (called by ſome *vegetable æther*, or the *æther of plants*) is a denomination given, by ſome modern chymiſts, to a liquor endued with very extraordinary properties; prepared from ſpirit of wine, and oil of vitriol.

Dr. Frobenius, who firſt brought it into England, deſcribes it as the pureſt fire, yet at the ſame time a moſt fluid water. Being poured on the hand, it feels cold; yet is ſo inflammable, that it catches fire and kindles even at a conſiderable diſtance from a candle. It is extremely light, and miſcible with water, yields an aromatic ſmell, and is ſo volatile, and evaporates ſo faſt, that it ſcarce ſeems to wet the finger dipped in it. *Vid. Phil. Tranſ. n.* 413. *p.* 283. *Mem. Acad. R. an.* 1734, *p.* 56.

Phoſphorus being diſſolved in this liquor, and the ſolution poured into a tub of warm water, a blue flame is produced, with ſmoke, and a ſmall degree of warmth.

Some of this *ætherial ſpirit of wine*, being poured into a tub of cold water, is ſet on fire and yields a copious flame by the touch of the point of the operator's ſword[*].—After the deflagration, the water is found cold. *Vid. Phil. Tranſ. n.* 428, *p.* 55, 58.

---

[*] But it muſt be obſerved, that the ſword is firſt privately warmed,

ed, and in applying it, the point is dexterouſly rubbed againſt a bit of phoſphorus lodged for the purpoſe on the ſide of the tub.---What pity to ſee chymiſtry debaſed with legerdemain!

SPIRIT *of ſulphur*, is a *ſpirit* drawn from ſulphur ſet on fire; the moſt ſubtile part whereof, is converted into a liquor, by ſticking to a glaſs bell ſuſpended over it, whence it falls drop by drop, into a trough, in the middle whereof is placed the ſtone pot wherein the ſulphur is burnt. See SULPHUR.

This *ſpirit* is held ſpecific for the ſame diſeaſes as *ſpirit* of vitriol. See SPIRIT *of vitriol.*

SPIRIT *of ſalt*, is a yellow liquor drawn, by chymiſtry, from ſea ſalt. See SALT.

The beſt, is that prepared in England. It is much uſed in medicine; but has not, perhaps, all the virtues aſcribed to it. The common *ſpirit of ſalt*, being very corroſive, may be dulcified, by letting it digeſt three days in a gentle ſand heat, with an equal quantity of *ſpirit* of wine mixed therewith. See DULCIFYING, FRESH-*water*, &c.

SPIRIT *of vitriol*, is vitriol dried in the ſun, or in defect thereof, by the fire, and then diſtilled by chymical operations ſeveral times repeated; firſt by a a reverberatory fire, and then in balneo Mariæ. See VITRIOL.

It is held excellent againſt the epilepſy, as well as againſt burning and malignant fevers.—The laſt *ſpirit* drawn from vitriol, and which is improperly called *oil of vitriol*, is uſed in the diſſolution of metals and minerals.

SPIRIT *of amber*, } See the articles { AMBER.
SPIRIT *of ſal armoniac*, } See the articles { ARMONIAC.

SPIRIT, is alſo uſed for any incorporeal being, or intelligence.—In which ſenſe, God is ſaid to be a *ſpirit*: angels are *ſpirits*; the devil, an *evil ſpirit*. See GOD, ANGEL, DEVIL, *&c.*

In this ſenſe, the human ſoul is alſo called a *ſpirit*, from its thinking and reflecting powers, which cannot be conceived to reſide in any thing material. See SOUL.

F. Malebranche obſerves, it is extremely difficult to conceive what it is, ſhould make the communication between the body and the *ſpirit*; for if the *ſpirit* have no material parts, it cannot move the body: but the argument muſt be falſe ſome how or other; for we believe that God can move bodies, and yet do not attribute any material parts to him.

SPIRIT, in theology, is uſed by way of eminence, for the third Perſon in the holy trinity: called *the Spirit*, *Holy Spirit*, or *Holy Ghoſt*. See TRINITY and PERSON.

The Macedonians, *&c.* deny the divinity of the *Spirit*: the Socinians his exiſtence: the Arians his co-equality with the Father. See ARIANS, SOCINIANS, *&c.*

Divines expreſs the manner wherein the *Spirit* was produced, by an active ſpiration or breathing of the Father and the Son; whence the denomination *ſpiritus*, q. d. breath.

Order of the holy SPIRIT. See HOLY *Ghoſt*.

SPIRIT, is alſo uſed among divines, for the divine power, and virtue; and the communication thereof to men.

In this ſenſe, the *Spirit* is ſaid to have gone out on the face of the deep, Gen. i. 2. And the prophets to have been poſſeſſed with the *Spirit* of God.—Providence, in this ſenſe, is that univerſal *Spirit* whereby God makes all nature to act.

Thus the holy virgin is ſaid to have conceived of the *Spirit*.

Private SPIRIT, is a term that made a great figure in the controverſies of the two laſt centuries. It ſignifies the particular ſenſe or notion each perſon has of the dogmata of faith, and the truths of religion, as ſuggeſted by his own thoughts, and the perſuaſion he is under with regard thereto.

The firſt reformers denying ſtrenuouſly any infallible interpreter of the ſcripture, or any ſettled judge of controverſies; maintained, that every perſon was to interpret and judge of revealed truths, by his own light, aſſiſted by the grace of God; and this was what they called *private ſpirit* or *judgment*. Againſt this, the arguments uſed by the Romaniſts are, that revealed truths being one and the ſame for all believers; the rule God has given us for judging of them, ought to repreſent them to us uniformly and the ſame; but the *private ſpirit* informs Luther one way, and Zuinglius another. It divides Oecolompadius, Bucer, Oſiander, *&c.* And the doctrine it diſcovers to the Confeſſionites, is quite different from that it ſhews the Anabaptiſts and Mennonites, in the very ſame paſſage of ſcripture.

SPIRIT, *Spiritus*, is alſo uſed in proſody, to ſignify the greater, or leſs degree of breath employed in the pronunciation of the initial Greek vowels, and of the letter ϱ. See ASPERATE.

In ſounding the vowels we may obſerve, every vowel has its ſound by a ſimple conformation of the mouth; wherein the breath has little or no concern, as being confined in the arteria aſpera: The *ſpirits* or breaths, which are placed on the initial vowels in words, are to denote the force this initial vowel is to have from the breath, when the word is pronounced. If the ſound of this vowel be ſmooth, as all the ſounds of the vowels naturally are, this is termed *ſpiritus lenis*, a *mild breath*; but, if this vowel be to be pronounced with a more vehement expulſion of the air, this is termed *ſpiritus aſper*, or a rough breath or aſperate; and when the aſperate and acute are in the ſame ſyllable, the mark of the breath in this initial vowel only ſignifies that the vowel is to be pronounced with a ſtronger breath than the initial mild vowels; for aſperates do not alter the tone of any ſyllable, but only ſtrengthen, increaſe and ſwell the tone.

Art of SPIRITS, } See the articles { ART.
Modes of SPIRIT, } See the articles { MODE.

SPIRITUALITIES of a biſhop, are ſuch profits as ariſe to him from the benefit of his juriſdiction in his dioceſe, and not as a baron of parliament. See BISHOP and TEMPORALITIES.

Such are thoſe of his viſitations, inſtitutions, ordinations, preſentation money, *&c.* See VISITATION, *&c.*

Guardian of the SPIRITUALITIES. See GUARDIAN.

SPIRITUALIUM *cuſtos*. See the article CUSTOS.

SPIRITUALIZATION, in chymiſtry, the action of extracting ſpirits from natural bodies. See SPIRIT.

Spiritualization, is an operation that belongs principally to fermented ſalts; then to fermented juices and liquors; the fermentation rendring the ſpirits volatile and inflammable. See FERMENTATION.

Spirit of wine is ſometimes *ſpiritualized* to that degree, that upon throwing a quantity into the air, not a drop ſhall fall down; but the whole evaporate and be loſt.

SPIRITUS *aceti*, See the article ACETUM.

SPITTLE. See the article SALIVA and SPUTUM.

SPITTLE, a corruption of the word *hoſpital*. See HOSPITAL.

SPLAIT *ſhoulder*; ſee the article SHOULDER.

SPLANCHNOLOGY*, in anatomy, a diſcourſe, or explication of the viſcera.—See *Tab. Anat.* p. 3. where the object of this branch is repreſented; ſee alſo VISCERA.

* The word is formed from the Greek, σπλαγχνον, *viſcus*, inteſtine, and λογος, diſcourſe.

Sarcology is divided into three parts, *viz.* *ſplanchnology*, *myology*, and *angeiology*. See SARCOLOGY.—*Splanchnology*, is that which treats of the internal parts, and particularly the viſcera.

SPLEEN, ΣΠΛΗΝ, *lien*, in anatomy, a ſoft, ſpungy, viſcus, of a darkiſh red, or rather livid, colour, ordinarily reſembling the figure of a tongue, though ſometimes triangular, and ſometimes roundiſh.—See *Tab. Anat.* (Splanch.) *fig.* 1. *lit. m.*

The *ſpleen* is uſually ſingle, though ſometimes there are two, and ſometimes three found. It is ſituate in the left hypochondrium, between the ſpurious ribs and the ſtomach; is ſomewhat convex on the ſide towards the former, and concave towards the latter. Its ordinary length is ſix inches; breadth three, and thickneſs one. It is connected to the omentum, and, by means of that and the blood veſſels, to the ſtomach and left kidney, and ſometimes to the diaphragm.

It is covered with two tunics; the external derived from the peritonæum, and connected to the internal only by intervention of the blood veſſels. The inner conſiſts of fibres very curiouſly interwoven. From this, probably, are derived thoſe innumerable cells or little bladders, which make up the main bulk of the *ſpleen*: though Malpighi rather takes them to ariſe from the venous duct. The cells communicate with each other, and diſcharge themſelves into the trunk of the ſplenic vein. Their inſide, according to Malpighi, is furniſhed with various minute glands adhering together; ſix, ſeven, or eight whereof form a kind of ſmall conglomerate glands, wherein the arteries and veins ſeem to terminate.

Its blood veſſels are the ſplenic artery, which furniſhes it with blood, from the cœliac; and the ſplenic vein, which carries it thence, by the porta, to the liver. See SPLENIC.

Its nerves come from the plexus lienaris, near the bottom of the ſtomach. The veſſels are all, ſo ſoon as they enter the *ſpleen*, wrapt up in one common capſula or membrane, and plentifully diſtributed together throughout the ſubſtance of the *ſpleen*. Beſides theſe, are lymphatics in great abundance.

The anaſtomaſes between the arteries and veins of the *ſpleen*, are more apparent than in any other part of the body. And this viſcus is obſerved to be furniſhed with a greater proportion of blood than any other parts. See ANASTOMASIS.

The uſe of the *ſpleen* has been diſputed in all ages; both, as no immediate uſe thereof appears from diſſection, and as we find, that animals from whom it has been cut, live very well without it. All the effects, *e. gr.* following the cutting it from a dog, are, that the animal grows more ſalacious than uſual; that it urines more frequently; is more hungry than ordinary; and for the firſt days is troubled with a vomiting and nauſea. It is added, that it is neceſſary the part be taken away to make a good runner.

Hence ſome have imagined that the *ſpleen* only ſerved to make a balance in the weight of the body; others, that it was only intended for the ſake of ſymmetry; others hold it an uſeleſs load, and one of nature's redundances; others, a pit, or common-ſhore, to diſcharge the fæces of the blood into; others a fire, by the heat whereof, the action of the ſtomach is animated.

Many of the ancients took it to be the receptacle of the atrabilis, or melancholic humour; for which reaſon, ſome of them call it the *organ of laughter*. See LAUGHTER, HYPOCHONDRIAC, *&c.*

Mr. Cowper, from the great quantity of blood, and the apparent inoſculations of the *ſpleen*, draws a very natural conjecture of the uſe thereof; at leaſt of the peculiar mechaniſm. He takes, then, the *ſpleen* to be only a ſubordinate organ, miniſtring to the circulation; and thinks, that by this congreſs of the arterial and venal blood, an impetus is communicated to the latter; by which its progreſs through the ramifications of the porta to the cava, is promoted, which would otherwiſe be ſo broke by the double ramifications of the porta, as to want ſtrength ſufficient to carry to the heart. See CIRCULATION.

The action or effect of the *ſpleen*, according to Dr. Boerhaave, is to receive the freſh arterial blood, prepare it in its glands, and pour it into its cells; to return what blood is left from this action, to the little veins, and thence to the ſplenic vein; to mix the humour thus prepared, with the nervous juice, and to prepare, attenuate, and more intimately unite them together into one humour.

Malpighi, and afterwards Dr. Keil, and ſome others, take the *ſpleen* to be a viſcus aſſiſtant to the liver, in the ſecretion, *&c.* of the bile. We have obſerved, that by reaſon of the nearneſs of the liver and heart, and the ſwift motion of the blood in the aorta, a humour conſiſting of particles that combine ſo ſlowly as thoſe of the bile do, could not be prepared but by bringing the blood round about through the ſtomach, inteſtines and omentum, *&c.* to the liver, to abate its velocity.

Now Dr. Keil conjectures, that thoſe parts were not ſufficient to receive all the blood neceſſary to be ſent to the liver; therefore nature framed the *ſpleen*, into whoſe cavities the blood being poured from a ſmall artery, moves at leaſt as ſlowly as any that paſſes otherwiſe to the liver; by which means the particles that compoſe the bile in the blood which paſſes through the ramus ſplenicus, by ſo long and ſlow a circulation, have more chances for uniting than otherwiſe they would, had they been carried by the branches of the cœliac directly to the liver; conſequently without the *ſpleen*, ſuch a quantity of bile as is now ſecerned, that is, as nature requires, could not have been ſeparated by the liver. See BILE; ſee alſo LIVER.

SPLEEN is alſo uſed for a diſeaſe, by phyſicians more uſually called the *hypochondriac diſeaſe*. See HYPOCHONDRIAC, and VAPOURS; ſee alſo SPLENETIC.

SPLENETIC, ΣΠΛΗΝΙΚΟΣ, a perſon affected with opilations and obſtructions of the ſpleen. See SPLEEN.

In *ſplenetic* people, the ſpleen is ſwelled beyond the natural bulk, or hardened ſo as to ſhew a ſcirrhous tumour thereon.

Splenetic people are diſtinguiſhed by a livid, lead-coloured complexion; their character is to be very prone to laughter; which is an expedient nature is ſuppoſed to make uſe of, to evacuate the too redundant humour the ſpleen is charged withal: whence it is that the ancients made the ſpleen the organ of laughter; and hence that popular ſaying of a perſon laughing heartily, that he *vents his ſpleen*. See LAUGHTER.

SPLENETIC *waters*; ſee the article WATER.

SPLENIC *veſſels*, a large artery, and vein of the ſpleen. See SPLEEN.

The SPLENIC *artery*, *arteria* SPLENICA, is a trunk of the left cœliac, ſerving to bring the blood from that artery to the ſpleen, to be there ſecreted, prepared, *&c.* Its progreſs is very much contorted; and after its arrival at the ſurface of the ſpleen, it is diffuſed through the ſubſtance thereof in ſmall branches, which ſeem to terminate in the cells.

The SPLENIC *vein*, *vena* SPLENICA, is formed out of the ſeveral minute veins of the ſpleen, uniting as they quit the ſurface thereof. It carries the blood ſecreted, *&c.* in the ſpleen, to the left branch of the vena porta, to be thence conveyed to the liver, there to be further prepared and converted into bile. See LIVER and BILE.

The *ſplenic vein* and *artery* manifeſtly communicate with each other: for water being poured into one of them, preſently diſcharges itſelf by the other. See SPLEEN.

SPLENII, in anatomy, a pair of muſcles, called alſo from their form *triangulares*.—See *Tab. Anat.* (Myol.) fig. 2. *. fig. 6. n. 5. fig. 7. n. 6.

They ariſe from the four upper ſpines of the vertebræ of the back, and from the two lower of the neck, and aſcending obliquely, adhere to the upper tranſverſe proceſſes of the vertebræ of the neck, and are inſerted into the upper part of the occiput. They pull the head backwards to one ſide, and are called *ſplenii*, from a ſuppoſed reſemblance to an ox's ſpleen.

SPLENT, or SPLINT, among farriers, a callous, inſenſible excreſcence, or griſtle, that ſometimes ſticks to an horſe's ſhank bone; generally on the inſide, below the knee.

If there be one oppoſite thereto on the outſide, it is called a *pegged* or *pinned ſplent*, becauſe it does, as it were, pierce the bone, and is extreamly dangerous: ſome call this a *double ſplent*, and others a *thorough ſplent*.

SPLENTS, in ſurgery, pieces of wood uſed in binding up broken limbs. See FERULA.

The word is alſo uſed for the pieces of a fractured bone.

SPLICE, at ſea.—They ſay, a cable or rope is *ſpliced*, when the ends of two pieces being untwiſted, the ſeveral ſtrands are wrought into one another by a fidd.

Alſo, when an eye is to be made at the end of a rope, the ends of the ſtrands, are, by a fidd, drawn into the ends of the other rope ſtrands; and this is called a *ſplice*.

To SPLICE, among gardeners, is to graft the top of one tree into the ſtock of another, by cutting them ſloping, and faſtening them together. See ENGRAFTING.

SPLINT. See the article SPLENT.

SPODIUM, in pharmacy, a kind of metalline calx, or aſhes, eſteemed cardiac, and by ſome held to have the ſame virtues with coral. See CORAL.

The *ſpodium* of the ancient Greeks was a greyiſh kind of recrement, found in form of aſhes on the hearths of furnaces wherein braſs was made; called by them σποδιον, which literally ſignifies *aſhes*.

Spodium is a metalline powder, nearly a-kin, both in origin and uſe, to tutia and pompholyx; only heavier than either. See TUTTY and POMPHOLYX.

The *ſpodium* of the Arabian phyſicians, as Avicenna and others, was made of the burnt roots of ruſhes, and reeds.

Some moderns alſo make a *ſpodium* of ivory burnt and calcined to a whiteneſs.—It is ſometimes counterfeited by burning bullocks or dogs bones; but theſe are of no value.

The *anti* SPODIUM, which the ancients ſubſtituted for their *ſpodium*, was made of myrtle leaves, galls, and ſome other ingredients, calcined.

SPOILS, SPOLIA, whatever is taken from an enemy in war.

Among the Greeks, the *ſpoils* were divided in common among the whole army; only the general's quota was the biggeſt.

By the military diſcipline of the Romans, the *ſpoils* belonged to the republic; particular perſons had no title to them; and ſuch of the generals, as valued themſelves on their probity, always carried them to the public treaſury.—Sometimes, indeed, the pillage was diſtributed by the general among the ſoldiery, to encourage them, or to reward them: but this was not done without a world of prudence and reſervedneſs, otherwiſe it came under the crime of Peculate.

The conſuls Romulus and Veturius, were condemned for having ſold the *ſpoils* taken from the Æqui. Livy, lib. 8.

SPONDAULA*, ΣΠΟΝΔΑΥΛΗΣ, in antiquity, a player of the flute, or other wind inſtrument of that kind, who, during the offering of ſacrifice, performed ſome ſuitable air in the prieſt's ear to prevent his hearing any thing that might diſtract him, or leſſen his attention. See SACRIFICE.

* The word is formed from the Greek σπονδη, *libation*, and αυλος, *flute*.

SPONDEE, SPONDÆUS, in the Greek and Latin proſody, a foot of verſe, conſiſting of two long ſyllables.—As *vertunt*. See FOOT, QUANTITY, and DISPONDEE.

The *ſpondee* is a grave meaſure: all Greek and Latin hexameters regularly end with a *ſpondee*. See VERSE, and MEASURE.

There are alſo *ſpondaic verſes*; that is, verſes compoſed wholly of *ſpondees*, or at leaſt that end with two *ſpondees*, as,

Conſtitit atque oculis Phrygia agmina circumſpexit.

SPONDYLUS, ΣΠΟΝΔΥΛΟΣ, a term anciently uſed for a vertebra of the ſpina dorſi. See VERTEBRA, *&c.*

SPONGE. See the article SPUNGE.

SPONGIOSA, in anatomy, an epithet given to ſeveral parts of the body, by reaſon of their texture, which is porous and cavernous, like that of the ſpunge: as

Corpora SPONGIOSA *penis*, called alſo, *corpora cavernoſa* and *nervoſa*. See CAVERNOSA *corpora*.

Oſſa SPONGIOSA of the noſe, called alſo *oſſa turbinata* and *cribriformia oſſa*. See CRIBRIFORME.

SPONTANEOUS*, SPONTANEUS, in the ſchools, a term applied to ſuch motions of the body, and mind, as we perform of ourſelves, without any conſtraint. See VOLUNTARY, and MOTION.

* The word is formed from the Latin adverb, *ſponte*, of one's own accord.

Thus, in morality, thoſe actions performed from an inward and natural principle, conformable to our own inclinations, excluding all conſtraint, but not excluding neceſſity; are called *ſpontaneous actions*. See NECESSITY.

In medicine, an evacuation effected without any application for that purpoſe, is called a *ſpontaneous evacuation*.—And a laſſitude or wearineſs, not occaſioned by any preceding fatigue, is called a *ſpontaneous wearineſs*.

It is held a grievous and dangerous error, with regard both to religion and morality, to hold that human liberty only conſiſts in *ſpontaneity*: M. le Clerc has been very harſhly treated, for making St. Auguſtin of this opinion. See LIBERTY, and FREEDOM.

SPONTANEOUS *generation*. See EQUIVOCAL *generation*.

SPONTANEOUS *precipitation*. See PRECIPITATION.

SPOONING, or SPOOMING, in the ſea language. When a ſhip being under ſail, in a ſtorm at ſea, cannot bear it; but is forced to put right before the wind; the ſeamen ſay, ſhe *ſpoons*.

And when in ſuch a caſe, there is danger leſt ſhe ſhould bring her maſts by the board, with her rolling about, or ſeel under water, and ſo founder, they uſually ſet up the fore-ſail to make her go the ſteadier, eſpecially if there be ſea-room enough: this they call *ſpooning with the fore-ſail.*

SPORADES, in aſtronomy, a name which the ancients gave to ſuch ſtars as were not included in any conſtellation. See STAR.

Theſe, the moderns more uſually call *informes* or *extraconſtellary ſtars*. See INFORMES, and CONSTELLATION.

Many of the *ſporades* of the ancients have been ſince formed into new conſtellations: *e. gr.* of thoſe between leo and urſa major, Hevelius has formed a conſtellation, called *leo minor*; of thoſe between urſa minor and auriga, the ſame perſon has formed another conſtellation called *lynx*: of thoſe under the tail of urſa major, another called *canis venaticus*, &c. See CONSTELLATION.

SPORADIC*, ΣΠΟΡΑΔΙΚΟΣ, in medicine, an epithet given to ſuch diſeaſes as have ſome ſpecial or particular cauſe, and are diſperſed here and there, affecting only particular conſtitutions, ages, *&c.* See DISEASE.

* The word is formed from the Greek *σπορας*, diſperſed, ſpread, of *σπειρω*, I ſow, ſtrew, *&c.*

Sporadic ſtand in oppoſition to *epidemic* diſeaſes, which are thoſe ariſing from a general cauſe, and that are common to all kinds of perſons, of what complexion and quality ſoever. See EPIDEMIC and ENDEMIC.

SPORTULA, in antiquity, a dole or largeſs, either of meat or money, given by princes or great men, to the people or poor. See ALMS.

The *ſportula* was properly the panier, or baſket wherein the meat was brought; or wherewith the poor went to beg it: thence the word was transferred to the meat itſelf; and thence to money ſometimes given in lieu of it.

Sportula was alſo frequently uſed in oppoſition to *recta cœna*, a formal or plentiful meal; as in Martial—*promiſſa eſt nobis* ſportula, *recta data.*

St. Cyprian gives the denomination, *ſportulantes fratres*, to ſuch clergymen as then received gifts, or gratuities, for their maintenance, like our prebends. See ALMS, *&c.*

SPOTS, in aſtronomy, dark places obſerved in the diſks or faces of the ſun, moon, and planets. See SUN, MOON, *&c.*

The *ſpots* in the ſun are only viſible through a teleſcope: ſome diſtinguiſh them into *maculæ* or dark *ſpots*, and *faculæ* or bright *ſpots*; but there ſeems little foundation for any ſuch diviſion. See MACULÆ and FACULÆ.

The *ſolar ſpots* have not been long obſerved. They are very changeable, as to number, form, *&c.* are ſometimes in a multitude, and ſometimes none at all.

Some imagine they may become ſo numerous, as to hide the whole face of the ſun; at leaſt the greateſt part of it; and to this aſcribe what Plutarch tells us, *viz.* that in the firſt year of the reign of Auguſtus, the ſun's light was ſo faint and obſcure, that one might look ſteadily at it with the naked eye. See ECLIPSE.

To which Kepler adds, that in 1547, the ſun appeared reddiſh, as when viewed through a thick miſt; and hence conjectures, that the *ſpots* in the ſun are a kind of dark ſmoke or clouds floating on the ſurface thereof.

Others will have them ſtars or planets tranſiting the body of the ſun.—But it is much more probable they are opake bodies, in manner of cruſts, formed like the ſcums on the ſurface of liquors. See SUN.

The *lunar ſpots* are fixed. Some will have them the ſhadows of the mountains, or uneven places of the moon's body; but their conſtancy diſcredits this opinion.—The more general and probable opinion is, that the *ſpots* in the moon, are ſeas, lakes, moraſſes, *&c.* which abſorbing part of the ſun's rays, reflect the fewer to us; ſo as to appear in form of dark *ſpots*: whereas the earthy parts, by reaſon of their ſolidity, reflect all their light, and thus appear perfectly bright.—M. Hartſoeker has another opinion, and takes the *ſpots* in the moon, many of them at leaſt, for foreſts, groves, *&c.* the leaves and branches whereof, intercept the rays reflected from the ground, and ſend them elſewhere.

The aſtronomers reckon about forty-eight *ſpots* on the moon's face; to each whereof they have given names. The twenty-firſt is one of the moſt conſiderable, and is called *Tycho.*

Planetary ſpots.—Aſtronomers find that the planets are not without their *ſpots*. Jupiter, mars, and venus, when viewed through a teleſcope, ſhew ſeveral very remarkable ones; and it is by the motion of theſe *ſpots*, that we conclude the rotation of the planets round their axes, in the ſame manner as that of the ſun is deduced from the motion of his maculæ. See PLANET, SUN, PHASES, *&c.*

SPOUT, or *Water*-SPOUT, in natural hiſtory, an extraordinary meteor, or appearance at ſea, and ſometimes at land, very dangerous to ſhips, *&c.* ofteneſt obſerved in hot, dry weather; called by the Latins, *typho*, and *ſipho*; by the French, *trompe*, &c. See METEOR.

Its firſt appearance is in form of a deep cloud, the upper part whereof is white, and the lower black. From the lower part of this cloud hangs, or rather falls down, what we properly call the *ſpout*, in manner of a conical tube, biggeſt at top. Under this tube is always a great boiling, and flying up of the water of the ſea, as in a jet d' eau. For ſome yards above the ſurface of the ſea, the water ſtands as a column or pillar; from the extremity whereof it ſpreads and goes off, as in a kind of ſmoke. Frequently, the cone deſcends ſo low, as to touch the middle of this column, and continue for ſome time contiguous to it; though ſometimes it only points to it, at ſome diſtance, either in a perpendicular or oblique line. See *Tab. Nat. Hiſt. fig.* 20.

Frequently it is ſcarce diſtinguiſhable, whether the cone or the column appear the firſt, both appearing all of a ſudden againſt each other. But ſometimes the water boils up from the ſea to a great height, without any appearance of a *ſpout* pointing to it, either perpendicularly or obliquely. Indeed, generally, the boiling or flying up of the water, has the priority, this always preceding its being formed into a column. Generally, the cone does not appear hollow, till towards the end; when the ſea-water is violently thrown up along its middle, as ſmoke up a chimney. Soon after this, the *ſpout* or canal breaks and diſappears; the boiling up of the water, and even the pillar, continuing to the laſt, and for ſome time afterwards; ſometimes till the *ſpout* form itſelf again, and appear a-new; which it ſometimes does, ſeveral times in a quarter of an hour.

M. de la Pyme, from a near obſervation of two or three *ſpouts* in Yorkſhire, deſcribed in the *Philoſophical Tranſactions*, gathers, that the *water-ſpout*, is nothing but a gyration of clouds by contrary winds, meeting in a point or centre; and there, where the greateſt condenſation and gravitation is, falling down into a pipe or great tube, ſomewhat like Archimedes's ſpiral ſcrew; and in its working and whirling motion, abſorbing and raiſing the water, in the ſame manner as the ſpiral ſcrew does; and thus deſtroying ſhips, *&c.*

Thus, June the 21ſt, he obſerved the clouds mightily agitated above, and driven together; upon which they became very black, and were hurried round, whence proceeded a moſt audible whirling noiſe, like that ordinarily heard in a mill. Soon after, iſſued a long tube or *ſpout*, from the center of the congregated clouds, wherein he obſerved a ſpiral motion, like that of a ſcrew; by which the water was raiſed up. Again, Auguſt 15, 1687. the wind blowing at the ſame time out of ſeveral quarters, created a great vortex and whirling among the clouds; the center whereof, every now and then, dropt down, in ſhape of a long, thin, black pipe, wherein he could diſtinctly behold a motion like that of a ſcrew, continually drawing upwards, and ſcrewing up, as it were, wherever it touched. In its progreſs it moved ſlowly over a grove of trees, which bent under it like wands in a circular motion. Proceeding, it tore off the thatch from a barn, bent a huge oak tree, broke one of it greateſt branches, and threw it to a great diſtance. He adds, that whereas it is commonly ſaid, the water works and riſes in a column, before the tube comes to touch it; this is doubtleſs a miſtake, owing to the fineneſs and tranſparency of the tubes, which do moſt certainly touch the ſurface of the ſea, before any conſiderable motion can be raiſed therein; but which do not become opake and viſible, till after they have imbibed a conſiderable quantity of water.

The diſſolution of *water-ſpouts*, he aſcribes to the great quantity of water they have glutted; which by its weight impeding their motion, whereon their force, and even exiſtence depends, they break and let go their contents; which uſe to prove fatal to whatever is found underneath.

A notable inſtance hereof, we have in the *Philoſophical Tranſactions*, related by Dr. Richardſon. A *ſpout* in 1718, breaking on Emott-moor, nigh Coln, in Lancaſhire, the country was immediately overflowed; a brook, in a few minutes, roſe ſix feet perpendicularly high; and the ground whereon the *ſpout* fell, which was ſixty-ſix feet over, was tore up to the very rock, which was no leſs than ſeven feet deep; and a deep gulf made for above half a mile; the earth, being raiſed on either ſide in vaſt heaps.

In Pliny's time, the ſeamen uſed to pour vinegar into the ſea, to aſſuage and lay the *ſpout*, when it approached them: our modern ſeamen think to keep it off, by making a noiſe with filing and ſcratching violently on the deck; or, by diſcharging great guns to diſperſe it.

SPOUTING *fountain*. See the article FOUNTAIN.

SPRAIN. See the article STRAIN.

SPRING, *fons*, in natural hiſtory, a fountain, or ſource of living water ariſing out of the ground. See WATER and FOUNTAIN.

The origin of *ſprings* or fountains, is a thing much controverted among our lateſt naturaliſts.—Meſſ. Mariotte and Perrault aſcribe it to rains: their doctrine is, that the rain-water penetrates the earth till ſuch time as it meets a clayey ſoil or ſtratum; which proving a ſufficient ſolid bottom, to ſuſtain and ſtop their deſcent, they glide along it that way to which the earth declines, till they meet with a place or aperture in the ſurface, through which they may eſcape, and make the head of a river. See STRATUM.

Now, that the rain is ſufficient for this effect, appears hence; that upon calculating the quantity of rain and ſnow which falls yearly on the tract of ground, that is to furniſh, for inſtance,

ſtance, the water of the Seine; it is found, that river does not take up above one ſixth part of it. See Rain.

Springs ordinarily ariſe at the feet of mountains: the reaſon, ſay they, is, that mountains collect the moſt waters, and give them the greateſt deſcent the ſame way: and that if we ſometimes ſee ſprings on high grounds, and even on the tops of mountains; they muſt be brought from other remoter places, conſiderably higher, along beds of clay or clayey ground, as in their natural channels.—If then, there happen to be a valley between a mountain, on whoſe top is a *ſpring*, and the mountain that is to furniſh it with water, the *ſpring* muſt be looked on as a water conducted from a reſervoir of a certain height through a ſubterraneous channel, to make a jet of an equal or ſomewhat leſs height. See Rain.

This theory M. de la Hire has taken under examination, in its moſt eſſential article, and that where the authors ſeem to have been the leaſt diſtruſtful.—He has endeavoured to find, by experiment, whether rain or ſnow water could penetrate the earth as low as the clayey ſtratum: the reſult of his enquiry, is, that they do not penetrate even ſixteen inches deep, in a quantity ſufficient to form the ſmalleſt collection of water on a ſolid bottom. Nay, this he found when the earth he made his experiment on, was quite naked of all herbs and plants; but as ſoon as ever any of theſe came up, and were grown to any bulk, ſo far was the rain that fell, from being able to gather itſelf at the depth of ſixteen inches, that it was not ſufficient even to feed the plants; but there was a neceſſity for watering them. For the quantity of water expended in the ordinary ſupport of plants, ſee Vegetation.

Dr. Halley refers the origin of *ſprings* merely to vapours raiſed by the heat of the ſun, or of ſubterraneous fires, from the ſea, lakes, rivers, *&c.* Theſe vapours thus raiſed, he ſuppoſes, are by the winds, carried over the low-lands, to the ſeveral mountains and ridges of mountains, and are there compelled, by the ſtream of air, to mount with it to the tops, where the atmoſphere being very rare and cold, retains but a ſmall part of them; the reſt is condenſed into dew, which preſently precipitates, gleeting down by the crannies of the ſtones; and part of it entering the caverns of the hills, is gathered therein, as in an alembic; which being once full, the overplus muſt run down at the loweſt part of the reſervoir, and breaking out by the ſide of the hills, form ſingle *ſprings*, many of which running down by the vallies or guts between the ridges of the hills, and at length uniting, form rivulets, and many of theſe meeting in a common channel form rivers. See River.

Now to ſhew that vapour is a ſufficient fund, to ſupply all our *ſprings*, rivers, *&c.* the ſame excellent author makes an eſtimate of the quantity of vapour raiſed from the ſea, by the action of the ſun: the reſult of an experiment he made to that purpoſe was, that the thickneſs of water evaporated from the ſurface of the ſea, in the ſpace of two hours, in ſummer-time, is one fifty-third part of an inch; which for the eaſe of calculation, being only ſuppoſed to be $\frac{1}{60}$; the quantity of $\frac{1}{10}$ of an inch will be found exhaled in twelve hours.—On this principle, every mile ſquare will be found to evaporate, in twelve hours, 6914 tuns of water, and every ſquare degree, thirty-three millions of tuns. The area of the Mediterranean then being eſtimated at 160 ſquare degrees, it will loſe in vapour, in a ſummer's day 5280 millions of tuns.

Yet the quantity of vapour thus raiſed, great as it is, is only the remains of what is raiſed another way, *viz.* by the winds, which ſometimes ſweep the water off faſter than the ſun takes it up. See Evaporation.

To find now, the quantity of water the Mediterranean receives, allow the moſt conſiderable rivers it receives, *viz.* the Iberus, Rhone, Tyber, Po, Danube, Neiſter, Boriſthenes, Tanais, and the Nile, each to furniſh ten times as much water as the Thames; not that any of them are, in reality ſo great, but ſo to allow for the leſſer rivulets: but the Thames is found, by calculation, to evacuate 20300000 tuns of water daily. All the nine rivers abovementioned, therefore, will only evacuate 1827 millions of tuns in a day, which is little more than a third of what is raiſed in that time in vapour. See Vapour.

After all that can be ſaid in favour, both of rain and vapour, it muſt be owned, they are both ſtill preſſed with great difficulties; and there is ſtill room to look out for a better theory. The perpetuity of divers *ſprings*, always yielding the ſame quantity of water, when the leaſt rain or vapour is afforded, as well as when the greateſt, is a ſtrong objection to both. Mr. Derham mentions one in his own pariſh of Upminſter, which he could never perceive by his eye to be diminiſhed in the greateſt droughts, even when all the ponds in the country, as well as an adjoining brook, have been dry for ſeveral months together; nor ever to be increaſed in the moſt rainy ſeaſons, excepting, perhaps, for a few hours, or at moſt for a day, from ſudden and violent rains. Had this *ſpring* its origin from rain or vapour, there would be found an increaſe and decreaſe of its water correſponding to thoſe of its cauſes; as we actually find in ſuch temporary *ſprings*, as have undoubtedly their riſe from rain and vapour: add to this, another conſiderable thing in this Upminſter *ſpring*, and thouſands of others, *viz.* that it breaks out of ſo inconſiderable a hillock or eminence, as can have no more influence in the conſideration of the vapours or ſtopping the clouds, than the lower lands about it have. The very higheſt ground in the country, he finds is not above 133 yards above the level of the ſea; and what is ſuch an inconſiderable riſe of land, to a perennial condenſation of vapours, fit to afford ſo conſiderable a *ſpring?* or the high-lands of the whole country, to the maintaining all its fountains and rivulets?

Other naturaliſts, therefore, have recourſe to the ſea, and derive the origin of *ſprings* immediately thence; but how the ſea-water ſhould be raiſed up to the ſurface of our earth, and even to the tops of the mountains, is a difficulty they cannot agree upon. See Mountain.

Some fancy a kind of hollow, ſubterranean rocks to receive the watery vapours from the bottom of the earth, and to act the part of alembics, in condenſing and converting them into water.—Others, as M. de la Hire, *&c.* ſet aſide the neceſſity of alembics, and think it enough that there be large ſubterranean reſervoirs of water at the height of the ſea, whence the warmth of the bottom of the earth, or even the central fire (if there be ſuch a thing) may raiſe vapours, which pervading not only the intervals and fiſſures of the ſtrata, but the bodies of the ſtrata themſelves, at length arrive near the ſurface; where, being condenſed by the cold, they glide along on the firſt bed of clay they meet withal, until an aperture in the ground lets them out. M. de la Hire adds, that the ſalts of ſtones and minerals may contribute to the detaining and fixing the vapours, and converting them into water.

But we have a ſtill more natural and eaſy way of exhibiting the riſe of the ſea-water up into mountains, *&c.* by putting a little heap of ſand, aſhes, a loaf of bread, or the like, in a baſon of water: in which caſe, the ſand, *&c.* will repreſent the dry land, or an iſland; and the baſon of water, the ſea about it.—Here, the water in the baſon will riſe to, or near the top of the heap, in the ſame manner, and from the ſame principle, as the water of the ſea, lakes, *&c.* riſe in the hills.—The principle of aſcent in both, is, doubtleſs, the ſame with that of the aſcent of liquids in capillary tubes, or between contiguous planes, or in a tube filled with aſhes; all which are now generally accounted for from the doctrine of attraction. See Ascent, Capillary, Attraction, *&c.*

Spring, *Ver*, in coſmography, denotes one of the ſeaſons of the year; commencing in the northern parts of the world, on the day the ſun enters the firſt degree of aries, which is about the 10th day of March, and ending when the ſun leaves gemini. See Season.

Or, more ſtrictly and generally, the *ſpring* begins on the day, when the diſtance of the ſun's meridian altitude from the zenith, being on the increaſing hand, is at a medium between the greateſt and leaſt.—The end of the *ſpring* coincides with the beginning of ſummer. See Summer.

Spring, *Elater*, in phyſics, denotes a natural faculty, or endeavour of certain bodies to return to their firſt ſtate, after having been violently put out of the ſame by compreſſing, bending them, or the like.

This faculty, the philoſophers uſually call *elaſtic force*, or *elaſticity*. See Elastic and Elasticity.

Fleas only jump to thoſe exceſſive heights, by means of a *ſpringy* membrane, eaſily viſible by a microſcope, and whereof we have a curious figure in Dr. Hook's Micrography. By the elaſtic force of this *ſpring*, they are enabled to leap 200 times the height of their own body. See Flea.

Nature has provided for the regular ſowing of the ſeeds of ſeveral kinds of plants, by furniſhing them with a *ſpring*, which is wound ſometimes round the outſide, and ſometimes round the inſide of the caſe wherein the ſeeds are contained. This *ſpring*, when ſtretched to a certain pitch by the full growth and maturity of the ſeed, ſuddenly, either breaks in two, as when on the outſide, and tears the caſe along with it; or elſe, by its vehement effort to unbend itſelf, as when in the inſide, it burſts the caſe into two parts like cups, and diſperſes the ſeeds. See Semination.

Spring, is more particularly uſed in the mechanic arts for a piece of tempered ſteel put in ſeveral machines to give them motion, by the endeavour it makes to unbend itſelf. See Machine and Automaton.

In watches, it is a fine piece of well-beaten ſteel, coiled up in a cylindrical caſe or frame, which by ſtretching itſelf forth, puts the wheels and the whole movement in motion. See Watch.

The *ſpring* of a lock, piſtol or the like, is a piece of ſteel violently bent, which beats back the bolt, or ſtrikes down the cock, when ſet at liberty. See Lock.

Spring *compaſſes*. See the article Compasses.

Spring *of the air*, or its elaſtic force. See Air and Elasticity.

Spring *a maſt*.—So the ſeamen call it, when a maſt is cracked, but not quite broken, in any part. See Mast.

Spring-*tide*, is the increaſing of a *tide* after a dead neap. See Tide.

The *ſpring-tides* happen about three days before the full or change of the moon; but the top or higheſt of the *ſpring-tides*, is three days after the full or change; then the water runs higheſt with the flood, and loweſt with the ebb, and the tides run more ſtrong and ſwift, than in the neaps. See NEAP, FLUX, *&c.*

SPRINGE, a ſnare or device made of twiſted wire, to catch birds or ſmall beaſts.

SPRINGY, or *elaſtic* bodies, are ſuch, as having had their figure changed by the ſtroke or percuſſion of another body, can recover again their former figure; which bodies, that are not elaſtic, will not do. See RESTITUTION.

Thus if a piece of ſteel be bent any way, it will recover again its former ſtraightneſs; but a piece of lead will ſtand bent in any form. See ELASTIC *bodies*.

SPUNGE, or SPONGE, SPONGIA, a kind of ſea fungus, or muſhroom found adhering to rocks, ſhells, *&c.* on the ſea-ſhore. See MUSHROOM.

The ancients diſtinguiſhed two kinds, *male* and *female*: but the moderns make only one kind; which, however, they diſtinguiſh with regard to its texture, into *coarſe* and *fine*.

Naturaliſts have been embaraſſed in all ages, whether to range *ſpunge* in the animal, mineral or vegetable family? Some would have it a concretion formed of the ſea-mud; and others an animal, at leaſt a zoophyte from its motion of contraction and dilatation. See ZOOPHYTE.

The greateſt part of our *ſpunges* are brought from the Mediterranean, eſpecially from Nicaria, an iſland thereof, near the coaſt of Aſia.

The diving or fiſhing for *ſpunges* is there reckoned the top qualification in the youth, who all get the better wives as they excel more herein. To this proof, the maids refer the preference among ſeveral ſuitors; placing themſelves on the brink of the ſea, to be witneſſes of the addreſs of each; and giving themſelves as a prize to the conqueror. See DIVING.

The fine or ſmall *ſpunges* are the moſt eſteemed; and uſually come to us from Conſtantinople. Their goodneſs conſiſts in their being very white, light, and the holes ſmall and cloſe; the larger and coarſer come from the coaſts of Barbary, particularly Tunis and Algier.

The *ſpunge* is a very uſeful matter in the arts. In phyſic it ſerves to foment parts inflamed. By analyſis, it yields a deal of volatile, ſharp ſalts, like other ſea-plants. Taken inwardly it choaks; and is for that reaſon cut ſmall, and fried or dipped in honey, and given to quadrupeds to kill them, which it ſeldom fails to do, by ſwelling and preventing the paſſage of the food into the inteſtines.

In *ſpunges* are found a kind of ſtones called *cyſtiolithi*, held good for the worms in young children, and taken in powder.

Pyrotechnical SPUNGES, are made of the large muſhrooms or fungous excreſcences growing on old oaks, aſhes, firs, *&c.* which being boiled in common water, then dried and well beaten, are put in a ſtrong lye, prepared with ſalt-petre, and again dried in an oven.

Theſe make the black match or tinder brought from Germany, uſed to receive and ſuſtain the fire ſtruck from a flint and ſteel, *&c.*

SPUNGE, is alſo uſed in gunnery, for a long ſtaff or rammer, with a piece of ſheep or lamb-ſkin wound about its end, to ſerve for ſcouring great guns when diſcharged, before they be charged with freſh powder. See SPUNGING, ORDNANCE, *&c.*

SPUNGING, in gunnery, the clearing a gun's inſide with a ſpunge, in order to prevent any ſparks of fire from remaining in her, which would endanger the life of him who ſhould load her again. See CANNON, SPUNGE, CHARGE, *&c.*

SPUN-YARN, among ſailors, the yarn of untwiſted ropes, whoſe ends are ſcraped and beaten thin, in order to be let into the ends of other ropes, and ſo made long as occaſion ſhall require.

SPUR*, was anciently a piece of the armour of a cavalier, faſtened to the talary, that is, the hind-part of that piece of a compleat armour, which covers the legs and feet.

* The word is derived from the German, *ſpohr*, or rather the Saxon *ſpora*, or Daniſh *ſpor*, which all ſignify the ſame.

At preſent, the *ſpur* is a piece of iron, or other metal, conſiſting of two branches incompaſſing the cavalier's heel, and a rowel in form of a ſtar, advancing out behind, to prick the horſe.

Louis le Debonnaire forbad eccleſiaſticks the profane faſhion of wearing *ſpurs*.—Anciently the difference between the knight and eſquire was, that the knight wore gilt *ſpurs*, whence the appellation of *eques auratus*, and the eſquire ſilvered ones. See KNIGHT and ESQUIRE.

SPURIOUS *diſeaſes*, are ſuch as in ſome ſymptoms cannot be brought under any diſtinct head, and therefore are called by the name of others, with which they moſt agree.--Whence, alſo, they are often denominated *baſtards*, *nothi*.

As, a *ſpurious* or baſtard pleuriſy, a *ſpurious* peripneumony, a baſtard quinſy; and the like. See PLEURISY, PERIPNEUMONY, *&c.*

SPURIOUS *fleſh*, is an appellation by ſome given to the fleſh of the lips, gums, glands, *&c.* See FLESH, GINGIVA, GLANDS, *&c.*

SPURIOUS *medals*, } See the articles { MEDALS.
SPURIOUS *ribs*, } See the articles { RIBS.
SPURIOUS *ſuture*, } See the articles { SUTURE.

SPUR-WAY, a horſe-way through a man's grounds, through which one may ride, by right or cuſtom.

SPUTUM, in medicine, *&c.* the ſpittle or excrement voided at the mouth. See SALIVA.

An examen of the *ſputum*, is of great conſequence in phthiſical caſes, and Bennet in his *Theatrum tabidorum*, applies himſelf in a particular manner thereto. — The *ſputum ſanguinis*, is a very dangerous ſymptom in that diſeaſe. See PHTHISIS.

SPY, a perſon paid to watch the actions, motions, *&c.* of another; particularly as to what paſſes in an army.

When a *ſpy* is found in a camp, he is immediately hanged. —Wicquefort ſays, an embaſſador is an honourable *ſpy*, under protection of the law of nations. See EMBASSADOR.

SQUADRON*, a body of horſe, whoſe number of men is not fixed, but is uſually from one hundred to two hundred. See ARMY.

* The word is formed from the Italian *ſquadrone*, of the Latin *ſquadro*, uſed by corruption for *quadro*: in regard, at firſt, the *ſquadrons* were always ſquare, and called alſo by the Latins, *agmina quadrata*.

The *ſquadron* uſually conſiſts of three troops; and each troop of fifty men: it never exceeds two hundred, becauſe a greater number cannot be advantageouſly poſted, nor have room to act in narrow grounds, woods, marſhes, defiles, *&c.* See TROOP.

The eldeſt troop takes the right of the *ſquadron*, and the ſecond the left, the youngeſt being in the centre.

A *ſquadron* is always drawn up three deep, or in three ranks, with the length of an horſe between each rank.—The ſtandard is always bore in the centre of the firſt rank. See DEPTH.

SQUADRON *of ſhips*, a diviſion, or part of a fleet, commanded by a vice or rear admiral, or ſome other commander or commodore. See FLEET, ADMIRAL, *&c.*

The number of ſhips in a *ſquadron* is not fixed: a ſmall number of veſſels, if they be in a body, and have the ſame commander, may make a *ſquadron*.

If there be a great number, they are uſually divided into three *ſquadrons*. And if the *ſquadrons* be numerous, each *ſquadron* is divided into three diviſions, diſtinguiſhed by their flags and colours.

SQUAMMOUS, SQUAMMOSUS, in anatomy, an epithet given to the ſpurious or falſe ſutures of the ſkull; becauſe compoſed of *ſquammæ*, or ſcales, like thoſe of fiſhes, or like tiles laid ſo as to reach over one another. See SUTURE.

The *ſuturæ ſquammoſæ*, are alſo called *mendoſæ*, and *temporales* from their terminating the temples, or oſſa temporis.

SQUARE, *Quadratum*, in geometry, a quadrilateral figure, both equilateral and equiangular. See FIGURE, QUADRILATERAL, EQUIANGULAR, *&c.*

To find the area of a SQUARE: ſeek the length of one ſide; multiply this by itſelf; the product is the area of the *ſquare*. See AREA.

Thus, if the length of a ſide be 345, the area will be 119025: and if the ſide of a *ſquare* be 10, the area will be 100.

Since, then, a decempeda contains 10 feet, a foot 10 digits, *&c.* a *ſquare* decempeda contains 100 *ſquare* feet, a *ſquare* foot 100 *ſquare* digits, *&c.*

The properties of a SQUARE, are, that its angles are all right, and, conſequently, its ſides perpendicular; that it is divided into two equal parts, by a diagonal; that the diagonal of a *ſquare* is incommenſurable to the ſide. See DIAGONAL, *&c.*

For the ratio of SQUARES: they are to each other in the duplicate ratio of their ſides. — *E. gr.* a *ſquare* whoſe ſide is double another, is quadruple of that other *ſquare*.

SQUARE *of the cube*, } See the article { POWER.
SQUARE *of the ſurdeſolid*, } See the article { POWER.

SQUARE *number*, the product of a number multiplied by itſelf. See NUMBER.

Thus 4, the product of 2 multiplied by 2; or 16 the product of 4 multiplied by 4, are *ſquare* numbers.

Such number is called a *ſquare number*, becauſe it may be ranged into the form of a *ſquare*, by making the root, or factor of the ſide of the *ſquare*. See ROOT.

The difference of two *ſquare* numbers, whoſe roots are not unity, is an uneven number, equal to double the root of the leſs, increaſed by unity.

Hence we have an eaſy method of conſtructing *ſquare* numbers for a number of roots proceeding in the natural ſeries; the double of the root of the antecedent increaſed by unity, being continually to be added to the preceding *ſquare*.

Thus, if $n=1$; $2n+1=3$: if $n=2$; then will $2n+1=5$: if $n=3$; then will $2n+1=7$: if $n=4$; then will $2n+1=9$, *&c.* Thus by a continual addition of the uneven numbers, ariſe the *ſquare* numbers.

SQUARE *root*, a number conſidered as the root of a ſecond power or ſquare number; or a number by whoſe multiplication into itſelf, a *ſquare* number is generated. See ROOT.

Thus the number 2, being that by whoſe multiplication into itſelf, the *ſquare* number 4 is produced; is, in reſpect hereof, called a *ſquare root*, or the *ſquare root* of 4.

Since, as unity is to the *ſquare* root, ſo is the root to the *ſquare* number; the root is a mean proportional between unity and the *ſquare* number.

A *ſquare* root conſiſting of two parts, is called a *binomial*; as 20+4. See BINOMIAL.

If it conſiſts of three, a *trinomial*, as 6+2—1. See TRINOMIAL.

Now, every *ſquare* number of a binomial root, is demonſtrated to be compounded of the *ſquare* of the firſt part, the product of double the firſt into the ſecond, and of the *ſquare* of the other part.

To extract the SQUARE *root out of any given number*; ſee EXTRACTION *of roots*.

SQUARE, *norma*, is alſo an inſtrument made of wood or metal, ſerving to deſcribe and meaſure right angles withal; ſuch is L E M, (*Tab. Geom.* fig. 42.)

It conſiſts of two rules or branches faſtened perpendicularly at one of their extremes. — When the two branches are moveable on a joint, it is called a *bevel*. See BEVEL.

To examine whether or no a *ſquare* be exact, deſcribe a ſemicircle A E F, of any length, at pleaſure; and therein, from each extreme of the diameter A and F, draw right lines to a point taken at pleaſure in the periphery, as E: to the ſides of the angle A E F, apply the *ſquare*, ſo as its vertex may fall on F. If this be poſſible, that *ſquare* is juſt.

Geometrical SQUARE, a compartiment frequently added on the face of the quadrant, called alſo *line of ſhadows*, and *quadrat*. See QUADRAT.

Magic SQUARES. See MAGIC *ſquare*.

SQUARE *battle*, or *battalion* of men, is one that hath an equal number of men in rank and file. See BATTALION.

To form any number of men into a *ſquare* battle, as ſuppoſe 500, extract the neareſt *ſquare* root of 500, which is in integers 22, and what will give the number of men for rank and file.—There will be a remainder of 16 men, who may be diſpoſed of, as the commander thinks beſt.

Hollow SQUARE, in the military art, is a body of foot drawn up with an empty ſpace in the middle, for the colours, drums and baggage; faced and covered by the pikes every way to keep off horſe.

SQUARE *cap*,	See	CAP.
SQUARE *character*,		HEBREW.
SQUARE *foot*,		FOOT.
SQUARE *nails*,		NAIL.
SQUARE *niche*,		NICHE.
SQUARE *pedeſtal*,		PEDESTAL.
SQUARE *pillar*,		PILLAR.
SQUARE *roof*,		ROOF.
SQUARE *winding ſtairs*,		STAIRS.
SQUARING,	See	QUADRATURE.
SQUIF,		SKIFF.
Wine of SQUILS,		SCILLÆ.
SQUILLÆ,	See	WINE.
SQUILITIC,		SCILITIC.
SQUINANCY, or *eſquinancy*,		QUINZY.
SQUINTING,		STRABISMUS.

ST, an indeclinable term, chiefly uſed to command ſilence.

The Romans had theſe two characters wrote over the doors of their eating rooms, as who ſhould ſay, *ſed tace*, or *ſilentium tene*.

Porphyry obſerves, the ancients made a point of religion of it, not to ſpeak a ſingle word in paſſing in or out of the doors.

STABLESTAND, in the foreſt law, is when a perſon is found at his ſtand in the foreſt, with a croſs-bow, or long-bow, ready to ſhoot at a deer, or elſe ſtanding cloſe by a tree with greyhounds ready to ſlip.

This is one of the four evidences, or preſumptions, by which a man is convicted of intending to ſteal the king's deer; the other three being back-berond, bloody-hand, and dog-draw. See FOREST, &c.

STACK *of wood*, among huſbandmen, is a pile of wood three foot long, as many broad, and twelve foot high.

STACTE, ΣΤΑΚΤΗ, in pharmacy, a fatty reſinous liquid matter, drawn from freſh myrrh, pounded or preſſed with a little water. See MYRRH.

This liquor is very odoriferous, and held mighty precious; making, alone, the perfume, called by Dioſcorides, *ſtacte*, and which ſmells finely, though very bitter to the taſte.

We have none of it now, but what is ſophiſticated; and what the apothecaries call *ſtacte*, is no more than liquid ſtorax. See STORAX

STADIUM *, ΣΤΑΔΙΟΝ, an ancient Greek long meaſure, containing 125 geometrical paces, or 625 Roman feet; correſponding to our furlong. See MEASURE and FURLONG.

* The word is formed from the Greek, ϛασις, ſtation; and it is ſaid, on this occaſion, that Hercules, after running ſo far at one breath, ſtood ſtill. The Greeks meaſured all their diſtances by *ſtadia*, which they call ϛαδιαζειν.

Eight *ſtadia* make a geometrical or Italian mile; and 20, according to M. Dacier, a French league: according to others, 24 make the league. See MILE and LEAGUE.

Guilletiere obſerves, that the *ſtadium* was only 600 Athenian feet, which amount to 625 Roman, 566 French royal feet, or 604 Engliſh feet: ſo that the *ſtadium* ſhould only have been 113 geometrical paces.—It muſt be obſerved however, that the *ſtadium* was different in different times, and places.

STADIUM was alſo the courſe or career, wherein the Greeks run their races. See GYMNASIUM.

Vitruvius deſcribes it as an open ſpace 125 paces long, terminated at the two extremes with two poſts, called *carcer* and *meta*. See PALÆSTRA.

Along it was built a kind of amphitheatre, where the ſpectators were pleaſed to ſee the athletæ exerciſe running, wreſtling, &c.

There were *ſtadia* likewiſe, covered over, and encompaſſed with colonnades and porticoes, ſerving for the ſame exerciſes in ill weather.—Captive children uſed to run the *ſtadium*. Ablanc. See GYMNASTIC.

A more natural derivation of the word *ſtadium*, from ϛασις, *ſtation*, than that popular one mentioned in the laſt article, may be drawn from the athletæ ſtopping and reſting, when at the end of this courſe: whence the name might be applied to the ſame diſtance, meaſured in any other place.

STADTHOLDER *, STADTHOUDER, or STATHOLDER, a governor, or lieutenant of a province, in the United NETHERLANDS; particularly that of Holland: where the word is moſt uſed, by reaſon of the ſuperior importance of the government of that province.

* Menage derives the word from *ſtadt*, ſtate; and *houder*, holding *q. d.* lieutenant of the ſtates: others will have it compounded of *ſtad*, or *ſtede*, *ſtead*, or place, and *houder*, holding, in regard this officer held the place of the counts, and repreſented them in their abſence.

The *ſtadtholder*, i. e. the *ſtadtholder* of Holland, is the firſt member of the republic: he is chief of all the courts of juſtice; and may preſide therein when he pleaſes. All ſentences, judgments, &c. are diſpatched in his name.—When an office becomes vacant in any of the courts, the ſtates propoſe three perſons to the *ſtadtholder*, who is to chuſe one of them.

He can even pardon criminals, which is a ſovereign prerogative; and has the choice of ſcabines, or chief magiſtrates in each city; to which end the council of the city preſent him two perſons, one of which he appoints.

In ſeveral cities, he has the ſame right of nominating the burgo-maſters, and counſellors; as at Rotterdam, Dort, &c. He has alſo a power to caſheer the magiſtrates, and put others in their room, when he finds it neceſſary for the public good; upon giving a reaſon for the ſame.

By article VI. of the union of Utrecht, the ſtates conſtitute him arbiter of all the differences that may ariſe between the ſtates of the ſeveral provinces; or between the cities and the members of the ſtates of the province. See STATES.

To the dignity of *Stadtholder*, is inſeparably annexed, that of captain, and admiral-general of the province; in which quality, he names all the officers, and diſpoſes of all military poſts.—It it he takes care of the execution of the ordinances of the ſtates; and his authority gives him a right to receive and give audience to embaſſadors from foreign princes, and even to ſend embaſſadors on his own private affairs.

The office of *ſtadtholder* is very ancient: the counts not being able to reſide in Holland, appointed *ſtadtholders* to command in their abſence, in the ſeveral provinces; beſides a governor general of all the ſeventeen provinces of the Netherlands.

William I. prince of Orange, was *ſtadtholder* of Holland and Zeeland, at the time when the Dutch ſhook off the Spaniſh yoke; which enabled him to contribute greatly to that happy event.

In 1567, the ſtates thought fit to ſuppreſs the office of *ſtadtholder*, by edict; and reſolved it ſhould never be conferred on any perſon for the future: but in 1672, William III. prince of Orange, afterwards king of England, being elected captain and admiral-general by the ſtates; ſome months afterwards they revoked the edict of ſuppreſſion in favour of that prince, who was declared *hereditary ſtadtholder*; an honour never conferred before.

STAFF, *baculus*, an inſtrument ordinarily uſed to reſt on in walking.—Card. Bona obſerves, in his treatiſe of liturgies, that anciently, thoſe who uſed a *ſtaff* in the church to lean on, were obliged to lay it by, and to ſtand alone, firm and upright, while the goſpel was a reading; to teſtify their reſpect, by their poſture, and to ſhew they were ready to obey Jeſus Chriſt, and to go whereſoever he ſhould command them.

The *ſtaff* is alſo frequently uſed as a kind of natural weapon, both of offence and defence.—The Lacedæmonians never wore any ſwords in time of peace; but contented themſelves with a thick, crooked *ſtaff*, which was peculiar to them.

Among the Romans, M. St. Evremond obſerves, blows with a *ſtaff* were the gentleſt correction they gave their ſlaves; inaſmuch as they received them over their cloaths.

Among the maſters of honour and arms, it is held a greater affront to be beaten with a *ſtaff*, than with a ſword; becauſe the ſword is the inſtrument of war, the *ſtaff* the inſtrument of outrage.

Blows with a *ſtaff* are very ſeverely puniſhed by the French laws: by a regulation of the marſhals of France, in 1653, for reparations and ſatisfactions of honour, it is adjudged, that a perſon who ſhall ſtrike another with a *ſtaff*, ſhall be impriſoned a whole year; unleſs ſix months be moderated, upon paying 3000 livres, applicable to the neareſt hoſpital; beſide which, the offender is to aſk pardon of the offended on his knees, *&c.* ready to receive from him a like number of blows with a *ſtaff*; which, on ſome occaſions, the latter may be obliged to give; if he have too much generoſity not to do it of himſelf.

By another regulation of the marſhals in 1679, he who ſtrikes with a *ſtaff*, after receiving blows with the fiſt in the heat of a fray, is condemned to two years impriſonment; and to four, if he ſtruck firſt with the fiſt.

Almacantars STAFF,	See	ALMACATTAR.
Augural STAFF,		LITUUS.
Back STAFF,		BACK *ſtaff*,
Paſtoral STAFF,		CROSIER.
Whip STAFF,		WHIP.
Croſs STAFF,		FORE *ſtaff*.
Fore STAFF,		
Jacob's STAFF,		RADIUS *aſtronomicus*.

STAFF, in muſic, five lines, on which, with the intermediate ſpaces, the notes of any ſong or piece of muſic are marked. See MUSIC.

Guido Aretin, the great improver of the modern muſic, is ſaid to be the firſt who introduced the *ſtaff*; marking his notes, by ſetting points (.) up and down them, to denote the riſe and fall of the voice; and each line and ſpace he marked at the beginning of the *ſtaff*, with Gregory's ſeven letters, a, b, c, d, e, f, g. See NOTE.

But others will have the artifice of an older date; and Kircher particularly affirms, that in the Jeſuits library at Meſſina, he found an old Greek MS. book of hymns, above ſeven hundred years old; wherein ſome hymns were written on a *ſtaff* of eight lines, marked at the beginning with eight Greek letters. The notes or points were on the lines, but no uſe made of the ſpaces. See SCALE, GAMMUT, SOLFAING, *&c.*

STAFF, in heraldry. See the article BATTOON.

STAFF, in ſurveying, a kind of ſtand, whereon to mount a theodolite, circumferentor, plain table, or the like, for uſe. It conſiſts of three legs of wood, joined together at one end, whereon the inſtrument is placed; and made peeked at the other, to enter the ground.—Its upper end is uſually fitted with a ball and ſocket. See BALL, *and ſocket*, and THREE-LEGGED.

Field STAFF,	See	FIELD.
Quarter STAFF,		QUARTER.
STAFF *officers*,		OFFICER.
Ward STAFF,		WARD.

STAGE, in the modern drama, the place of action and repreſentation; included between the pit, and the ſcenes.

The *ſtage* anſwers to the proſcenium or pulpitum of the ancient theatre. See THEATRE, PULPITUM, PROSCENIUM, *&c.*

Laws of the STAGE, are the rules and decorums to be obſerved, with regard to the œconomy and conduct of a dramatic performance to be exhibited on the *ſtage*.—Theſe relate, principally, to the unities, the diſpoſition of the acts and ſcenes, the unravelling, *&c.* See UNITY, ACT, SCENE, CATASTROPHE.

STAGGERS, or STAVERS, in the manage. See STAVERS.

STAIRCASE, an aſcent incloſed between walls, or a balluſtrade, conſiſting of *ſtairs* or ſteps, with landing places and rails; ſerving to make a communication between the ſeveral ſtories of a houſe. See STAIR.

The conſtruction of a compleat *ſtaircaſe*, is one of the moſt curious works in architecture. The common rules to be obſerved therein are as follow,

1°. That it have a full, free light, to prevent accidents of ſlipping, falling, *&c.*

2°. That the ſpace over head be large and airy, which the Italians call *un bel sfocato*, good ventilation, in regard a man ſpends much breath in mounting.

3°. That the half paces, or landing places, be conveniently diſtributed for repoſing in the way.

4°. That to prevent rencounters, *&c.* the *ſtaircaſe* be not too narrow; but this laſt is to be regulated by the quality of the building.

5°. That care be taken in placing the *ſtaircaſe*, ſo as the ſtairs may be diſtributed, without prejudice to the reſt of the building.

The kinds of *ſtaircaſes* are various: in ſome, the ſtairs are *ſtraight*, in others *winding*; in others both ways, or *mixt*.

Again, of *ſtraight ſtairs*, called alſo *flyers*, ſome fly directly forwards; others are ſquare; others triangular; others called *French Flights*.

Of *winding ſtairs*, called alſo *ſpiral*, or *cockle ſtairs*, ſome are ſquare, ſome circular, and ſome elliptical.—And theſe again are various; ſome winding round a ſolid, and others an open newel.

Laſtly, of *mixed ſtairs*, ſome are called *dog legged*: others both wind about a ſolid newel, and fly about a ſquare open newel.

Straight STAIRS, are ſuch as always fly, that is, proceed in a right line; and never wind: whence their denomination. See FLYERS.—Of theſe there are ſeveral kinds; as,

Direct flyers, or *plain flyers*, which proceed directly from one floor to another, without turning either to the right or left; ſeldom uſed, except for garret or cellar *ſtairs*.

Square flyers, which fly round the ſides of a ſquare newel, either ſolid or open; having at every corner of the newel, a ſquare half ſtep, taking up $\frac{1}{4}$ of a circle. So that they fly from one half ſtep to another, and the length of the *ſtairs* is perpendicular to the ſide of the newel.

Triangular flyers, which fly round by the ſides of a triangular newel, either ſolid or open, having at each corner of the newel a trapezial half ſtep, taking up $\frac{2}{3}$ of a circle: ſo that they fly from one half ſtep to another; and their length is perpendicular to the ſide of the newel.

French flyers, which fly, firſt directly forwards, till they come within the length of a *ſtair* of the wall; and then have a ſquare half pace, from which you immediately aſcend to another half pace, from which the *ſtairs* fly directly back again, parallel to their firſt flight.

Winding STAIRS, are ſuch as always wind, and never fly; of theſe there is great variety; as,

Circular winding STAIRS, whereof there are four kinds, *viz.* ſuch as wind about a ſolid newel, the fore edge of each being in a right line, pointing to the centre of the newel; commonly uſed in church ſteeples, and great old houſes: ſuch as wind round an open newel, the fore ſide of each being in a right line, pointing to the centre of the newel; as thoſe in the Monument, London: ſuch as wind round a ſolid newel, only the fore ſide of each, an arch of a circle, either concave or convex, pointing near to the circumference of the newel: and ſuch as reſemble the laſt, in all other reſpects, ſave that they have an open newel.—Any of theſe winding *ſtairs* take up leſs room than other kinds.

In *ſtairs* that wind round a ſolid newel, architects make the diameter of the newel either $\frac{1}{6}$ or $\frac{1}{4}$ or $\frac{1}{3}$ or $\frac{3}{7}$ of that of the *ſtaircaſe*, according as that is in bigneſs.—If very ſmall, the newel is but $\frac{1}{6}$, and if large, $\frac{3}{7}$, *&c.*

In *ſtairs* that wind round an open newel, Palladio orders the newel to be $\frac{1}{2}$ the diameter of the *ſtaircaſe*; though there does not appear any reaſon why the newel here ſhould not be proportioned to the *ſtaircaſe*, as in the former.

As to the number of *ſtairs* in each revolution; Palladio orders, that in a *ſtaircaſe* of 6 or 7 foot diameter, the *ſtairs* in each revolution be 12; if the diameter be 8, the *ſtairs* to be 16; if 9 or 10, the *ſtairs* to be 20; and if 18, to be 24.

Elliptical winding STAIRS, whereof there are two kinds: the one winding round a ſolid, the other round an open newel, they are much of the ſame nature as circular ſtairs, excepting, that in the one, the newel is a circle, and in the other an ellipſis.

Square winding STAIRS, are ſuch as wind round a ſquare newel, either ſolid or open; the fore ſide of each ſquare being in a right line, pointing to the centre of the newel.

Triangular winding STAIRS, are ſuch as wind round a triangular newel; the fore ſide of each being a right line, pointing to the centre of the newel.

Columinated winding STAIRS: Palladio mentions a *ſtaircaſe* in Pompey's portico at Rome, ſet on columns, ſo, as that the light they receive from above may diſtribute itſelf to all parts alike.

Double winding STAIRS: Scamozzi mentions a *ſtaircaſe* in this form, made by Piedro del Bergo, and Jean Coſſin, at Sciamburg in France, in the king's palace.—It is ſo contrived, as that two perſons, the one aſcending, and the other deſcending, ſhall never meet.

Dr. Grew deſcribes a model of this kind of *ſtaircaſe*, kept in the muſæum of the Royal Society. The foot of one of the *ſtaircaſes*, he ſays, is oppoſite to that of the other, and both make a parallel aſcent, and within the ſame cylinder. The newel in the middle is hollow, and built with long apertures, to convey light from candles placed at the bottom, and on the ſides of the newel, into both caſes.

Quadruple winding STAIRS: Palladio mentions a *ſtaircaſe* of this form, in the caſtle of Chambor near Bloys. It conſiſts of four *ſtaircaſes*, carried up together, having each its ſeveral entrance, and going up one over another, in ſuch manner, as that being in the middle of the building, the four ſerve to lead to four apartments: ſo that the people of the one need not go up and down the *ſtairs* of the other; yet being open in the middle, they all ſee each other paſs.

Mixt STAIRS, are ſuch as partly *fly*, and partly *wind*; whence ſome call them *flyers and winders*.—Of theſe there are ſeveral kinds, as,

Dog legged STAIRS, which firſt fly directly forwards, then wind a ſemi-circle, and then fly directly backwards, parallel to that.

Square flyers and winders, have a ſquare newel, either ſolid or open, and fly by the ſides of the newel, winding a quadrant of a circle at each corner.

Solid and open newelled flyers and winders, are of two kinds; the one winds a quadrant of a circle about a ſolid newel, then flies by the ſide of a ſquare open newel; then winds again, by the ſide of a ſolid newel, then flies again, and ſo alternately.—The other flies firſt, then winds, and then flies again, alternately.

TAIRS, in building, the ſteps whereby we aſcend and deſcend, from one ſtory of a houſe to another. See BUILDING.

The dimenſions of *ſtairs* are differently aſſigned by different authors: in this however they agree, that they muſt not be more than ſix, nor leſs than four inches high; nor more than eighteen, nor leſs than twelve inches broad; nor more than ſixteen, nor leſs than ſix foot long, each *ſtair*.—But theſe meaſures have only regard to fine buildings; ordinary houſes are excepted: yet even in theſe, the *ſtairs* are not to exceed eight inches in height; nor be leſs than nine inches in breadth; nor three feet in length.

To reduce the dimenſions of *ſtairs* to ſome natural, or at leaſt geometrical ſtandard, Vitruvius borrows the proportions of the ſides of a rectangle triangle, which the ancient ſchool expreſſed by the numbers 3, 4, and 5. The firſt for the perpendicular height; the ſecond for the horizontal breadth; and the third for the whole ſlope or inclination, from the edge of one *ſtair* to that of another.

But this rule is ſet aſide, and with good reaſon, by the modern builders. For, on this principle, the lower the *ſtairs*, the narrower they muſt be; and *ſtairs*, for inſtance, four inches high (ſuch as we find mentioned in ancient architects) muſt be but 5 $\frac{1}{3}$ inches broad.

One rule to be regarded in the making of *ſtairs*, is, that they be laid according to the Italian phraſe, *con un tantino da ſcarpa*, i. e. ſomewhat ſloping, or a little higheſt behind, that the foot may, as it were, both aſcend and deſcend at once; which, though obſerved by few, is found a ſecret and delicate deception of the pains in mounting.

STALACTITES, **STALAGMITES**, or **STAGONITES**, in natural hiſtory, a ſtony, ſparry ſort of icicles, which hang down from the tops or arches of grotto's, and ſubterranean caverns; and from the roofs of buildings, and capitals of pillars of ſuch places as are built over hot ſprings, &c. See STONE and SPAR.

Of this kind are the *ſal*, *alumen*, and *vitriolum ſtalacticum*; the *minera ferri ſtalactica*, the *vitriolum capillare*, the *alumen capillare*, &c.

The *ſtalactites*, which incruſtrate, or line the tops and ſides of caves, &c. are manifeſtly formed of exſudations or exſtillations of petrifying juices out of the neighbouring rocky grounds. Thoſe in the cave on the top of Bredon hill, Mr. Derham fancies, might be formed by the rains ſoaking through, and carrying with it impregnations from the ſtones; the hill, there, being all rocky.

STALE, the urine of cattle. See URINE.

STALE alſo denotes a living fowl, put in any place to allure and bring others where they may be taken. See DECOY.

For want of theſe, a lark, or any other bird, ſhot, his entrails taken out, and dried in an oven, in his feathers, with a ſtick thruſt through to keep him in a convenient poſture, may ſerve as well as a live one.

STALK, in botany, the ſtem, or ſtock of a plant. See STEM.

Stalks are diſtinguiſhed into ſeveral kinds, *viz.* the *naked ſtalk*, which has no leaves on.—*Creſted ſtalk*, which has furrows, or ridges.—*Winged ſtalk*, which has leaves on both ſides.—*Striped ſtalk*, which is of two or more colours, &c.

Fruticoſe ſtalk. See the article FRUTICOSE.

STALKING, a term of conſiderable import in fowling; applied to a kind of ſcreen, or device to hide the fowler, and amuſe the game, while he gets within ſhot.

Of ſuch devices there are ſeveral kinds, *viz.*

A STALKING *hedge*, which is an artificial hedge, two or three yards long, and a yard and half high, made with ſmall wands, to be light and portable, yet buſhed out like a real hedge, with ſtakes to ſupport it, while the fowler takes his aim.

STALKING *horſe*, is an old jade trained up for the purpoſe, which will gently walk up and down as you would have him, in water, &c. beneath whoſe fore-ſhoulder, the ſportſman ſhelters himſelf and gun. When thus got within ſhot, he takes aim from before the fore-part of the horſe; which is much better than ſhooting under his belly.

To ſupply the defect of a real *ſtalking* horſe, an artificial one is frequently made, of old canvas, ſhaped in form of a horſe, with his head bent down, as if grazing; ſtuffed with any light matter, and painted.—In the middle it is fixed to a ſtaff ſhod at the foot, to ſtick into the ground while aim is taken.—For change, when the fowls begin to be uſed to the *ſtalking* horſe, and to know it, ſome *ſtalk* with an ox, cow, deer or the like.

Others uſe a *ſtalking-tree*, and others a *ſtalking-buſh*.

STAMINA[*], in botany, thoſe fine threads, or capillaments growing up within the flowers of tulips, lilies and moſt other flowers, around the ſtyle or piſtil. See FLOWER and PISTIL.

On the tops of the *ſtamina*, or chives, grow thoſe little capſulæ or knobs, called *apices*, which M. Tournefort makes eſſential to the *ſtamina*; whence M. Reaumur, who aſſures us in the memoirs of the French academy, that he could never diſcover any apices on the threads of the fucus marinus, refuſes to call them *ſtamina*; though he adds, one may ſuppoſe that the apices fall as ſoon as the threads or *ſtamina* begin to be unfolded. See APICES.

In ſome tubular flowers, as the narciſſus, digitalis, &c. M. Geoffroy obſerves the *ſtamina* are exceedingly ſhort; and in ſome flowers there are no *ſtamina* at all, as in the long ariſtolochia, wherein the apices are immediately faſtened on the capſula which incloſes the fruit. In ſome other flowers, as thoſe of thiſtles, lettice, chicory, &c. the apices are incloſed in the *ſtamina*; ſeveral of which uniting form a little tube in manner of a ſcabbard, in the inſide whereof are the apices furniſhed with their farina; the reſt of the cavity being taken up by the piſtil; which is a little thread placed on the embryo of the ſeed.

M. Tournefort takes the uſe of the *ſtamina* to be, as it were, ſo many excretory canals, for diſcharging the growing embryo of its redundant juices; and of theſe excrements of the fruit, he takes that farina or duſt, found in the apices, to be formed. See FARINA.

But M. Geoffroy, Mr. Bradley, and other late writers on plants, as well as ſome former, aſſign the *ſtamina* a nobler uſe. Theſe authors, explaining the generation of plants, in a manner analogous to that of animals, maintain the uſe of the *ſtamina* to be to ſecrete, in their fine capillary canals, a juice, which being collected, hardened and formed into a farina or duſt in the tips or apices, is thence, when the plant arrives at maturity, diſcharged, by the burſting of the apices, upon the top of the piſtil; whence is a paſſage for it to deſcend into the uterus, where being received, it impregnates and fecundifies the plant.

On this principle, it may be ſaid, that the ſame flower contains both ſexes, which contribute each their part to the generation: that the *ſtamina* are the male part; and the farina, which is always found of an oily, glutinous nature, the ſeminal liquor; and that the piſtil is the female part, which conducts the ſemen to the ova or embryo's. See GENERATION *of plants*.

STAMINA, in the animal body, are thoſe ſimple, original parts, which exiſted firſt in the embryo, or even in the ſeed; and by whoſe diſtinction, augmentation, and accretion by additional juices, the human body, at its utmoſt bulk is ſuppoſed to be formed. See EMBRYO, BODY, &c.

All that is eſſential to the animal, are the *ſtamina*, which exiſt *in ovo*; the reſt being foreign, additional and even accidental.

The *ſtamina* ſeem to coincide with the ſolids, which are ſurprizingly ſmall in quantity. See SOLID.

STAMINEOUS *flowers*, among botaniſts, are ſuch as are ſo far imperfect, as to want thoſe coloured leaves, we call *petala*; and which only conſiſt of a piſtil ſurrounded by ſtamina. See FLOWER, STAMINA, &c.

Such plants as bear *ſtamineous* flowers, Mr. Ray makes to conſtitute a large genus which he calls *herbæ flore imperfecto*, *ſive apetalo*, *ſtamineove*.—And theſe he divides into ſuch as,

1. Have their fruit or ſeed totally divided from the flower; which are ſuch plants as are ſaid to be of different ſexes; the reaſon of which is, that from the ſame ſeed, ſome plants ſhall ariſe with flowers, and no fruit; and others, with fruit, and no flowers: as hops, hemp, ſtinging-nettles, ſpinach, mercurialis and phyllon.

2. Such as have their fruit only a little disjoined from their flowers; as the ambroſia, bardana minor, ricinus, and the heliotropium tricoccon.

3. Such as have their fruit immediately contiguous, or adhering to their flower: and the ſeed of theſe is either, 1. Triangular; of which ſort, ſome are lucid and ſhining, as the lapathum, rhabarbarum, and biſtorta, to which alſo may be added the perſicaria: others are rough and not ſhining; as the helleborus albus, ſegopyrum, convolvulus niger, and the polygonum. 2. Such as have a roundiſh ſeed, a little flatted or compreſſed, or of any other figure but the former triquetrous or triangular one; and theſe have their flower, or the calyx of the flower, adhering to the bottom or baſis of the ſeed or fruit; as the potamogiton, blitum ſylveſtre, parietaria, atriplex, blitum ſativum, amuranthes hocloceríeus, and the ſaxifraga aurea. 3. Such whoſe flowers adhere to the top of the ſeed; as the beta, aſarum, archimilla. And to theſe kind of plants, Mr. Ray reduces alſo the kali geniculatum, ſedum fruticoſum, the ſcoparia or belvidere of the Italians.

STAMPING-*mill*, or *knocking-mill*, an engine uſed in the tin-works, to bruiſe the ore ſmall. See TIN.

STANCHEONS, in building. See PUNCHION.

STAND, *Stable* STAND. See STABLESTAND.

STANDARD[*], in war, a ſort of banner or flags, bore as a ſignal for the joining together of the ſeveral troops belonging to the ſame body. See FLAG, &c.

---

[*] The word is Latin, and literally ſignifies threads.

[*] Du Cange derives the word from *ſtandarum* or *ſtantarum*, *ſtandardum*, or *ſtandale*, words uſed in the corrupt Latin, to ſignify the principal *flag* of an army. Menage derives it from the German, *ſtander*, or the Engliſh, *ſtand*.

The *ſtandard* is uſually a piece of ſilk, a foot and half ſquare, on which is embroidered the arms, device, or cypher of the prince, or the colonel.—It is fixed on a lance, eight or nine foot long, and carried in the centre of the firſt rank of a ſquadron of horſe. See SQUADRON.

The *ſtandard* is uſed for any martial enſign of horſe; but more particularly for that of the general; or the royal *ſtandard*.—Thoſe born by the foot are rather called *colours*. See COLOUR, FLAG, and ENSIGN.

The ancient kings of France bore St. Martin's hood for their *ſtandard*. The Turks preſerve a green *ſtandard* born by Mahomet, with a world of devotion; as believing it to have been brought down by the angel Gabriel. Every time it is diſplayed, all who profeſs the Mahometan faith, are obliged to take arms; thoſe who refuſe, are to be deemed as infidels.

STANDARD, in commerce, the original of a weight, meaſure, or coin, committed to the keeping of the magiſtrate, or depoſited in ſome public place, to regulate, adjuſt, and try the weights uſed by particular perſons in traffic. See MEASURE, WEIGHT, &c.

The juſtneſs of weights and meaſures, is of that conſequence to the ſecurity and good order of trade, that there is no civilized nation but makes it part of their policy to preſerve the equality thereof by means of *ſtandards*. The Romans and Jews even ſeem to have affixed a kind of religious worſhip to theſe *ſtandards*, by laying them up in their temples, as it were under the eye of their deities.

The *ſtandards* of weights and meaſures in England, are appointed by Magna Charta, to be kept in the Exchequer, by a ſpecial officer, called the *clerk*, or *comptroller of the market*. See CLERK *of the market*.

The *ſtandard* of gold coin is 22 carats of fine gold, and 2 carats of alloy in the pound weight troy; and the French, Spaniſh, and Flemiſh gold, are nearly of the ſame fineneſs.—The pound weight is cut into forty-four parts and a half, each current for 21 ſhillings. See GUINEA, COINAGE, ALLOY, CARAT, &c.

The *ſtandard* of ſilver is 11 ounces and two penny weight of ſilver, and 18 penny weight of alloy of copper. Whether gold or ſilver be above or below *ſtandard*, is found by aſſaying. See ASSAY.

STANDARDS, or STANDELS, in huſbandry, are young trees, reſerved at the felling of woods, for growth of timber.

STANNARIES, STANNARIA, the mines and works, where tin is dug, and purified; as in Cornwall, Devonſhire, &c. See TIN.

There are four courts of the *ſtannaries* in Devonſhire, and as many in Cornwall; and ſeveral liberties granted to them by ſeveral acts of parliament, in the time of Edward I. &c. though ſomewhat abridged under Edward III. and 17 Car. I. c. 15.

STANZA*, in poetry, a certain ſtated number of grave verſes, containing ſome perfect ſenſe, terminated with a reſt, or pauſe.

> * The word is Italian, and literally ſignifies a ſtand or ſtation, becauſe of the pauſe to be made at the end of each *ſtanza* or complete ſenſe.

What the *couplet* is in ſongs, and the *ſtrophe* in odes, the *ſtanza* is in the greater and graver pieces, as epic poems, &c. See COUPLET and STROPHE.

Indeed the Italians ſcarce write any poems, but they divide them into *ſtanza's*.—There are *ſtanza's* of four, ſix, eight, ten, twelve verſes, and ſometimes of an uneven number of verſes, as five, ſeven, &c. but theſe laſt are ſomewhat more difficult to execute, by reaſon of the three verſes to one rhyme.

The French lay it down as a rule, that if the firſt *ſtanza* begin with a maſculine, or a feminine verſe, the ſecond is to begin and end with the ſame.

Every *ſtanza* ought not only to contain a perfect ſenſe, but to be terminate with ſome lively and ingenious thought, or ſome juſt and pertinent reflexion.

Stanza's were firſt introduced from the Italian into the French poetry, about the year 1580, and thence transferred into the Engliſh.

The uſe of *ſtanza's* in tragedy, or comedy, is condemned by all the beſt critics: for though we ſpeak verſe on the ſtage, it is ſtill preſumed we are ſpeaking proſe. *Stanza's* ſhew a deſtree of ingenuity on the part of the poet, which has nothing of nature in it on the part of the actor. Add to this, that *ſtanza's* are not fit to expreſs every thing: wrath, threatening, &c. ſit very ill on a regular *ſtanza*: though irreſolution, reveries, and every thing that leads the actor to think on what he is to reſolve, agrees well enough with the unequal cadence of the *ſtanza*.

STAPES, in anatomy, a little bone ſituate in a cavity of the feneſtra ovalis; thus called from its reſembling a ſtirrop. See EAR.

The *ſtapes* is one of the four little bones faſtened to the tympanum of the ear, firſt diſcovered and publiſhed, as Fallopius tells us, by Jo. Phil. ab Ingraſſia, a phyſician of Sicily. Its uſe is in ſtretching, or relaxing the membrana tympani. See TYMPANUM; ſee alſo HEARING and EAR.

STAPHYLINUS. See PALOTOSTAPHYLINUS, PERISTAPHYLINUS, PTERYGOSTAPHYLINUS, and SPHENOSTAPHYLINUS.

STAPLE*, STAPULA, primarily ſignifies a public place, or market, whither merchants, &c. are obliged to bring their goods to be bought by the people: as the Greve, or the places along the Seine, for the wines and corns at Paris; whither the merchants of other parts are obliged to bring thoſe commodities. See MARKET.

> * Voſſius and Menage derive the word from *ſtaplus*, which is found in the Ripuary laws, ſignifying a place where juſtice is adminiſtred. Others derive it from the German *ſtapel*, or Latin *ſtapula*, which Boxhornius derives farther, from the German *ſtapelen*, to put in a heap.

STAPLE, alſo ſignifies a city or town, where merchants jointly agree to carry certain commodities, as wool, cloth, lead, tin, &c. in order to their being commodiouſly ſold by the great.

In England, *ſtaples* were ſettled and appointed to be conſtantly kept at York, Lincoln, Newcaſtle upon Tyne, Norwich, Weſtminſter, Canterbury, Chicheſter, Wincheſter, Exeter, and Briſtol; to which places merchants and traders were to carry goods to ſell in thoſe parts.

The *ſtaple* commodities of England, were chiefly wool, leather, cloth, tin, lead, &c. though by *ſtaple goods*, is now generally meant any proper ſaleable commodities, not eaſily ſubject to periſh. See WOOL, &c.

The principal *ſtaples* now exiſting, are Amſterdam for all goods from the Eaſt-Indies, Spain, the Mediterranean, and the Baltic: Fluſhing for thoſe of the Weſt-Indies; Middleburgh for French wines; Dort for Rheniſh wines and Engliſh cloth; Verre in Zeland for Scotch merchandizes, &c.

The *ſtaples* in the Levant, called by the French, *Eſchelles*, i. e. *ſcales*, are ſuch cities where the Engliſh, French, Dutch, Italians, &c. have conſuls, factors, and magazines; and whither they ſend veſſels regularly each year.—The principal of theſe are Smyrna, Alexandretta, Aleppo, Seyda, Cyprus, Sallee, Alexandria, Cairo, Tunis, Algiers, Tripoli, the Morea, Candia, and the iſlands of the Archipelago. See FACTORY.

Statute STAPLE, } See the articles { STATUTE.
Law of the STAPLE, } { LAW.

STAR, STELLA, in aſtronomy, a general name for all the heavenly bodies. See HEAVEN.

The *ſtars* are diſtinguiſhed, from the phænomena of their motion, &c. into *fixed* and *erratic*.

Erratic, or *wandering* STARS, are thoſe whoſe diſtances and places, with regard to each other, are continually changing. Theſe are what we properly call *planets*. See PLANET.

Though, to the ſame claſs, may likewiſe be referred, what we popularly call *blazing ſtars* or *comets*. See COMET.

Fixt STARS, called alſo, by way of eminence, *ſtars*, are thoſe which continually keep the ſame diſtance, with regard to each other. See FIXT.

The principal points that have come under the conſideration of aſtronomers concerning the *fixt ſtars*, are their *diſtance*, *magnitude*, *number*, *nature*, and *motion*.

Diſtance of the fixed STARS.—The fixed *ſtars* are bodies exceedingly remote from us; ſo remote, that we have no diſtances in the planetary ſyſtem to compare to them. See DISTANCE.

Their immenſe diſtance is argued hence, that they have no ſenſible parallax: that is, that the diameter of the earth's orbit bears no ſenſible proportion thereto; but they are ſeen the very ſame in all the points thereof. Mr. Flamſteed, indeed, ſeems to have diſcovered a ſmall parallax: ſirius, *e. gr.* he finds to have a parallax of twenty ſeconds. Admitting this, we have data enough to determine their diſtance, a thing hitherto deſpaired of.

For thus, the ſun's parallax being had, and his mean diſtance being 34377 ſemi-diameters of the earth, the diſtance of ſirius from the earth will be found to be 35477064 ſemi-diameters of the earth. See PARALLAX.

Mr. Huygens attempts the diſtance of the *ſtars* by another method, *viz.* by making the aperture of a teleſcope ſo ſmall, as that the ſun through it appears no bigger than ſirius. In this ſtate he found the ſun's diameter to be as 1 to 27664 of his diameter, when ſeen with the naked eye. Were the ſun's diſtance, then, 27664 times as great as it is, it would be ſeen of the ſame diameter with ſirius; ſo that allowing ſirius to be equal in magnitude with the ſun (which is a very reaſonable ſuppoſition) the diſtance of ſirius from the earth, will be found to be to that of the ſun from the earth, as 27664 to 1. On which principle, ſirius will be 951005328 ſemi-diameters of the earth diſtant from our earth.

If it be urged, that theſe methods are too precarious, to conclude any thing from them, yet this we can demonſtrate, that the *ſtars* are remoter than ſaturn; nay, that they are vaſtly more remote than ſaturn, as ſaturn has a great parallax, and the *ſtars* ſcarce any at all. See SATURN.

The *magnitudes of the fixed* STARS, appear to be very different; which difference probably ariſes, not from any diverſity in their real magnitudes, but from their diſtances, which are different. From this difference, the *ſtars* become diſtributed into ſeven ſeveral claſſes, called *magnitudes*. See MAGNITUDE.

The firſt claſs, or *ſtars* of the firſt magnitude, are thoſe neareſt us, and whoſe diameters are, therefore, biggeſt. Next theſe, are thoſe of the ſecond magnitude, and ſo on to the ſixth, which comprehends the ſmalleſt *ſtars* viſible to the naked eye. All beyond, are called *teleſcopic ſtars*. See TELESCOPICAL. Not that all the *ſtars* of each claſs appear juſtly of the ſame magnitude; there is a great latitude in this reſpect; and thoſe of the firſt magnitude, appear almoſt all different in luſtre and ſize. Other *ſtars* there are, of intermediate magnitudes, which aſtronomers cannot refer to this, rather than the next claſs, and therefore place them between the two.

Procyon, for inſtance, which Ptolemy makes of the firſt magnitude, and Tycho of the ſecond, Mr. Flamſteed lays down as between the firſt and ſecond.

Thus, inſtead of ſix ſeveral magnitudes, we have really ſix times ſix.

Some authors aſſert, that the *ſtars* of the firſt magnitude, ſubtend an angle of at leaſt a minute; but the earth's orbit ſeen from the *fixed ſtars*, we have obſerved only ſubtends an angle of twenty ſeconds; and hence they conclude, that the diameter of the *ſtars* is vaſtly greater than that of the earth's whole orbit.

Now a ſphere, whoſe ſemi-diameter only equals the diſtance between the ſun and earth, is ten millions of times greater than the ſun; conſequently, the *fixed ſtars* muſt be much more than ten millions of times greater than the ſun.

But here is a miſtake; for the diameters, even of the largeſt *ſtars* viewed through a teleſcope, which magnify, *e. gr.* a hundred times, ſubtend no ſenſible angle at all, but are mere lucid points.

The *ſtars* are likewiſe diſtinguiſhed, with regard to their ſituation, into *aſteriſms* or *conſtellations*, which are nothing but aſſemblages of ſeveral neighbouring *ſtars*, conſidered as conſtituting ſome determinate figure, as of an animal, *&c.* and denominated therefrom: a diviſion as ancient as the book of Job; wherein we find mention of orion and the pleiades, *&c.* See CONSTELLATION.

Beſides the *ſtars* thus diſtinguiſhed into magnitudes and conſtellations, there are others not reduced to either. Thoſe not reduced into conſtellations, are called *informes*, or *unformed ſtars*; of which kind, ſeveral ſo reputed by the ancients, have been ſince formed into new conſtellations by the modern aſtronomers; as *cor Caroli* by Dr. Halley, *ſcutum Sobieſci*, by Hevelius, *&c.* See INFORMES.

Thoſe not reduced to claſſes or magnitudes, are called *nebulous ſtars*, being ſuch as only appear faintly, in form of little lucid nebulæ or clouds. See NEBULOUS.

The *number of* STARS appears to be vaſtly great, almoſt infinite; yet have aſtronomers long ago aſcertained the number of thoſe viſible to the eye; which are found vaſtly fewer than one would imagine.—Hipparchus 125 years before the incarnation, on occaſion of a new *ſtar* then appearing, made a catalogue of the *ſtars*, i. e. an enumeration thereof, with an exact deſcription of their magnitudes, ſituations, longitude, latitude, *&c*, that it might be known, if any the like change ſhould happen for the future in the heavens. Hipparchus made the number of viſible *ſtars* 1022. Theſe were reduced into forty-eight conſtellations, and he laid it down, that if there ſometimes appeared more in winter nights, it was owing to a deception of the ſenſe —Ptolemy added four *ſtars* to Hipparchus's catalogue, and made the number 1026.—In the year 1437, Ulug Beigh, grandſon of Tamerlane, in a new catalogue he made, only gave 1017.

But in the ſeventeenth century, when aſtronomy began to be retrieved, their number was found to be much greater.—To the forty-eight conſtellations of the ancients, were added twelve new ones, diſcovered towards the ſouth-pole, and two towards the north; beſides ſeveral others not univerſally admitted, as the flower de lis, the royal oak, *&c.* See CONSTELLATION.

Tycho Brahe publiſhed a catalogue of 777 *ſtars*, from his own obſervations; which Kepler, from Ptolemy and others, increaſed to 1163, Ricciolus, to 1468, and Bayer, to 1725: Dr. Halley added 373 obſerved by him, within the antartic circle.—Hevelius, from his own obſervations, and thoſe of Dr. Halley, and the ancients, made a catalogue of 1888 *ſtars*: and Mr. Flamſteed has ſince made a catalogue of no leſs than 3000 *ſtars*, all from his own moſt accurate obſervations. See CATALOGUE.

Of theſe 3000, it is true, there are many only viſible through a teleſcope; nor does a good eye ſcarce ever ſee more than an hundred at the ſame time in the cleareſt heaven: the appearance of innumerable more, frequent in clear winter nights, ariſes from our ſight's being deceived by their twinkling, and from our viewing them confuſedly, and not reducing them to any order. Yet for all this, the *ſtars* are really almoſt infinite. Riccioli makes no ſcruple to affirm, in his new *Almageſt*, that a man who ſhould ſay there are above twenty thouſand times twenty thouſand, would ſay nothing improbable.

For a good teleſcope directed almoſt to any point of the heavens, diſcovers numbers that are loſt to the naked ſight: particularly in the milky way, which is nothing but an aſſemblage of *ſtars*, too remote to be ſingly ſeen, but ſo cloſely diſpoſed, as to give a luminous appearance to that part of the heavens where they are. See GALAXY.

In the ſingle conſtellation of the pleiades, inſtead of ſix or ſeven *ſtars* ſeen by the beſt eye, Dr. Hook, with a teleſcope twelve foot long, told ſeventy-eight; and with larger glaſſes, many more of different magnitudes. F. de Rheita, a capuchin, affirms, that he has obſerved above 2000 *ſtars* in the ſingle conſtellation of orion.

The ſame author found above 188 in the pleiades. And Huygens looking at the *ſtar* in the middle of orion's ſword; inſtead of one, found it to be twelve. Galileo found eighty in orion's ſword; twenty-one in the nebulous *ſtar* of his head; and thirty-ſix in the nebulous *ſtar*, præſepe.

The *changes that have happened in the* STARS, are very conſiderable; contrary to the opinion of the ancients, who held, that the heavens and heavenly bodies were incapable of any change, the matter thereof being permanent and eternal, infinitely exceeding the hardneſs of diamonds, and not ſuſceptible of any different form. And, in effect, till the time of Ariſtotle, and even two hundred years afterwards, there had no change been obſerved.

The firſt, was in the year 125, before the incarnation; when Hipparchus diſcovering a new *ſtar* to appear, was firſt induced to make a catalogue of the *ſtars*, that poſterity, as we have obſerved, might perceive any future changes of the like kind.

In the year 1572, Tycho Brahe, obſerved another new *ſtar* in the conſtellation caſſiopeia, which was, likewiſe, the occaſion of his making a new catalogue. Its magnitude, at firſt, exceeded that of the biggeſt of our ſtars, ſirius and lyra; it even equalled that of venus, when neareſt the earth; and was ſeen in fair day-light. It continued ſixteen months; towards the latter part whereof, it began to dwindle, and at laſt totally diſappeared, without any change of place in all that time.

Leovicius tells us of another *ſtar* appearing in the ſame conſtellation, about the year 905, which reſembled that of 1572; and quotes another ancient obſervation, whereby it appears, that a new *ſtar* was ſeen about the ſame place in 1264.

Dr. Keil takes thoſe to have been all the ſame *ſtar*; and does not know but it may make its appearance a-new 150 years hence.

Fabricius diſcovered another new *ſtar* in the neck of the whale, which appeared and diſappeared ſeveral times in the years 1648 and 1662. Its courſe and motion, are deſcribed by M. Bouillaud.

Simon Marius diſcovered another in andromeda's girdle, in 1612 and 1613; though M. Bouillaud ſays, it had been ſeen before, in the 15th century. Another was obſerved by Kepler in ſerpentarius. Another of the third magnitude in the conſtellation cygnus, near the bill, in the year 1601, which diſappeared in 1626, and was obſerved again by Hevelius in 1659, till the year 1661, and again in 1666 and 1671, as a *ſtar* of the ſixth magnitude.

It is certain, from the ancient catalogues, that many of the ancient *ſtars* are not now viſible. This is particularly notorious in the pleiades, or ſeven *ſtars*, whereof only ſix are now viſible to the eye; a thing long ago obſerved by Ovid: witneſs the verſe, *Quæ ſeptem dici, ſex tamen eſſe ſolent.*

M. Montanere, in his letter to the Royal Society in 1670, obſerves, that there are now wanting in the heavens, two *ſtars* of the ſecond magnitude, in the ſtern of the ſhip argo and its yard; which had been ſeen till the year 1664. When they firſt diſappeared it is not known; but he aſſures us, there was not the leaſt glympſe of them in 1668. He adds, he has obſerved many more changes in the *fixed ſtars*, even to the number of an hundred.

For the *nature of the fixt* STARS, their immenſe diſtance leaves us greatly at a loſs about it. What we can gather for certain from their phænomena, is as follows:

1°. That the fixt *ſtars* are greater than our earth. This is demonſtrable thus: ſuppoſe two *ſtars* C and D (*Tab. aſtronomy*, fig. 7.) the one in the eaſtern horizon, and the other in the weſtern. As ſoon as D arrives in C; C will appear in D. But ſince both move with the ſame velocity, while C deſcribes the arch C H D; the *ſtar* D deſcribing an arch equal to C D H, will appear in F: wherefore, if the *ſtars* C and D be leſs than the earth, the *ſtar* C will not be ſeen in the eaſtern horizon, when the other, D, is arrived at the weſtern: But as this is contrary to experience, it follows, that the *ſtars* being in L and S, and there ſeen at the ſame time by ſpectators in A and B, are greater than the earth A B.

2°. The fixt *ſtars* are farther diſtant from the earth, than the fartheſt of the planets. For we frequently find the fixt *ſtars* hid behind ſaturn's body, the higheſt of the planets.

3°. The fixt *ſtars* ſhine with their own light: for they are much farther from the ſun than ſaturn, and appear much ſmaller than ſaturn; but ſince, notwithſtanding this, they are found to ſhine much brighter than ſaturn, it is evident they cannot borrow their light from the ſame ſource as ſaturn does, *viz.* the ſun: but ſince we know of no other luminous body beſide the ſun, whence they might derive their light; it follows, that they ſhine with their own native light. Hence 1°. we deduce, that the fixt *ſtars* are ſo many ſuns; for they have all the characters of ſuns. See SUN.

2°. That in all probability, the *ſtars* are not ſmaller than our ſun.

3°. That it is highly probable, each *ſtar* is the centre of a ſyſtem, and has planets or earths revolving round it, in the ſame manner as round our ſun, *i. e.* has opake bodies illuminated, warmed and cheriſhed by its light. See SYSTEM. How immenſe then, does the univerſe appear! Indeed it muſt either be infinite, or infinitely near it. See UNIVERSE. Kepler, it is true, denies, that each *ſtar* can have its ſyſtem of planets as ours has; and takes them all to be fixed in the ſame ſurface or ſphere; urging, that were one twice or thrice as remote as another, it would appear twice or thrice as ſmall, ſuppoſing their real magnitudes equal; whereas there is no difference in their apparent magnitudes, juſtly obſerved, at all. But to this we oppoſe, that Huygens has not only ſhewn that fires and flames are viſible at diſtances where other bodies, comprehended under equal angles, diſappear; but it ſhould likewiſe ſeem, that the optic theorem about the apparent diameters of objects being reciprocally proportional to their diſtances from the eye, does only hold while the diameter of the object has ſome ſenſible ratio to its diſtance.

4°. The *ſtars* which appear and diſappear by turns, being always found to increaſe in magnitude at their firſt appearance, and to decreaſe as they begin to diſappear, and being likewiſe ſtill viſible through teleſcopes, for ſome time after they are loſt to the naked eye (of which we have various inſtances in the *Philoſophical Tranſactions*) ſeem to be no more than planets performing their periods about the fixt *ſtars*, as their reſpective ſuns; unleſs any perſon ſhould rather incline to Dr. Keil's opinion, *viz.* that the *ſtars* loſe their brightneſs, and diſappear, by their becoming covered with maculæ or ſpots, ſuch as are frequently found to ovorſpread the ſun. See SPOTS.

5°. Thoſe temporary *ſtars*, which, upon their diſappearing, have never been found to return again; are probably conjectured to be of the number of comets, which make long excurſions from their ſuns, or the centers of the upper planetary ſyſtems, *i. e.* from the fixt *ſtars*; returning too ſeldom to have their returns perceived. See COMET.

Motion of the STARS.—The fixed *ſtars* have two kinds of motions; one called the *firſt*, *common* or *diurnal motion*, or the *motion of the primum mobile:* by this they are carried along with the ſphere or firmament wherein they appear fixed, round the earth, from eaſt to weſt, in the ſpace of twenty-four hours.

The other, called the *ſecond* or *proper motion*, is that whereby they go backwards from weſt to eaſt round the poles of the ecliptic, with an exceeding ſlowneſs, as not deſcribing above a degree of their circle in the ſpace of ſeventy-one or ſeventy-two years, or 51 ſeconds in a year.

Some have imagined, I do not know on what grounds, that when they are got round to the points, whence they firſt departed, nature will have finiſhed her courſe, and the *ſtars* having performed their career, the heavens will remain at reſt, unleſs the being, who firſt gave them motion, appoint them to begin another circuit.

On the footing of this calculation, the world ſhould laſt about 30000 years, according to Ptolemy; 25816 according to Tycho; 25920 according to Riccioli; and 24800 according to Caſſini. See PRECESSION *of the equinox*.

In effect, the latitudes of the fixt *ſtars*, we find, by comparing the obſervations of the ancient aſtronomers with thoſe of the moderns, continue ſtill the ſame; but their longitude is by this ſecond motion always increaſing.

Thus *e. gr.* the longitude of cor leonis, was found by Ptolemy, *A. D.* 138, to be 2° 30′; in 1115 it was obſerved by the Perſians to be 17° 30′: in 1364, by Alphonſus 20° 40′; in 1586 by the prince of Heſſe, 24° 11′; in 1601 by Tycho, 24° 17′; and in 1690 by Mr. Flamſteed 25° 31′ 20″; whence the proper motion of the *ſtars*, according to the order of the ſigns in circles parallel to the ecliptic, is eaſily inferred.

It was Hipparchus firſt ſuſpected this motion, upon comparing the obſervations of Tymocharis and Ariſtyllus with his own. Ptolemy, who lived three centuries after Hipparchus, demonſtrated the ſame by undeniable arguments. See LONGITUDE.

Some, it is true, have imagined a change in the latitudes of the *ſtars*; but ſuch an opinion has little countenance from obſervation. See LATITUDE.

Tycho Brahe makes the increaſe of longitude in a century 1° 25′; Copernicus 1° 23′ 40″ 12‴; Flamſteed and Ricciolus 1° 23 20″; Bullialdus 1° 24′ 54″; Hevelius 1° 24′ 46″ 50‴; whence, with Flamſteed, the annual increaſe of the longitudes of the fixed *ſtars* may be well fixed at 50″.

From theſe data, the increaſe of the longitude of a *ſtar* for any given time, is eaſily had; and hence the longitude of a *ſtar* for any given year, being given, its longitude for any other year is readily found: *e. gr.* the longitude of ſirius in Mr. Flamſteed's tables for the year 1690 being 9° 49′ 1″; its longitude for the year 1724 is found, by multiplying the interval of time, *viz.* 34 years by 50″, the product 1700″ or 28′ 2″ added to the given longitude, will give the longitude required, 10° 17′ 3″.

The principal phænomena of the fixt *ſtars*, ariſing from their common and proper motion, beſides their longitude, are their altitudes, right aſcenſions, declinations, occultations, culminations, riſings and ſettings; which ſee under their proper articles, ALTITUDE, ASCENSION, DECLINATION, OCCULTATION, &c.

The ſeveral *ſtars* in each conſtellation, *e. gr.* in taurus, bootes, hercules, &c. their longitudes, latitudes, magnitudes, names, places, &c. as fixed by Mr. Flamſteed in the *Britannic Catalogue*; ſee under the proper article of each conſtellation, TAURUS, BOOTES, HERCULES, &c.

To learn to know the ſeveral fixt *ſtars* by the globe; ſee GLOBE.

The parallax and diſtance of the fixt *ſtars*, ſee under PARALLAX and DISTANCE.

Circumpolar STAR,	See	CIRCUMPOLAR.
Morning STAR,		MORNING.
Place of a STAR,		PLACE and APPARENT.
Pole STAR,		POLE.

STAR, in fortification, a little fort, with five or more points, or ſaliant and re-entring angles, flanking one another, and their faces 90 or 100 foot long. See FORT.

Formerly, *ſtar* forts were frequently made in lines of circumvallation, after two or three redoubts. See REDOUBT and SCONCE.

STAR, in pyrotechny, a compoſition of combuſtible matters, which being born or thrown aloft into the air, exhibits the appearance of a real *ſtar*.

Stars are chiefly uſed as appendages to rockets, a number of them being uſually incloſed in a conical cap or cover at the head of the rocket, and carried up with it to its utmoſt altitude, where the *ſtars* taking fire, are ſpread around, and exhibit an agreeable ſpectacle. See ROCKET.

To make STARS; mix three pounds of ſalt petre, eleven ounces of ſulphur, one of antimony, and three of gunpowder duſt: or twelve ounces of ſulphur, ſix of ſalt petre, five and a half of gunpowder duſt, four ounces of olibanum, one of maſtic, camphir, ſublimate of mercury, and half a one of antimony and orpiment.

Moiſten the maſs with gumwater, and make it into little balls, of the ſize of a cheſnut, which dry either in the ſun or the oven. Theſe ſet on fire in the air, will repreſent *ſtars*.

STAR, in heraldry, denotes a charge frequently born on the ſhield, and the honourable ordinaries, in the figure of a *ſtar*. It differs from the *mullet*, or ſpur-rowel, in that it is not pierced as this laſt is. See MULLET.

It uſually conſiſts of five rays or ſpokes. When it has ſix or eight, as among the Germans and Italians, particular mention muſt be made thereof in blazoning.

On medals, STARS are marks of conſecration and deification, being intended as ſymbols of eternity.—F. Joubert ſays, they ſometimes expreſs the children of princes reigning; and ſometimes the children dead, and placed in the rank of deities. See DEIFICATION.

STAR, is alſo a badge of the honourable orders of the garter and bath. See GARTER.

Order of the STAR, or our *lady of the* STAR, an order of knighthood inſtituted by king John of France in the year 1352, denominated from a *ſtar* they wore on the ſtomach.

At firſt there were but thirty knights; but the order in time became depreciated by the multitude of perſons admitted, without any diſtinction. For which reaſon, Charles VII. when grand-maſter thereof, quitted it, and gave it the chevalier du Guet, knight of the watch at Paris, and his archers, who ſtill wear a *ſtar* on their coats. But this account is contradicted by others; who will have the order inſtituted by king Robert in 1022 in honour of the holy virgin, and to have fallen into diſregard during the wars of Philip de Valois.

Juſtiniani mentions another *order of the ſtar*, at Meſſina in Sicily, called alſo *the order of the creſcent*. It was inſtituted in the year 1268, by Charles of Anjou, brother of St. Louis, king of the two Sicilies.

Others will have it inſtituted in 1464, by Renatus duke of Anjou, who took the title of king of Sicily. At leaſt, it appears from the arms of this prince, that he made ſome alteration in the collar of the order; for inſtead of flower-de-luces and *ſtars*, he only bore two chains, whence hung a creſcent, with the old French word *loz*, which in the language of Rebus, ſignified *loz in a creſcent*.

The order being dropt into obſcurity, was raiſed again by the people of Meſſina, under the name of the *noble academy of the knights of the ſtar*; reducing the ancient collar to a ſingle *ſtar* placed on a forked croſs, and the number of knights to ſixty-two. Their device was, *monſtrant regibus aſtra viam*, which they expreſſed by the four initial letters

M R
*
A V

with the *ſtar* in the middle.

STAR, in the manage.—*White* STARS *in the forehead*, are eſteemed good marks in all horſes, except white and grey ones: where nature fails to produce this good criterion, our jockies have frequent recourſe to art. See HORSE.

The method of making *ſtars*, practiſed among the Dutch, is to roaſt a large onion in hot aſhes, and when near thoroughly

roughly done, to divide it in two, and dip it in ſcalding hot wallnut oil. This done, they immediately apply the flat ſide thereof to the place the *ſtar* is to be on, and keep it there half an hour. After taking it off, they anoint the ſcalded place with ointment of roſes: in a ſhort time, the ſcarf ſkin falls off, and white hairs grow up in its room; but the middle always continues bare of hair, which is the certain characteriſtic of an artificial *ſtar*.

The method moſt uſed among us, is to ſhave the hair from the place it is to be made on; then to apply a little oil of vitriol with a feather, or the like, paſſing it lightly over the bald place. This eats away the roots of the former hair, which will be ſucceeded by white. The ſore is healed up with copperas and green ointment.

To make a *black* STAR, on a white or other coloured horſe; waſh the place to be changed, frequently, with fern roots and ſage boiled in lye; and it will breed black hairs. The ſame may be done, by beating ſour milk, galls and ruſt together, and anointing the part therewith.

A red STAR is made with an ounce of aqua-fortis, a pennyworth of aqua-vitæ, and ſilver to the value of eighteenpence, all heated together in a glaſs, and the place anointed therewith. This immediately turns the hair to a perfect red; but it laſts no longer than till the horſe caſts his coat; when it is to be renewed.

STARBOARD, denotes the right hand ſide of a ſhip: as larboard does the left. See LARBOARD.

They ſay, *ſtarboard the helm*, or *helm a ſtarboard*, when the man at the helm ſhould put the helm to the right ſide of the ſhip. See HELM.

STARCH, a fecula, or ſediment, found at the bottom of veſſels wherein wheat has been ſteeped in water; of which fecula, after ſeparating the bran from it, by paſſing it through ſieves, they form a kind of loaves, which being dried in the ſun, or an oven, is afterwards broke into little pieces, and ſo ſold.

The beſt is white, ſoft, and friable, eaſily broke into powder. Such as require very fine *ſtarch*, do not content themſelves, like the ſtarch-men, with refuſe wheat, but uſe the fineſt grain. The proceſs is as follows;

Method of making STARCH *of wheat*.—The grain being well cleaned, is put to ferment in veſſels full of water, which they expoſe to the ſun when in its greateſt heat; changing the water twice a day, for the ſpace of eight or twelve days, according to the ſeaſon. When the grain burſts eaſily under the finger, they judge it ſufficiently fermented. The fermentation perfected, and the grain thus ſoftened; it is put, handful by handful, in a canvas bag, to ſeparate the flour from the huſks, which is done by rubbing and beating it on a plank, laid a-croſs the mouth of the empty veſſel that is to receive the flour.

As the veſſels are filled with this liquid flour, there is ſeen ſwimming a-top, a reddiſh water, which is to be carefully ſcummed off from time to time, and clean water put in its place; which, after ſtirring the whole together, is all to be ſtrained through a cloth or ſieve, and what is left behind, put into the veſſel with new water, and expoſed to the ſun for ſome time; and as the ſediment thickens at the bottom, they drain off the water four or five times, by inclining the veſſel, but without paſſing it through the ſieve. What remains at bottom, is the *ſtarch*, which they cut in pieces to get out, and leave it to dry in the ſun. When dry, it is laid up for uſe.

To uſe *ſtarch*, they take as much as is needed, and ſteep it in water over night, changing the water four or five times. The ſtarch-men uſing the refuſe of wheat, only obſerve a part of all theſe things in their proceſs; but their *ſtarch* falls far ſhort of this.

Starch is uſed along with ſmalt, or ſtone blue, to ſtiffen and clear linen. The powder thereof is alſo uſed to whiten, and powder the hair.

It is alſo uſed by the dyers to diſpoſe their ſtuffs to take colours the better.

STAR-CHAMBER, *camera ſtellata*, was a chamber at Weſtminſter, ſo called, from its roof being painted with gilt ſtars. See CHAMBER.

STAR-FORT, or *redoubt*, in fortification, is a work with ſeveral faces, generally compoſed of from five to eight points, with ſaliant and re-entring angles flanking one another; every one of its ſides containing from twelve to twenty-five fathoms. See FORT, and REDOUBT.

STARTING, among brewers, the putting of new beer, or ale, to that which is decayed, to revive it again.

STATE, or *eſtate*, an empire, kingdom, province, or extent of country under the ſame government. See ESTATE, EMPIRE, PROVINCE, *&c.*

The *ſtate*, or *ſtates* of the king of England, include the Britiſh iſlands, and the Weſt India plantations, as Virginia, Carolina, Maryland, *&c.* to which may be added the dutchies of Brunſwic-Lunenburg, Bremen, *&c.*

Free STATE. See the article FREE.

STATE is alſo uſed for the policy or form of government of a nation.—Hence, miniſters of *ſtate*; reaſons of *ſtate*, *&c.* See GOVERNMENT, MINISTER, RATIO *ſtatus*, &c.

Politicians diſtinguiſh ſeveral forms of *ſtate*, *viz.* the *monarchic*, as that of England; ſee MONARCHY: the *democratic*, as that of Rome and Athens; ſee DEMOCRACY: the *oligarchic*, as that of Venice; ſee OLIGARCHY: and the *ariſtocratic*, as that of Sparta; ſee ARISTOCRACY, *&c.*

STATE *of a diſeaſe*, the ſame with *acme*. See ACME.

STATED *winds*. See the article WIND.

STATER, an ancient coin, weighing four Attic drachms: it was either of ſilver, or gold; the former worth about two ſhillings four-pence ſterling. See COIN.

STATERA *Romana*, or ſtilyard, a name given to the Roman balance. See STILYARD.

STATES, a term applied to the ſeveral orders, or claſſes of a people, aſſembled to conſult of matters for the publick good. See ESTATES.

STATES-GENERAL, the name of an aſſembly, conſiſting of the deputies of the ſeven United Provinces.

In this aſſembly, the deputies of each province, what number ſoever they be, have only one voice, and are eſteemed as but one perſon; the votes being given by provinces. Each province preſides at the aſſembly in its turn, according to the order ſettled among them; Guelderland preſides firſt, then Holland, *&c.*

This aſſembly is the repreſentative of the ſovereignty of the union, which reſides properly in the general aſſembly of the ſtates themſelves of all the provinces: but as that aſſembly ordinarily conſiſts of ſeven or eight hundred perſons, it was reſolved, after the departure of the earl of Leiceſter, in order to avoid expence, and the confuſion of ſo numerous a body, that the provincial eſtates ſhould, for the future, be ordinarily repreſented by their deputies, under the name of the *ſtates-general*, who were always to reſide at the Hague, and who alone are now called *ſtates-general*.

Since that new regulation, there have been but two general aſſemblies of the *ſtates* of the provinces; the former held in 1600 at Berg-op-Zoom, to confirm the truce agreed on with the arch-duke Albert, with the greater ſolemnity: and the latter in 1651.

STATES *of Holland*, an aſſembly conſiſting of the deputies of the councils, or colleges of each city; wherein reſides the ſovereignty of that province.

Originally, none but the nobility and the ſix principal cities had ſeats, or voices in the *ſtates*.—At preſent there are the deputies of eighteen cities.—The nobility have the firſt voice, The other provinces of the union have likewiſe their *ſtates*, repreſenting their ſovereignty: deputies from which conſtitute what they call the *ſtates-general*. See STATES-GENERAL.

STATHOLDER. See the article STADTHOLDER.

STATICAL *baroſcope*. See BAROSCOPE, and BAROMETER.

STATICKS, STATICE, a branch of mathematics, which conſiders weight or gravity, and the motion of bodies ariſing therefrom. See MOTION, and HYDROSTATICKS.

Thoſe who define mechanics, the ſcience of motion, make *ſtaticks* a member thereof, *viz.* that part which conſiders the motion of bodies ariſing from gravity. See GRAVITY.

Others make them two diſtinct doctrines; reſtraining mechanics to the doctrine of motion and weight in reference to the ſtructure and power of machines; and *ſtaticks* to the doctrine of motion conſidered merely as ariſing from the weight of bodies, without any immediate reſpect to machines.—On which footing, *ſtaticks* ſhould be the doctrine or theory of motion; and mechanics the application thereof to machines. See MECHANICS.

For the laws of STATICKS, ſee GRAVITY, DESCENT, *&c.*

STATICKS, STATICI, in medicine, a kind of epileptics, or perſons ſeized with epilepſies. See EPILEPSY.

Staticks differ from *cataleptics*, in that, theſe laſt have no ſenſe of external objects, nor remember any thing that paſſes at the time of the paroxyſm: whereas the *ſtatici* are all the while taken up with ſome very ſtrong lively idea, which they remember well enough, out of the fit. See CATALEPSIS.

STATION, in geometry, *&c.* a place pitched upon to make an obſervation, take an angle, or the like.

An inacceſſible height or diſtance is only to be taken, by making two *ſtations*, from two places, whoſe diſtances are known.—In making maps of provinces, *&c.* *ſtations* are fixed on all the eminences, *&c.* of the country, and angles taken thence to the ſeveral towns, villages, *&c.*

In ſurveying, the inſtrument is to be adjuſted by the needle, to anſwer the points of the horizon, at every *ſtation*; the diſtance from the laſt *ſtation* to be meaſured, and an angle to be taken to the next *ſtation*: which includes the whole buſineſs of ſurveying. See SURVEYING.

In levelling, the inſtrument is rectified, that is placed level, at each *ſtation*, and obſervations made forwards and backwards. See LEVELLING.

Line of STATION in perſpective. See the article LINE.

STATION, in aſtronomy, the poſition or appearance of a planet in the ſame point of the zodiac for ſeveral days. See PLANET.

As the earth, whence we view the motions of the planets, is out of the centre of their orbits, the planets appear to proceed irregularly; being ſometimes ſeen to go forwards, that is from weſt to eaſt, which is called their *direction*; ſometimes to go backwards, or from eaſt to weſt, which is called their *retrogradations*. See DIRECTION and RETROGRADATION.

Now between theſe two ſtates, there muſt be an intermediate one, wherein the planet neither appears to go backwards nor forwards, but to ſtand ſtill and keep the ſame place in her orbit; which is called her *ſtation*. See STATIONARY.

STATION, STATIO, in church hiſtory, is applied to the faſts of the fourth and ſixth days of the week; that is, Wedneſday and Friday; which many among the ancients obſerved with much devotion, till three of the clock in the afternoon. See FAST.

S. Peter of Alexandria, in his *Canonical Epiſtle*, can. 15. obſerves, that it was appointed conformably to ancient tradition, to faſt weekly on thoſe days: on Wedneſday, in memory of the counſel the Jews took to put our Saviour to death; and on Friday, on account of his paſſion.—Some regard to which is ſtill had by the church of England. See ABSTINENCE.

STATION is alſo uſed in the church of Rome, for a church where indulgences are to be had on certain days. See INDULGENCE.

It was St. Gregory that fixed the *ſtations* at Rome, i. e. the churches where the office was to be performed each day of Lent, and on ſolemn feaſt days. Theſe *ſtations* he marked down in his *Sacramentary*, as they now ſtand in the *Roman Miſſal*; appropriating them chiefly to the patriarchal and titular churches: but though the *ſtations* were fixed, the archdeacon did not fail at each *ſtation*, to publiſh to the people the following *ſtation*.

STATION is alſo a ceremony in the Romiſh church, wherein the prieſts or canons go out of the choir to ſing an anthem before the crucifix, or the image of our lady.—This ceremony is aſcribed to S. Cyril.

STATIONARY, in aſtronomy, the ſtate of a planet when it ſeems to remain immoveable in the ſame point of the zodiac. See STATION.

The planets having ſometimes a progreſſive and ſometimes a retrograde motion; there will be ſome point wherein they appear *ſtationary*. Now a planet will be ſeen *ſtationary*, when the line that joins the earth's and planet's center, is conſtantly directed to the ſame point in the heavens; that is, when it keeps parallel to itſelf.—For all right lines drawn from any point of the earth's orbit, parallel to one another, do all point to the ſame ſtar; the diſtance of thoſe lines being inſenſible, in compariſon of that of the fixed ſtars.

Saturn is ſeen *ſtationary*, at the diſtance of ſomewhat more than a quadrant from the ſun; jupiter at the diſtance of 52°, and mars at a much greater diſtance.

Saturn is *ſtationary* eight days, jupiter four, mars two, venus one and a half, and mercury an half; though the ſeveral ſtations are not always equal. See Saturn, *&c.*

STEATOCELE, ΣΤΕΑΤΟΚΗΛΗ, in medicine, a rupture, or tumour of the ſcrotum, conſiſting of a fatty ſubſtance reſembling ſuet collected therein. See HERNIA.

STATUARY, STATUARIA, a branch of ſculpture, employed in the making of ſtatues. See STATUE.

Statuary is one of thoſe arts wherein the ancients ſurpaſſed the moderns: indeed it was much more popular, and more cultivated among the former than the latter. See SCULPTURE.—It is diſputed between *ſtatuary* and painting, which of the two is the moſt difficult and the moſt artful. See PAINTING.

The invention of *ſtatuary* was at firſt very coarſe. Leon Battiſta Alberti, who has an expreſs treatiſe on ſtatues, imagines that it took its riſe from ſomething caſually obſerved in the productions of nature, that, with a little help, ſeemed diſpoſed to repreſent the figure of ſome animal.—The common ſtory is, that a maid, full of the idea of her lover, made the firſt eſſay, by the aſſiſtance of her father's implements, who was a potter. This, at leaſt, is pretty certain, that earth is the firſt matter *ſtatuary* was practiſed upon. See POTTERY.

STATUARY is alſo uſed for the artificer, who makes ſtatues. Phidias was the greateſt *ſtatuary* among the ancients, and Michael Angelo among the moderns.

STATUARY *column*,	See the articles	COLUMN.
STATUARY *fountain*,		FOUNTAIN.

STATUE, STATUA, a piece of ſculpture in full relievo, repreſenting a human figure. See FIGURE, and IMAGE.

Daviler more ſcientifically defines *ſtatue* a repreſentation in high relievo and inſulate, or ſome perſon diſtinguiſhed by his birth, merit, or great actions; placed as an ornament in a fine building, or expoſed in a public place to preſerve the memory of his worth.

In ſtrictneſs, the term *ſtatue* is only applied to figures on foot; the word being formed from the Latin, *ſtatura*, the ſize of the body; or from *ſtare*, to ſtand.

Statues are formed with the chiſſel, of ſeveral matters, as ſtone, marble, plaiſter, *&c.* See STONE, MARBLE, CHISSEL, *&c.*

They are alſo caſt of various kinds of metal, particularly gold, ſilver, braſs, and lead.—For the method of caſting *ſtatues*, ſee FOUNDERY *of ſtatues*.

Dædalus, the ſon of Eupalmus, who lived not only before the ſiege of Troy, but even before the expedition of the Argonauts, among many other notable contrivances aſcribed to him, is ſaid to have been the inventor of *ſtatues*.—And yet it is certain, there were ſtatuaries before him; only it was he who firſt found how to give them action and motion, and to make them appear as if alive. Before him, they made them with the feet joined together, never intending to expreſs any action. He firſt looſened the feet of his, and gave them the attitudes of people walking and acting.—The Phœnicians are ſaid to have been the firſt who erected *ſtatues* to the gods. See IDOL.

The Greeks ſucceeded in their *ſtatues* beyond the Romans; both the workmanſhip and the fancy of the Roman *ſtatues* were inferior to the Grecian. Indeed we have very few remaining, that have eſcaped the injuries of time.

Statues are uſually diſtinguiſhed into four kinds.—The firſt, are thoſe leſs than the life: of which kind we have ſeveral *ſtatues* of men, of kings, and gods themſelves.

The ſecond, thoſe equal to the life: in which manner it was, that the ancients, at the publick expence, uſed to make *ſtatues* of perſons eminent for virtue, learning, or the ſervices they had done.

The third, thoſe that exceed the life: among which, thoſe which ſurpaſſed the life once and a half, were for kings and emperors; and thoſe double the life, for heroes.

The fourth kind, were thoſe that exceeded the life twice, thrice, or even more; and were called *coloſſus's*. See COLOSSUS.

Every *ſtatue* reſembling the perſon it is intended to repreſent, is called *ſtatua iconica*.

Allegorical STATUE, that which, under a human figure, or other ſymbol, repreſents ſomething of another kind, as a part of the earth, a ſeaſon, age, element, temperament, hour, *&c.*

Caryatic STATUE,	See the articles	CARYATIDES.
Coloſſal STATUE,		COLOSSUS.

Curule STATUES, thoſe which are repreſented in chariots drawn by bigæ, or quadrigæ, that is, by two, or four horſes: of which kind there were ſeveral in the Circus's, Hippodromes, *&c.*—or in cars, as we ſee ſome with triumphal arches on antique medals. See CURULE.

Equeſtrian STATUE, that repreſenting ſome illuſtrious perſon on horſeback—as that famous one of Marcus Aurelius at Rome; and that of king Charles I. at Charing-croſs.

Greek STATUE, denotes a figure that is naked and antique; it being in this manner the Greeks repreſented their deities, athletæ of the olympic games, and heroes.

The reaſon of this nudity, whereby the Greek *ſtatues* are diſtinguiſhed, is, that thoſe who exerciſed wreſtling, wherein the Greek youth placed their chief glory, always performed naked. See ATHLETA, GYMNASIUM, *&c.*

The *ſtatues* of heroes were particularly called *Achillean ſtatues*, by reaſon of the great number of figures of that prince, in moſt of the cities of Greece.

Hydraulic STATUE, any figure placed as an ornament of a fountain, or grotto; or that does the office of a jet d' eau, a cock, ſpout, or the like, by any of its parts, or by any attribute it holds.—The like is to be underſtood of any animal ſerving for the ſame uſe.

Pedeſtrian STATUE, a *ſtatue* ſtanding on foot—as that of king Charles II. in the Royal Exchange, and that of king James II. in the Privy Gardens.

Perſian STATUE. See the article PERSIAN *order*.

Roman STATUES, is an appellation given to ſuch as are cloathed, and which receive various names from their various dreſſes.

Thoſe of emperors with long gowns over their armour, were called *ſtatuæ paludatæ*; thoſe of captains and cavaliers, with coats of arms, *thoracatæ*; thoſe of ſoldiers, with cuiraſſes, *loricatæ*; thoſe of ſenators and augurs, *trabeatæ*; thoſe of magiſtrates with long robes, *togatæ*; thoſe of the people with a plain tunica, *tunicatæ*; and, laſtly, thoſe of women with long trains, *ſtolatæ*.

The Romans had another diviſion of *ſtatues*, into *divine*, which were thoſe conſecrated to the gods; as Jupiter, Mars, Apollo, *&c.*—*Heroes*, which were thoſe of the demi-goods; as Hercules, *&c.*—and *Auguſti*, which were thoſe of the emperors; as thoſe two of Cæſar and Auguſtus, under the portico of the capitol.

Foundery of STATUES,	See the articles	FOUNDERY.
Pedeſtal of STATUES,		PEDESTAL.
Plinth of STATUES,		PLINTH.

Repairing a STATUE. See the article REPAIRING.

STATURE, the ſize or height of a man.—From the Latin, *ſtatura*, of *ſtare*, to ſtand.

The *ſtature*, or pitch of a man, is found admirably well adapted to the circumſtances of his exiſtence. Had man, obſerves Dr. Grew, been a dwarf; he could ſcarce have been a reaſonable creature: For, to that end, he muſt have had a jolt-head; and then he would not have had body and blood to ſupply his brain with ſpirits: or if he had had a ſmall, proportional head, there would not have been brain enough for his buſineſs.—Again, had man been a giant, he could not have been ſo commodiouſly ſupplied with food: for there would not have been fleſh enough of the beſt edible beaſts to ſupply his turn; or if the beaſts had been made proportionably bigger, there would not have been graſs enough, *&c.* See DWARF, GIANT, *&c.*

It is a common opinion, however, and has been ſo ever ſince Homer's time, that people in the earlieſt ages of the world, much ſurpaſſed the moderns in *ſtature*; and it is true, we read of men, both in ſacred in profane hiſtory, whoſe pitch appears ſurprizing: but then it is true, they were eſteemed giants.

The ordinary *ſtature* of men, Mr. Derham obſerves, is, in all probability the ſame now, as at the beginning; as may be gathered from the monuments, mummies, *&c.* ſtill remaining. The oldeſt monument in the world, is that of Cheops, in the firſt pyramid of Egypt, which Mr. Greaves obſerves, ſcarce exceeds the meaſure of our ordinary coffins. The cavity, he ſays, is only 6.488 feet long, 2.218 feet wide, and 2.160 deep: from which dimenſions, and thoſe of ſeveral embalmed bodies, taken by him in Egypt, that accurate writer concludes, there is no decay in nature; but that the men of this age are of the ſame *ſtature* as thoſe three thouſand years ago.

To theſe we have other and later inſtances to add from Hakewell: the tombs at Piſa, which are ſome thouſands of years old, are no longer than ours. The ſame may be ſaid of Athelſtan's in Malmſbury church; Sheba's in Paul's, of the year 693, *&c.*

The like evidence we have from the ancient armour, ſhields, veſſels, *&c.* dug up at this day, *e. gr.* the braſs helmet dug up at Metaurum, fits one of our men; yet it is allowed to have been left there at the overthrow of Aſdrubal. Add, that Auguſtus was five foot nine inches, which was the meaſure of our queen Elizabeth; only the queen exceeded the emperor by two inches, allowance being made for the difference between the Roman and our foot.

STATUS *de manerio*, in ancient records, denotes all the tenants and legal men within the lands of a manor, aſſembled in their lord's court, to do their cuſtomary ſuit, and enjoy their rights and privileges. See MANOR, *&c.*

STATUTE, STATUTUM, in its general ſenſe, ſignifies a law, ordinance, decree, *&c.* See LAW, DECREE, *&c.*

STATUTE, in our laws and cuſtoms, more immediately ſignifies an act of parliament, made by the three eſtates of the realm; and having the force of a law. See LAW, and PARLIAMENT.

Acceſſory by STATUTE,	See the articles	ACCESSORY.
Action upon the STATUTE,		ACTION.

STATUTE *ſeſſions*, called alſo *petit ſeſſions*, are meetings in every hundred, to which conſtables repair, and others, both maſters and ſervants, for deciding differences between maſters and ſervants, rating of wages, beſtowing people in ſervice, who being fit to ſerve, either refuſe to ſeek, or cannot get maſters. See SESSIONS.

STATUTE *merchant*, is a bond of record acknowledged before one of the clerks of the *ſtatutes* merchant and mayor or chief warden of the city of London, or two merchants of the ſaid city for that purpoſe aſſigned, or before the mayor, chief warden, or maſter of other cities or towns, or other ſufficient men for that purpoſe appointed; ſealed with the ſeal of the debtor and of the king, which is of two pieces, the greater to be kept by the mayor, chief warden, *&c.* and the leſſer by the ſaid clerks. Its effect is, that if the obligor pay not the debt at the day, execution may be awarded againſt his body, lands, and goods; and that the obligee ſhall hold the ſame till the debt be levied.

Tenant per STATUTE *merchant*. See TENANT.

STATUTE *ſtaple*, is a ſort of *ſtatute* merchant, relating to merchants, and merchandizes of the ſtaple. See STAPLE.

The *ſtatute* ſtaple is of two kinds; *proper*, and *improper*.

Proper is a bond of record, acknowledged before the mayor of the ſtaple, in the preſence of one or more conſtables of the ſtaple; by virtue of which the creditor may forthwith have execution of the body, lands, and goods of the debtor, on non-payment.

Improper is a bond of record, founded upon the *ſtatute* 23 Hen. VIII. c. 6. of the nature of a proper *ſtatute* ſtaple as to the force and execution of it, and acknowledged before one of the chief juſtices; or in their abſence, before the mayor of the ſtaple, and recorder of London.

STAVERS, or STAGGERS, among farriers, a giddineſs in a horſe's head, which ends in madneſs.

It is frequently occaſioned, by turning out a horſe to graſs too ſoon, before well cold; where, by hanging down his head to feed, ill vapours and humours are generated, which oppreſſing the brain, are the next cauſe of this diſeaſe.—Sometimes it comes by over exerciſe in hot weather, which inflames the blood, *&c.* and ſometimes by noiſome ſmells in the ſtable, exceſſive eating, *&c.*

The ſigns of it, are dimneſs of ſight, reeling, and ſtaggering, watery eyes, *&c.* At length, for very pain, he beats his head againſt the wall, thruſts it into the litter, riſes and lies down with fury, *&c.*

The methods of cure are various; but they all begin with bleeding.

STAVES, *Flag* STAVES,	See	FLAG *ſtaves*.
Levelling STAVES,		LEVELLING *ſtaves*.
Tip STAVES,		TIP *ſtaves*.

STAY, in the ſea language, a big, ſtrong rope, faſtened to the top of one maſt, and the foot of that next before it, towards the prow, ſerving to keep it firm, and prevent its falling aſtwards, or towards the poop.—See *Tab. Ship. fig.* 1. *n.* 29, 33, 78, 85, 120. See alſo the article MAST.

All maſts, top-maſts, and flag-ſtaves, have their *ſtays*; except the ſprit-ſail top-maſts. That of the main-maſt is called the *main ſtay*.

The main-maſt, fore-maſt, and thoſe belonging to them, have alſo *back ſtays*, to prevent their pitching forwards, or over-board; as going on either ſide her. See BACK *ſtays*.

To STAY *a ſhip*, or *bring her on the* STAYS, is to manage her tackle and ſails, ſo as that ſhe cannot make any way forwards, which is done in order to her tacking about.

STEADY, a word of command at ſea, for the man at the helm to keep the ſhip *ſteady* in her courſe, and not to make angles (or *yaws* as they call them) in and out. See HELM.

STEATOMA, ΣΤΕΑΤΩΜΑ, a kind of ſwelling, or abſceſs; conſiſting of a matter much like ſuet; ſoft, without pain, and without diſcolouring the ſkin; contained in a cyſtis, and eaſily turned out upon inciſion. See TUMOR.

STEEL, a kind of iron refined, and purified by the fire, with other ingredients; which renders it whiter, and its grain cloſer, and finer than common iron. See IRON.

Steel, of all other metals, is that ſuſceptible of the greateſt degree of hardneſs, when well tempered; whence its great uſe in the making of tools and inſtruments of all kinds. See TEMPERING.

The true method of making *ſteel* has been greatly concealed, and the public long abuſed by counterfeit ones.—The following method we have from Agricola; and is affirmed by Kircher to be that practiſed in the iſland of Ilva; a place famous in all ages for the manufacture of good *ſteel*, from the time of the Romans to ours.

Heat a quantity of iron red hot, cut it into ſmall pieces, mix it with a ſort of ſtone that eaſily melts. This mixture put by little and little into a crucible, firſt filled with charcoal-duſt, and heated red hot; when melted off, three, four, or more pieces of iron are to be put in the middle of it; there boil them five or ſix hours with a ſtrong fire. The workman is to ſtir the melted matter often, that the pieces of iron may ſoak in the ſmaller particles of the melted matter; which particles conſume, and thin the groſſer ones of the iron pieces, and are, as it were, a ferment to them, and make them tender. One of the pieces is now taken out of the fire, and put under the great hammer, to be drawn out into bars, and wrought; and hot as it is, plunged into cold water.—Thus tempered, it is again worked upon the anvil; then breaking it, it is conſidered, whether in any part it looks like iron; or whether it be wholly condenſed, and turned into *ſteel*.

Damaſcus STEEL,	See the articles	DAMASCUS.
Engraving on STEEL,		ENGRAVING.
Faggot of STEEL,		FAGGOT.
Nealing of STEEL,		NEALING.

STEEL, in medicine. See the article CHALYBEAT.

STEEL *Wine*. See the article WINE.

STEELYARD, or STILYARD, in mechanics, a kind of balance called alſo *ſtatera Romana*, or the *Roman balance*; by means whereof, the gravity of different bodies are found by the uſe of one ſingle weight. See BALANCE.

Conſtruction of the STEELYARD.—It conſiſts of an iron beam A B (*Tab. Mech. fig.* 35.) wherein a point is aſſumed at pleaſure, as C, and on this a perpendicular raiſed C D. On the ſhorter arm A C, is hung a ſcale or baſon to receive the bodies weighed: the weight I is ſhifted this and that way on the beam, till it be a counter-balance to one, two, three, four, *&c.* pounds placed in the ſcale; and the points are noted wherein I weighs as one, two, three, four, *&c.* pounds. From this conſtruction of the *ſteelyard*, the manner of uſing it is apparent. But the inſtrument being very liable to deceit, is therefore not to be countenanced in commerce.

Spring STEELYARD, is a kind of portable balance, ſerving to weigh any matter, from about one to forty pounds.

It is compoſed of a braſs tube, into which goes a rod, and about that is wound a ſpring of tempered ſteel in a ſpiral form. On this rod are the diviſions of pounds and parts of pounds, which are made by ſucceſſively hanging on to a hook faſtened to the other end, one, two, three, four, *&c.* pounds.

Now the ſpring being faſtened by a ſcrew, to the bottom of the rod; the greater weight is hung on the hook, the more will the ſpring be contracted, and, conſequently, a greater part of the rod will come out of the tube; the proportions of which greater weights are indicated by the figures appearing againſt the extremity of the tube.

STEEPLE, an appendage generally raiſed on the weſtern end of a church to hold the bells. See CHURCH, and BELL.

Steeples are denominated from their form, either *ſpires*, or *towers*.—The firſt, are ſuch as aſcend continually diminiſhing either conically or pyramidically.

The latter are mere parallelepipeds, and are covered a-top, plat-form like.

In each kind, there is uſually a ſort of windows or apertures to let out the ſound; and ſo contrived, at the ſame time, as to drive it down.

Maſius, in his treatiſe of bells, treats likewiſe of *ſteeples.* The moſt remarkable in the world, is that at Piſa, which leans all on one ſide, and appears every moment ready to fall; yet is in no danger. This odd diſpoſition, he obſerves, is not owing to a ſhock of an earthquake, as is generally imagined; but was contrived ſo at firſt by the architect; as is evident from the cielings, windows, doors, *&c.* which are all in the level.

STEER, *Hog* STEER. See the article HOG.

STEERAGE, the act of ſteering. See STEERING.

The word is alſo uſed for a place in a ſhip, next below the quarter-deck, before the bulk-head of the great cabin; where the ſteers-man ſtands and lodges.—See *Tab. Ship.* fig. 2. n. 102.

STEERING, in navigation, the directing a veſſel from one place to another, by means of the helm and rudder. See HELM and RUDDER.

He is held the beſt *ſteers-man*, who uſes the leaſt motion in putting the helm over to and again, and who keeps the ſhip beſt from making yaws; that is, from running in and out. See YAWS.

There are three methods of *ſteering*, 1°. By any mark on the land, ſo as to keep the ſhip even by it.—2°. By the compaſs, which is by keeping the ſhip's head on ſuch a rhumb or point of the compaſs, as beſt leads to port.—3°. To ſteer as one is bidden or conned; which, in a great ſhip, is the duty of him that is taking his turn at the helm. See COND. — For the theory and effect of *ſteering*; ſee SAILING, COURSE, *&c.*

STEGANOGRAPHY, ΣΤΕΓΑΝΟΓΡΑΦΙΑ, the art of ſecret writing, or of writing in cyphers; known only to the perſons correſponding. See CIPHER.

One Æneas Tactitus, two thouſand years ago, as we are told by Polybius, had invented twenty different manners of writing, ſo as no body, but thoſe let into the ſecret, could underſtand any thing of the matter.

But now-a-days, hardly any thing can be written by this art, but what may be decyphered, and the meaning diſcovered. And to this art of decyphering, that excellent mathematician, Dr. Wallis, hath contributed much. See DECIPHERING.

STEGNOSIS, ΣΤΕΓΝΟΣΙΣ, an obſtruction of any natural diſcharge, eſpecially that by the pores. See PERSPIRATION.

STEGNOTICKS*, ΣΤΕΓΝΟΤΙΚΑ, in medicine, remedies proper to cloſe, and ſtop the orifices of the veſſels, or emunctories, when relaxed, ſtretched, lacerated, *&c.* See STYPTICK and ASTRINGENT.

* The word is formed from the Greek ϛεγω, *impedio, conſtipo*, I hinder, cloſe.

Such are pomegranate leaves, red roſes, plantain leaves, tormentil roots, *&c.*—*Stegnoticks* are proper in the hæmorrhoids, and other fluxes of blood.

STELLA, } See the articles { PSEUDO *ſtella.*
STELLAR, } See the articles { INTER *ſtellar.*

STELLATE *plants*, ſuch as have their leaves growing on the ſtalks, at certain diſtances, in the form of a ſtar with beams; or, ſuch flowers as are ſtar-like, or full of eyes reſembling ſtars, in the thrum and pendants. See PLANT.

Mr. Ray makes this the tenth genus of Engliſh plants; of which kind is croſs-wort, mollugo, wild madder, aſperula, or woodruff, gallium or ladies bed-ſtraw, aparine or cleavers, rubia tinctorum or dyers madder.—To which he adds, as a-kin to this genus, the naſturtium Indicum, Indian creſſe, or yellow lark-ſpur.

STELLIONATE* STELLIONATUS, in the civil law, a kind of crime committed by a fraudulent bargain, where one of the parties ſells a thing for what it is not.

* Cujas ſays the word comes from *ſtellio*, a very ſubtile kind of lizzard.---We find mention hereof in the *code*, leg. ix. tit. 34.

As, if I ſell an eſtate for my own, which belongs to another; or convey a thing as free and clear, which is already engaged to another; or put off copper for gold, *&c.*

The Romans frequently uſed *ſtellionatus* to expreſs all kinds of crimes that had no proper names.

STEM, in botany, that part of a plant ariſing out of the root, and which ſuſtains the leaves, flowers and fruits. See PLANT.

In trees, the *ſtem* is called the *trunk*, or *ſtock*; in Latin *caudex* and *truncus*. See STOCK, *&c.*

In herbs, it is ordinarily called the *ſtalk*; by the Latins, *caulis* and *ſcapus*, when ſtreight like a column. See STALK.

When ſlender, and creeping on the ground, as that of nummulary, ſome authors call it *viticulus.*

In the ſeveral kinds of corn and plants of that kind, it is more properly called *culmus.* See CULMUS.

The *ſtem* of the plant, according to Dr. Grew, is no more than the cutis or ſkin which at firſt covers the two lobes, and the plume of the ſeed, and which is further dilated as the plant grows. See PLUME, SEED, *&c.*

STEM *of a ſhip*, is that main piece of timber which comes bending from the keel below, where it is *ſcarfed* as they call it, that is pieced in; and riſes compaſſing right before the fore-caſtle.

This *ſtem* it is, which guides the rake of the ſhip; and all the butt-ends of the planks forwards, are fixed into it.

This in the ſection of a firſt rate ſhip, is called the *main ſtem.*—See *Tab. Ship.* fig. 1. lit. b. fig. 2. n. 1.

STENCH. See the article STINK.

STENTOROPHONIC *tube*, a ſpeaking trumpet; thus called from *ſtentor* (a perſon mentioned in the fifth book of the Iliad, who could call louder than fifty men) and φωνη, *voice.*

The *ſtentorophonic* horn of Alexander the Great is famous; with this he could give orders to his army at the diſtance of 100 ſtadia; which is above twelve Engliſh miles. See SPEAKING *trumpet.*

STEP. See the articles PACE, STAIR, *&c.*

STEP *and Leap*, in the manage, one of the ſeven airs or artificial motions of a horſe; conſiſting, as it were, of three airs; *viz.* the pace or ſtep which is terra a terra; the raiſing, which is a curvet; and the whole finiſhed with a ſault or *leap*. See AIR and SALTS.

The *ſtep*, properly, puts a horſe on the hand, and gives him a riſe to leap; like one that runs before he leaps, that he may go the higher, or the further.

For leaps of all kinds, the rider is not to give any aids or helps with his legs; only to hold the horſe well up with the bridle-hand when he riſes before, that he may riſe the higher behind: when he begins to riſe behind, he is to put the bridle-hand a little forwards to hold him before, and ſtay him there on the hand, as if he hung in the air; timing the motion of the bridle-hand ſo, as to take him like a ball on the bound, which is the great ſecret in leaping.

STEPHENS's *water*. See the article WATER.

STERCORARIANS*, or STERCORANISTÆ, a name which thoſe of the Romiſh church anciently gave to ſuch as held that the hoſt was liable to digeſtion, and all its conſequences, like other food. See HOST.

* The word is formed from the Latin, *ſtercus*, dung.

Card. Humbert in his anſwer to Nicetas Pectoratus treats him as a *ſtercoraniſt*, merely for holding, that the euchariſt breaks the faſt; which opinion he imagined led directly into *ſtercoraniſm.*

STEREOBATA*, or STEREOBATES, in the ancient architecture, the baſis or foundation, whereon, a column wall or other piece of building is raiſed. See BASE.

* The word is formed from the Greek ϛερεοβατες, *ſolid prop.*

This anſwers pretty well to the continued ſocle or baſement of the moderns. See SOCLE.

Some confound it with the ancient *ſtylobata*, or pedeſtal; but in effect, the *ſtereobata* is that to the ſtylobata which the ſtylobata is to the ſpira or baſe of the column. See PEDESTAL.

STEREOGRAPHIC *projection of the ſphere*, is that wherein the eye is ſuppoſed to be placed in the ſurface of the ſphere. See PROJECTION *of the ſphere.*

Stereographic projection is, the projection of the circles of the ſphere on the plane of ſome one great circle; the eye being ſuppoſed placed in the pole of that circle. See CIRCLE, SPHERE and PERSPECTIVE.

The method and practice of this projection, in all the principal caſes, *viz.* on the planes of the meridian, equinoctial and horizon, is as follows:

STEREOGRAPHIC *projection on the plane of the meridian.*—Let ZQNE (*Tab. Perſpect.* fig. 22.) be the meridian, Z and N the poles, as alſo the zenith and nadir; E Q the equinoctial and horizon; Z N the equinoctial colure, and prime vertical circle: Z 15 N, Z 30 N, Z 45 N, *&c.* are hour-circles or meridians, and alſo azimuths, becauſe the pole is in the zenith. To deſcribe theſe circles, find the points, 15, 30, 45, 60, *&c.* in the equinoctial, by ſetting the half-tangent of their diſtance from ♈; and then their centers are found by ſetting their co-ſecants, both ways, from their points of interſection with the equator: ♋, ♋, and ♑, ♑, are the northern and ſouthern tropics, which are deſcribed by ſetting the half tangent of 23 degrees 30 minutes from ♈ each way; then the tangent of its complement, *viz.* 66 degrees 30 minutes, each way from thence on the colure produced, gives their centres. By this method, all parallels of declinations may be drawn.—Or you might have ſet the co-ſecant of the parallel from the centre of the primitive, which would alſo have found the ſame point for the centre of the parallel, whoſe radius is equal to the tangent of its diſtance from its pole.

The parallels in this projection, are alſo almacanters, or parallels of altitude; ♋, ♑ is the ecliptic, which muſt be divided from the diviſion on the ſcale of half tangents; but denominated according to the ſigns of the zodiac, reckoning 30 degrees to each ſign.

STEREOGRAPHIC *projection on the plane of the equinoctial.*—

Let S C (fig. 23.) be the meridian, and ſolſtitial colure; E N the equinoctial colure, and hour-circle of 6; P the north pole; ♋ ♋, the northern tropic; E ♋ N the northern half of the ecliptic (whoſe centre is found by ſetting off the ſecant of 23 degrees 30 minutes from ♋) and its pole is at *a* the interſection of the polar circle and meridian, being the place through which all circles of longitude muſt paſs; and E Z N the horizon of London, which is deſcribed thus: ſet the half tangent of the co-latitude, from P to Z; then the tangent of the ſame, ſet from P to O, or its ſecant from Z to O, gives its centre; and its pole will be at *h* 38 degrees 30 minutes, (in the half tangents) diſtant from F, where *h* is at the zenith.

To draw any other circles in this projection; 1. For circles of longitude, which muſt all paſs through *a*, and the ſeveral degrees of the ecliptic; ſet the tangent of 66 degrees, 30 minutes, from *a* downwards, on the meridian produced; which will find a point, through which a perpendicular, drawn to the meridian, ſhall contain in it the centers of all the circles of longitude, whoſe diſtances ſet off to the radius P *x*, ſhall be the tangents of the degrees of their diſtances from the meridian S P C (which is that belonging to 180 degrees.)—2. All parallels of declination are drawn by ſetting the half tangents of their diſtances from P.—3. All azimuths or vertical circles muſt paſs through *h* at the zenith: ſince, therefore, the zenith is 38 degrees 30 minutes diſtant from P, ſet the co-ſecant of that (or the ſecant of 51 degrees 30 minutes) from *h* on the meridian extended below, and that will find the point *x*, the centre of the azimuth of eaſt and weſt, *viz.* E *h* N; and the centres of all the reſt are in a line, that is perpendicular to the meridian, and drawn through *x*.—4. Circles of altitude or almacanters, are leſſer circles, whoſe poles are not in the plane of the projection; thus the circle O *e*, is a parallel of altitude 50 degrees above the horizon.—5. All hour-circles are ſtrait lines from the center to the limb.

Stereographic *projection on the plane of the horizon.*—First draw a circle repreſenting the horizon, and quarter it with two diameters; then will z be the zenith of the place, 12 z 12 the meridian; 6 z 6 the prime vertical, or azimuth of eaſt and weſt; (fig. 24.) make z P=half tangent of 38° 30′. (or tangent of 19° 15′) P ſhall be the pole of the world. Make z E=half tangent of 51° 30′ (or tangent of 25° 45′)
and E *o*=ſecant
z *o*=tangent } of 38 degrees 30 minutes; then
ſhall *o* be the center of the equinoctial 6 Æ 6.

In this projection, almacanters are all parallel to the primitive circle: and azimuths are all right lines paſſing through z the centre of the primitive, to the equal diviſions in the limb. Parallels of declinations are all leſſer circles, and parallel to the equinoctial, and their interſections with the meridian are found, by ſetting the half-tangent of their diſtance from the zenith, ſouthward or northward, or both ways from z.—Their centres are found, by biſſecting the diſtance between thoſe two points; for the middle will be the center of the parallel. Thus z ♋ = half tangent of 20° 00′ =
diſtance of the tropic of ♋ from the zenith - - - - - - - - -
And z ♑ = half-tangent of 75° = diſtance of the tropic of ♑ from the zenith - - - - - - - - } to the ſouthward, or downward from z,
and the interſection again with the north of the meridian, is at
105° 30′
152° 30′ } for { ♑ ♋ } to the northward, or upward from z.

For the hour-circles make z *c* = tangent of 51° 30′, or P *c* = ſecant of 51° 30′, draw G C T perpendicular to the produced meridian: then, if from *c* with the radius z *c*, you ſet off the tangents of 15° 30° 45°, *&c.* both ways, you will have the centres of the ſeveral hour-circles, 7 and 5, 8, 4, *&c.*

Note, in all *ſtereographic* projections, all diameters are meaſured on the ſcale of half-tangents; and this is the ground of all dialling, or the true projection of the hour-circles of the ſphere on any given plane. See Sphericks, Dialling, *&c.*

STEREOGRAPHY*, the art of drawing the forms or figures of the ſolids upon a plane. See Solid.

* The word is formed from the Greek ςερεος, ſolid, and γραφω, I deſcribe.

STEREOMETRY*, ΣΤΕΡΕΟΜΕΤΡΙΑ, that part of geometry, which teaches how to meaſure ſolid bodies, *i. e.* to find the ſolidity, or ſolid content of bodies; as globes, cylinders, cubes, veſſels, ſhips, *&c.* See Solid and Solidity.

* The word is formed of the Greek ςερεος, ſolid; and μετρον, meaſure.

The methods hereof, ſee under the reſpective bodies, as Globe, Sphere, Cylinder, *&c.* See alſo Gauging.

STEREOTOMY*, the art or act of cutting ſolids, or making ſections thereof; as walls and other members in the profiles of architecture. See Section.

* The word is formed from ςερεος, and τομη, ſection.

STERILITY*, the quality of a thing that is barren; in oppoſition to *fecundity*. See Fecundity.

* The word is formed from the Latin *ſterilitas*, of *ſterilis*, barren.

Sterility was held a grievous affliction by the wives of the ancient patriarchs.—Nature has annexed *ſterility* to all monſtrous productions, that the creation might not degenerate. Hence the *ſterility* of mules, *&c.* See Monster, Mule, *&c.*

Women frequently become *ſterile* after a miſcarriage or a difficult labour, by reaſon the uterus or ſome other of the genital parts are injured thereby. See Abortion, *&c.*

The *ſterility* of mercury, ſay the alchymiſts, reſembles that of women who are too cold and moiſt; and who, by being purged and heated, would be cured of their *ſterility*, as mercury is when purged according to the rules of art.

STERLING, a term frequent in the Engliſh commerce. A *pound*, *ſhilling*, or *penny ſterling*, ſignifies as much as a pound, ſhilling or penny of lawful money of England, as ſettled by public authority. See Pound, Shilling, *&c.*—Antiquaries and critics are greatly divided, as to the origin of the word *ſterling*. Buchanan ſetches it from the caſtle of Striveling or Sterling in Scotland, where a ſmall coin was anciently ſtruck, that in time, according to him, came to give name to all the reſt.—Camden derives the word from *eaſterling* or *eſterling*; obſerving, that in the reign of King Richard I. money coined in the eaſt parts of Germany, began to be of eſpecial requeſt in England, by reaſon of the purity thereof, and was called *eaſterling money*, as all the inhabitants of thoſe parts were called *Eaſterlings*; ſome of whom, ſkilled in coinage, were ſoon after ſent for over to perfect the Engliſh money, which was thenceforwards denominated from them, *ſterling*, for *eaſterling*, or *eſterling*: not, ſays Camden, from Striveling in Scotland, nor from *ſtella*, a ſtar which ſome dream to have been coined thereon; for in old deeds, the Engliſh ſpecies are always called *nummi eaſterlingi*, which implied as much as good and lawful money, *&c.*—Somner, again, derives the word from the Saxon, *ſteore*, a rule or ſtandard; intimating, that this, as to weight and fineneſs, was to be the common ſtandard of all current money.

In Stow, and ſome other of our ancient writers, *ſterling*, or eaſterling is alſo uſed for a certain coin, amounting nearly to our ſilver-penny: and on ſome occaſions we find the ſame word *ſterling* uſed in the general for a piece of money; it being obſervable, that, for a good while together, there was no other coin but pennies, with which *ſterlings* or eaſterlings were become ſynonymous: much as among the ancients, the words *denarius* and *nummus* were uſed. See Penny, Money, Coin, *&c.*

STERN *of a ſhip*, uſually denotes all the hindermoſt part of her; but properly, is only the outmoſt part abaft. See Ship, Abaft, *&c.*

Stern, among hunters, is the tail of a wolf, or a grey-hound. See Tail.

Stern *Chaſe*. See the article Chase.

STERNOHYOIDEUS, in anatomy, a pair of muſcles ariſing from the upper and internal part of the bone of the ſternum, and part of the clavicle, and adjoining part of the firſt rib, with a broad origin; and running from the aſpera arteria, glandulæ thyroideæ, and cartilago ſcutiformis, terminates in the baſe of the os hyoides. It draws the bone ſtraight downward.—See *Tab. Anat.* (Myol.) fig. 2. *n.* 7, 8.

STERNOTHYROIDEUS, in anatomy, a pair of muſcles of the larynx; ariſing in the ſternum, or breaſt-bone, and terminating in the cartilago thyroides. They ſerve to draw down that cartilage.

STERNUM, ΣΤΕΡΝΟΝ, the breaſt-bone, a cartilaginous ſort of bone which makes the forepart of the breaſt, and into which the ribs are fitted.—See *Tab. Anat.* (Oſteol.) fig. 3. n. 11. See alſo the article Bone.

In adults, it conſiſts of one ſingle piece; but in infants, of ſeveral, according to the diverſity of age. Kerkringius tells us, he has never ſeen more than ſix. They continue cartilaginous until ſeven years of age; and are not very ſolid afterwards, but ſpongeous. See Cartilage.

At the lower extremity of the *ſternum*, is a cartilage, called *xiphoides* or *enſiformis*, becauſe reſembling the point of a ſword. See Xiphoides, *&c.*

The uſe of the *ſternum* is to defend the heart, and to receive the extremities of the true ribs. See Rib.

STERNUTATION. See the article Sneezing.

STERNUTATIVE, or Sternutatory, a medicine proper to produce ſneezing. See Sneezing.

Sternutatives, called alſo *ptarmicks*, are of two kinds, *gentle* and *violent*. Of the firſt kind are betony, ſage, marjoram, tobacco, and the whole faſhionable tribe of ſnuffs. See Snuff.

Of the latter kind are euphorbium, white hellebore, pellitory, *&c.* See Ptarmics.

Sternutatives operate by their ſharp, pungent parts vellicating the inner membrane of the noſe, which is exceedingly ſenſible, and occaſioning the ſerous matter contained in the glands of the noſe, and in ſeveral ſinus's ſituate in the baſe of the cranium, and the os frontis, to be expelled. See Nose, Pituita, *&c.*

STEW, a ſmall kind of fiſh-pond, the peculiar office whereof is, to maintain fiſh, and keep them in readineſs, for the daily uſes of a family, *&c.* See Fish-pond.

The fiſh bred in the large ponds, are drawn and put in here. For two large ponds of three or four acres a-piece, it is adviſeable to have four *ſtews*, each two rods wide, and three long. The *ſtews* are uſually in gardens, or at leaſt near the houſe, to be more handy, and the better looked to.

The method of making them, is to carry the bottom in a continual decline from one end, with a mouth to favour the drawing with a net. See Pond.

Stews*, or **Stues**, were alſo places anciently permitted in England, to women of profeſſed incontinency, for the proffer of their bodies to all comers.—Theſe were under particular rules, and laws of diſcipline, appointed by the lord of the manor.

* The word is probably borrowed from the French, *eſtuves*, hot baths, in regard wantons are wont to prepare themſelves for venereal acts, by bathing.

STEWARD, or **Seneschal**, an officer, whereof there are various kinds; thus called from the Saxon, *ſteda*, ſtead, place, or room, and *ward*, keeper, *q. d.* a deputy, or perſon appointed in the place of another. See Seneschal.

Lord High **Steward** *of England*, is the firſt and higheſt officer of the crown; as having the power of what we call a *vice-roy*, the Danes, *&c. ſtadtholder*, and the Swedes, *reichs droſſet*, q. d. *vice rex.* Chamberlayne. See Lord.

Common lawyers call him *magnus Angliæ ſeneſcallus.* His office, as expreſſed in an ancient record, is to ſuperviſe and regulate the whole kingdom, both in time of peace and war, immediately under the king and after him; an authority ſo very great, that it was not judged ſafe, to truſt it any longer in the hands of any ſubject.

The office was hereditary and permanent in the family of the dukes of Lancaſter, till the time of Henry IV. ſince whom it has only been made *pro hac vice*, occaſionally: as to officiate at a coronation; at the arraignment and trial of ſome nobleman for treaſon, or other great crime.—During his ſtewardſhip, he bears a white ſtaff in his hand; and the trial, *&c.* ended, he breaks his ſtaff, and with it, his commiſſion expires.

Lord **Steward** *of the houſhold*, is an officer to whom the ſtate of the king's houſe is committed; to be ruled and guided at his diſcretion. See Lord and Houshold.

He has authority over all officers and ſervants of the king's houſe, except thoſe of the chapel, chamber, and ſtable; which are under the lord chamberlain, maſter of the horſe, and dean of the chapel. See Chamberlain, *&c.*

Steward *of a ſhip*, is he who receives all the victuals from the purſer; and is to ſee it well ſtowed in the hold: all things of that nature belonging to the ſhip's uſe, are in his cuſtody: he looks after the bread, and diſtributes out the ſeveral meſſes of victuals in the ſhip.

He hath an apartment for himſelf in the hold, which is called the *ſteward's room.*—See *Tab. Ship.* fig. 2. lit. Y.

STIGMATA, ΣΤΙΓΜΑΤΑ, in natural hiſtory, denotes points, or ſpecks uſually ſeen on the ſides of the bellies of inſects; particularly the ſphondylium, where they are very apparent. See Insect.

They are nothing but the extremities of certain veſſels terminating in the ſides at each nodus or inciſure, and ſerving them for lungs.

Stigmata, in antiquity, certain marks impreſſed on the left ſhoulder of the ſoldiers, when liſted. See Mark.

Stigmata, were alſo a kind of notes, or abbreviations; conſiſting only of points, diſpoſed various ways, as in triangles, ſquares, croſſes, *&c.* See Abbreviation and Note.

Stigmata, is alſo a term introduced by the Franciſcans, to expreſs the marks, or prints of our Saviour's wounds, impreſſed by him on the body of their ſeraphic father, St. Francis.

It was one morning, about the feaſt of the Exaltation, in the year 1224, that St. Francis, being at prayers on mount Alvernus, whither he had retired to paſs the Michaelmas Lent; ſaw a ſeraph with ſix burning wings, in other reſpects like a man; with his hands and his feet ſtretched upon a croſs. With two of the wings he covered his body, two were raiſed over his head, and with two he flew ſwiftly down. Five rays proceeded from the five wounds of the perſon crucified, and were directed to the correſpondent five parts of the body of the ſaint.

Upon the viſion's diſappeared, he ſaw the marks of the nails, *&c.* on his own hands and feet; the ſame as he had ſeen them in the image of the crucifix. His hands and feet were found pierced with nails in the middle; the heads of the nails were plainly ſeen within the fleſh on one ſide, and the points clenched on the other. On his right ſide appeared a red ſcar, as from the wound of a ſpear, which frequently run with blood, and ſtained his gown, *&c.*

The good man, we are told, took a world of pains to hide the *ſtigmata*; but thoſe of his hands and feet were ſeen in his life-time, maugre all his endeavours, by ſeveral of the brotherhood, who affirmed it upon oath, and by ſome cardinals, ſays St. Bonaventure, who atteſted the miracle both by word and writing, and expreſſed it in the hymns, anthems, *&c.* compoſed in honour of St. Francis. After his death, they were ſeen by fifty of his religious, as well as by St. Clara and her nuns, and an infinite number of ſeculars; many of whom felt them with their hands, to be the more certain.

A ſolemn feaſt was hereupon appointed to be annually celebrated, in memory of the miracle, called *the feaſt of the* ſtigmata *of St. Francis*; and a peculiar maſs or office compoſed for the ſame.

An archi-confraternity was erected on the ſame occaſion, by Frid. Pizzi, a Roman chirurgeon, in the year 1594.

STIBIUM, ΣΤΙΒΙ, or ΣΤΙΜΜΙ, an ancient name for antimony, now ſeldom uſed. See Antimony.

STILE and **Stilus.** See the article Style.

STILES, in carpentry, denote the upright pieces which go from the bottom to the top in any wainſcot, or the like.

STILLATITIOUS *oils*, are ſuch as are procured by diſtillation,—in oppoſition to thoſe got by infuſion, expreſſion, *&c.* See Oil and Distillation.

STILLYARD, **Stilyard**, or **Steelyard**, in commerce.—*The company of the* Stillyard was a community, or corporation of foreign merchants, eſtabliſhed at London; thus called, from the place where they had their reſidence, called the *Stillyard*, near the bridge, which was aſſigned them by act of parliament; and which, in ſome records, is called *Guildhalda Teutonicorum*; being, as ſome write, a broad place, or yard, where much ſteel had uſed to be ſold.

This company was created in the year 1215, under Hen. III. in favour of the free cities of Germany, who had been aſſiſtant to him in his wars againſt France. See Commerce.

It had rendered itſelf miſtreſs of all the Engliſh manufactories, particularly thoſe of cloth; which it was allowed not only to ſell throughout the kingdom, but alſo to tranſport abroad. See Woolen.

The prejudice theſe privileges did, by which the company frequently abuſed the nation, occaſioned its being broke, by ſentence of the judges, under Edward IV. But it redeemed its rights, and laſted to the year 1552, when it was ſuppreſſed by Edward VI. See Hanse.

STIMULATING, **Stimulans**, a property in angular or ſharp bodies, whereby they vellicate, and cauſe vibrations and inflections of the fibres of the nerves, and a greater derivation of nervous fluid into the part affected.

Stimulants produce pain, heat, redneſs, *&c.*—They may be reduced to violent penetrating depilatories, gentle ſinapiſms, veſicatories, and cauſtics. See Sinapism, Vesicatory, *&c.*

STING, *aculeus*, an apparatus in the body of certain inſects, in form of a little ſpear; ſerving them as a weapon of offence. See Incest, Arms, *&c.*

The *ſting* of a bee, or waſp, is a curious piece of mechaniſm: it conſiſts of a hollow tube, at the root whereof is a bag full of ſharp, penetrating juice, which, in ſtinging, is injected into the fleſh through the tube.

Within the tube, Mr. Derham has obſerved, there lie two ſmall ſharp-bearded ſpears: in the *ſting* of a waſp, he told eight beards on the ſide of each ſpear, ſomewhat like the beards of fiſh-hooks. See *Tab. Nat. Hiſt. fig.* 29 & 30.

One of theſe ſpears in the *ſting*, or ſheath, lies with its point a little before the other; to be ready, as ſhould ſeem, to be firſt darted into the fleſh: which once fixed, by means of its foremoſt beard, the other then ſtrikes in too; and ſo they alternately pierce deeper and deeper, their beards taking more and more hold in the fleſh: after which, the ſheath or *ſting* follows, to convey the poiſon into the wound; which, that it may pierce the better, is drawn into a point, with a ſmall ſlit below that point, for the two ſpears to come out at.

By means of theſe beards it is, that the animal is forced to leave its *ſting* behind it, when diſturbed, before it can have time to withdraw the ſpears into their ſcabbard.

STINK, or **Stench**, a diſagreeable ſmell exhaling from a corrupted, or other body; and which is prejudicial to the noſe and brain. See Smell.

A *ſtinking* breath is uſually the reſult either of diſeaſed lungs, or of ſcorbutic gums, *&c.* See Foetor.

A *ſtinking* noſe, *fœtor naris*, is the reſult of a deep ulcer within the noſe, whence ariſe fœtid ſcabs, *&c.*—Its cauſe, according to Galen, is a ſharp, putrid humour falling from the brain, on the proceſſus mamillares.—This is reckoned by the civilians, one of the legal cauſes of annulling marriage.

STIPEND, **Stipendium**, among the Romans, ſignified the ſame with *tribute*; and hence *ſtipendiarii* were the ſame with *tributarii.* See Tribute.

STIPITE, *Nativi de* **Stipite.** See Nativi.

STIPULATION, in the civil law, the act of *ſtipulating*; that is, of treating, and concluding terms, and conditions to be inſerted in a contract. See Treaty and Contract.

Stipulations were anciently performed at Rome, with abundance of ceremonies; the firſt whereof was, that one party ſhould interrogate, and the other anſwer, to give his conſent and oblige himſelf.

By the ancient Roman law, no body could *ſtipulate*, but for himſelf; but as the tabelliones were public ſervants, they were allowed to *ſtipulate* for their maſters; and the notaries ſucceeding the tabelliones have inherited the ſame privilege.—The *ſtipulation* had its origin in the *lex aquilia*, and another law of the emperor Arcadius.

The word is formed from the Latin, *ſtipula*, a ſtraw; becauſe, in making a ſale, a ſtraw was given the purchaſer, in ſign of a real delivery. Which cuſtom is ſtill retained in ſome parts of France, particularly at Verdun. The cuſtom always has been on this occaſion, for the two parties to break a ſtraw between them, and each take his moiety; which they afterwards joined again, to recognize their promiſe.

STIRROP, or STIRRUP, a reſt or ſupport for the horſeman's foot; ſerving to keep him firm in his ſeat, and enable him to mount. See SADDLE.

The great art of a cavalier in the ancient tournaments, was to make his antagoniſt loſe his *ſtirrop*, that is, ſlip the foot out of it.

For combating, it is a rule to have the right foot *ſtirrop* ſomewhat ſhorter than the other.

Stirrops are allowed a modern invention: Menage obſerves, that St. Jerom is the firſt author who mentions them.—Matthiolus relates, that the Turks have a knack of poiſoning their *ſtirrops*, with ſo ſubtile and penetrating a poiſon, that it makes its way through the boots, and kills the rider. F. le Comte tells us, that the Tartars ride croſs-legged, and with their *ſtirrops* exceedingly ſhort.

STOCK, in gardening, *&c.* the ſtem or trunk of a tree. See STEM.

For STOCKS *of fruit trees*; the beſt to graft on, are thoſe raiſed of kernels of wildings, and crabs of the moſt thriving trees. Though the fruit always take after the graft; yet the *ſtock* has ſome influence. A wild *ſtock* is always found to enliven a dull apple. See ENGRAFTING.

To have a quantity of *ſtocks* to graft on; old trees are to be cut down within two inches of the ground, which will cauſe a multitude of ſuckers to riſe from the roots. When theſe are riſen half a yard, they are to be covered up with good earth a foot thick, and as ſoon as they have put forth roots, in winter, are to be conveyed into the nurſery, where, in a year or two, they will be ready to graft. Cherry *ſtocks*, plumb *ſtocks*, and pear *ſtocks*, may be thus raiſed from ſuckers, as well as from ſtones or ſeeds; but thoſe raiſed this latter way are preferred. See FRUIT-*tree*, &c.

Brokers STOCK, } See the articles { BROKER.
Capital STOCK, } See the articles { CAPITAL.
Pen STOCK, } See the articles { PEN *ſtock*.

STOCKFISH, or STOCKFISCH, in commerce, a kind of dried, ſalted fiſh; of a greyiſh aſh-colour, only the belly ſomewhat whiter. See FISH.

The commerce of *ſtockfiſh* is very conſiderable in Holland, both from the great conſumption thereof in the country, and from their victualling their veſſels therewith. It is ſaid to take its name from being as hard as a *ſtock*, or from its needing to be beaten with a ſtick, to fit it for eating. See FISHERY.

STOCKING, that part of the cloathing of the leg and foot, which immediately covers their nudity, and ſkreens them from the rigor of the cold. See SHOE.

Anciently, the only *ſtockings* in uſe, were made of cloth, or milled ſtuffs ſewed together; but ſince the invention of knitting and weaving *ſtockings* of ſilk, wool, cotton, thread, *&c.* the uſe of cloth *ſtockings* is quite out of doors.

The modern *ſtockings*, whether wove or knit, are a kind of plexus's formed of an infinite number of little knots, called *ſtitches*, *loops*, or *maſhes*, intermingled in one another.

Knit STOCKINGS are wrought with needles made of poliſhed iron, or braſs wire, which interweave the threads, and form the maſhes the *ſtocking* conſiſts of.

This operation is called *knitting*; the invention whereof it were difficult to fix preciſely; though it is commonly attributed to the Scots, on this ground, that the firſt works of this kind came from thence.—It is added, that it was on this account, that the company of *ſtocking* knitters eſtabliſhed at Paris 1527, took for their patron St. Fiacre; who is ſaid to have been the ſon of a king of Scotland.

Woven STOCKINGS are ordinarily very fine: they are manufactured on a frame or machine made of poliſhed iron; the ſtructure whereof is exceedingly ingenious, but withal exceedingly complex, ſo that it were very difficult to deſcribe it well, by reaſon of the diverſity and number of its parts; nor is it even conceived, without a deal of difficulty, when working before the face.

The Engliſh and French have greatly conteſted the honour of the invention of the *ſtocking loom*; but the matter of fact, waving all national prejudices, ſeems to be this, that it was a Frenchman firſt invented this uſeful and ſurprizing machine; who, finding ſome difficulties in procuring an excluſive privilege, which he required, to ſettle himſelf at Paris, went over into England, where his machine was admired, and the workman rewarded according to his merit.

The invention thus imparted to the Engliſh, they became ſo jealous hereof, that for a long time it was forbid, under pain of death, to carry any of the machines out of the iſland, or communicate a model thereof to foreigners.—But, as it was a Frenchman firſt inriched our nation with it, ſo a Frenchman firſt carried it abroad; and by an extraordinary effort of memory and imagination, made a loom at Paris, on the idea he had formed thereof, in a voyage he made to England. This loom, firſt ſet up in the year 1656, has ſerved for the model of all thoſe ſince made in France, Holland, *&c.*

Fulling of STOCKINGS. See the article FULLING.

STOCKS, in ſhip carpentry, a frame of timber and great poſts made a-ſhore, to build pinnaces, ketches, boats, and ſuch ſmall craft, and ſometimes ſmall frigates upon. See SHIP and VESSEL.

Hence we ſay, *a ſhip is on the ſtocks*, when ſhe is building.

STOICAL *fate*. See the article FATE.

STOICISM, the doctrines and opinions of Zeno's followers, called *ſtoicks*. See STOICKS.

STOICKS, a ſect of ancient philoſophers, the followers of Zeno; thus called from the Greek, ϛοα, *portico*, in regard Zeno uſed to teach under a portico, or piazza. See PORTICO and PHILOSOPHY.

The author of this ſect, Zeno, was of Cittium, a town in Cyprus, inhabited by a colony of Phœnicians; whence he is ſuppoſed to have borrowed many of his dogmata from the Phœnician philoſophy, which many learned men maintain was, itſelf, borrowed from the Jewiſh: though it muſt be allowed, there appear as many things in the *ſtoick* philoſophy, borrowed from Plato's and Socrates's ſchool, as from that of Moſes.

Zeno making a trading voyage from Cittium to Athens, richly freighted with Tyrian purple, was ſhipwrecked not far from port; upon which, we are told, conſulting the oracle how he ſhould beſt ſpend the reſt of his life, he was anſwered, ει ζυγχρωτιζοιτο τοις νεκροις, *by becoming of the ſame colour with the dead:* upon which he applied himſelf to the ſtudy of the ancient philoſophers; and became a hearer of Crates the Cynic.—But Laertius tells us, he had too much natural modeſty to give into the Cynic impudence.

From Crates, he had recourſe to Xenocrates, then to Polemon; and at length began to think of inſtituting a new ſect.—To this purpoſe, a ϛοα, *portico*, called from the pictures of Polignotus therein, the *painted portico*, was pitched on. Here, uſing to walk and philoſophize; he was ſoon attended by a great number of diſciples, hence called Στοικοι, *Stoici.*

He became exceedingly reverenced at Athens, for the probity and ſeverity of his life and manners, and the conſiſtency thereof with his doctrine; inſomuch that the Athenians decreed him, when living, a golden crown, and uſed in dubious times to depoſite the keys of the city with him: and after his death, conſecrated an altar to him.

One of his chief followers was Cleanthes, who was ſucceeded by Chryſippus, and he by Diogenes Babylonius, Antipater, Panætius, and Poſſidonius among the Greeks; and by Cato, Varro, Cicero, Seneca, the emperor Antoninus, *&c.* among the Romans; and by Pantenus, and Clemens Alexandrinus, among the Chriſtians.

The *Stoicks* cultivated logics, phyſics, metaphyſics, *&c.* but chiefly ethics.—The principle of their dogmata of the former kinds, are as follows.

That there are certain καταλεψεις, *comprehenſions*, (which others call κοιναι εννοιαι, *common notices*, or *innate ideas*, or *principles*, and Cicero, *inchoatæ intelligentiæ*, beginnings of underſtanding) naturally found in the mind: that God is the ſeminal cauſe of the univerſe: that the world is an animal; which opinion the *Stoicks* maintained in common with the Platoniſts, by reaſon of God's inhabiting and informing every part thereof, in quality of an anima mundi. See ANIMA.—That nature is an artificial fire, tending to generation: and, that the world is to be deſtroyed at laſt by a conflagration. See CONFLAGRATION.

For the morality of the *Stoicks*, it was couched much in paradoxes: as, that a wiſe man is void of all paſſion or perturbation of mind: that pain is no real evil; but that a wiſe man is happy in the midſt of the ſevereſt torture: that a wiſe man is always the ſame, and always joyful: that none but a wiſe man is free; all others are ſlaves: that none but a wiſe man is rich: that none but a wiſe man ought to be eſteemed a king, magiſtrate, poet, or philoſopher: that all wiſe men are great: that all things are a wiſe man's, who is contented with himſelf: that wiſe men are the only friends, and the only lovers: that nothing ever happens to a wiſe man beyond expectation: that all virtues are inviolably connected together: that all good things are equal, and equally to be deſired; and that goodneſs admits of no increaſe or diminution.

Whether virtue might be loſt or no, was hotly diſputed among them? Chryſippus held it might, by drunkenneſs and atrabilis; Cleanthes, that it could not, by reaſon of the firmneſs of the καταλεψεις, *comprehenſions*.

They owned but one God; whom, however, they called by various names, as *Mind*, *Fate*, *Jupiter*, &c. by which they did not mean various things; but various powers and relations of the ſame things. Providence, they expreſſed under the name of *Fate*, which Chryſippus defines to be a natural ſeries or compoſition of things mutually following each other by an immutable nexus or tie, fixed from all eternity. Laſtly, they held, that the human ſoul ſurvived the body. See FATE, *&c.*

STOLE *, STOLA, a ſacerdotal ornament, wore by the Romiſh pariſh prieſts over the ſurplice, as a mark of ſuperiority in their reſpective churches.

* The word is Greek, ϛολη, ſignifying a long robe, or veſtment.

The *ſtole* is worn by other prieſts over the alb, at celebrating of maſs; in which caſe, it goes a-croſs the ſtomach: and by deacons over the left ſhoulder, ſcarf-wiſe.

The *ſtola* is a broad ſwath, or ſlip of cloth or ſtuff, hanging from the neck to the feet, with three croſſes thereon.—The biſhops anciently pretended, that the pariſh prieſts were never to appear before them, but in their *ſtoles*. In Flanders and Italy, they always preach in *ſtoles*. It is ſuppoſed to be a repreſentation of the borders of the long robe worn by the Jewiſh high prieſts.

The *ſtola* of the ancient Romans, *&c.* was very different from that now in uſe: the former was a kind of robe fitter for women than men; though it was held a robe of honour among all nations. Kings themſelves ſometimes uſed it, and ſometimes beſtowed it as a reward of virtue.

Groom of the STOLE, the eldeſt gentleman of his majeſty's bed-chamber; whoſe Office and honour it is, to preſent and put on his majeſty's firſt garment or ſhirt every morning; and to order the things in the chamber. See BED-*chamber*.

Order of the STOLE, an order of knights inſtituted by the kings of Arragon; though as to the particular author, or time of the inſtitution, we are in the dark. The firſt time we hear of it, is under Alphonſus V. who mounted the throne in 1416. Juſtiniani takes it to have been inſtituted about the year 1332.

Order of the golden STOLE, a military order at Venice; thus called from a golden *ſtole* which the knights wear over the left ſhoulder, reaching to the knee, both before and behind, a palm and a half broad. None are raiſed to this order but the patricians or noble Venetians. Juſtiniani obſerves, that the time of the inſtitution of this order is unknown.

STOMACH, ΣΤΟΜΑΧΟΣ, *ventriculus*, in anatomy, a hollow, membranous, organical part of an animal, deſtined to receive the food after deglutition, and convert it into chyle.—See *Tab. Anat.* (Splanch.) fig. 2. lit. d. d. h. See alſo FOOD, DIGESTION, CHYLE, *&c.*

Its form is longiſh, compared by ſome to a gourd, by others to a bag-pipe. It is ſituate in the epigaſtrium, declining a little further to the left than the right. Its upper part is connected to the diaphragm, the bottom to the cawl; the right ſide to the duodenum, and the left to the ſpleen.

It has two orifices, one at each end. The left orifice is properly called ϛομαχος, from ϛομα, mouth; and alſo καρδια: this is joined to the oeſophagus, of which it ſeems to be only a continuation.—By this orifice, the aliments enter the ſtomach, where being digeſted, they aſcend obliquely to the pylorus, or right orifice, which is united to the firſt of the inteſtines.—See *Tab. Anat.* (Splanch.) fig. 2. lit. 6. See alſo OESOPHAGUS, and PYLORUS.

The *ſtomach* conſiſts of four membranes or coats: the firſt and inmoſt is formed of ſhort fibres, which ſtand perpendicularly upon the fibres of the next coat, and are to be ſeen plainly towards the pylorus: when the *ſtomach* is diſtended with meat, theſe fibres become thick and ſhort. Whilſt they endeavour to reſtore themſelves by their natural elaſticity, they contract the cavity of the *ſtomach* for the attrition and expulſion of the aliments.—This coat is much larger than the reſt, being full of plaits and wrinkles, and chiefly about the pylorus: theſe plaits retard the chyle, that it runs not out of the *ſtomach* before it be ſufficiently digeſted.—In this coat, there are alſo a great number of ſmall glands which ſeparate a liquor, which beſmears all the cavity of the *ſtomach*, and helps the concoction of the aliments; for which reaſon this coat is called the *tunica glanduloſa*.—See *Tab. Anat.* (Splanch.) fig. 2. lit. i.

The ſecond is much finer and thinner; it is altogether nervous; is of an exquiſite ſenſe, and is called *nervoſa*.—See *Tab. Anat.* (Splanch.) fig. 2. lit. k.

The third is muſcular, being made of ſtreight and circular fibres: the ſtreight run upon the upper part of the *ſtomach*, between its ſuperior and inferior orifices; and the circular run obliquely from the upper part of the *ſtomach* to the bottom. Of theſe, the innermoſt deſcend towards the right ſide, and the outermoſt towards the left; ſo that by their action, both ends of the *ſtomach* are drawn towards its middle, and the whole is equally contracted: by their contraction and continual motion, the attrition and digeſtion of the aliments is in great meaſure performed.

The fourth tunic is common; it comes from the peritonæum.

The *ſtomach* ſends veins to the porta, and branches to the gaſtrepiploica, accompanied with others of the cœliac; all lying immediately under the fourth coat.

The eight pair of nerves gives two conſiderable branches to the *ſtomach*, which are ſpread much about the upper orifice; by which it is rendered very ſenſible: whence alſo proceeds the great ſympathy betwixt the *ſtomach*, head, and heart; on account whereof, Van Helmont thought, that the ſoul had its ſeat in the upper part of the *ſtomach*.

For the motion of the STOMACH; Dr. Pitt, in the *Philoſophical Tranſactions*, acquaints us, that in diſſecting a dog, he found the periſtaltic motion of the guts continued through the *ſtomach*; the pylorus, which is uſually found as high as the diaphragm, being, in every undulation, brought below the very bottom of the *ſtomach*; ſo that he could manifeſtly obſerve a conſtriction in the middle of the *ſtomach*, at every motion downwards, paſſing it in ſo as to be able to compreſs whatever was contained in its cavity. Theſe motions, he obſerves, were as regular as any he ever obſerved in the gutts; and adds, that he has ſince obſerved the ſame in three others; whence one may ſafely enough conclude it holds of all. See PERISTALTIC.

Hence, we eaſily ſee the reaſon of the quick diſtribution of the nouriſhment; the food being no ſooner opened by the drink and ſpittle, *&c.* than it has a free motion through the pylorus into the inteſtines, from this compreſſion in the middle of the *ſtomach*. See INTESTINES.

Ruminating animals have four *ſtomachs*; yet it is obſerved that ſome of theſe, which have four in Europe, have only two in Africa, probably by reaſon the herbs in Africa are more nouriſhing. See RUMINANT.

Birds that live ordinarily of ſeeds covered with a tough rind, have a kind of *ſtomach*, called the *crop*, or *gizzard*, conſiſting of four large muſcles without-ſide, and a hard callous membrane within.—Such as live on fleſh, as eagles, vultures, *&c.* have only one. See CARNIVOROUS, GRANIVOROUS, *&c.*

STOMACHIC, ΣΤΟΜΑΧΚΙΟΣ, a medicine that ſtrengthens the *ſtomach*; and promotes the office of digeſtion. See STOMACH, and DIGESTION.

Of this kind are wormwood, rhubarb, mint, maſtic, aloes, pepper, cinnamon, and aromatic bitters: good wine is alſo a *ſtomachic*.

STOMACHIC, in anatomy, is applied to the arteries, veins, *&c.* of the *ſtomach*; called alſo *gaſtric*. See GASTRIC.

The *ſtomachic* veins terminate in the trunk of the vena porta, and the ſplenic vein. See VEIN.—The *ſtomachic* arteries ariſe from the cœliac. See ARTERY.—The *ſtomachic* nerves come from the eighth pair. See NERVE.

STOMACHIC *coronary*, } See the articles { CORONARY.
STOMACHIC *water*, } { WATER.

STONE, in natural hiſtory, a hard, ſolid body, neither malleable, fuſible by fire, nor ſoluble in water; formed by ſucceſſion of time, in the body of the earth. See FOSSIL.

For the origin and formation of STONES, M. Tournefort, on his return from the eaſt, in the year 1702, propoſed to the royal academy, a new theory.

On a curious ſurvey of the famous labyrinth of Crete, he obſerved, that ſeveral people had engraven their names in the living rock, whereof its walls are formed; and, what was very extraordinary, the letters whereof they conſiſted, inſtead of being hollow, as they muſt have been at firſt (being all cut with knife-points) were prominent, and ſtood out from the ſurface of the rock, like ſo many baſſo-relievo's. See LABYRINTH.

This is a phænomenon no otherwiſe accountable for, than by ſuppoſing the cavities of the letters filled inſenſibly, with a matter iſſuing from out of the ſubſtance of the rock; and which even iſſued in greater abundance than was neceſſary for filling the cavity. Thus is the wound made by the knife healed up, much as the fracture of a broken bone is conſolidated by a callus, formed of the extravaſated nutritious juice, which riſes above the ſurface of the bone: and this reſemblance is the more juſt; as the matter of the letters was found whitiſh, and the rock itſelf greyiſh.

Something very like it is obſerved in the barks of trees, wherein letters have been cut with the knife; ſo that the poet had reaſon to ſay, that the characters grew as the trees themſelves grew: *creſcent illæ, creſcetis amores.*

M. Tournefort ſupports his opinion by ſimilar callus's apparently formed in ſeveral other *ſtones*, which had re-united after, by accident, they had been broken.

From theſe obſervations, it follows, that there are *ſtones* which grow in the quarries, and of conſequence that are fed; that the ſame juice which nouriſhes them, ſerves to rejoin their parts when broken; juſt as in the bones of animals, and the branches of trees, when kept up by bandages; and, in a word, that they vegetate. See VEGETATION.

There is, then, no room to doubt but that they are organized; or that they draw their nutritious juice from the earth. This juice muſt be firſt filtrated and prepared in their ſurface; which may be here eſteemed as a kind of bark; and hence it muſt be conveyed to all the other parts.

It is highly probable, the juice which filled the cavities of the letters, was brought thither from the bottom of its roots;

nor is there any more difficulty in conceiving this, than in comprehending how the ſap ſhould paſs from the roots of our largeſt oaks, to the very extremities of their higheſt branches.

It muſt be owned, the heart of theſe trees is exceedingly hard; and yet thoſe of Braſil, called *iron wood*, guaiacum, and ebony, are much harder. Coral is as hard in the ſea as out of it; and ſea muſhrooms, which every body allows to grow, are true *ſtones*, and ſo, like the common *ſtones*, are uſed in America to make lime of.

None, we believe, ever doubted that ſhells grow by means of a nutritious juice; and yet this juice is conveyed along the narrow canals of theſe exceſſively hard bodies, as well as through thoſe of plants, which are much leſs hard. See SHELL.

Some *ſtones*, then, muſt be allowed to vegetate and grow like plants: but this is not all; probably they are generated in the ſame manner; at leaſt there are abundance of *ſtones*, whoſe generation is inconceivable, without ſuppoſing they come from a kind of ſeeds, wherein the organical parts of the *ſtones* are wrapped up in little; as thoſe of the largeſt plants are in their grains.

The *ſtones*, called *cornu Ammonis*, *lapus Judaicus*, *aſtroites*, thoſe of Bologna, and Florence, the ſeveral kinds of pyrites, ſea muſhrooms, cryſtals of the rock, and an infinity of other *ſtones*, ſuppoſe their ſeveral ſeeds; as much as muſhrooms, truffles, and various kinds of moſſes, whoſe ſeeds were never yet diſcovered. See MUSHROOM, CRYSTAL, CORAL, &c.

How ſhould the cornu Ammonis, which is conſtantly in figure of a volute, be formed without a ſeed, containing that ſame ſtructure in little? who moulded it ſo artfully? and where are the moulds? Far from this, theſe kinds of *ſtones* are found in the earth, like common flints. Nor were either moulds, or any thing like them, ever diſcovered. See CORNU *Ammonis*.

M. Tournefort examines the ſeveral kinds of *ſtones* abovementioned, and finds them under the ſame neceſſity of ſeed. Again, that immenſe quantity of flints, wherewith the Crau of Arles is covered, is a ſtrong argument in behalf of this theory.

The country there, for twenty miles round, is full of roundiſh flints; which are ſtill found in equal abundance, to whatever depth you dig. M. Peireſc, who firſt propoſed the generation of *ſtones* by means of ſeeds (though he took the word *ſeed* in a very different ſenſe from M. Tournefort) firſt brought this extraordinary campagne as a proof thereof. In effect, how could ſo many ſimilar flints be formed? There is no ſaying they are coeval with the world, without aſſerting at the ſame time, that all the *ſtones* in the earth were produced at once; which were to go directly contrary to the obſervations above mentioned.

Among the ſeeds of *ſtones*, M. Tournefort obſerves, there are ſome, which do not only grow ſoft by the juices of the earth, but even become liquid. Theſe, then, if they penetrate the pores of certain bodies, grow hard, petrify, and aſſume the figure or impreſſion of the body: thus what we call *pectinites*, *conchites*, *mytulites*, *oſtracites*, *nautilites*, *echinites*, &c. are real *ſtones*, the liquid ſeeds whereof have inſinuated into the cavities of the ſhells called *pecten*, *concha*, *mytulus*, *oſtrea*, *nautilus*, *echinus*.

On the contrary, if thoſe liquid ſeeds fall on flints, on ſhells, ſand, &c. they incloſe thoſe ſeveral bodies, and fixing between them, form a kind of cement, which yet grows like other *ſtones*. It is highly probable that ſuch rocks as are only an aſſemblage of maſticated flints, have been formed by a number of theſe liquid ſeeds; in like manner as the quarries full of ſhells: unleſs the rocks have envelloped theſe bodies in their growth.

He adds, that there are ſeeds of real *ſtones* incloſed in the ſpawn of certain ſhell-fiſh; as well as that hard ſolid matter deſtined to the forming their ſhells.

There is a particular kind of ſhell-fiſh, called *pholas*, which is never found any where but in the cavities of flints, which are always found exactly fitted to receive them. Now, it is highly improbable the fiſh ſhould come and dig ſuch a nitch to ſpawn in; it is much more likely, the *ſtones* they are found incloſed in, were at firſt ſoft; and that the matter they are formed of, was originally found in the ſpawn, in like manner as the matter which forms the egg-ſhell, is really found in the ſeed thereof.

From the whole, he concludes, that the ſeed of *ſtones*, and even of metals, is a kind of duſt which probably falls from them while they are alive, *i. e.* while they continue to vegetate as above. This duſt may be compared to the ſeeds of ſeveral plants, as thoſe of ferns, capillaries, moſſes, truffles, &c. which no microſcope ever yet diſcovered; though their exiſtence is not at all to be doubted. See SEED.

Probably, flints and pebbles are among *ſtones*, what truffles are among plants; nor is this opinion new; Pliny aſſures us, that Theophraſtus and Mutianus believed, that *ſtones* produced *ſtones*: and Gregory Nazianzen adds, that there were authors who even believed that *ſtones* made love,

Εστι και αψυχοισι γαμος και δεσμος ερωτος, *Poem. de Virgin.*

M. Geoffroy accounts for the origin and formation of *ſtones*, in a different manner.—He lays it down as a principle, that all *ſtones*, without exception, have been fluid; or at leaſt a ſoft paſte, now dried and hardened: witneſs the *ſtones* wherein are found foreign bodies; witneſs, alſo, figured *ſtones*, &c.

On this principle, he examines the formation of the different kinds of *ſtones*; and ſhews, that the earth alone ſuffices for the ſame, independent of all ſalts, ſulphurs, &c. The metallic particles contained in flints, give them their colour; but theſe are only accidents: for proof of which, he inſtances the ſapphires and emeralds of Auvergne, which loſe all their colour by a moderate fire conſuming their metallic parts; but without any damage to their tranſparence; they being hereby rendered mere cryſtals.

To view rock cryſtal, indeed, one would not take it for earth; and yet earth it muſt be, not water congealed, as the ancients imagined. See CRYSTAL.

M. Geoffroy conceives two kinds of primitive particles in the earth.—Thoſe of the firſt kind, are exceedingly fine, thin lamellæ, equal to each other, or nearly ſo. Now, when theſe meet together, from any cauſe whatever, in a ſufficient quantity; the regularity and equality of their figures determines them to range themſelves equally and regularly; and thus to form a homogeneous compound, which is very hard, from the immediate contact of the parts; and very tranſparent, by reaſon of their regular diſpoſition, which leaves a free paſſage to the rays of light every way: and this is cryſtal. See CRYSTAL.

The parts of the ſecond kind have all ſorts of irregular figures; and muſt accordingly form aſſemblages that are much opaker and leſs hard. Now cryſtal is formed wholly of parts of the firſt kind; and all other *ſtones* of a mixture of the two kinds of parts together: this mixture is abſolutely neceſſary, in order to unite and bind together the parts of the ſecond kind, and give them a hardneſs and conſiſtence, without which they would only make a ſand or duſt. Water, now appears the fitteſt vehicle, to carry the parts of the firſt kind. This is ſeen from ſeveral petrifying ſprings, which incruſtate the pipes through which their waters are conveyed, or even ſolid bodies laid in them for ſome time. The Water does not diſſolve thoſe earthy parts; it only keeps them in fuſion, as it does the juices wherewith plants are fed.

This water, thus charged with earthy particles of the firſt kind, M. Geoffroy calls the *ſtoney*, or *cryſtalline* juice, whereof thoſe bodies are primarily formed.

STONES are of various kinds, with regard to the places they are produced in: the moſt ordinary are under ground; others in the bodies of men, and other animals; others ſeem to be generated by the ſea, as pumice, &c. and others, the effect of a petrifying virtue in certain waters. See PETREFACTION, &c. Of theſe, ſome ſerve ſimply for magnificence, and ornament; as all thoſe called,

Precious STONES; which make the commerce of lapidaries and jewellers. See PRECIOUS *ſtone*, and GEM.

Others, much uſefuller, if one might credit all the virtues attributed to them, are uſed in medicine; ſuch as bezoards, Jews *ſtone*, eagles *ſtone*, &c. See BEZOARD, ÆTITES, JUDAICUS, &c.

Others, again, are uſed in painting; either to prepare colours from, by calcining and grinding them, or to be uſed as crayons or pencils for deſigning: of which number are the Armenian *ſtone*, black lead, ruddle, &c. See ARMENIAN, RUDDLE, &c.

Laſtly, much the greateſt quantity, and thoſe too of the moſt immediate and common uſe, are thoſe employed in building; ſuch as free *ſtone*, marble, lime *ſtone*, fire *ſtone*, &c. See MARBLE, &c.

For *Free* STONE, that dug in the peninſula of Portland, and thence called *Portland ſtone*, is much uſed; being ſofter and whiter than Purbec *ſtone*, and is commonly raiſed out of the quarries in bigger blocks than that.

Some alſo call Ryegate, or fire *ſtone*, *free ſtone*. See FIRE.

Mr. Boyle obſerves, that a competent knowledge of the nature of the ſap or juice found in *ſtones* uſed in building, is of the laſt importance; the ſame *ſtone* dug out of the ſame quarry at one ſeaſon, being found to moulder away in a few winters, which dug at another ſeaſon, will brave the weather for many ages: and there are others, which, though dug at the proper ſeaſon, yet make but ruinous building, if uſed at an improper ſeaſon.

The ſame author adds, that as there are ſome ſorts of *ſtones* which will decay in a few years, there are others will not have attained their full hardneſs in thirty or forty years, or even much more. See PORPHYRY.

STONES are divided by biſhop Wilkins into *vulgar*, *middle priced*, and *precious*.

1. *Vulgar* STONES, or ſuch as are of little price, are diſtinguiſhable by their different magnitudes, uſes, and conſiſtence, into the

- Greater magnitudes of *ſtone*, uſed either about
  - Buildings, whether of
    - Walls; chiefly being of a
      - ſofter conſiſtence, whether natural or factitious,
        - 1 *free ſtone*, *brick*.
      - harder conſiſtence; not eaſily yielding to the tool of the workman, growing either in
        - great maſſes,
          - 2 *ragg*.
        - leſſer maſſes; whether ſuch as are for their figure,
          - more knobbed, and unequal; uſed for the ſtriking of fire, either the more common, which is leſs heavy; or leſs common, which is more heavy, as having ſomething in it of a metalline mixture,
            - 3 *flint*, *marcaſite*, fire *ſtone*.
          - more round and even,
            - 4 *pebble*, thunderbolt.
    - Roof, or pavement, being of a laminated figure, either natural, or factitious,
      - 5 *ſlate*, *tyle*.
  - Metals, either for the
    - ſharpening, or trying of them,
      - 6 *whet ſtone*, *touch ſtone*.
    - poliſhing, or cutting of them; being either of a more ſpongy and ſoft, or of a more hard conſiſtence,
      - 7 *pumice*, *emery*.
- leſſer magnitudes, either more, leſs, or minute,
  - 8 *ſand*, *gravel*.

2. *Middle priced* STONES, are either of a

- ſhining politure, or capable of it; whether of a
  - ſimple white colour, and more ſoft conſiſtence,
    - 1. *alabaſter*.
  - ſometimes white, ſometimes black or green, and ſometimes variegated with veins, growing in greater or leſſer maſſes,
    - 2 *marble porphyry*, *agat*.
  - ſpotted with red, upon a greeniſh colour, or with ſpots of gold colour upon blue,
    - 3 *jaſpis*, *heliotrope*, *laziul*, *azure ſtone*.
- Tranſparency, either
  - brittle; whether natural or factitious,
    - 4 *cryſtal*, *glaſs*.
  - fiſſile into flakes, either greater or leſſer,
    - 5 *ſelenite*, Muſcovia *glaſs*, *iſing glaſs*, *ſpar*, *talc*.
- Relation to metals, attracting iron, or making of braſs,
  - 6 *load ſtone*, *cadmia calaminaris*.
- Incombuſtible nature,
  - 7 *amiantus*, *aſbeſtus*.
- Strange original; not being properly minerals, though uſually reckoned amongſt them; but either a ſubmarine plant, or ſuppoſed to proceed from a liquid bitumen,
  - 8 *coral*, *coralline*, *amber*.

3. *Precious* STONES; which ſee under the article PRECIOUS *ſtone*.

Bolonian STONE,	See the articles	BOLONIAN.
Calamine STONE,		CALAMINARIS.
Eagles STONE,		ÆTITES.
Emery STONE,		EMERY.
Fire STONE,		FIRE.
Horſham STONE,		HORSHAM.
Jewiſh STONE,		JUDAICUS.
Infernal STONE,		LAPIS *infernalis*.
Lime STONE,		LIME *ſtone*.
Philoſophers STONE,		PHILOSOPHERS.
Pumice Stone,		PUMICE.
Roll-rich STONES,		ROLL.
Sanguine STONE,		SANGUINE.
Touch STONE,		TOUCH.
Whet STONE,		WHET *ſtone*.

STONE, alſo denotes a certain quantity, or weight of ſome commodities. See WEIGHT.

A *ſtone* of beef at London, is the quantity of eight pounds: in Herefordſhire, twelve pounds; in the North, ſixteen pounds.—A *ſtone* of glaſs is five pounds; of wax, eight pounds.

A *ſtone* of wool (according to the ſtatute of 11 Hen. VII.) is to weigh fourteen pounds; yet in ſome places it is more, in others leſs; as in Glouceſterſhire, fifteen pounds; in Herefordſhire, twelve pounds.

Among horſe-courſers, a *ſtone* is the weight of fourteen pounds.

Caſting in STONE. See the article CASTING.

STONE *of ſcandal*,		SCANDAL.

STONE, in medicine, is the denomination of a diſeaſe, called alſo *calculus*, and *lithiaſis*; and, occaſionally, the *gravel*. See CALCULUS, GRAVEL, *&c.*

It conſiſts of a ſtoney concretion, formed either in the bladder or kidneys; which prevents the diſcharge of urine, and occaſions violent pains. See BLADDER, and KIDNEYS.

The *ſtone*, Etmuller ſays, is not a diſeaſe, but the product of a diſeaſe: the diſeaſe, properly, is the *lithiaſis*, or the diſpoſition of the kidneys and bladder to generate *ſtones*.

The *ſtone* is generated, according to ſome authors, of the earthy viſcid parts of the blood, hardened, in courſe of time, by the heat of the kidneys; much after the manner as brick is baked in a kiln.—Dr. Quincy ſuppoſes it generated of the harder parts of the urine, pent up by the ſtreightneſs of the ducts, and brought into contact and coheſion.—Etmuller aſcribes the *ſtone*, ſometimes to the ſtoney and metallic particles of our foods and drinks, which the reins, through weakneſs and relaxation thereof, cannot eject; but more uſually to the unequal ſtrength of the kidneys: whence it is that we ſee one kidney breeds *ſtones*, the other remaining ſound.

The *ſtone* in the bladder, is firſt formed in the pelvis of the kidneys; whence falling into the bladder, it becomes augmented by new lamellæ or coats. See PELVIS.

The diagnoſtic ſigns of the *ſtone in the kidneys*, are, 1° A fixed, obtuſe pain in the region of the loins, appearing like a weight loading the reins. As the *ſtone* falls out of the pelvis into the ureter, the pain is exceedingly acute and racking, which holds till either the *ſtone* be got into the bladder, or returned again to the pelvis. 2° An inflexibility of the ſpina dorſi, from the extenſion and compreſſion of the nerves. 3° A ſtupor of the thigh and leg of that ſide, from the conſent of parts. 4° A retraction of the teſticle. 5° A very ſmall quantity of urine, either thin and limpid, or bloody. But as ſoon as the *ſtone* is got into the bladder, the urine becomes thick, turbid, blackiſh, and in great quantity.

The diagnoſtics of the *ſtone in the bladder*, are a ſenſe of heavineſs in the perinæum and inguinal region, a perpetual and troubleſome deſire of making water, which is followed with a ſharp pain, principally in the glans of the penis, whence a prolapſus of the anus. But the ſureſt way of finding it, is by the touch, *viz.* by thruſting the finger or a catheter up the anus.

The cure of the *ſtone*, is either by a liquor that will diſſolve or break the concrete *ſtone*; ſo as it may be evacuated piecemeal: which is called a *lithontriptic*; or by enlarging the capacity of the veſſels; or by the operation of cutting, called *lithotomy*.

We have yet no aſſured lithontriptic known, how many ſoever may pretend to it; the moſt noted, are Daffey's elixir, Tipping's liquor, and Rogers's powder. See LITHONTHRIPTIC.

The moſt uſual cure is by cutting; the various manners whereof, ſee under LITHOTOMY.—In ſome deſperate caſes, the *ſtone* has been known to make itſelf a way through the ſpinal muſcles.

Dr. Liſter obſerves, that *ſtones* are found, not only in the bladder and kidneys, but alſo in the pituitary ducts, the brain, liver, lungs, ſtomach, inteſtines, and joints of the hands and feet; to which may be added, that in the *Philoſophical Tranſactions*, we have likewiſe accounts of *ſtones* in the pineal gland, the heart, gall-bladder, *&c.*

Stones are diſtinguiſhed into three kinds, *white*, *red*, and *yellow*; which laſt are the moſt uſual.

Deckers recommends calcined egg-ſhells as excellent in all ſuppreſſions of urine; Hamilton, linſeed oil; and Mr. Boyle, the herb arſemart.

STONE-BLUE, a mineral preparation, properly called *ſmalt*. See SMALT.

STONEHENGE, in antiquity, a famed pile or monument of huge ſtones on Saliſbury plain, ſix miles diſtant from that city. It conſiſts of the remains of four ranks of rough *ſtones*, ranged one within another, ſome of them, eſpecially in the outermoſt and third rank, twenty foot high, and ſeven broad; ſuſtaining others, laid acroſs their heads, and faſtened by mortiſes: ſo that the whole muſt have anciently hung together.

Antiquaries are divided, as to the origin, uſe, ſtructure, *&c.* of this wonderful fabric. Moſt of them take the *ſtones* to be artificial, and to have been made on the ſpot; which ſeems the more probable, as we are pretty well aſſured the ancients had the art of making *ſtones* with ſand, and a ſtrong lime or cement; and as the *ſtones* ſeem too big for land-carriage; and yet are in a plain, which for ſome miles round ſcarce affords any *ſtones* at all.—Inigo Jones, however, a better judge than moſt antiquaries, is poſitive that the *ſtones* are all natural; and there is hardly any architect or naturaliſt who examines the grain of them exactly, but will be of his mind.—As to their unweildineſs, which is brought as an argument againſt their being portable, it is without foundation; they being merely but trifles compared to many other *ſtones* which are known to have been thus carried.

The legends give us various other accounts; ſome will have them brought miraculouſly by St. Patrick, from Ireland; others, *&c.*

As to its uſe, ſome antiquaries take it to have been an ancient temple of the Druids *; others, of the Romans, dedicated to Cœlus; in which they are confirmed by its having been open a-top. Others, reading the name, *ſtone-hengiſt*, maintain it to have been a monument erected in memory of Hengiſt, the firſt general of the Saxons in England: others will have it a funeral monument, raiſed to that brave Romano-Briton, Aurelius Ambroſius; to which opinion, ſome circumſtances of his actions, the ſtill remaining Latin name of the place (Mons Ambroſii) and that very ancient Welſh proverb, *Mal gwaith Emrys*, Like the work of Ambroſe, give ſome countenance.

STOOL, *alvus*, in medicine. A thing is ſaid to be voided by *ſtool*, when it is diſcharged by the anus, or fundament. See ANUS.

In the Philoſophical Tranſactions, we have inſtances of ſick perſons voiding factitious ſtones, balls, *&c.* by *ſtool*. See EXCREMENT.

Cucking STOOL. See the article CUCKING.

STOOMING *of wine*, the putting bags of herbs, or other ingredients into it. See WINE, NODULE, SACCULUS, *&c.*

STOOPING, in falconry, is when a hawk being upon her wings, at the height of her pitch, bends down violently to take the fowl.

STOPS, } in grammar. See { POINTS.
STOPPING, } { PUNCTUATION.

Saturday STOP. See the article SATURDAY.

STORAX, or STYRAX, a reſinous, odoriferous gum, brought from Syria; whereof there are two, or three kinds: *red ſtorax*, *ſtorax calamita*, and *liquid ſtorax*.

Red or *dry* STORAX, called alſo *Jews incenſe*, is a gum or reſin oozing out at an inciſion made in the trunk and biggeſt branches of a tree, called *ſtorax*, not unlike our quince-tree. Its fruit is of the ſize of a filberd, and contains a white, oily kernel, of a ſmell perfectly like *ſtorax*.

It muſt be choſen in a maſs, of a reddiſh colour, ſoft and fat, and of an agreeable ſmell, bearing no reſemblance to liquid *ſtorax*.—That in cakes, in balls, *&c.* is all ſophiſticated; and only a wretched compoſition of liquid *ſtorax*, and the impurities of the true red *ſtorax*, and other drugs. That in powder is ſtill worſe.

Red *ſtorax* is of ſome uſe in medicine; and is alſo uſed by the perfumers, and often ſubſtituted for frankincenſe. See FRANKINCENSE.

STORAX *calamita*, thus called from the ruſhes or quills, in Latin, *calami*, it was anciently brought in, is, by ſome, held to be only a compoſition of ſeveral excellent drugs; and among the reſt, of red *ſtorax*, whence its name: though authors have generally taken it for a natural gum, different from the red *ſtorax*. Hoffman's conjecture is, that it only differs from the other in age; the *ſtorax* growing higher coloured with keeping.

It muſt be choſen in fine white tears, very dry, and not bitter; ſometimes it is in reddiſh maſſes, full of theſe whitiſh tears, only mixed with a ruddy ſubſtance.

Theſe two kinds are eſteemed excellent pectorals, ſtomachics, and cephalics.

Liquid STORAX, is a kind of factitious reſin, of a greyiſh colour, compounded of true *ſtorax*, common reſin of the pine oil, and wine, beaten with water, into the conſiſtence of an unguent.

The druggiſts alſo call it *ſtacte*, to diſtinguiſh it, and ſell it for the better price. See STACTE.

The beſt is that of Holland. It is eaſily kept in a cellar, by pouring water on it from time to time. It is an ingredient in an unguent which experience has ſhewn to be excellent againſt the ſcorbutus, and gangrene.

STORE. *Bill of* STORES. See the article BILL.

STORGE, ΣΤΟΡΓΗ, a Greek term, frequently uſed by naturaliſts, to ſignify that paternal inſtinct, or natural affection, which all, or moſt animals bear their young. See INSTINCT.

The *ſtorge* is an admirable principle implanted by the all-wiſe Creator throughout the animal world, for the preſervation thereof; and is governed by ſuch rules as make it beſt contribute thereto. By means of this, with what care and alacrity do animals nurſe their young? and what dangers will they avoid for their ſecurity? even the moſt timorous creatures, which at other times fly the face of men, dogs, *&c.* will, for the ſake of their young, expoſe themſelves. Thus hens, inſtead of flying from, will aſſault ſuch as meddle with their brood; and partridges, before their young can fly, will frequently drop down before the dogs, firſt at leſs, then at greater diſtances, to dodge, and draw them off, from purſuing their young. With what concern do others lead about their young in places of ſafety? and ſome even admit them for ſhelter into their bowels.

Thus the oppoſum, Dr. Tyſon obſerves, has a curious bag on purpoſe for the ſecuring and carrying about her young; and ſome ſay, the teats lie in it. The ſame author adds, from Oppian, that the dog-fiſh, upon any ſtorm or danger, receives her young into her belly, which come out again when the fright is over. The ſquatina and glaucus do the like.

With what tenderneſs do others ſeek and prepare the food for their young, teach them to ſuck, cheriſh, or lull them to reſt, *&c.* like ſo many nurſes, deputed by the Creator to take care of his creatures? and ſtill in proportion, as they grow up and become fit to look to themſelves, this *ſtorge* abates; and, at length, when no longer needed, becomes extinct. Mr. Ray obſerves, that young doves are fed with meat firſt eat by the dam, and ſodden a-while in her prolobe. And Cluſius obſerves, that the old ſemale Ethiopian takes no food but from the male, after this manner.

The returns made by the young to the parent animal, when grown old, are not leſs conſiderable. Pliny ſays of rats, that they nouriſh their aged parents with eminent piety.

St. Ambroſe, and after him Olaus Magnus, obſerve of the crane, that when the parents, through old age, are bereft of their feathers, and left half naked, their offspring ſtand around them, and cheriſh them with their own feathers; that they ſeek food for them; and when nature, as it often happens, repairs their decays, and reſtores them to ſtrength again, they take them up by turns, on their wings, and habituate their unpractiſed limbs to their ancient art of flying.

STORM, in the military art. See ASSAULT.

STOVE, in building, a hot houſe or room. See HYPOCAUSTUM, SUDATORY, FIRE, CHIMNEY, *&c.*

Palladio obſerves, that the ancients uſed to warm their rooms with certain ſecret pipes, which came through the walls, conveying heat to ſeveral parts of the houſe, from one common furnace. Whether this were a common cuſtom, ſays Sir Henry Wotton, or a curioſity, we cannot determine; but it was certainly, both for profit and uſe, far beyond the German *ſtoves*.

STOVE, among confectioners, denotes a little cloſet well cloſed on all ſides, wherein are ſeveral ſtories or rows of ſhelves made of wiars one above another, for the drying of ſweetmeats.

STOWAGE, in the ſea language, the putting of goods orderly into the hold of a ſhip; the moſt ponderous and heavy next the ballaſt. See HOLD.

STRABISMUS, ΣΤΡΑΒΙΣΜΟΣ, a diſorder of the eye, makes it look a-ſquint, either upwards, downwards, or awry.

The *ſtrabiſmus* conſiſts in a retraction of the ball of the eye, towards one ſide; occaſioned by a convulſion, or a palſy of one of its muſcles.

Children are apt to acquire it through the careleſſneſs of their nurſes, in placing them always on the ſame ſide the light, or of any other remarkable object that occaſions them to turn their eyes that way.

To remedy it, care is to be taken, that the light, or other notable body, be placed on the other ſide of them; or elſe a maſk put on them, the holes whereof are ſo diſpoſed, as that to ſee through them, the child be obliged to turn his eyes the oppoſite way.

STRAIGHT, STREIGHT, or STRAIT, in hydrography, a narrow ſea, or gut, ſhut up between lands on either ſide, and affording a paſſage out of one great ſea into another. See SEA and OCEAN.

The moſt celebrated *ſtreight* in the world, is that of Gibraltar, which is about one hundred and thirty miles long and twelve broad, joining the Mediterranean ſea, with the Atlantic ocean.

The *ſtreights* of Magellan, diſcovered in 1520, by F. Magellan, were uſed ſome time, as a paſſage out of the north into the ſouth ſea; but ſince the year 1616, that the *ſtreight* of le Maire has been diſcovered, the former has been diſuſed; both becauſe of its length, which is full three hundred miles, and becauſe the navigation thereof is very dangerous, from the waves of the north and ſouth ſeas meeting herein, and claſhing.

The *ſtreight* at the entrance of the Baltic, is called the *Sound*. See SOUND.—That between England and France, *Le pas de Calais*, or the *channel*.—The *ſtreights* of *Babelmandel*, of *Weigats*, of *Jeſſo*, of *Anian*, of *Davis*, and *Hudſon*, &c.

STRAIGHT is alſo uſed in geography, for an iſthmus, or neck of land between two ſeas; preventing the communication thereof. See ISTHMUS.

STRAIGHT *arches*, } See the articles { ARCH.
STRAIGHT *ſtairs*, } { STAIRS.

STRAIN, or SPRAIN, a violent extenſion of the ſinews or tendons of ſome muſcle. See TENDON.

---

* Antiquaries are now pretty well agreed, that it was a Britiſh temple; and Dr. Langwith thinks it might eaſily be made probable, at leaſt, that it was dedicated to the ſun and moon. V. Stukel. *Stone-henge*, a temple reſtored to the Britiſh Druids.---Inigo Jones has given a fine ſcheme of the work, and ſtrives hard to perſuade the World, that it was Roman: but Dr. Langwith, who took his meaſures on the ſpot, aſſures us, he could by no means reconcile them with that ſcheme.

STRAINED *ſugar.* See the article SUGAR.

STRAINING *, is the clarification of a liquor, by paſſing it through a ſieve, or filtre. See FILTRATION.

* The word is derived from the French, *eſtreindre*; which is formed from *ex*, out of; and *ſtringere*, to preſs.

STRAIT. See the article STRAIGHT.

STRAND *and ſtream*, in ancient cuſtoms, a freedom from all impoſitions upon goods or veſſels by land or water.

STRANDED *, is when a ſhip is by tempeſt, or ill ſteerage, run on ground, and ſo periſhes.

* The word is formed from the Saxon *ſtrand*, a ſhore or bank of the ſea, or a great river.

STRANGER, in law, denotes a perſon who is not privy, or party, to an act.

Thus a *ſtranger* to a judgment, is he to whom a judgment does not belong: in which ſenſe the word ſtands directly oppoſed to *party*, or *privy*. See PARTIES and PRIVY.

STRANGURY *, ΣΤΡΑΓΓΟΥΡΙΑ, in medicine, a diſeaſe occaſioning a frequent and involuntary emiſſion of urine, in very ſmall quantities, and, as it were, drop by drop; with an intenſe pain. See URINE.

* The word is formed from the Greek, *στραγξ*, *gutta*, drop, and *ȣρον*, urine.

The *ſtrangury* ariſes from the too great acrimony of the urine, which vellicating the nervous parts of the bladder, occaſions a continual inclination to urine.

New beer, and other liquors, not well fermented, uſually occaſion the *ſtrangury*—The extreme ſharpneſs of the urine in the *ſtrangury*, ſometimes produces an ulcer in the bladder. Some authors confound the *ſtrangury*, which the Latins call *urinæ ſtillicidium*, with the *urinæ incontinentia*.—The difference between them conſiſts in this, that in the former, the urine comes away with pain, in the latter without. The former proceeds from the acrimony of the urine; and the latter from a relaxation or palſy of the ſphincter of the bladder, which cannot keep the neck thereof cloſe ſhut. See URINE.

STRAP, among ſurgeons, a ſort of band uſed to ſtretch out members in the ſetting of broken, or disjointed bones. See BANDAGE.

STRAPADO *, or STRAPPADO, a kind of military puniſhment, wherein the criminal's hands being tied behind him, he is hoiſted up with a rope, to the top of a long piece of wood, and let fall again almoſt to the ground; ſo that by the weight of his body in the ſhock, his arms are diſlocated.—Sometimes he is to undergo three *ſtrapado's*, or more.

* The word is formed from the Franch *eſtrapade*, which ſignifies the ſame; and which is ſuppoſed to come from the old proverb *eſtreper*, to break, extirpate; or from the Italian *ſtrappata*, of the verb *ſtrappare*, to wreſt by force.

STRATA, in natural hiſtory, the ſeveral beds, or layers of different matters, whereof the body of the earth is compoſed. See EARTH.

The *ſtrata* include all the layers of earths, minerals, metals, ſtones, &c. lying under that upper tegument or ſtratum, the turf, or mould. See FOSSIL, MINERAL, METAL, &c.

The time when thoſe ſeveral *ſtrata* were laid, was, doubtleſs, at the creation; unleſs, with ſome great naturaliſts, as Steno, Dr. Woodward, &c. we ſuppoſe the globe of the earth to have been diſſolved by the flood. See DELUGE.

At that time, ſays Mr. Derham, whenever it was that the terreſtrial globe was in a chaotic ſtate, and the earthy particles ſubſided, then theſe ſeveral beds were repoſited in that commodious order, wherein they are now found; and that, as is aſſerted, according to the laws of gravity; the lower ſtill heavier than the upper.

But Dr. Leigh, in his *Natural Hiſtory of Lancaſhire*, ſpeaking of the coal-pits, denies the *ſtrata* to lie according to the laws of gravitation; obſerving that the *ſtrata* there, are firſt a bed of marle, then free-ſtone, next iron-ſtone, then coal, or channel mire, then ſome other *ſtrata*, then coal again, &c.

This determined Mr. Derham to make a nicer enquiry into the matter; accordingly, in 1712, he cauſed divers places to be bored, laying the ſeveral *ſtrata* by themſelves; and afterwards determined very carefully their ſpecific gravity. The reſult was, that in his yard, the *ſtrata* were gradually ſpecifically heavier and heavier, the lower and lower they went; but in another place in his fields, he could not perceive any difference in the ſpecific gravities.

Acquainting the Royal Society therewith, their operator Mr. Haukſbee, was ordered to try the *ſtrata* of a coal-pit, which he did to the depth of thirty *ſtrata*: the thickneſs and ſpecific gravity of each whereof, he gives us in a table in the *Philoſophical Tranſactions*; and from the whole makes this inference, that it evidently appears, the gravities of the ſeveral *ſtrata* are in no manner of order; but purely caſual, as if mixed by chance. See VEIN and COAL.

STRATARITHMOMETRY *, in war, the art of drawing up an army, or any part of it, in any given geometrical figure; and of expreſſing the number of men contained in ſuch a figure, as they ſtand in array, either near at hand, or at any diſtance aſſigned. Harris.

* The word is formed from the Greek, *στρατος*, army, *αριθμος*, number, and *μετρον*, meaſure.

STRATEGEM *, ΣΤΡΑΤΗΓΗΜΑ, a military wile; or a device in war, for the ſurprizing, or deceiving an enemy.

* The word is formed from the Greek, *ςρατηγεω*, I lead or command an army.

The ancients dealt mightily in *ſtrategems*; the moderns wage war more openly, and on the ſquare.—Frontinus has made a collection of the ancient *ſtrategems* of war.

STRATEGUS, ΣΤΡΑΤΗΓΟΣ, in antiquity, an officer among the Athenians, whereof there were two choſen yearly, to command the troops of the ſtate. See CAPTAIN, GENERAL, &c. See alſo ARCHISTRATEGUS.

Plutarch ſays, there was one choſe from out of each tribe, but Pollux ſeems to ſay, they were choſe indifferently out of the people. It was the people themſelves made the choice; and that on the laſt day of the year, in a place called *Pynx*.

The two *ſtrategi* did not command together; but took their turns, day by day; as we find from Herodotus and Cornelius Nepos. Sometimes, indeed, as when a perſon was found of merit vaſtly ſuperior, and exceedingly famed in war, the command was given to him alone: but it was ever a rule, not to put any perſon in the office, but whoſe eſtate was in Attica, and who had children, that there might be ſome hoſtages, and ſecurities for his conduct and fidelity.

STRATIFICATION, STRATIFICATIO, in chymiſtry, the arrangement of different matters, in ſeveral ſtrata or layers, alternately; called alſo by the Latins, *ſtratum ſuper ſtratum*; and marked in books of chymiſtry with S S S.

This operation is uſed in calcining of minerals or metals with ſalts or other matters. See CALCINATION.

To purify gold by cæmentation, they *ſtratify* laminæ, or plates of gold in a crucible, with a dry paſte called *cæment*. See CÆMENT and CÆMENTATION.

STRAY. See the article ESTRAY.

STREAM-*anchor*, is a ſmall anchor made faſt to a *ſtream*-cable; for a ſhip to ride by in gentle *ſtreams*, and in fair weather. See ANCHOR.

STREAM-*works*, are certain works in the tin-mines, when the miners follow the veins of metal, by cutting trenches, &c. See TIN.

STREIGHT. See the article STRAIGHT.

STRENÆ, in antiquity, *new years gifts*; preſents made out of reſpect on new-year's day; as a happy augury for the enſuing year. See *New* YEAR'*s day*.

The ancient lawyers derive the word hence, That theſe preſents were only given *viris ſtrenuis*; Symmachus adds, that the uſe hereof was firſt introduced by king Tatius, Romulus's colleague, who received branches of vervain gathered in the ſacred grove of the goddeſs Strenia, as a happy preſage of the beginning year.

Anciently, a pound of gold was given to the emperors every new-year's day, by way of *ſtrena*.—Du Cange obſerves, that *ſtrina*, or *ſtrinna*, denoted a kind of tribute which the people of Dalmatia or Croatia payed to the Venetians, or to the kings of Hungary, whom they obeyed voluntarily.

STRENGTH, *vis*. See FORCE and POWER.

The *ſtrengths* of different animals of the ſame ſpecies, or of the ſame animal at different times, are demonſtrated to be in a triplicate proportion of the quantities of the maſs of their blood: the whole *ſtrength* of an animal, is the force of all the muſcles taken together; therefore, whatever increaſes *ſtrength*, increaſes the force of all the muſcles, and of thoſe ſerving digeſtion, as well as others. See MUSCLE.

Yet, notwithſtanding the truth of this, the quantity of blood may be increaſed in ſuch circumſtances, as to abate the *ſtrength*. The equilibrium between the blood and veſſels being deſtroyed, wonderfully leſſens the *ſtrength*. The ſudden ſuppreſſion of perſpiration, though it increaſes the quantity of the blood, as it muſt conſiderably do, by Sanctorius's calculation, yet it leſſens the *ſtrength*; becauſe the retained matter, being what ought to be evacuated, ſo alters the texture of the blood, as to make it unfit for muſcular motion. Suppoſe the increaſe of quantity to be connected with an extraordinary viſcidity, the quantity of ſmall ſeparable parts decreaſing, as the viſcidity increaſes, the quantity of animal ſpirits ſeparated in the brain, will be leſs; and the tenſion of the fibres being in proportion to the animal ſpirits forced into them, they will not be able to counterpoiſe the great weight of the blood, and ſo the *ſtrength* will be diminiſhed.

Bellini proves, that if the blood be ſo vitiated, as to increaſe or diminiſh *ſtrength*; it amounts to the ſame as if the blood were in a natural ſtate, but its quantity increaſed or diminiſhed in the ſame proportion: ſo that the blood, when vitiated, may ſo impair the *ſtrength* of the muſcles, as even to ſpoil digeſtion; and yet in ſome caſes, it may be ſo vitiated, as to help digeſtion, and increaſe *ſtrength*.

M. de le Hire, in a calculation of the *ſtrength* of a man in drawing and bearing, ſhews, that the *ſtrength* of an ordinary man walking in a horizontal direction, and with his body inclining forwards, is only equal to twenty-ſeven pounds; which is much leſs than one would have imagined.

He adds, that this force would be much greater, if the man were to walk backwards; and that it is for this reaſon, the watermen fetch their oars from before, backwards: and though he obſerves, the gondoliers of Venice fetch them the contrary way, yet this is, becauſe they chuſe to loſe the advantage of *ſtrength*, to have that of ſeeing the place they are going to, in the numerous turns and canals they there meet withal.

It is known by experience, that a horſe draws, horizontally, as much as ſeven men; conſequently, his *ſtrength* will be 189 pounds. A horſe, as to puſhing forwards, has a great advantage over a man, both in the *ſtrength* of its muſcles, and the diſpoſition of the whole body; but the man has the advantage over the horſe in aſcending. M. de la Hire ſhews, that three men laden with 100 pounds a-piece, will aſcend a pretty ſteep hill with more eaſe and expedition, than a horſe loaden with 300 pounds.

Hakewell furniſhes us with abundance of inſtances of extraordinary *ſtrength*: Clunher, provoſt of the great church of Meſnia in 1522, carried a pipe of wine out of the cellar, and laid it in the cart.—Mayolus ſaw one hold a marble pillar in his hand three foot long, and one in diameter, which he toſſed in the air, and catched again like a ball.—A little man of Mantua, called *Rodamas*, could break a cable.—Ernando Burgh fetched up ſtairs, an aſs laden with wood, and threw both into the fire. At Conſtantinople, in 1581, one lifted a piece of wood which twelve men could ſcarce raiſe; then lying all along, bore a ſtone which ten could but juſt roll on him.—G. of Fronſbergh, baron of Mindleheim, could raiſe a man off his ſeat with his middle finger, and ſhove a cannon out of its place.—Cardan ſaw a man dance with two men in his arms, two on his ſhoulders, and one on his neck. Patacona, captain of the Coſſacks, could tear an horſe-ſhoe; and the ſame is reported of the late Auguſtus king of Poland. —On Putney Common, is a ſtone with an inſcription, mentioning a man, who in that place out-drew five horſes in his own team.—A gigantic woman of the Netherlands, could lift a barrel of Hamburgh beer.—Mr. Carew had a tenant that could carry ſix buſhels of wheat in meal (of fifteen gallons meaſure) with the lubber a-top of it. And J. Roman of the ſame country, could carry the carcaſs of an Ox. See Hakewell's *Apology*, p. 238.

STRENGTHENERS, *corroborants*, ſuch medicines as add to the bulk and firmneſs of the ſolids. See SOLIDS and STRENGTH.

Strengtheners differ from *cordials*, as a bandage does from a fleſh-bruſh: the latter are ſuch as facilitate and drive on the vital actions; but the former, ſuch as confirm the ſtamina, and maintain the ſolids in ſuch a condition, as to exert themſelves into action on all proper occaſions, with the greateſt force and vigour. See CORDIAL.

The continual waſte, which conſtant motion makes in the conſtitution, were it not for frequent and proper ſupplies, would ſoon wear the body quite out. The attritions and abraſions of the circulating fluids, would quickly carry away the canals in which they circulate, were not ſomewhat furniſhed in their compoſition, which is ſuited to fall into, adhere with, and recruit that which is waſhed off. And thoſe particles muſt be much more diſpoſed ſo to do, whoſe adheſions are greateſt, when once they come into contact; ſuch are thoſe of bodies we call *glutinous*, and which eaſily form themſelves into jellies, and ſuch like conſiſtences: for the parts of ſuch bodies are very light, by the over-proportion of their ſurfaces to their ſolidities, whereby their motions are both more languid, when in circulation; and when they ſtop, their coheſions will be much the ſtronger, with whatſoever they happen to fall into contact. See NUTRITION.

Medicines of this tribe, are therefore of great ſervice in hectics; where the ſwift motion of a thin, ſharp blood, wears away the ſubſtance of the body, inſtead of nouriſhing it: for they not only retard the inordinate motion, but give ſuch a weight and conſiſtence to the juices, as fits them alſo for nouriſhment.—There are likewiſe other cauſes, which may weaken the ſolids, by admitting, or occaſioning them to relax too much.

Whatſoever therefore acts as a ſtimulus, and criſps and corrugates the fibres into a more compacted tone, which moſt auſtere and pointed bodies do, will remove ſuch weakneſs, and increaſe ſtrength: and as too much moiſture may alſo contribute to ſuch a relaxation, what has no other quality but that of abſorbing, and drying up ſuch ſuperfluous humidities, may deſerve, though accidentally, to come under this denomination. See FIBRE, &c.

STRETCH.—When at ſea, they are going to hoiſt the yard, or hale the ſheet; they ſay, *ſtretch forward the ſheets*: meaning, that the part which the men are to hale by, ſhould be put into their hands, in order to their haling.

STRIÆ, in the ancient architecture, the liſts, fillets or rays which ſeparate the ſtriges or flutings of columns. See STRIGES and FLUTING.

STRIÆ, among naturaliſts, denote the ſmall grooves or channels in the ſhells of cockles, ſcollops, &c.

STRICTOR, in anatomy, the ſame as *ſphincter*. See SPHINCTER.

STRIGES, in the ancient architecture, are what in the modern we call *flutings*. See FLUTING.

They were thus denominated, as being ſuppoſed to have been originally intended to imitate the folds or plaits in womens robes; which the Latins call *ſtrigæ*.—The fillets or ſpaces between them, were called *ſtriæ*. See STRIÆ.

STRIKE, or STRYKE, a meaſure, containing four buſhels; two of which make a quarter. See BUSHEL and QUARTER.

A STRIKE *of flax*, is as much as can be heckled at one handful.

STRIKE, is a ſea word variouſly uſed.—When a ſhip in a fight, or upon meeting with a man of war, lets down, or lowers her top-ſails, at leaſt half-maſt high; they ſay, *ſhe ſtrikes*: meaning, ſhe yields or ſubmits, or pays her devoir to that man of war, as ſhe paſſes by. See FLAG.

When a top-maſt is to be taken down, they ſay, *ſtrike the top-maſt*.

And when any thing is let down or lowered into the hold, they call it *ſtriking down into the hold*.

Alſo, when a ſhip touches ground in a ſhoal-water, they ſay, *ſhe ſtrikes*.

STRIKE *a hull*. See the article HULL.

STRIKING.—The puniſhment appointed by our laws, for *ſtriking within the king's court*, whereby blood is drawn, is, that the criminal ſhall have his right-hand ſtruck off, in a moſt ſad and ſolemn manner.

For *ſtriking in Weſtminſter-Hall*, while the courts of juſtice are ſitting, the puniſhment is impriſonment for life, and forfeiture of one's eſtate.

STRIKING *watch*. See the article WATCH.

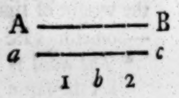
STRING, in muſic. See the article CHORD.

If two *ſtrings* or chords of a muſical inſtrument only differ in length; their tones, that is, the number of vibrations they make in the ſame time, are in the inverſe ratio of their lengths.

If they only differ in thickneſs, their tones are in the inverſe ratio of their diameters.—As to the tenſion of *ſtrings*, to meaſure it regularly, they muſt be conceived ſtretched or drawn by weights; and then, cæteris paribus, the tones of two *ſtrings* are in a direct ratio of the ſquare roots of the weights which ſtretch them, that is, *e. gr.* the tone of a *ſtring* ſtretched by a weight, 4, is an octave above the tone of a *ſtring*, ſtretched by the weight 1.

It is an obſervation of an old ſtanding, that if a viol or lute-*ſtring* be touched with the bow, or hand, another *ſtring* on the ſame, or another inſtrument, not far from it, if in uniſon to it, or in octave, or the like, will at the ſame time tremble of its own accord. See UNISON.

But it is now found, that not the whole of that other *ſtring* doth thus tremble; but the ſeveral parts, ſeverally, according as they are uniſons to the whole, or the parts of the *ſtring* ſo ſtruck. Thus ſuppoſing A B to be an upper octave to *a c*, and therefore an uniſon to each half of it ſtopped at *b*.



If while *a b* is open, A B be ſtruck, the two halves of this other, that is *a b* and *b c* will both tremble; but the middle point will be at reſt; as will be eaſily perceived, by wrapping a bit of paper lightly about the *ſtring a c*, and removing it ſucceſſively from one end of the *ſtring* to the other. In like manner, if A B were an upper twelfth to *a c*, and conſequently, an uniſon to its three parts *a* 1, 1 2 and 2 *c*; if *ac* being open, A B be ſtruck, its three parts *a* 1, 1 2 and 2 *c* will ſeverally tremble; but the points 1 and 2 remain at reſt. This, Dr. Wallis tells us, was firſt diſcovered by Mr. William Noble of Merton college; and after him by Mr. T. Pigot of Wadham college, without knowing that Mr. Noble had obſerved it before. To which we may add, that M. Sauveur, long afterwards, propoſed it in the Royal Academy at Paris, as his own diſcovery, as it is like enough it might: but upon his being informed, by ſome of the members then preſent, that Dr. Wallis had publiſhed it before, he immediately reſigned all the honour thereof.

STRINGENT—*Line of Defence* STRINGENT. See LINE.

STRING-HALT, a ſudden twitching or ſnatching up of an horſe's hinder leg, much higher than the other, as if he trod on needles; generally befalling only the beſt mettled horſes, and ranked in the number of ſpavins. See SPAVIN.

It frequently happens upon taking cold, after hard riding, or ſore Labour; eſpecially upon waſhing him when too hot, which chills the blood, and ſo benumbs the ſinews, as to take away the ſenſe and feeling of the member.

To cure it, the middle vein is taken up above and underneath the thigh; under which is found a *ſtring*, which is to be cut away, and the part anointed with butter and ſalt.

STRIPED *ſtalk*, } See the articles { STALK.
STRIPED *velvet*, } { VELVET.

STROAKING, a method of cure which ſome people have given into, in certain diſeaſes, conſiſting in a mere application of the hand to the part affected, in the way of friction or rubbing. See EVIL.

That friction has very conſiderable uſes in many diſeaſes, is allowed. See FRICTION.

But, as to the particular efficacy of the *ſtroak* of particular perſons; we ſee little foundation for it in nature. Experience, indeed, ſeems to afford ſome; to which we do not well know what to object.

Mr. Thoreſby, in the *Philoſophical Tranſactions*, gives ſeveral remarkable inſtances of cures performed by that famous *ſtroaker*, M. Greatrix. Mr. Thoreſby's own brother being ſeized with a violent pain in his head and neck; Mr. Greatrix coming accidentally thither, gave immediate eaſe to his head, by only *ſtroaking* it with his hand: he then fell to *ſtroak* his back; whence the pain immediately fled to his right thigh: then he purſued it with his hand to the knee, from thence to the leg, ancle, foot, and at laſt to the great toe, where it grew more violent; but upon rubbing there, it vaniſhed.

Another relation of the ſame author having great pain and weakneſs in her knees, which occaſioned a white ſwelling; that had hung to her ſeveral years, in ſpight of all means; the ſame *ſtroaker* rubbing both her knees, gave her preſent eaſe; the pain flying downwards from his hand, till he drove it out of the toes: after which the ſwelling ſoon went abſolutely away.

Mr. Thoreſby gives various other like inſtances, all among his acquaintance; and adds, that when Mr. Greatrix *ſtroaks* only for pains, he uſes nothing but his hand; but that for ulcers, or running ſores, he uſes ſpittle on his hand or fingers.

STROBILITES *vinum*. See VINUM.

STROPHE, in the Greek and Latin poetry, a ſtanza, or certain number of verſes including a perfect ſenſe; ſucceeded by another, conſiſting of the ſame number and meaſure of verſes, and in the ſame diſpoſition and rhythmus, called *antiſtrophe*. See ANTISTROPHE.

What the couplet is in ſongs, and the ſtanza in epic poetry; *ſtrophe* is in odes. See COUPLET and STANZA.

The word is Greek, ϛροφη, formed from ϛρεφω, I turn; becauſe at the end of the *ſtrophe*, the ſame meaſures returned again; or rather, as the term related principally to the muſic or dancing, becauſe at firſt coming in, the chorus, or the dancers turned to the left, and that meaſure ended, they turned back again to the right.

STRONG *place*,	See the articles	PLACE.
STRONG *pulſe*,		PULSE.

STRUCTURE, in architecture. See BUILDING.

STRUMÆ*, in medicine, tumours ariſing moſt uſually on the neck and throat; called alſo *ſcrophulæ*, and, popularly the *evil*, or *king's evil*. See EVIL.

* The word is Latin, formed, as ſome will have it, *a ſtruendo*, becauſe they grow inſenſibly, *ſtructim aſſurgunt*.--The Greeks call them χοιραδες, ſores.

STRYKE. See the article STRIKE.

STUC*, or STUCCO, in building, a compoſition of white marble pulveriſed and mixed with plaiſter or lime; the whole ſifted, and wrought up with water; to be uſed like common plaiſter. See PLAISTER, &c.

* This is what Pliny means by *marmoratum opus*; and *albarium opus*. See MOSAIC, &c.

Of this are made ſtatues, buſts, baſſo relievo's, and other ornaments of architecture. See STATUE, &c.

STUES. See the article STEWS.

STUFF, in commerce, a general name for all kinds of fabrics of gold, ſilver, ſilk, wool, hair, cotton or thread, manufactured on the loom; of which number are velvets, brocades, mohair, ſattins, taffetys, cloths, ſerges, &c. See CLOTH, VELVET, BROCADE, &c.

STUFF is particularly uſed, for certain kinds of ſlight woolen ſtuffs, uſed principally for linings and womens wear; as linſeys, rateens, &c.

Bleaching of STUFFS,	See	BLEACHING.
Croſs-grained STUFF,		CROSS-GRAINED.
Fulling of STUFFS,		FULLING.

STUM, the flower of wine ſet a working. See WINE, MUST, FERMENTATION, &c.

Hence to *ſtum*, is to put certain ingredients into ſick and decayed wine, in order to revive it, and make it briſk.

STUMBLING, in the manage, &c. a vice in a horſe, either *natural* or *accidental*.

The *natural* ariſes from the ſinews of the fore-legs being ſomewhat too ſtraight, which cramps the horſe, and prevents his uſing his legs with the neceſſary freedom and nimbleneſs.—The way to cure them, is to cut him of the cords, *i. e.* to make a ſlit on the top of his noſe, and with a cornet, to raiſe up the great ſinews, to cut them aſunder, and heal them up again with a proper ſalve.

The *accidental* ariſes from a ſplint, wind-gall, being foundered, pricked, ſtubbed, gravelled, &c.

STUNG.—*Adder* STUNG. See the article ADDERSTUNG.

STUPA. See the article STUPHA.

STUPEFIERS, in medicine, the ſame as narcotics, and opiates. See NARCOTIC and OPIATE.

STUPHA, STUPA, STUPE ſometimes denotes a fomentation. See FOMENTATION.

STUPOR, a numbneſs, occaſioned by any accidental bandage that ſtops the motion of the blood and nervous fluids, or by a decay in the nerves, as in a palſy, &c.

STYGIAN *liquors*; a term which ſome chymiſts apply to the corroſive acid ſpirits, as aqua regia, from their efficacy in deſtroying or diſſolving mixt bodies. See SPIRIT, AQUA *regia*, &c.

STYLE, ΣΤΥΛΟΣ, a kind of bodkin, wherewith the ancients wrote on plates of lead, or on wax, &c. and which is ſtill uſed to write on ivory leaves, and paper prepared for that purpoſe, &c. See WRITING.

This is the origin of all the other ſignifications of the ſame word in Engliſh.

STYLE, STYLUS, in chirurgery, denotes a long ſteel inſtrument, which goes diminiſhing to a point at one end, ſo as to be of a conical form; ſerving either to expand and open, or to be thruſt into a part.

The *ſtyle* is frequently uſed to be thruſt in red-hot, in cannulæ, and to be pulled out again, immediately: it is put in and drawn out ſucceſſively, as often as is neceſſary. In order to do this, it is good to have two *ſtyles*, to be put in alternately. See CANNULA.

STYLE, in dialling, denotes the gnomon or cock of a dial, raiſed in the plane thereof, to project a ſhadow. See GNOMON.

STYLE, STYLUS, in botany, the part riſing up in the middle of a flower, and bearing, by its lower part, on the rudiment of the fruit, or ſeed.

This, we more uſually call the *piſtil*: though Bradley makes a diſtinction; calling it *ſtyle* when it is only joined or contiguous to the ſeed or fruit; and *piſtil* when it contains the ſeed or fruit within it; as the ovary does the egg. See PISTIL.

STYLE, in matters of language, is a particular manner of delivering a man's thoughts in writing, agreeably to the rules of ſyntax; or, as F. Buffier more accurately defines it, the manner wherein the words conſtructed according to the laws of ſyntax, are arranged among themſelves, ſuitably to the genius of the language. See LANGUAGE.

This definition fixes the notion of *ſtyle*, to ſomething determinate, which before was very vague and arbitrary; whence many authors, even of note, confounded it with ſyntax itſelf. See SYNTAX.

From the definition, it appears, that *ſtyle* ſuppoſes or includes the ſyntax; and that ſyntax does not extend ſo far as *ſtyle*: for the ſyntax may be very juſt, where the *ſtyle* is wretched, were it only in this example: "God always "rewards with great fidelity, and greater liberality, the juſt:" or this, "There is no body, who more than I ho-"nour you."

The regimens and terminations of each word, are perfectly juſt in each of theſe phraſes: there is no fault then, in the ſyntax; but there is ſomething wanting in the arrangement of the words, to ſuit them to the genius of the language; there is a fault then, in the *ſtyle*.

Indeed, againſt what particular rule of grammar the fault is committed, it is ſcarce poſſible to determine preciſely; the taſte and uſe of a language being ſo exceedingly delicate and precarious. It is true, a fault in *ſtyle*, is not leſs a fault againſt grammar, than is a fault in *ſyntax*; only the former is leſs preciſe and palpable than the latter.

A very common error in grammarians, F. Buffier adds, is to confound two kinds of *ſtyles* in one: the *grammatical ſtyle*, or that directed by the rules of grammar; and the *perſonal ſtyle*, which depends leſs on the grammar, than on the perſon that writes; whether with regard to his particular taſte and genius, or with regard to his matter, or the kind or character of his work.

There are a great many differences between the two; the moſt eſſential is, that the one may be diverſified an infinite number of ways, and the other cannot.—In effect, the perſonal *ſtyle* is naturally variable, according to the different genius's, humours, and complexions.

It is the imagination that acts, that conceives, that propoſes, and that expreſſes things, according to its character, which is different in all men, and which is to be varied, according to the particular kind of the work.

Hence ariſes the gay, the grave, the florid, the jejune, the copious, the conciſe, the poetical, the epiſtolary, the burleſque *ſtyles*. See FLORID, BURLESQUE, &c.

Theſe perſonal *ſtyles* are all independant on the grammatical; and we have authors, who excel in the one, yet are miſerably defective in the other. The perſonal *ſtyle* is not under the direction of grammar; but of the imagination, or rather of rhetoric, that art having to do directly with our thoughts, as grammar with our words.

This, however, may be ſaid, that grammar is far from being able to vary the ſame words of a phraſe with equal perfection; and that generally there is but one way of delivering them in the taſte and genius of the language. Thus, the grammatical *ſtyle* is invariable in the following phraſe, and proportionably in others. "Death is a law, which all men "are to undergo." For you cannot well range the words otherwiſe than they here are, without going out of the bounds of grammar. Would you ſay, "A law is death, "which all men," &c. or "law is a death, which," &c. But in the perſonal *ſtyle*, where the imagination comes to be concerned, this ſentence might be varied infinite ways, according to the kind of the writing, whether oratorial, poetical, &c. As, "Death neither ſpares the prince nor the "peaſant. Death knocks equally at the monarch's palace "and the beggar's hut," &c.

STYLE, in oratory and poetry, is reſtrained wholly to what F. Buffier calls the *perſonal ſtyle*.

Language refers principally to the matter of the diſcourſe, *viz.* the words; elocution to the particular members or parts thereof; and *ſtyle* to the whole compoſition.

The maſters of the art, reduce the kinds of *ſtyle* to three; the *ſublime*, the *low*, and the *intermediate*, or *equable ſtyle*.

Sublime STYLE, is that conſiſting in magnificent words and ſentences; which by its noble boldneſs, raviſhes the hearers, and extorts admiration even from the unwilling. See SUBLIME.

Low or *ſimple* STYLE, is that ordinarily uſed in ſmaller and humbler works; as epiſtles, dialogues and common diſcourſe. The chief virtues hereof are perſpicuity, ſmoothneſs, eaſineſs, and cleanneſs; it muſt be very ſparing in the uſe of tropes and figures, eſpecially the more violent ones, as the proſopopœia, apoſtrophe, *&c.*

Intermediate, or *equable* STYLE, partakes of the magnificence of the *ſublime*, and the ſimplicity of the *low*. It neither riſes to the majeſty of the one in words and ſentences; nor yet is ſmartly pointed like the other: but, as Tully excellently expreſſes it, *Eſt ſtylus quidam interjectus, intermedius, & quaſi temperatus; nec acumine inferioris, nec fulmine utens ſuperioris, vicinus amborum, in neutro excellens, utriuſque particeps.*

The ſame author calls it the *florid* and *poliſh'd ſtyle*; it being in this that all the graces and beauties of language are principally to be uſed.

For the choice of *ſtyle*, in the general, the matter is to determine it. Such *ſtyle*, ſays Cicero, is to be choſen, as expreſſes great things magnificently, middle things moderately, and low things ſubtilly: but more particularly, as there are three branches of the duty of an orator, to teach, to delight, and to move; the ſimple *ſtyle* is uſed to teach, the middle to delight, and the ſublime to move.

Again, the ſimple or low *ſtyle* is fit for comedy, the ſublime for tragedy; and the middle for hiſtory.—Cæſar, it is true, rather uſed the ſimple than the intermediate *ſtyle*; but then he wrote commentaries, not a hiſtory, as is obſerved by Tully.

Again, the ſimple *ſtyle* is fit for bucolics, and eclogues; the intermediate *ſtyle* for georgics; and the ſublime for epics: which triple difference we eaſily deſcry in Virgil, though he ſometimes mixes them all in the *Æneid* itſelf, uſing the ſimple *ſtyle* in the fifth book, where he deſcribes games, and the intermediate in the beginning of the poem. Care is ſtill to be taken, that the *ſtyle* be not flat and dull, on pretence of being ſimple.

M. Boileau obſerves, that in all languages a mean thought expreſſed in noble terms, is better liked than the nobleſt thought expreſſed in mean terms: the reaſon he gives, is, that every body cannot judge of the force and juſtneſs of a thought: but ſcarce any body but perceives the meanneſs of words. The latter we find by our ſenſes, the former by our reaſon.

He adds, that the words in different languages do not always anſwer juſtly to one another; and that a noble Greek term cannot frequently be expreſſed in another language, but by a very mean one.

This we ſee in the words *aſinus* in Latin, *ane* in French, and *aſs* in Engliſh, which are the meaneſt imaginable, in thoſe three languages; yet the word expreſſing that animal, has nothing mean in it, either in Greek or Hebrew, but is uſed in the fineſt and nobleſt paſſages.

Add to this, that languages are exceedingly capricious on this head: a bull, a heifer, a goat, a boar, *&c.* may be uſed in the ſublimeſt paſſages, without debaſing the *ſtyle*; but a cow, a ſheep, a hog, a ſow, *&c.* would be intolerable. Shepherd and herdſman, are fine words; hog-keeper and cow-ward, which carry the ſame ideas, vicious to the laſt degree. The chief faults in *ſtyle* are, its being *tumid* and *ſwollen*; or *cold* and *puerile*, or *ſtiff*, or *looſe*, or *dry* and *jejune*.

A *tumid* STYLE is that immediately ſtuffed with big words and ſentences; ſuch are thoſe verſes of the emperor Nero, ridiculed by Perſius.

Torva mimalloneis implerunt cornua bombis
Et raptum vitulo caput ablatura ſuperbo
Baſſaris, & lyncem mænas flexura corymbis, &c.

Frigid, or *puerile* STYLE, is that which affects certain trifling ornaments, inſipid jeſts, remote and ſtrained alluſions, redundant deſcriptions, *&c.*—Such, *e. gr.* as, a centaur's riding himſelf, more golden than gold, *&c.*—Of this vice, that paſſage of Virgil ſeems guilty,

Num capti potuere capi? Num incenſa cremavit
Troja viros?

And that in Plutarch, and Dion Caſſius; "It was no wonder Diana's temple ſhould be burnt the night Alexander was born; as that goddeſs, attending at ſo great a birth, could not be in the way to extinguiſh the flames."—And that in Plautus, where a perſon is repreſented ſo exceedingly covetous, that he would invoke heaven and earth, if he ſaw but a grain of ſmoke eſcape out of his cottage. See FRIGID.

Looſe STYLE, is that which wanting articles, numbers, *&c.* fluctuates here and there, not connected or joined together. This is a fault ſo frequent, eſpecially in young writers, that we ſhall ſpare giving inſtances of it.

Dry, jejune STYLE, is that which is deſtitute of ornament, ſpirit, *&c.* The ancients made a notable diſtinction of *ſtyles*, into *Laconic*, and *Aſiatic*.

Aſiatic STYLE, is that which is very diffuſive and prolix; or where abundance of words are uſed to expreſs a little matter: thus called, by the Greeks, from the people of Aſia, who affected ſuch redundances, in oppoſition to the

Laconic STYLE, which is diſtinguiſhed by its exceeding conciſeneſs; and by comprehending a deal of matter under a few words. See LACONICISM.

Such, *e. gr.* is that anſwer returned by the Lacedæmonians, to a long epiſtle of an enemy, threatening to deſtroy them with fire and ſword; ει, *ſi*, if; that is, do *if* you can: or, that returned by the ſame people to king Philip, demanding ſome extravagant thing of them, ȣ, *non*, no. Or that of Cleomenes, the Spartan general, to the ambaſſador of Samos; "As to what you have ſaid, the firſt part I do not remember; the middle I do not underſtand; the laſt I do not approve." Or that epiſtle of Archidamus to Elei, who were preparing war againſt him; Archidamus to the Eleans: "It is good to be quiet." Or that of Cæſar to the Roman ſenate, after his conquering Pharnaces, king of Pontus: *veni, vidi, vici*; I came, I ſaw, I conquered.

Marotic STYLE. See the article MAROTIC.

STYLE, in juriſprudence, the particular form, or manner of proceeding in each court or juriſdiction, agreeable to the rules and orders eſtabliſhed therein.—Thus we ſay, the *ſtyle* of the court of Rome, of the court of chancery, of parliament, of the privy council. See CHANCERY, *&c.*

STYLE, in muſic, denotes a peculiar manner of compoſing, or ſinging.

The *ſtyle* is, properly, the manner each perſon has, either of compoſing, of performing, or teaching; which is very different; both in reſpect of the different genius's of countries and nations, and of the different matters, places, times, ſubjects, expreſſions, *&c.*

Thus we ſay, the *ſtyle* of the Chariſſimi, of Lully, of Lambert; the *ſtyle* of the Italians, the French, the Spaniards, *&c.* The *ſtyle* of gay pieces of muſic, is very different from that of ſerious pieces: the *ſtyle* of church muſic is very different from theatrical muſic. The *ſtyle* of the Italian compoſitions, is poignant, florid, expreſſive; that of the French compoſitions, natural, flowing, tender, *&c.*

Hence, the various epithets, given to diſtinguiſh theſe various characters; as, the ancient and modern *ſtyle*, the Italian and German *ſtyle*, the eccleſiaſtical and dramatic *ſtyle*, the gay, grave, majeſtic, natural, ſoft, familiar, gallant, low, ſublime *ſtyles*, &c.

STYLO *recitativo*, or *drammatico*, in the Italian muſic, is a *ſtyle* fit to expreſs the paſſions. See RECITATIVE.

STYLO *eccleſiaſtico* is full of majeſty, very grave, and fit to inſpire devotion.

STYLO *motectico*, is a various, rich, florid *ſtyle*, capable of all kinds of ornaments, and of conſequence, fit to expreſs various paſſions, particularly admiration, grief, *&c.*

STYLO *madrigaleſco*, is a *ſtyle* proper for love, and the other ſofter paſſions.

STYLO *hyperchematico*, is a *ſtyle* proper to excite mirth, joy, dancing, *&c.* and of conſequence, full of briſk, gay motions.

STYLO *ſymphoniaco*, is a *ſtyle* fit for inſtrumental muſic: but as each inſtrument has its particular effect, there are as many different ſymphoniacal *ſtyles*.—The *ſtyle* of violins, for inſtance, is uſually gay; that of flutes, melancholy and languiſhing; and that of trumpets, ſprightly, and animated.

STYLO *meliſmatico*, is a natural, artleſs *ſtyle*, which any body, almoſt, may ſing.

STYLO *phantaſtico*, is a free, eaſy, humorous manner of compoſition, far from all conſtraint, *&c.*

STYLO *choraico*, is the *ſtyle* proper for dancing; and is divided into as many different kinds, as there are dances; as the *ſtyle* of ſarabands, of minuets, of gavots, rigadoons, *&c.*

STYLE, in chronology, denotes a particular manner of accounting time, with regard to the retrenchment of ten days from the calendar, in the reformation made thereof under pope Gregory XIII.

Style is either *old* or *new*.

Old STYLE is the Julian manner of computing, which obtains in England, and ſome other proteſtant ſtates, who refuſed to admit of the reformation. See JULIAN.

New STYLE, is the Gregorian manner, followed by the catholics, and others, in conſequence of that reformation. See GREGORIAN.

Hence, there has ariſen a difference of ten days, between the old *ſtyle* and the new, the latter being ſo much beforehand with the former: ſo that when the catholics, *e. gr.* reckoned the 21ſt of May, we only reckoned the 11th.

This difference of ten days, was increaſed in the year 1707, to eleven days, by reaſon that year was not the Biſſextile in the old *ſtyle*, but was in the new; ſo that the 10th day of the one, correſponded to the 21ſt of the other.

There are ſeveral places, however, where the new *ſtyle* has begun to obtain, even among proteſtants; and it is not unlikely, that the old *ſtyle* may, in time, dwindle quite away. —At the Diet of Ratiſbon in 1700, it was decreed, by the body of proteſtants of the empire, that eleven days ſhould be retrenched from the old *ſtyle*, to accommodate it for the future to the new. And the ſame regulation has ſince paſſed into Sweden and Denmark. England holds out, almoſt alone, for the old *ſtyle*. See CALENDAR.

STYLES *of hunting*. See the article HUNTING.

STYLET, STYLETTO, a ſmall, dangerous kind of poniard, which may be concealed in the hand; chiefly uſed in treacherous aſſaſſinations. See PONIARD.

The blade is uſually triangular, and ſo ſlender, that the wound it makes, is almoſt imperceptible.—The *ſtyletto* is ſtrictly prohibited in all well diſciplined ſtates.

STYLITES, ΣΤΥΛΙΤΗΣ, an appellation given to a kind of ſolitaries, who ſpend their life ſeated on the tops of columns, to the better diſpoſed for meditation, &c. See HERMIT, ANACHORET, &c.

Of theſe, we find ſeveral mentioned in ancient writers, and even as low as the eleventh century. The founder of the order was St. Simeon *Stylites*, a famous anachoret in the fifth century; who firſt took up his abode on a column ſix cubits high; then on a ſecond of twelve cubits; a third of twenty two; and at laſt on another of thirty ſix, where he lived ſeveral years.

The extremities of theſe columns were only three foot in diameter, with a kind of rail or ledge about, that reached almoſt to the girdle, ſomewhat reſembling a pulpit. There was no lying down in it.—The faquirs, or devout people of the eaſt, imitate this extraordinary kind of life to this day. See FAQUIR.

STYLOIDES, in anatomy, an apophyſis of the os petroſum, thus called from its reſembling a ſtyle or ſtylet.—See *Tab. Anat.* (Oſteol.) *fig.* 13. *lit. e.* See alſo the articles GRAPHOIDES and PETROSUM *Os*.

STYLOGLOSSUS, in anatomy, a pair of muſcles, running off ſharp and fleſhy, from the proceſſus ſtyloides; whence deſcending obliquely forwards, they are inſerted into the root of the tongue.—They ſerve to pull the tongue up in the action of deglutition.

STYLOHYOIDEUS, in anatomy, a pair of muſcles ſpringing from the proceſſus ſtyloides, and inſerted into the baſis and horns of the os hyoides; which it draws laterally upwards.

STYLOPHARYNGEUS, in anatomy, a pair of muſcles ariſing round and fleſhy, from the proceſſus ſtyloides; and which, in its oblique deſcent becomes thicker, and is afterwards expanded on the back parts of the fauces.—It ſerves to draw up, and dilate the pharynx.

STYPTIC, ΣΤΥΠΤΙΚΟΝ, in medicine, *aſtringent*; a remedy that has the virtue of ſtopping blood, or of binding up the aperture of a wounded veſſel. See BLOOD and ASTRINGENT.

The ſervice, nettle, Solomon's ſeal, &c. are *ſtyptics*.—There are various *ſtyptic* waters, and powders of great efficacy, in moſt of which, vitriol is the principal ingredient. See VITRIOL and WATER.

The uſual *ſtyptic* water is made of colcothar calcined, or vitriol diſſolved with burnt allum, ſugar-candy, the urine of a young man, &c.

Dr. Colbatch's *ſtyptic* powder has been famed; though Mr. Cowper, in the *Philoſophical Tranſactions*, gives us a number of inſtances, wherein it was applied with very little or ill ſucceſs in human ſubjects: but he gives us others made in dogs, where it anſwered well.

M. Tournefort obſerves, from the analyſis he has made of *ſtyptic* and aſtringent plants, that acids and earths prevail therein; though ſome of them yield an urinous ſpirit. On this principle, he aſſerts, that their ſalt is analogous to allum, and that there is ſomewhat of ſal ammoniac in their texture.—But Chomel notes, that this does not hold univerſally.

STYRAX, ΣΤΥΡΑΞ, in medicine. See STORAX.

SUB, a Latin prepoſition ſignifying *under*, or *below*; frequently uſed, in compoſition, in our language.—*E. gr.*

SUB-BRIGADIER, an officer in the cavalry, who commands under the brigadier; aſſiſting him in the diſcharge of his functions. See BRIGADIER.

SUB-CHANTOR, an officer in the choir, who officiates in the abſence of the chantor, &c. See CHANTOR.

SUB-DEAN, a dignity in certain chapters beneath the dean. See DEAN.

SUB-PRIOR, a clauſtral officer, who aſſiſts the prior, &c. See PRIOR.

SUB-DEACON, an inferior miniſter, who anciently attended at the altar, prepared the ſacred veſſels, &c. and was inveſted with the firſt of the holy orders. See ORDER.

According to the canons, a perſon muſt be twenty two years of age, to be promoted to the order of *ſub-deacon*. See DEACON.

It is diſputed among the Romaniſts, whether the ſub-deaconhood be a ſacrament or not; in regard *ſub-deacons* are ordained without impoſition of hands, and that there is no mention made of them in ſcripture. Yet Bellarmin holds the affirmative ſide of the queſtion.

By the papal canons, a married man may be ordained *ſub-deacon*; upon condition his wife conſent to it, make a vow of continence, and ſhut herſelf up in a monaſtery.

SUBALTERN *, a ſubordinate officer, or one who diſcharges his poſt under the command, and direction of another. See OFFICER.

* The word is formed from the Latin, *ſub*, and *alter*, another.

Such are lieutenants, ſub-lieutenants, cornets and enſigns, who ſerve under the captain. See LIEUTENANT, &c.

We alſo ſay, *ſubaltern* courts, juriſdictions, &c.—Such are thoſe of inferior lords, with regard to the lord paramount; hundred courts, with regard to county courts, &c.

For the *ſubaltern* perſons in an epic poem, F. Boſſu obſerves, there is no neceſſity to be very ſtrict in preſerving every one's character. See CHARACTER and PERSON.

The patriarchs, M. St. Evremont tells us, had ſeveral wives, who did not all hold the ſame rank; but there were ſeveral *ſubaltern* to the principal wife.

SUBALTERN *genus*. See the article GENUS.

SUBCLAVIAN, SUBCLAVIUS, is applied to any thing under the arm-pit, or ſhoulder; whether artery, nerve, vein, or muſcle.

SUBCLAVIUS, more particularly denotes a muſcle which ariſes from the lower ſide of the clavicula, near the acromium; and deſcends obliquely to be inſerted into the upper part of the firſt rib, near the ſternum.—See *Tab. Anat.* (Myol.) *fig.* 2. *n.* 9.

SUBCONTRARY *poſition*, in geometry, is when two ſimilar triangles are ſo placed, as to have one common angle, V, (*Tab. Geom. fig.* 44.) at the vertex, and yet their baſes not parallel.

If the ſcalenous cone BVD be ſo cut by the plane CA, as that the angle at C=D; the cone is then ſaid to be cut *ſubcontrarily* to its baſe BD.

SUBCUTANEUS, in anatomy, a thin membranous muſcle, running under the ſkin, called alſo *quadratus genæ*, and *platyſma myoides*. See QUADRATUS.

It ariſes with a pretty broad origin, from the hind part of the neck, and from the pectoral muſcle below the clavicle. It adheres firmly to the panniculus carnoſus; from which it is not ſeparated without difficulty, and therefore was not anciently diſtinguiſhed from it; and is inſerted, obliquely, on each ſide, into the lower jaw-bone near the ſkin, lips, and ſometimes the bottom of the noſe; all which parts it draws downwards and a-wry.

A convulſion herein is called a *ſpaſmus cynicus*.—In ſome perſons, it reaches to the ears, and in others not; which is the reaſon ſome folks have a faculty of moving their ears, which others want. See EAR.

SUBDUCTION, in arithmetic, the ſame as ſubſtraction. See SUBSTRACTION.

SUBDUPLE *ratio*, is when any number or quantity is contained in another, twice.—Thus 3 is ſaid to be *ſubduple* of 6, and 6 is duple of 3. See RATIO and DUPLE.

SUBJECT, SUBDITUS, a perſon under the rule and dominion of a ſovereign prince, or ſtate. See GOVERNMENT, &c.

Of *ſubjects*, ſome are ſo by birth, others by acts of naturalization. See NATIVE, ALIEN, DENIZEN, NATURALIZATION, &c.

Anciently the lords called, abuſively, thoſe who held lands or fees of them, or owed them any homage, *ſubjects*. See VASSAL.

SUBJECT, SUBJECTUM, is alſo uſed for the matter of an art, or ſcience; or that which it conſiders, or wherein it is employed.—Thus the human body is the *ſubject* of medicine. See OBJECT.

In this ſenſe, anatomiſts call the body they are diſſecting, and whereon they read lectures, their *ſubject*. See BODY, &c.

The *ſubject* of logic, is thinking, or reaſoning: but more particularly, in a ſyllogiſm, one of the terms of a propoſition is called the *ſubject*, and the other the *attribute*. See PROPOSITION, ATTRIBUTE, &c.

In poetry, the *ſubject* is the matter treated of; the event related, or ſet to view, and inriched with ornaments.

SUBJECT alſo denotes the ſubſtance or matter to which an accident is added. See ACCIDENT.

It is a maxim, that two contraries can never ſubſiſt in the ſame *ſubject*.

SUBJECTIVE *part*. See the article PART.

SUBJUNCTIVE, in grammar, the fourth mood, or manner of conjugating verbs; thus called, becauſe uſually ſubjoined to ſome other verb, or at leaſt to ſome other particle, as, *If I loved: though this were true*, &c. See MOOD.

The Greek is almoſt the only language that properly has any *ſubjunctive* mood; though the French, Spaniſh, and Italian, have ſome ſhew thereof.—In all other languages, the ſame inflexions ſerve for the optative, and the *ſubjunctive* moods: for which reaſon, the *ſubjunctive* mood might be retrenched from the Latin, and thoſe other grammars; it not being the different ways of ſignifying, which may be very much multiplied, but the different inflexions, that conſtitute the different moods. See OPTATIVE, &c.

SUBLAPSARY, or *Infralapſary*, in theology, a term applied to ſuch as hold, that God having foreſeen the fall of

Adam, and in conſequence thereof, the loſs of mankind; reſolved to give a grace ſufficient for ſalvation to ſome, and to refuſe it to others. See GRACE and SUPRALAPSARY.

Sublapſary is uſed as ſynonymous with *infralapſary*; in oppoſition to *ſupralapſary*. See INFRALAPSARY, and SUPRALAPSARY.

SUBLIMATE, a chymical preparation, the baſis whereof is mercury, or quickſilver. See FLOWERS, and SUBLIMATION.

There are two kinds of *ſublimate*, *corroſive* and *ſweet*; which ſee under the article MERCURY.

Refining of gold by SUBLIMATE. See REFINING.

SUBLIMATION, SUBLIMATIO, in chymiſtry, an operation which differs little from diſtillation, excepting, that in diſtillation, only the fluid parts of bodies are raiſed; but in *ſublimation*, the ſolid and dry: and that the matter to be diſtilled may be either ſolid or fluid; but *ſublimation* is concerned only about ſolid ſubſtances. See DISTILLATION.

There is alſo another difference, namely, that rarefaction, which is of very great uſe in diſtillation, has hardly any room in *ſublimation*; for the ſubſtances which are to be ſublimed, being ſolid, are incapable of rarefaction; and ſo it is only impulſe can raiſe them.

However, it may not be improper to inquire a little more nicely into the reaſon of ſuch a diverſity in the elevation of bodies; why ſome do aſcend with a gentle heat, and others are not to be raiſed by the moſt vehement fire: and ſuch an enquiry will more properly come in here, becauſe this head contains all the buſineſs of volatility and fixation. See VOLATILITY, and FIXITY.

The cauſe of this elevation, and aſcent in the particles of bodies, is to be aſcribed to the fire; not only on account of impulſe, but of another property the fire has; namely, to inſinuate itſelf into all the interſtices of theſe bodies, and thereby break the coheſion of their parts, ſo that at laſt they become divided into very ſmall parts, if not into the ſmalleſt that art can reduce them into. See PARTICLE.

Particles thus ſeparated and divided, loſe much of their gravity. For the gravity of the ſame particle decreaſes in the ſame proportion as the cube of the diameter is leſſened. Suppoſe, therefore, a body, whoſe diameter is 12: if, then, its diameter be made leſs by 1, *viz.* 11, the gravity of that body will be only 9 ¼, or thereabouts: a body, therefore, by being divided into very minute corpuſcles, becomes eaſy to be ſublimed.

Add, that the ſurface of a body decreaſes in a very different manner from gravity, only as the ſquare of the diameter is leſſened. Where the gravity decreaſes, in ſuch a ſeries, as is expreſſed by the numbers 1728, 1331, 1000, the diminution of the ſurface will obſerve this proportion, *viz.* 144, 121, 100; and when, upon reducing the diameter to 6, the gravity becomes leſs than 2, the ſurface will ſtill amount to 36.

How much this contributes to a quick aſcent, will appear from the *ſublimation* of camphire, benzoin, and arſenic; whoſe particles, as they cohere but looſely, are, for that reaſon, diffuſed into a larger ſurface; upon which account they are the eaſieſt to be ſublimed of any: nay, theſe ſolid particles, upon account of their ſurface, will ſooner aſcend than ſome fluids.

So flower of ſulphur riſes ſooner than oil, not only than that of vitriol, but any other, though ever ſo light.

By this contrivance of nature, *viz.* that the gravity of bodies decreaſes in a triplicate, but their ſurface in a duplicate proportion of their diameters; it comes to paſs, that bodies, which have a very different gravity, may be raiſed with the ſame force. Thus the ſalts of animals, as of harts-horn, human blood, of vipers, *&c.* being compoſed of very minute corpuſcles, as is found by experience, in diſtilling them, do eaſily aſcend; becauſe the ſurface in them is not leſſened ſo much as the gravity is; and the ſalts of vegetables, as of tartar, balſam, *&c.* which are of a more cloſe texture, by reaſon of their larger ſurfaces, are without much difficulty raiſed.

The corpuſcles alſo of minerals and metals, though very compact and heavy, do, in ſome meaſure, give way to the fire, and are capable of being ſublimed. In all theſe inſtances, the breadth of the ſurface, which expoſes the particles more to the impetus of the fire, is the reaſon why they are raiſed with as much eaſe, as if their gravity had been leſſened, by diminiſhing their ſurface: ſo that particles, though ever ſo different in weight, may be equally raiſed by the ſame degree of heat, if the proportion of their gravity be reciprocal to that of their ſurfaces.

SUBLIME, in diſcourſe, ſomething extraordinary, and ſurprizing, which ſtrikes the ſoul, and makes a ſentiment or compoſition raviſh and tranſport.

This is what Longinus, who has wrote expreſly on the ſubject, means by *ſublime*.—The definition, indeed, is not his, but M. Boileau's; for the author writing his book after another of Cecilius on the ſame ſubject, employed almoſt wholly in ſhewing what the *ſublime* is, declined defining it, as ſuppoſing it well known.

By the definition, it may appear, that the *ſublime* is a very different thing from what the orators call the *ſublime ſtyle*. See STYLE.

The *ſublime* ſtyle neceſſarily requires big and magnificent words; but the *ſublime* may be found in a ſingle thought, a ſingle figure, a ſingle turn of words. A thing may be in the *ſublime* ſtyle, and yet not be *ſublime*, *i. e.* have nothing extraordinary and ſurprizing.

For inſtance: "The Almighty Author of the univerſe, with "a ſingle word, created light." This, now, is in the *ſublime* ſtyle, yet it is not *ſublime*, there being nothing extraordinary in it, which another perſon might not eaſily hit on. But in "God ſaid, let there be light, and there was light;" ſo extraordinary a turn of expreſſion, which ſhews the obedience of the creature to the orders of his creator, is truly *ſublime*, and has ſomething more in it than human.

Longinus makes five ſources of the *ſublime*. The firſt, a certain elevation of mind, which makes us think happily. The ſecond, is the pathetic, or that natural vehemence and enthuſiaſm, which ſtrikes and moves us: theſe two are owing almoſt wholly to nature, and muſt be born with us; whereas the reſt depend, partly, on art. The third is, the turning of figures in a certain manner, both thoſe of thoughts and of ſpeech. The fourth, nobleneſs of expreſſion, which conſiſts of two parts, the choice of words, and the elegant, figurative diction. The fifth, which includes all the reſt, is the compoſition and arrangement of the words in all their magnificence and dignity. See PATHETIC, *&c.*

SUBLIME *geometry*. See the article GEOMETRY.

SUBLIMING *pots*. See the article ALUDELS.

SUBLINGUAL *glands*, in anatomy, two glands under the tongue, placed one on each ſide thereof. See TONGUE.

Theſe, called alſo *hypoglottides*, filtrate a ſerous humour, of the nature of ſaliva, which they diſcharge by little ducts near the gums, into the mouth. See HYPOGLOTTIDES.

SUBMULTIPLE, in geometry, *&c.*—A *ſubmultiple* number or quantity, is that which is contained a certain number of times in another; and which therefore repeated a certain number of times, becomes exactly equal thereto.

Thus 3 is a *ſubmultiple* of 21.—In which ſenſe, a *ſubmultiple* coincides with an aliquot part. See ALIQUOT *part*.

SUBMULTIPLE *ratio*, is that between the quantity contained, and the quantity containing.—Thus the ratio of 3 to 21 is *ſubmultiple*. See RATIO.

In both caſes, *ſubmultiple* is the reverſe of multiple: 21, *e. gr.* being a multiple of 3, and rhe ratio of 21 to 3 a multiple ratio. See MULTIPLE.

SUBMULTIPLE *ſubſuperparticular*. } See RATIO.
SUBMULTIPLE *ſubſuperbipartiens*. }

SUBNORMAL, in geometry, a line which determines the point in the axis of a curve, where a normal or perpendicular, raiſed from the point of contact of a tangent to the curve, cuts the axis. See CURVE.

Or, the *ſubnormal* is a line, which determines the point where-in the axis is cut by a line falling perpendicularly on the tangent in the point of the contact.

Thus T M (*Tab. Conics*, fig. 19.) being a tangent to a curve in M; and M R a normal or perpendicular to the tangent; the line P R intercepted between the ſemiordinate P M and the normal M R, is called the *ſubnormal*.

Hence, 1°, In a parabola, as AM, *&c.* the *ſubnormal* PR is to the ſemiordinates PM, as PM is to PT, and MR to TM. 2°. In the parabola, the *ſubnormal* P R is ſubduple the parameter; and, conſequently, an invariable quantity.

SUBORDINATED, and SUBORDINATING *affections*. See AFFECTIONS.

SUBORDINATION, a relative term, expreſſing the degree of inferiority between one thing and another.

There is a ſeries of *ſubordinations* running throughout all nature. In the church there are ſeveral degrees of *ſubordination*, as of deacons to prieſts; prieſts to prelates, *&c.*—The like are obſervable in the ſecular ſtate; in offices of war, juſtice, *&c.* and even

In the ſciences, trigonometry is *ſubordinate* to geometry; and in the virtues, abſtinence and chaſtity are *ſubordinate* to temperance: in muſic, ſome call the plagal tones, *ſubordinate tones*. See TONE.

SUBORNATION, SUBORNATIO, a ſecret or underhand preparing, inſtructing or bringing in, a falſe witneſs; or corrupting or alluring a perſon to do ſuch a falſe act. See WITNESS, EVIDENCE, *&c.*

Hence, the *ſubornation* of perjury, mentioned in the act of general pardon, 12 Car. II. c. 8. is the alluring or diſpoſing to perjury. See PERJURY.

SUBPŒNA *, a writ, whereby any perſon under the degree of peerage, is called to appear in chancery, in caſes where the common law hath made no proviſion.

* The name is taken from the words in the writ, which charge the party ſummoned to appear at the day and place aſſigned, *ſub pœna centum librarum*, on the penalty of an hundred pounds.

The peers, in the like caſes, are called by the lord chancellor's letter, giving notice of the ſuit intended againſt them, and requiring them to appear.

There is alſo a *ſubpœna ad teſtificandum*, for ſummoning of witneſſes in other courts, as well as in chancery.

There is alſo a *ſubpœna* in the exchequer, as well in the court of equity there, as in the office of pleas.

SUBPOPLITÆUS, in anatomy. See Poplitæus.

SUBREPTION *, Subreptio, the act of obtaining a favour from a ſuperior by ſurprize, or a falſe repreſentation. See Subreptitious.

* The word is formed from the Latin, *ſub*, under, and *repo*, I creep.

Subreption differs from *obreption*, in that the latter denotes a falſe expreſſion of the quality of a thing, or fact, *&c.* And *ſubreption*, a want of expreſſion, or a fraudulent reticency or concealment of a thing, which would have rendered the obtaining of the favour more difficult. See Obreptitious.

SUBREPTITIOUS or Surreptitious, a term applied to a letter, licence, patent, or other act, fraudulently obtained of a ſuperior, by concealing ſome truth, which had it been known, would have prevented the conceſſion or grant. See Subreption.

The benefit of letters, licences, *&c.* is forfeited, when they are found contrary to the informations given; they being then reputed *ſubreptitious*.

Papal bulls and ſignatures are null and *ſubreptitious*, when the true ſtate of the benefice, the manner of the vacancy, and other neceſſary matters, are not juſtly ſignified to the pope.

SUBROGATION, or Surrogation, in the civil law, the act of ſubſtituting a perſon in the place, and intitling him to the rights of another. See Surrogate and Substitution.

In its general ſenſe, *ſubrogation* implies a ſucceſſion of any kind; whether of a perſon to a perſon, or of a perſon to a thing.

There are two kinds of *ſubrogation*; the one *conventional*, the other *legal*.

Conventional Subrogation, is a contract, whereby a creditor transfers his debt, with all appurtenances thereof, to the profit of a third perſon.

Legal Subrogation, is that which the law makes in favour of a perſon, who diſcharges an antecedent creditor; in which caſe there is a legal tranſlation of all rights of the ancient creditor to the perſon of the new one.

This the civilians more uſually call *ſucceſſion*, as being wholly the work of the law, and to diſtinguiſh it from the conventional *ſubrogation*, which they alſo call *ceſſion*. See Cession.—The word is formed from the Latin, *ſubrogatio*, of the verb *rogare*, which, among the ancient Romans, ſignified to aſk, to interrogate; whence it was, that they called the laws themſelves *rogationes*, in regard the people made them, upon being aſked by the magiſtrates.—And as laws made by the people could not be changed without their conſent, and without being aſked a-new; if they thought good to have the law wholly aboliſhed, *lex abrogabatur*; if only a part of it were to be aboliſhed, *lex derogabatur*; and if any clauſe or amendment were added to it, *lex ſubrogabatur*.

The new magiſtrates were alſo *ſubrogated* in the place of the old ones: for during the time of the republic, no magiſtrate could be, but by conſent of the people, nor, of conſequence, but by law; ſince whatever the people thought good, was law.—This is what occaſioned Salmaſius to ſay, that *ſubrogare* and *ſubſtituere per legem*, were reciprocals.

SUBSCAPULARIS, in anatomy, a muſcle ariſing from the baſis and ſide of the ſcapula; and, ſpreading itſelf under the whole convex, or under ſide of it, is inſerted by a ſemicircular tendon, into the neck of the os humeri, and draws it down to the ſide of the trunk.—See *Tab. Anat.* (Myol.) fig. 1. n. 16.

SUBSCRIPTION, the ſignature put at the bottom of a letter, writing, or inſtrument. See Signature.

In church hiſtory, we meet with inſtances of *ſubſcriptions* wrote in the blood of Jeſus Chriſt. Nicetas, in the life of Ignatius, ſpeaking of the *ſubſcriptions* made at the council, wherein that patriarch was depoſed, ſays, they *ſubſcribed*, not with common ink, but what ſtrikes a man with horror, with a pen dipped in the blood of Chriſt. The hiſtorian Theophanes, tells us, that pope Theodore mixed the blood of Chriſt with the ink, wherein he wrote the depoſition of Pyrrhus.

Subscription, in the Engliſh commerce, is uſed for the ſhare, or intereſt, which particular perſons take in a public ſtock, or a trading company, by writing their names, and the ſhares they require, in the books or regiſter thereof. See Company, Bubble, Fund, *&c.*

The French have likewiſe adopted the word *ſubſcription*; uſing it in ſpeaking of the actions of their India company.

A *ſubſcription* differs from an *action*; in that the firſt is properly only an action begun, or an engagement, by making the firſt payment, to acquit the reſt in the time limited; and that the other is the whole action, performed in all its parts. See Action.

Subscription, in the commerce of books, ſignifies an engagement to take a certain number of copies of a book going to be printed; and a reciprocal obligation of the bookſeller or publiſher, to deliver the ſaid copies, on certain terms. The uſual conditions of theſe *ſubſcriptions* are, on the part of the bookſeller, to afford the books cheaper to a ſubſcriber than to another, by one third or one fourth of the price; and on the part of the latter, to advance half the money in hand, and to pay the reſt on the delivery of the copies: an agreement equally advantageous to the one and the other; as the bookſeller is hereby furniſhed with money to carry on works, which would otherwiſe be above his ſtock; and the ſubſcriber, receives, as it were, intereſt for his money, by the moderate price the book ſtands him in.

Subſcriptions had their riſe in England, and it is but very lately that they are got into other countries. They were firſt ſet on foot, in the middle of the laſt century, for the printing of Walton's *Polyglott bible*, which is the firſt book ever printed by way of *ſubſcription*.

From England, they paſſed a few years ago into Holland, and are juſt now introduced into France. F. Montfaucon's *collection of antiquities*, is the firſt book there publiſhed by *ſubſcriptions*, which were ſo very numerous, that great numbers were refuſed. The ſame method has been ſince propoſed, for the publication of S. Chryſoſtom by the Benedictines; but not with equal ſucceſs.

All the other books ſince printed in France by *ſubſcription*, are M. Dacier's *Tranſlation of Plutarch's lives*; *the Deſcription of Verſailles*, and F. Daniel's *Hiſtory of the French militia*. In England, they are become exceedingly frequent; and their frequency has rendered them liable to ſome abuſes, which begin to diſcredit them.

SUBSEQUENT, ſomething that comes after another, particularly with regard to the order of time. See Posterior, *&c.*

When two feſtivals happen on the ſame day, the principal one is celebrated; and the other transferred to the *ſubſequent* day. *i. e.* to the morrow.

SUBSESQUIALTERATE. See the article Ratio.

SUBSIDY, Subsidium, in law, any aid, tax, or tribute granted, by authority of parliament, to the king, on preſſing occaſions of the ſtate; levied on the ſubjects, according to their ſeveral abilities, or the yearly produce of their lands, goods, *&c.* See Tax.

Such is the land tax, or royal aid, as it is called; which is uſually at the rate of two, three, or four ſhillings in the pound, for lands; and of two ſhillings and eight pence for goods, and perſonal eſtate, when of four ſhillings for lands. See Aid, *&c.*

The ancient Saxon kings had no *ſubſidies* collected after the manner of ours; but in lieu thereof, had ſeveral cuſtoms, whereby they levied money or perſonal ſervice on the people, for the repairing of cities, caſtles, bridges, military expeditions, *&c.* which they called *burgbote*, *brigbote*, *herefare*, *heregeld*, &c.

But upon the land's becoming oppreſſed by the Danes, king Ethelred in the year 1007, agreed to pay them yearly 10000 *l.* for redemption of peace; which ſum was afterwards increaſed to 36000 *l.* and at length to 48000 *l.* which was called *Danegeld*, and was levied on land; each hide, or ploughland, that of the church only excepted, being ceſſed 12 *d.* See Danegeld.

Hence the tribute came to be called *hidage*, a name that afterwards became common to all taxes and *ſubſidies* impoſed on lands; as thoſe on cattle were called *hornegeld*. See Hidage.

Both theſe the Normans ſometimes called *taxes*, from the Greek ταξις, order; ſometimes from their own language, *taillage*; and ſometimes, according to the cuſtom beyond-ſea, *ſubſidia*, and *auxilia*. See Auxilium.

After the conqueſt, theſe *ſubſidies* ſeem to have been granted differently from what they now are; as every ninth lamb, every ninth fleece, every ninth ſheep, *&c.* Sometimes the rate was every tenth, and ſometimes every fifteenth, *&c.* See Fifteenth, *&c.*

In France, the king alone, by his own authority, impoſes *ſubſidies* on his people, at his own diſcretion. What Grotius ſays, that thoſe who pay *ſubſidies* to other ſovereigns, to ingage them in their defence againſt powerful enemies, by ſo doing, acknowledge their own weakneſs, and that ſuch an acknowledgment diminiſhes ſomewhat of their dignity; muſt be underſtood of ſuch ſtates as are too weak to defend themſelves, and who, in reſpect hereof, render themſelves in ſome meaſure, tributary; not of ſuch as ſubſiſting by their own ſtrength, give *ſubſidies* to their weaker neighbours, to prevent their being over-run by others.

Such, *e. gr.* as the kings of England and France, are with regard to Sweden and ſeveral other princes; to whom they generally grant *ſubſidies* in the treaties they conclude with them.

In the liſt of Engliſh duties, or impoſitions, are divers kinds of *ſubſidies*: old *ſubſidy*, additional impoſition to the old *ſubſidy*, new *ſubſidy*, third *ſubſidy*, two-thirds *ſubſidy*. See Duty, Custom, *&c.*

SUBSTANCE, Substantia, ſomething that we conceive to ſubſiſt of itſelf, independantly of any created being, or any particular mode or accident. See Ens.

Thus a piece of wax is a *ſubſtance*; becauſe we can conceive it as ſubſiſting of itſelf, and of its own nature, without any dependance on any other created nature, or without any particular mode, form, colour, *&c.* See MODE.

Spinoſa maintains, that there is but one only *ſubſtance* in nature, whereof all created things are ſo many different modifications; and thus he makes the ſoul of the ſame *ſubſtance* with the body. The whole univerſe, according to him, is but one *ſubſtance*; which *ſubſtance*, he holds endowed with an infinity of attributes, in the number of which are thinking and extenſion. All bodies are modifications of this *ſubſtance*, conſidered as extended; and all ſpirits modifications of the ſame *ſubſtance*, conſidered as thinking. See BODY and THINKING. See alſo SPINOSISM.

Mr. Lock's philoſophy of *ſubſtances*, is more orthodox: our ideas of *ſubſtance*, that great author obſerves, are only ſuch combinations of ſimple ideas, as are taken to repreſent diſtinct things, ſubſiſting by themſelves; in which the confuſed idea of *ſubſtance*, is always the chief. Thus the combination of the ideas of a certain figure, with the powers of motion, thought, and reaſoning, joined to *ſubſtance*, make the ordinary idea of man; and thus the mind obſerving ſeveral ſimple ideas to go conſtantly together, which being preſumed to belong to one thing, or to be united in one ſubject, are called by one name; which we are apt, afterwards, to talk of and conſider as one ſimple idea. See IDEA.

We imagine the ſimple ideas do not ſubſiſt by themſelves; but ſuppoſe ſome ſubſtratum, wherein we ſubſiſt, which we call *ſubſtance*.

The idea of pure *ſubſtance*, is nothing but the ſuppoſed, yet unknown ſupport of thoſe qualities which are capable of producing ſimple ideas in us. See QUALITY.

The ideas of particular *ſubſtances* are compoſed out of this obſcure and general idea of *ſubſtance*, together with ſuch combinations of ſimple ideas, as are obſerved to exiſt together, and ſuppoſed to flow from the internal conſtitution, and unknown eſſence of that *ſubſtance*.

Thus we come by the ideas of man, horſe, gold, *&c.* Thus the ſenſible qualities of iron, or a diamond, make the complex idea of thoſe *ſubſtances*, which a ſmith, or a jeweller, commonly knows better than a philoſopher. See DEFINITION.

The ſame happens concerning the operations of the mind, *viz.* thinking, reaſoning, *&c.* which we concluding not to ſubſiſt by themſelves, nor apprehending how they can belong to body, or be produced by it, we think them the actions of ſome other *ſubſtance*, which we call *ſpirit*; of whoſe *ſubſtance* or nature we have as clear a notion, as of that of body; the one being but the ſuppoſed ſubſtratum of the ſimple ideas we have from without; as the other of thoſe operations, which we experiment in ourſelves within: ſo that the idea of corporeal *ſubſtance* in matter, is as remote from our conceptions, as that of ſpiritual *ſubſtance*.

Hence we may conclude, that he has the perfect idea of any particular *ſubſtance*, who has collected moſt of thoſe ſimple ideas which exiſt in it; among which, we are to reckon its active powers and paſſive capacities, though not ſtrictly ſimple ideas.

Subſtances are generally diſtinguiſhed by ſecondary qualities; for our ſenſes fail us in the diſcovery of primary ones, as the bulk, figure, texture, *&c.* of the minute parts of bodies, on which their real conſtitutions and differences depend. See PARTICLE.—And ſecondary qualities are nothing but powers, with relation to our ſenſes.

The ideas that make our complex ones of corporeal *ſubſtances*, are of three ſorts: Firſt, the ideas of primary qualities of things, which are diſcovered by our ſenſes; ſuch as bulk, figure, motion, *&c.* Secondly, the ſenſible ſecondary qualities, which are nothing but powers to produce ſeveral ideas in us, by our ſenſes. Thirdly, the aptneſs we conſider in any *ſubſtance*, to cauſe or receive ſuch alterations in its primary qualities, as that the *ſubſtance* ſo altered, ſhould produce in us different ideas from what it did before.

Beſides the complex ideas we have of material *ſubſtances*, by the ſimple ideas taken from the operations of our own minds, which we experiment in ourſelves, as thinking, underſtanding, willing, knowing, *&c.* co-exiſting in the ſame *ſubſtance*; we are able to frame the complex idea of a ſpirit: and this idea of an immaterial *ſubſtance*, is as clear, as that we have of a material. See SPIRIT.

By joining theſe with *ſubſtance*, of which we have no diſtinct idea, we have the idea of ſpirit: and by putting together the ideas of coherent ſolid parts, and a power of being moved, joined with *ſubſtance*, of which likewiſe we have no poſitive idea; we have the idea of matter. See MATTER.

Further, there are other ideas of *ſubſtances*, which may be called *collective*, which are made up of any particular *ſubſtances*, conſidered as united into one idea; as a troop, army, *&c.* which the mind does by its power of compoſition. Theſe collective ideas, are but the artificial draughts of the mind, bringing things remote, and independent, into one view, the better to contemplate and diſcourſe of them united into one conception, and ſignified by one name. For there are no things ſo remote, which the mind cannot, by this art of compoſition, bring into one idea; as is viſible in that ſignified by the name *univerſe*. See COMPOSITION.

Such is the generally received doctrine of *ſubſtance*: but Bp. Berkeley, in his *Principles of human knowledge*, and Mr. Collier, in his *Clavis Univerſalis*, have made great refinements thereon. See BODY, EXISTENCE and EXTERNAL.

SUBSTANTIAL, or SUBSTANCIAL, in the ſchools, ſomething belonging to the nature of *ſubſtance*. See SUBSTANCE and CONSUBSTANTIAL.

It is generally diſputed, whether or no there be ſuch things as *ſubſtantial* forms? i. e. forms independant of all matter; or forms that are ſubſtances themſelves. See FORM.

SUBSTANTIAL is alſo uſed in the ſame ſenſe with *eſſential*; in oppoſition to *accidental*: in which relation it gives room for abundance of diſtinguo's. See ESSENTIAL and ACCIDENTAL.

SUBSTANTIVE, in grammar, is a quality aſcribed to a noun or name, when the object it denotes is conſidered ſimply, and in itſelf, without any regard to its qualities. See NOUN.

When the object is conſidered, as clothed with certain qualities, the noun is ſaid to be *adjective*. See ADJECTIVE.

For a more palpable criterion; all nouns, to which one cannot add the word *thing*, are *ſubſtantives*; and all thoſe to which *thing* may be added, are adjectives.

F. Buffier obſerves, it is a common miſtake in grammarians, to define a noun *ſubſtantive*, to be that which denotes a ſubſtance.—The miſtake ariſes hence, that finding all ſubſtances expreſſed by *ſubſtantives*, they have called all kinds of nouns, *ſubſtantives*. But it does not follow, that all nouns deſign ſubſtances; witneſs the nouns *accident*, *lightneſs*, &c. which are far from expreſſing ſubſtances, and yet are true nouns *ſubſtantives*.—Perhaps grammarians mean nothing here by *ſubſtance*, but the ſubject ſpoke of: if ſo, the definition is not amiſs.

Nouns *ſubſtantives* ſometimes become adjectives; and nouns adjectives become *ſubſtantives*. In effect, the nature of the adjective being to expreſs the quality of an object; if that quality be the object itſelf ſpoke of, then, on the foot of our definition, it becomes a *ſubſtantive*.—If, I ſay, a *good prince*, the word *good* is apparently an adjective, becauſe it repreſents the prince as clothed with the quality of goodneſs. But if I ſay, the *good* ought to be preferred to the bad; it is evident, *good* is the ſubject ſpoke of, and, conſequently, a *ſubſtantive*. Indeed, cuſtom does not allow us to uſe all adjectives indifferently, as *ſubſtantives*; nor all *ſubſtantives*, as adjectives. The laws obſerved herein are as follow:

All nouns either ſignify an individual, as Socrates, Alexander, *&c.* or a ſpecies; as man, horſe, *&c.* or an eſſential quality, as rational, material, *&c.* or an accidental one, as black, white, good, fair, *&c.* or a dignity, office, art, *&c.* as king, preſident, philoſopher, *&c.*

Thus have we four kinds of nouns; whereof the firſt is very rarely taken adjectively; for as they ſignify individuals or particular beings, they can ſcarce be applied to any thing but the thing they properly ſignify: yet we have ſometimes known the name of Cato taken adjectively; as, "this is to be Ca-"to, indeed." Nor does Malherbe ſcruple to ſay in French "plus Mars que le Mars de la Thrace." Add that proper "names are ſometimes converted into the name of dignities, *&c.* as Cæſar, Auguſtus, *&c.* In which caſe, they may be conſidered, in the ſame light, as nouns of the fourth kind.—Nouns of the ſecond kind, are alſo ſometimes taken adjectively, as "he is much a man," *&c.* The third kind are adjectives of themſelves. For the fourth kind, all grammarians rank them among *ſubſtantives*; excepting F. Buffier who will have them to be adjectives; or, to uſe his own term, modificatives. Be that as it will, they are frequently uſed adjectively, "he is more a king, and more a philoſo-"pher, than any of his predeceſſors."

Now for adjectives taken *ſubſtantively*, 1° Participles paſſive, are very rarely thus taken; though we ſometimes ſay, "the "loved are leſs happy than the lovers; the taught have the "advantage of the untaught: the beſieged made a ſalley," *&c.* And, 2° Participles active are taken ſtill more rarely for *ſubſtantives*. We ſcarce ever, *e. gr.* ſay "the loving, "the reading;" but "the lover, the reader:" yet we ſay, "the ſtudent, the proteſtant, the tenant, the appellant, the "opponent," *&c.*—3° For nouns adjectives, thoſe applied to men are not only uſed *ſubſtantively*, but are even become *ſubſtantives* by uſe; whether they be ſuch as regard religion; as "chriſtian, pagan, mahometan," *&c.* or opinion; as "ſtoic, peripatetic, carteſian," *&c.* or country; as "the Engliſh, French, Italians:" or temperament; as "the "melancholic, phlegmatic, choleric," *&c.* Under the ſame rule, are likewiſe comprehended abundance of adjectives, ſignifying a number of people agreeing in ſome common attribute; as, "the learned, the great, the devout, the "brave, the diſſolute," *&c.* But uſe is here to be regarded; for we do not ſay "the elegant," as we ſay "the "learned;" but "elegant writers," *&c.* It is cuſtom, and the ear alone, that are to decide about theſe differences.

Again, adjectives taken *ſubſtantively*, for other things beſide men, are either ſo uſed, to ſignify a number or ſet of things that have ſome common quality; or to expreſs an abſtract quality. In both which, as in thoſe of men, there are ſome authorized by cuſtom, and others formed every day on their model.

With regard to which laſt, uſe, again, and the ear, are to decide. Here all the adjectives of colours, are uſed *ſubſtantively*; as "the white, black, green," *&c.* Some of thoſe of qualities; "as "the cold," *&c.* thoſe of time; as "the "paſt, preſent, future:" and many of other matters; as "the agreeable, the ſublime, the principal," *&c.* Nor is it only in the poſitive, but alſo in the comparative and ſuperlative degrees, that adjectives are uſed *ſubſtantively*; as "the "better of the two: the beſt of it," *&c.*

SUBSTANTIVE *verb.* See the article VERB.

SUBSTITUTE*, SUBSTITUTUS, a perſon appointed to officiate for another, in caſe of abſence, or other legal impediment. See ATTORNEY, and SURROGATE.

* The word is formed from the Latin, *ſub*, under, and *ſtatuo*, I appoint, eſtabliſh.

In the French law, the procureurs, or proctors, are obliged to name two of their brethren for *ſubſtitutes*, whoſe names are wrote after theirs in the liſt; to receive ſignifications and ſummons's made in their abſence. See PROCURATOR, *&c.*

SUBSTITUTE, in medicine, denotes a drug, or remedy that may be uſed in lieu of another; or that ſupplies the place of another of like virtue, which is not to be had: called alſo *ſuccedaneum.* See SUCCEDANEUM.

The root of the great centaury, and ſometimes the rhaponticum, are uſed as *ſubſtitutes* to rhubarb. See RHUBARB.

SUBSTITUTION, in grammar, the uſing of one word for another; or one mode, ſtate, perſon or number of a word for another.—This the grammarians otherwiſe call *ſyllepſis.* See SYLLEPSIS.

SUBSTITUTION, in the civil law, a diſpoſition of a teſtator, whereby he ſubſtitutes one heir to another, who has only the uſufruit, and not the property of the thing left him.

Subſtitution is a kind of fiduciary inheritance, called alſo *fidei commiſſio*, in regard the immediate inheritor has only the uſe or produce of the thing; the body thereof being ſubſtituted and appropriated to certain perſons, who are likewiſe to have the uſufruit in their turns, but never the property.

In ſome countries, *ſubſtitution* is perpetual; in France, it only holds to the fourth generation.—*Subſtitution* anſwers to *remainder*, in common law. See REMAINDER.

Among the Romans, there were abundance of theſe fiduciary heirs; who enjoyed inheritances, till they returned them into the hands of the right heir: and the reaſon why they did not likewiſe reſtore the fruits, or that the fruits were not deemed to make a part of the inheritance, but only of the thing, was, that the fiduciary or truſtee was obliged to run the riſks, and to ſtand the charge of the culture of the land.

SUBSTITUTION, in algebra, *&c.* is the putting in the room of any quantity in an equation, ſome other quantity, which is equal to it, but expreſſed after another manner. See QUANTITY, and EQUATION.

SUBSTRACTION, or SUBTRACTION, in arithmetic, the ſecond rule, or rather operation, in arithmetic; whereby we deduct a leſs number from a greater, to learn the preciſe difference:

Or, more juſtly, *ſubſtraction* is the finding a certain number from two homogeneous ones given; which, with one of the given numbers, is equal to the other. See ARITHMETIC.

The doctrine of *ſubſtraction* is reducible to what follows:

To SUBSTRACT *a leſs number from a greater.*—1° Write the leſs number under the greater, in ſuch manner, as that homogeneous figures anſwer to homogeneous, *i. e.* unites to unites, tens to tens, *&c.* as directed under ADDITION. 2° Under the two number, draw a line. 3° *Subſtract*, ſeverally, unites from unites, tens from tens, hundreds from hundreds; beginning at the right-hand, and proceeding to the left; and write the ſeveral remainders in their correſpondent places, under the line. 4° If a greater figure come to be *ſubſtracted* from a leſs; borrow an unite from the next left-hand place; this is equivalent to 10, and added to the leſs number, the *ſubſtraction* is to be made from the ſum: or if a cypher chance to be in the next left-hand place, borrow the unite from the next further place.

By theſe rules, any number may be *ſubſtracted* out of another greater. For example;

If it be required, from 9800403459
To *ſubſtract* 4743865263

The remainder will be found 5056538196

For, beginning with the right-hand figure, and taking 3 from 9, there remains 6 unites, to be wrote underneath the line: going then to the next place, 6 I find, cannot be taken from 5; wherefore, from the place of hundreds 4, I borrow 1, which is equivalent to 10, in the place of tens; and from the ſum of this 10 and 5, *viz.* 15, *ſubſtracting* 6, I find 9 tens remaining, to be put down under the line. Proceeding to the place of hundreds, 2 with the 1 borrowed at the laſt, make 3, which *ſubſtracted* from 4, leave 1. Again, 5 in the place of thouſands, cannot be *ſubſtracted* from 3; for which reaſon, taking 1 from 4, in the place of hundreds of thouſands, into the empty place of tens of thouſands, the cypher is converted into 10 tens of thouſands, whence one 10 being borrowed, and added to the 3, and from the ſum 13 thouſand, 5 thouſand being ſubſtracted, we ſhall have 8 thouſand to enter under the line: then ſubſtracting 6 tens of thouſands from 9, there remain 3. Coming now to take 8 from 4; from the 8 further on the left, I borrow 1, by means whereof, the two cyphers will be turned each into 9. And after the like manner is the reſt of the *ſubſtraction* eaſily performed.

If heterogeneous numbers be to be ſubſtracted from each other; the unites borrowed are not to be equal to ten; but to ſo many as there go of unites of the leſs kind, to conſtitute an unite of the greater: for example;

l.	*s.*	*d.*
45	16	6
27	19	9
17	16	9

For ſince 9 pence cannot be ſubſtracted from 6 pence; of the 16 ſhillings, one is converted into 12 pence; by which means, for 6 we have 18 pence; whence 9 being ſubſtracted, there remain 9. In like manner, as 19 ſhillings cannot be ſubtracted from the remaining 15; one of the 45 pounds is converted into 20 ſhillings, from which, added to the 15, 19 being ſubtracted, the remainder is 16 ſhillings. Laſtly, 27 pounds ſubtracted from 44 pounds, there remains 17.

If a greater number be required to be ſubtracted from a leſs, it is evident the thing is impoſſible.—The leſs number, therefore, in that caſe, is to be ſubtracted from the greater; and the defect to be noted by the negative character. *E. gr.* If I am required to pay 8 pounds, and am only maſter of 3; when the 3 are paid, there will ſtill remain 5 behind; which are to be noted,—5.

Subſtraction is proved, by adding the remainder to the ſubtrahend, or number to be ſubſtracted: for if the ſum be equal to the number whence the other is to be ſubſtracted, the *ſubſtraction* is juſtly performed.—For example;

		l.	*s.*	*d.*	
9800403459		156	11	3 ¼	
4743865263	ſubtrahend	21	17	2 ½	ſubtrahend
5056538196	remainder	134	14	0 ¾	
9800403459		156	11	3 ¼	

SUBSTRACTION, in algebra, is performed by connecting the quantities with all the ſigns of the ſubtrahend changed; and at the ſame time uniting ſuch as may be united; as is done in addition. See ALGEBRA, QUANTITY, CHARACTER, and ADDITION.

Thus $+7a$ ſubſtracted from $+9a$, makes $+9a-7a$, or $2a$,

In the *ſubſtraction* of compound algebraic quantities; the characters of the ſubtrahend, are to be changed into the contrary ones, *viz.* + into —; and — into +. See QUANTITY.

To SUBSTRACT *ſpecious numbers, or quantities frome one another; both thoſe affected with the ſame, and thoſe with contrary characters.*—1° If the quantities deſigned by the ſame letter have the ſame ſigns; and the leſs to be ſubſtracted from the greater; the *ſubſtraction* is performed as in common arithmetic, *e. gr.*

$$\begin{array}{llll}
5b+4d-f & =5\,\textit{ſh.}+4\,p.-\tfrac{1}{4} \\
2b+d\;-f & =2\,\textit{ſh.}+1\,p.-\tfrac{1}{4} \\
\hline
3b\quad 3d-0 & \;\;3\,\textit{ſh.}+3\,p.\quad 0
\end{array}$$

2° If a greater quantity be to be ſubſtracted out of a leſs; the leſs muſt be ſubſtracted out of the greater, and to the remainder muſt be prefixed the ſign —, if the quantities be affected with the ſign +; or the ſign +, if they be affected with —.

$$\begin{array}{llll}
16a+2b-9d & =16\,\textit{lib.}+2\,\textit{ſh.}-9\,d. \\
19a+3b-11d & \;\;19\quad +3\quad -11 \\
\hline
-3a-1b+2 & \;\;-3\quad -1\quad +2
\end{array}$$

3° If the quantities have different ſigns; the *ſubſtraction* is converted into addition, and to the aggregate is prefixed the ſign of the quantity, whence the *ſubſtraction* is to be made: for example;

$$\begin{array}{ll}
8a-5c+9d & =8\,\textit{lib.}-5+9\,d. \\
6a-8c-7d & =6\quad -8-7 \\
\hline
2a+3c+16d & =2\,\textit{lib.}+3+16
\end{array}$$

4° If the quantities be expreſſed in different letters, they muſt be connected; only the characters of the ſubtrahend muſt be changed into the contrary ones; for example;

$$\begin{array}{ll}
a+b-c & a+d \\
d-e+f & c-e-g \\
\hline
a+b-c-d+e-f & a+d-c+e+g
\end{array}$$

Substraction *of logarithms*,	See	Logarithm.
Substraction *of vulgar fractions*,		Fractions.
Substraction *of decimals*,		Decimals.

SUBSTRUCTION, in building, denotes underpinning, ground-ſelling, *&c.* See Foundation.

SUBSTYLAR *line*, in dialling, a right line, whereon the ſtyle or gnomon of a dial is erected. See Gnomon and Line.

In polar, horizontal, meridianal, and northern dials, the *ſubſtylar* line is the meridianal line, or line of 12 a clock; or the interſection of the plane, whereon the dial is delineated, with that of the meridian. See Meridian.

In eaſterly and weſterly dials, the *ſubſtylar* line, is the line of 6 a clock; or the interſection of the plane, whereon the dial is delineated, with the prime vertical. See Dial.

SUBSUPERPARTICULAR,	See	Ratio.
SUBSUPERPARTIENS,		

SUBTANGENT *of a curve*, the line that determines the interſection of a tangent with the axis; or, that determines the point wherein the tangent cuts the axis, prolonged. See Curve and Tangent.

Thus, in the curve A M, *&c.* (*Tab. Anal. fig.* 10.) the line T P intercepted between the ſemiordinate P M, and the tangent T M, is the *ſubtangent*. And P R is to P M, as P M to P T; and P M to P T, as M R to T M.

It is a rule in all equations, that if the value of the *ſubtangent* comes out poſitive, the point of interſection of the tangent and axis, falls on that ſide of the ordinate, where the vertex of the curve lies: as in the parabola and paraboloides.

If it come out negative, the point of interſection will fall on the contrary ſide of the ordinate, in reſpect of the vertex or beginning of the abſciſſe: as in the hyperbola, and hyperboliform figures.

And univerſally, in all paraboliform, and hyperboliform figures, the *ſubtangent* is equal to the exponent of the power of the ordinate, multiplied into the abſciſs.

Thus in the common parabola, whoſe property is $p\,x = y\,y$. The *ſubtangent* is in length, equal to x, the abſciſs mnltiplied by 2, the exponent of the power of $y\,y$, the ſquare of the ordinate; that is, it is equal to twice the abſciſs; and by the former rule for paraboliform figures, it muſt be taken above the ordinate, in the axis produced.

Thus, alſo, in one of the cubical paraboloids, where $p\,x\,x = y\,y\,y$; the length of the *ſubtangent* will be $\frac{3}{2}$ of the abſciſs.

In the parabola, the *ſubtangent* P T is double the abſciſs A P; and the ſubnormal is P R ſubduple of the parameter. See Normal.

SUBTENSE *, in geometry, a right line oppoſite to an angle, and preſumed to be drawn between the two extremities of the arch which meaſures that angle. See Angle and Arch.

* The word is formed from the Latin, *ſub*, under, and *tendo*, I ſtretch.

The *ſubtenſe* of the angle coincides with the chord of the arch. See Chord.

In every rectangle triangle, the ſquare of the *ſubtenſe* of the right angle, is equal to the ſquares of the *ſubtenſes* of both the other angles; by the 47th prop. of Euclid. This wonderful property of that triangle, was firſt diſcovered by Pythagoras; who, in the tranſport of joy hereby occaſioned, ſacrificed a hecatomb. See Triangle and Hypothenuse.

SUBTERRANEOUS, or Subterranean, ſomething under-ground. See Fossil.

Naturaliſts talk much of *ſubterranean* fires, as the cauſe of volcano's. See Fire and Volcano.—*Subterranean* winds, as the cauſe of earthquakes. See Earthquake.

Mr. Boyle gives us an inſtance, from the diſſertation *de admirand. Hungar. aquis*, of a huge *ſubterranean* oak dug out of a ſalt mine in Tranſylvania, ſo hard, that it could not eaſily be wrought on by iron tools; which yet, being expoſed to the air out of the mine, became ſo rotten, that in four days it was eaſy to be broken and crumbled between one's fingers. Mr. Derham adds, that the trees turned out of the earth, by the breaches at Weſt Thurrock and Dagenham, though probably no other than alder, and interred many ages ago, in a rotten, oozy mould, were ſo exceedingly tough, hard, and ſound, at firſt, that he could make but little impreſſion on them with the ſtrokes of an ax; yet being expoſed to the air and water, ſoon became ſo rotten, as to be crumbled between the fingers. See Wood.

SUBTILE, in phyſics, intimates a thing exceedingly ſmall, fine, and delicate: ſuch as the animal ſpirits, the effluvia of odorous bodies, *&c.* are ſuppoſed to be. See Spirits, Effluvia, *&c.*

One kind of matter is only more *ſubtile* than another, in that being divided into ſmaller parts, and thoſe, too, more agitated; on the one hand, it makes leſs reſiſtance to other bodies; and on the other, inſinuates itſelf more eaſily into their pores. See Matter, Particle, Atom, *&c.*

The Carteſians ſuppoſe a *ſubtile* matter for their firſt element. See Cartesian and Element.

This they lay down as ſo exceedingly fine, that it penetrates the minute pores of glaſs, and other ſolid bodies; and from this they account for moſt of the phænomena of nature. See Vacuum, Plenum, Suction, *&c.*

Yet they do not pretend to prove the exiſtence of this matter, otherwiſe than by conſequence. See Materia *ſubtilis*.

SUBTILIZATION, Subtilisatio, the act of ſubtilizing, or rendering any thing ſmaller and ſubtiler; particularly, the diſſolving or changing a mixt body into a pure liquor, or a fine powder, by ſeparating the groſſer parts therefrom. See Pulverization, Attenuation, *&c.*

SUBTRIPLE *ratio*, is when one number or quantity is contained in another three times. See Ratio.

Thus, 2 is ſaid to be *ſubtriple* of 6, as 6 is triple of 2.

SUBURBICARY *, Suburbicarius, an epithet given to thoſe provinces of Italy, *&c.* which compoſed the ancient dioceſe, or patriarchate of Rome. See Province.

* The term is formed from the Latin, *ſub*, under, and *urbs*, city.---They were alſo ſometimes called *urbicary* provinces.

Authors uſually reckon ten of theſe *ſuburbicary* provinces; whereof Italy, from the Po to the heel made ſeven, and the iſles of Sicily, Sardinia, and Corſica, the other three.

Yet Salmaſius will have the *ſuburbicary* provinces confined to thoſe four in the neighbourhood of Rome, to which the authority of the præfect of Rome extended; and theſe he makes the limits of the dioceſe of ancient Rome. See Diocese.

F. Sirmond takes the other extreme, and comprehends all the weſt under the name of *ſuburbicary* provinces.—Rufinus, who lived in the age of the council of Nice, explains the power aſcribed to the pope, in the ſixth canon of that council, by ſaying, that he had the care and ſuperintendance of the *ſuburbicary* provinces. Hence the different ſentiments of authors, with regard to the *ſuburbicary* provinces; ſome only conſidering the pope as biſhop of Rome; others, as patriarch of the weſt, *&c.* See Pope.

SUCCEDANEUM *, in pharmacy, a remedy ſubſtituted in the place of another firſt preſcribed, when the ingredients are wanting, neceſſary for the compoſition of that other. See Substitute.

* The word is formed from the Latin *ſuccedo*, to ſucceed, to come after.

Subſtitute and *ſuccedaneum*, are of equal import; unleſs, with ſome authors, we chuſe to uſe ſubſtitute, where a ſimple of like virtue is put for another; and *ſuccedaneum*, where a compound is uſed with the ſame intention.

SUCCENTURIATI *renes*, in anatomy. See Renes *ſuccenturiati*.

SUCCENTURIATION, the act of ſubſtituting. See Substitution.

SUCCENTURIATUS, in anatomy, a muſcle, called alſo *pyramidalis*. See Pyramidalis.

SUCCESSION, Successio, in philoſophy, an idea which we get by reflecting on that train of ideas conſtantly following one another in our minds when awake. See Idea and Mode.

The diſtance between any parts of this *ſucceſſion*, is what we call *duration*. When this *ſucceſſion* of ideas ceaſes, we have no perception of time, or of the duration thereof; but the moment we fall aſleep, and that wherein we awake, ſeem connected. See Duration.

They, who think we get the idea of *ſucceſſion* from our obſervation of motion by our ſenſes, will come into Mr. Lock's ſentiment, above, when they conſider that motion produces an idea of *ſucceſſion* no otherwiſe, than by producing a continued train of diſtinguiſhable ideas.

A man that looks on a body moving, perceives no motion, unleſs that motion produces a conſtant train of ſucceſſive ideas. But where-ever a man is, though all things be at reſt about him, if he thinks, he will be conſcious of *ſucceſſion*. See Motion.

Succession, in aſtronomy. The Succession *of the ſigns*, is the order wherein they follow each other, and according to which, the ſun enters, ſucceſſively, into one, then into another, called, alſo, *conſequentia*. See Sign.

This order is expreſſed in the two following technical verſes:

Sunt Aries, Taurus, Gemini, Cancer, Leo, Virgo,
Libraque, Scorpius, Arcitenens, Caper, Amphora, Piſces.

When a planet is direct, it is ſaid to go according to the order and *ſucceſſion of the ſigns*, or *in conſequentia*; that is, from Aries to Taurus, *&c.* When retrograde, it is ſaid to go contrary to the *ſucceſſion of the ſigns*, or *in antecedentia*; *viz.* from Gemini to Taurus, then to Aries, *&c.* See Planet, Direct, Retrogradation, *&c.*

Succession, in the civil law, implies a right to the whole effects left by a defunct. See Inheritance and Descent.

Of this there are ſeveral kinds, *ab-inteſtate*, *inteſtate*, *&c.*

Succession *ab-inteſtate*, is that which a perſon has a right to by being next of kin, which is, what we call, being *next heir at law*. See Ab-Intestate.

Teſtamentary Succession, is that which a perſon comes to by virtue of a will. See Testament.

Succession *in the direct line*, is that, coming from aſcendents or deſcendents. See Direct.

Collateral SUCCESSION, is that, coming by uncles, aunts, or other collaterals. See COLLATERAL.

Ajacent, or *abandoned* SUCCESSION, is a burthenſome or vexatious one, which no body will accept of.

There is no real *ſucceſſion* in benefices; for here, no body inherits. See BENEFICE.

In effects that cannot be divided, as kingdoms, &c. the *ſucceſſion* falls on a ſingle head; which is uſually the eldeſt ſon of the deceaſed, as being ſuppoſed the indiviſible repreſentative of his father.

In effects that are divided, all the children repreſent their father. It was on this principle, M. Courtin obſerves, that each of the ſons of Jacob had his ſhare aſſigned him in the Land of Promiſe. It is true, Manaſſeh and Ephraim, the two ſons of Joſeph, had likewiſe their ſhares; but this was becauſe a double portion had been allotted their father, wherein he was treated as elder brother, in conſideration of the great ſervices he had done his father and brethren. See PRIMOGENITURE.

SUCCESSIVE *action*. See the article ACTION.

SUCCESSOR, a perſon who holds the place which another held before him; whether he arrived at it by election, collation, inheritance, or otherwiſe. See SUCCESSION.

Our hiſtorians tell us, that queen Elizabeth could never bear to hear of a *ſucceſſor*. The king of the Romans is preſumptive *ſucceſſor* to the empire. See HEIR, &c.

The canoniſts ſay, a coadjutor is a neceſſary *ſucceſſor* to a prelature; a reſignee to the reſignant. See COADJUTOR, RESIGNATION, &c.

Civilians ſay, a titular uſufructuary can do nothing to the prejudice of his *ſucceſſor*.

SUCCINUM, in pharmacy, *karabe*, or *amber*; a bituminous juice or reſin, which from a fluor grows hard and brittle. See AMBER.

The whiteſt, and moſt tranſparent, is accounted beſt: it is of no great uſe in medicine, *per ſe*, as its texture ſeems too compact to open and yield to the natural concoctions; though ſome have a great opinion of it, as a balſamic, and give it in gonorrhœa's particularly.—But it is certain, that what pharmacy extorts from it, is of great efficacy; eſpecially in nervous caſes.

SUCCISA, a medicinal alexipharmic herb; called alſo *morſus diaboli*, or the *devil's bit*. See MORSUS *diaboli*.

It is a powerful ſudorific, inſomuch that Sir Theodore Mayerne obſerves, in the *Philoſophical Tranſactions*, laying a perſon ſick of a plague, or other malignant fever, on a bed thereof, moderately hot, he ſhall ſweat till they take him off; and much more, if he drink of the decoction or juice of the herb. But the *ſucciſa* is now little uſed.

SUCCOTRINE *aloes*. See the article ALOES.

SUCCUBUS, or SUCCUBA, a term uſed by ſome viſionary writers, to ſignify a dæmon, or ſpirit, who aſſumes the ſhape of a woman, and, as ſuch, lies with a man. See DÆMON, &c.

Some authors uſe *incubus* and *ſuccubus*, indiſcriminately; but they ought to be diſtinguiſhed; *incubus* being only properly uſed, where the dæmon is ſuppoſed to be in form of a man, and, as ſuch, lies with a woman.

SUCCULA, in mechanics, a bare axis, or cylinder, with ſtaves in it to move it round; but without any tympanum, or peritrochium. See AXIS, and PERITROCHIUM.

SUCCUS *pancreaticus*, } See { PANCREATIC *juice*.
SUCCUS *nervoſus*, } { NERVOUS *juice*.

SUCKERS, *off-ſets*, in agriculture, and gardening, young ſhoots proceeding from the root of a tree; being of the ſame kind with the tree from which they ſpring: for that ſuch as grow from trees raiſed by grafting or inoculation, follow the nature of the ſtock. See ROOT, ENGRAFTING, &c.

They ſometimes ſpring forth near the body of the mother-plant; but other *ſuckers* at a greater diſtance from it are better: yet the former removed when there is leaſt ſap in the top, and preſerving what fibrous roots are upon them, often proſper.

When they are taken up, the ground is to be well opened, and if they grow from the body of the tree, or great roots, they muſt be cut off cloſe to the ſtem, and ſet preſently. See STOCK.

It forwards much the ſpringing out of *ſuckers*, to bare the roots of trees, and ſlip them in ſome places. See ABLAQUEATION.

SUCKING *pump*. See the article PUMP.

SUCTION, SUCTIO, the act of ſucking, or of drawing up a fluid, as air, water, or the like, by the mouth, and lungs.

Air is ſucked in at the mouth, by the muſcles of the thorax and abdomen diſtending the cavity of the lungs and abdomen, by which means the air included therein is rarified, and ceaſes to be a counterbalance to the external air, which, of conſequence, is driven in by the preſſure of the atmoſphere through the mouth and noſtrils. See RESPIRATION.

Air is ſucked through a pipe, in the ſame manner as with the naked mouth: it being here all one as if the mouth were extended the length of the pipe.

The *ſuction* of heavier liquors is performed after the ſame manner, *e. gr.* in lying prone to drink out of a ſpring, &c. the lips are applied cloſe to the ſurface of the water, ſo as to prevent any paſſage of the air between them; then the cavity of the abdomen, &c. being diſtended as before, the preſſure of the air incumbent on the ſurface of the water without the circumference of the mouth, prevailing over that upon the water within the ſame, the fluid is raiſed, from the ſame principle as water in a pump. See PUMP.

In ſucking a heavy liquor, as water, through a pipe, the longer the pipe is, the greater difficulty is found in the *ſuction*; and the bigneſs or diameter of the pipe, makes a further alteration therein. The reaſon of this ariſes from that great principle in hydroſtatics, that fluids preſs in the compound ratio of the baſes and perpendicular altitudes. See FLUID.

From what we have ſaid, it evidently enough appears, that what we call *ſuction*, is not performed by any active faculty in the mouth, lungs, &c. but is performed by the mere impulſe and preſſure of the atmoſphere. See AIR, and ATMOSPHERE.

A very curious and intelligent perſon diſtinguiſhes two different ſorts of *ſuction* perform'd after two quite different manners; a diſtinction which however hitherto overlooked by authors, ſeems abſolutely neceſſary in order, I think, to give a juſt account of the nature of this phænomenon.

Suction, then, according to him, is perform'd either, 1°, By the dilatation of the thorax; or, 2°, By that of the cavity of the mouth.

In the former caſe the lungs are kept continually diſtended; for if the breath be let go, ever ſo little, the liquor in the tube will begin to ſubſide.

On the contrary, when *ſuction* is performed by inlarging the cavity of the mouth, we may ſuck with our utmoſt force, and yet breathe freely through the noſtrils at the ſame time. This is the true and proper *ſuction*: the other ought rather to be call'd ſupping, than ſucking through a tube.

Note, The cavity of the mouth is inlarg'd by being a little open'd, while the lips are cloſe ſhut, the tongue being at the ſame time contracted, and drawn backwards towards the throat.

SUCULA, in mechanics. See the article SUCCULA.

SUDAMINA, little heat-pimples in the ſkin, like millet grains, frequent in youth; eſpecially thoſe of a hot temperament, and that uſe much exerciſe. See SWEAT.

SUDATORY, SUDATORIUM, a name given by the ancient Romans to their hot or ſweating rooms; ſometimes alſo called *laconica*. See BATH, and GYMNASIUM.

The *ſudatory* was a ſpecies of their hypocauſta, or ſtoves. See HYPOCAUSTUM, &c.

SUDOR, in medicine. See the article SWEAT.

SUDOR *Anglicanus*, the *Engliſh ſweat*, or *ſweating ſickneſs*; is the name of an epidemic diſeaſe, firſt perceived in England, in 1485. It was properly, a ſort of plague; thus called, becauſe attended with an extraordinary kind of ſweat. It made its return four times in the ſpace of ſixty-ſix years, *viz.* in 1506, 1517, 1528, and 1551.

It began with a ſweat, which never ended, but either with the death of the patient, or his recovery. If he ſurvived twenty-four hours he was ſafe. Few people eſcaped of it at firſt; too much care, and too little, were found equally deſtructive.

The patient was to wait, without ſtirring, either in his bed, or in his clothes, according to the condition nature was ſurprized in; without burthening him either with remedies or with foods; without cloathing either too much or too little; and, if poſſible, without either eating or drinking. The ſweat to be kept up, without either promoting it, by any extraordinary heat, or checking it by the leaſt cold.

This was what was found by experience; and which was at length practiſed, with happy ſucceſs. The diſeaſe was firſt felt on the 21ſt of September, and in the ſame day ſpread itſelf all over England; where, after a great mortality, it ſtopped all at once, towards the end of October.

Its ravages were ſo great, that in ſome parts it took off a third part of the people in a very little time.

At its return under Henry VIII. in 1506, it was as general, and as dangerous as before, and again diſappeared all at once. At the third attack, in 1528, it was leſs fatal; inſomuch that Bellay, biſhop of Bayonne, then ambaſſador in England, who ſweated like the reſt, tells us, that of forty thouſand ſouls, ſeized with it in London, only two thouſand died. In 1524, it paſſed over into Ireland, where it killed great numbers.

SUDORIFIC, in medicine, a remedy that cauſes, or promotes ſweat. See SWEAT.

Sudorifics only differ from *diaphoretics* in the degree of their action; the one promoting ſenſible perſpiration, the other inſenſible. See DIAPHORETICS.

To the claſs of *ſudorifics* belong, 1°. All things that moving violently through the body, attenuate the humours, and accelerate their motion.

2°. Such things, as at the ſame time diminiſh the reſiſtence in the ſudatory veſſels about the cutis.

To which ſome add a third kind, *viz.* ſuch as abſorb the acidities of the blood, and thus ſet at liberty the matter of the ſweat.

The firſt intention is chiefly effected by a copious drinking of very hot waters; by acids drawn from vegetables by fermentation and diſtillation; or thoſe of foſſils, attenuated by repeated diſtillations, eſpecially if theſe be drunk mixed with hot water; by alcali's both volatile and fixt, diluted with hot water; by all compound ſalts, diſſolved in water; by ſapa's, metallic cryſtals, or the attenuated parts of metals themſelves, as ſtibium diaphoreticum, fixt ſulphur of Tachenius, bezoardic mineral, diaphoretic mercury, diaphoretic gold, &c. by ſharp, ſubtile, acrimonious aromatics: as abſynthium, abrotonum, opium, aſparagus, anis, aſclepias, ariſtolochia, gum ammoniac, carduus benedictus, caraways, cinnamon, camomile, ſaffron, capillus veneris, china, dittany, eupatorium, gentian, hyſſop, laurel, mint, leek, roſemary, ſage, ſavin, ſaſſafras, ſcordium, thyme, veronica, nettle, and other medicines compounded hereof, as venice-treacle, mithridate, diaſcordium, orvietan, &c.

The ſecond is chiefly effected by cleanſing the ſkin, by vaporous lotions, baths, and frictions; by relaxing the cutaneous and ſubcutaneous veſſels, which is beſt done by hot water ſprinkled all over the body, the head excepted; by increaſing the external heat about the naked body, as by the warmth of a bed, a vapour-bath, &c,

The third is effected by abſorbents; as corals, crabs-eyes, diaphoretic antimony, bezoar, &c. See each under its proper article.

SUET *, Sebum, a kind of fat, found in deer, ſheep, oxen, hogs, &c. which melted down and clarified, makes what we call *tallow*, uſed in the making of candles. See Fat and Tallow.

* The word is formed from the Latin, *ſuedum*, *ſebum*, or *ſevum*, which ſignify the ſame; and theſe *a ſue*, by reaſon of the fatneſs of that beaſt.

Anatomiſts, &c. diſtinguiſh four kinds of fat in the body of an animal. The firſt, which fixes itſelf, and after melting, cools into a very firm conſiſtence, they call *ſuet*.

It is found in greateſt abundance in the lower belly, and about the kidneys.

F. le Comte mentions a tree in China, that bears *ſuet*, or tallow. See Tallow-*tree*.

SUFFERANCE, in ancient cuſtoms, a delay, or reſpite of time, which the lord granted his vaſſal, for the performance of fealty and homage; ſo as to ſecure him from any feodal ſeizure. See Service, Vassal, Fee, &c.

Sufferance, ſay the cuſtoms, is equivalent to fealty and homage, while it holds. See Fealty and Homage.

The word is alſo uſed for a delay which the lord grants his vaſſals, to quit their hands of fees or inheritances they have acquired, till they have paid the due of indemnity, &c.

Bill of Sufferance. See the article Bill.

SUFFICIENT, in the ſchool theology. — Sufficient *grace*, denotes a help or aſſiſtance which God gives to man, to enable him to act and perform his duty. See Grace.

It is allowed an article of faith, that grace is neceſſary; and that without grace, nothing that is good, or that can any way intitle us to heaven, can be done: it is allowed too, that God does not refuſe the neceſſary aſſiſtances; and it is allowed, that man, frequently, either does not act when he ſhould, or acts what he ſhould not.

From theſe principles, which are generally admitted by all ſects, however different in other reſpects, it follows, that there is ſome aſſiſtance of God which man reſiſts; ſome wherewith man does not act, wherewith yet he might act; or ſome, whereby he does evil, by which he might do good. It is this aſſiſtance that is called *ſufficient grace*: becauſe ſufficing to make us act, though we do not act with it.

SUFFITUS, Suffiment, or Suffumigation, in medicine, a thickiſh powder, prepared of odoriferous plants, gums, &c. which being thrown on coals, the vapours or ſteam thereof, are received by ſmelling. See Fumigation and Suffumigation.

SUFFOCATION, Suffocatio, in medicine, a privation, or obſtruction of reſpiration. See Respiration.

Suffocation ſometimes ariſes from a too great abundance of blood thrown on the lungs, or the muſcles of the larynx, and preventing the ingreſs of the air; as is the caſe in quinzies, ſuffocating catarrhs, peripneumonies, &c. See Quinzy, &c.

The fumes of wines, or ſtrong beers, when boiling, cauſe *ſuffocation*, by interrupting the circulation of the blood. And the ſame may be obſerved of the fumes of lime, wherewith walls are whitened; and thoſe of charcoal, antimony, ſulphur, vitriol, and ſpirit of nitre.

The *ſuffocation* under water, is owing partly to the paſſage of the air being ſtopped up, and partly to the irruption of the water into the breaſt. See Drowning.

In France they diſpatch their people that are raving mad by *ſuffocating* them between two pillows: the ſame is alſo ſometimes practiſed here in caſes of hydrophobia's, &c.

Suffocation *of the womb*, or *matrix*, is a diſeaſe pretty frequent in women, called alſo *fits of the mother*. In this, the patient imagines a malignant vapour riſing from the matrix, and ſo preſſing againſt the lungs and the diaphragm, as to prevent the free motion neceſſary to reſpiration.

Its true cauſe is a convulſion of the muſcles of the larynx, which ſtraighten the wind-pipe, and prevent the air's paſſing into the lungs. Hence it is, that hyſteric women feel conſtrictions in the throat, as if one were ſtrangling them with a cord. See Hysteric.

SUFFOCATIVE *catarrh*. See the article Catarrh.

SUFFRAGAN, Suffraganeus, in the eccleſiaſtical polity, a term applied to a biſhop, with reſpect to his archbiſhop on whom he depends, and to whom appeals lie from the biſhop's official. See Bishop.

In this ſenſe, the archbiſhop of Canterbury has twenty-one *ſuffragans*; and the archbiſhop of York four.

The term was never heard of before the eighth century.— Some derive it hence, that the biſhops are to help and aſſiſt the archbiſhop; *quia archiepiſcopo* ſuffragari & *aſſiſtere tenentur*. Others ſay, it is becauſe eccleſiaſtical matters are determined by their votes, or ſuffrages; & ſuffraganei *dicuntur quia eorum* ſuffragiis *cauſæ eccleſiaſticæ judicantur*. Others hold, they are called *ſuffragans*, becauſe when called by the metropolitan to a ſynod, they have a right of ſuffrage, or of voting; or becauſe they could not be conſecrated without his ſuffrage or conſent.

Suffragan is alſo uſed for a chorepiſcopus, or an aſſiſtant biſhop, or co-adjutor, who has a title *in partibus infidelium*, and aſſiſts another in the diſcharge of his function, or diſcharges it himſelf in the abſence of that other. See Chorepiscopus, Coadjutor, &c.

Theſe are by ſome alſo called *ſubſidiary biſhops*. See Bishop.

By ſtatute 26 Henry VIII. every biſhop and archbiſhop is allowed to appoint ſome one, ſome two, and ſome three biſhops *ſuffragans*, under them; the ſeats, or reſidences whereof, are fixed by the ſame ſtatute. The *ſuffragan* biſhop for the dioceſe of Canterbury, to be at Dover only; for York, at Nottingham and Hull; for London, at Colcheſter; for Wincheſter, at Guilford, Southampton, and in the iſle of Wight, &c.

Du Cange obſerves, that the title *ſuffragan* has alſo been given to ſuch prieſts as are ſubject to the viſitation of the arch-deacon: and *ſuffragans of the pope*, to the biſhops of ſuch dioceſes, as are immediately ſubject to the pope.

SUFFRAGE *, Suffragium, a voice or vote, given in an aſſembly, where ſomething is deliberated on, or where a perſon is elected to an office or benefice. See Vote.

* The word is formed from the Latin, *ſuffragium*, which anciently ſignified money, as appears in the eight novel of Juſtinian: *ut judices ſine* ſuffragio *fiant*; and the ſixth novel: *qui emerit præſulatum per* ſuffragium, *epiſcopatu & ordine eccleſiaſtico excidat*.

Suffrages are ſometimes given by word of mouth; and ſometimes in writing, as at elections liable to a ſcrutiny. See Scrutiny. The preſident or chairman of the aſſembly uſually collects the *ſuffrages*.

Suffrages *of the ſaints*, in the Romiſh church, denote the prayers and interceſſions which the ſaints are ſuppoſed to make to God, in behalf of the faithful. See Saint.

SUFFRUTEX, *under-ſhrub*; among botaniſts, a name given to the loweſt ſort of woody, perennial plants: ſending no leaves from their root, and beginning to be branched from the very bottom of the ſtalk. Such are lavender, rue, ſage, &c. See Plant, Tree, &c.

SUFFUMIGATION *, Suffumigatio, in medicine, a term applied to all remedies that are received into the body in form of fumes, *i. e.* of ſmoak, vapour, or perfume. See Smoak, Vapour, &c.

* The word is formed from the Latin *ſub*, under, and *fumus*, ſmoak.

Suffumigations are compoſed of different matters, according to the nature of the diſeaſe. See Suffitus. Their intentions are to ſoften ſharp, ſerous humours, to provoke or check the courſe of the menſes, to raiſe a ſalivation in venereal evils, &c.

SUFFUSION, Suffusio, in medicine, an overflowing of ſome humour, ſhewing itſelf in the ſkin; particularly that of the blood or bile. See Blood, Bile, &c.

That redneſs ordinarily ariſing from ſhame, is only a *ſuffuſion* of blood appearing in the cheeks. See Blushing.

The jaundice is a *ſuffuſion* of bile over the whole body. See Jaundice.

Suffusion is alſo uſed for a little film or pellicle, formed in the aqueous humour of the eye, before the pupil; called, alſo, *cataract*. See Hypochyma and Cataract.

SUGAR, Saccharum, a very ſweet, agreeable juice, expreſſed from a kind of canes, or reeds, growing in great plenty in the Eaſt and Weſt-Indies; particularly in Madera, Braſil, and the Caribbee iſlands.

It is a queſtion not yet decided among botaniſts, &c. whether the ancients were acquainted with this cane, and whether they knew how to expreſs the juice from the ſame? What we can gather from the arguments advanced on either ſide, is, that if they knew the cane and the juice, they did not know the art of condenſing, hardening and whitening it, and, of conſequence, knew nothing of our *ſugar*.

Some ancient authors, indeed, ſeem to mention *ſugar*, under the name of *Indian ſalt*; but they add, that it oozed out of the cane of itſelf; and there hardened like a gum; and was even friable between the teeth, like our common ſalt: whereas *ſugar* is expreſſed by a machine on purpoſe, and coagulated by the fire.

Theirs, Salmaſius tells us, was cooling and looſening, whereas ours, the ſame writer aſſerts, is hot, and excites thirſt. Hence, ſome have imagined, that the ancient and modern *ſugar* plants were different: but Matthiolus, on Dioſcorides, c. 75. makes no doubt they were the ſame; and others are even of opinion, that ours has a laxative virtue, as well as that of the ancients, and that it purges pituita.

The generality of auhors, however, agree, that the ancient *ſugar* was much better than the modern; as conſiſting of only the fineſt and matureſt parts, which made themſelves a paſſage, and were condenſed in the air.—The interpreters of Avicenna and Serapion, call *ſugar*, *ſpodium*; the Perſians, *tabaxir*; and the Indians, *mambu*.

Salmaſius aſſures us, that the Arabs have uſed the art of making *ſugar*, ſuch as we now have it, above 800 years. Others produce the following verſes of P. Terrentius Varro Atacinus, to prove that it was known before Jeſus Chriſt.

Indica non magna nimis arbore creſcit arundo,
Illius extentis premitur radicibus humor,
Dulcia cui nequeunt ſucco contendere meila.

Another queſtion among naturaliſts is, whether the *ſugar* canes be originally of the Weſt-Indies; or whether they have been tranſlated rather from the Eaſt?

The learned of theſe laſt ages, have been much divided on the point: but ſince the diſſertation of F. Labat, a dominican miſſionary, publiſhed in 1722, there is no longer room to doubt but that the *ſugar* cane is as natural to America as India: all that can be ſaid in favour of the latter, is, that the Spaniards and Portugueſe firſt learnt from the orientals, the art of expreſſing its juice, boiling it, and reducing it into *ſugar*.

Culture of the SUGAR *cane.* The reed or cane, whence this uſeful juice is drawn, reſembles thoſe others we ſee in moraſſes, and on the edges of lakes; excepting that the ſkin of theſe latter is hard and dry, and their pulp void of juice; whereas the ſkin of the *ſugar* reed is ſoft, and the ſpongeous matter or pith it contains, very juicy, though that in a greater or leſs degree, according to the goodneſs of the ſoil, its expoſure to the ſun, the ſeaſon it is cut in, and its age; which four circumſtances contribute equally to its goodneſs and its bulk.

The *ſugar* cane uſually grows five or ſix foot high, and about half an inch in diameter; though F. Labat mentions ſome extraordinary ones in the iſle of Tabago, twenty-four foot high. The ſtem or ſtalk is divided by knots, a foot and half a-part. At the top it puts forth a number of long, green, tufted leaves, from the middle whereof, ariſe the flower and the ſeed. There are likewiſe leaves ſpringing out from each knot; but theſe uſually fall as the cane riſes; and it is a ſign, either that the cane is naught, or that it is far from its maturity, when the knots are ſeen beſet with leaves.

The ground fit for *ſugar* canes, is that which is light, ſoft, and ſpongy, lying on a deſcent proper to carry off the water, and well turned to the ſun. They uſually plant them in pieces, cut a foot and half below the top of the flower. Theſe are ordinarily ripe in ten months, though ſometimes not till fifteen; at which time, they are found quite full of a white ſucculent marrow, whence is expreſſed the liquor whereof *ſugar* is made. When ripe, they are cut, their leaves cleared off, and they are carried in bundles to the mills. The mills conſiſt of three wooden rollers, covered with ſteel plates; and have their motion either from the water, the wind, cattle, or even the hands of ſlaves. See *Sugar*-MILL.

Two rules belonging hereto are, that no canes above four foot, or under two foot and a half long be ſent to the mills; and, that no more canes be cut than can be conveniently preſſed in twenty-four hours; in regard they will heat, ferment, and turn ſour.

Preparation of SUGAR.—The juice coming out of the canes, when preſſed and broke between the rollers, runs through a little canal into the *ſugar-houſe*; which is near the mill; where it falls into a veſſel, whence it is conveyed into the firſt copper or cauldron, to receive its firſt preparation, only heated by a ſlow fire to make it ſimmer. With the liquor, is here mixed a quantity of aſhes and quick-lime; the effect of which mixture, aſſiſted by the action of the fire, is, that the unctuous parts are ſeparated from the reſt, and raiſed to the top, in form of a thick ſcum, which is kept conſtantly ſcumming off; and ſerves to feed the poultry, &c. withal.

The juice, in the next place, is purified in a ſecond copper; where a briſker fire makes it boil; and all the time the caſting up of its ſcum is promoted by means of a ſtrong lye, compoſed of lime-water, and other ingredients.

This done, it is purified and ſcummed in a third boiler, wherein is caſt a kind of lye, that aſſiſts in purging it, collects together its impurities, and makes them riſe to the ſurface; whence they are taken with a ſkimmer.

From the third, it is removed to a fourth boiler, where the juice is further purified by a more violent fire: and hence to a fifth; where it is brought to the conſiſtence of a ſyrop. In a ſixth boiler, the ſyrop receives its full coction; and here all the impurities left from the former lyes, are taken away by a new lye, and a water of lime and allom caſt into it. In this laſt copper, there is ſcarce found one third of what was in the firſt; the reſt being waſted in ſcum.

By thus paſſing, ſucceſſively, a number of coppers, the *ſugar* juice is purified, thickened, and rendered fit to be converted into any of the kinds of *ſugar* hereafter mentioned. The ſize of the ſeveral coppers always diminiſhes, from the firſt to the laſt; each being furniſhed with a furnace, to give a heat proportionable to the degree of coction the juice has received. In ſome large *ſugar* works, there are alſo particular coppers, for the boiling and preparing the ſcums.

F. Labat mentions ſeveral different *kinds of* SUGARS, prepared in the Caribbees, *viz. Crude ſugar*, or *moſcovado*; *ſtrained* or *brown ſugar*; *earthed* or *white ſugar*, in powder; *refined ſugar*, either in powder or loaves; *royal ſugar*; *candied ſugar*; *ſugar of fine ſyrop*; *ſugar of coarſe ſyrop*; *ſugar of the ſcum.*

Crude SUGAR, or moſcovado, is that firſt drawn from the juice of the cane, and whereof all the reſt are compoſed.

The method of making it, is that already deſcribed as for *ſugar* in the general.—We need only add, that when taken out of the ſixth copper, it is put in a cooler, where ſtirring it briſkly together, it is let ſtand to ſettle, till a cruſt, of the thickneſs of a crown piece, be formed thereon. The cruſt being formed, they ſtir it up again, then put it into veſſels, where it ſtands to ſettle, till it be fit to barrel.

Strained or *brown* SUGAR, though whiter and harder, does not differ much from the crude *ſugar*: though it is held a medium between this laſt and the earthed *ſugar*; which is the white powder *ſugar*.

The preparation of this, is the ſame as that of the moſcovado, with this difference, that to whiten it, they ſtrain the liquor through blankets, as it comes out of the firſt copper. The invention of ſtrained *ſugar* is owing to the Engliſh, who are more careful than their neighbours, in the preparation hereof; for they not only ſtrain it, but when boiled, put it in ſquare wooden forms, or moulds, of a pyramidal figure; and when it has purified itſelf well, they cut it in pieces, dry it in the ſun, and barrel it up.

Earthed SUGAR, is that which is whitened by means of earth laid on the top of the forms it is put in, to purge itſelf.

The making of this *ſugar*, is begun after the ſame manner as that of crude *ſugar*; except that they only uſe the beſt canes in it; that they work with more care and nicety; that when the liquor is in the firſt copper, the aſhes they put in, are little or nothing mixt with lime, for fear of reddening it; and that they ſtrain it through a blanket, from the firſt to the ſecond copper.

When it has paſſed all the ſix coppers, it is laden out into a cooler; whence it is put into conical moulds or forms, the tips whereof are perforated, but now ſtopped with linen or other ſtuff; and theſe ranged evenly before the furnace. When it has been a quarter of an hour in the forms, it is cut with a *ſugar* knife, that is, it is ſtirred briſkly this way, and that, for half an hour.

This ſerves not only to promote the forming of the grain, and the diffuſing it equally throughout; but alſo to determine the unctuous parts of the *ſugar* to mount to the top, that they may be ſcummed off.

The forms being left to ſtand fifteen hours in this ſtate, the holes at the bottom are then unſtopped, to give a paſſage to the ſyrop, and to determine it to take that way. When enough of theſe forms are filled, to fill a ſtove, which uſually contains five or ſix hundred forms; they viſit the *ſugar* in all the forms to examine the quality thereof, and to ſee if it quit the form eaſily; that it may either have the earth given it, as the refiner, who viſits it, judges proper; or be melted over again, if it do not prove well.

This done, the forms are planted, each on its pot, with the tip of the cone downwards; the top is taken off, and in lieu thereof, they put in ſome *ſugar* in grain, to within an inch of the edge; which ſpace is left for the earth prepared for it.

The earths here uſed are of various kinds; the good qualities of each whereof, are, that they do not tinge the water, that they let it filtrate eaſily through, and that they do not imbibe the fatty part of the *ſugar*. Before put in the forms, the earth is ſteeped in water twenty-four hours; and at length applied, in the conſiſtence of a pulp.

As ſoon as the earth is on the *ſugar*, all the windows of the refining room are ſhut, that the air and heat may not dry the earth. When it is quite dry, which uſually happens in nine or ten days time, it is taken off; and after cleaning the ſurface of the *ſugar* with bruſhes, and raking it up an inch deep, and again laying it level as before, they give it a ſecond earth.

The whiteneſs of the *ſugar* of each form, is ſeen from the firſt earth; experience ſhewing, that a ſecond or third earth do not make the *ſugar* any whiter, but only whitens the head of the loaf. When the ſecond earth is taken off, they cleanſe the ſurface of the *ſugar* with a bruſh, and with a knife looſen the edge of it, where it ſticks to the form, that neither the form nor the *ſugar*-loaf be damaged in taking out the latter. The windows are now opened, and the forms left to ſtand eight or ten days to dry. While the *ſugar* is draining in its forms, a ſtove is prepared to receive them.

The ſtove being ſufficiently heated, by means of the furnace therein, loaves are taken out of the forms one after another; and ſuch as are white from one end to the other, are carried to the ſtove, as are, alſo, the reſt, after cutting off what is not white, to be farther refined.

When the loaves are all ranged in the ſtove, a moderate fire is made for about two days, during which time, they viſit every part of the ſtove very carefully, to ſee that every thing is in good order, and to repair any thing that may go amiſs.

After theſe two days, they ſhut the trap-door a-top of the building, and increaſe the fire. Eight or ten days and nights continued violent fire uſually ſuffice to dry a ſtove of *ſugar*.

When they judge it ſufficiently done, they open the trap-door, and chuſe a hot dry day to pound the *ſugar*, which is performed with huge, hard, heavy wooden peſtles; when pounded, it is put up in barrels, and well trodden down as it is put in, that the barrels may hold the more.

SUGAR *of the ſcum*.—This is all made of the ſcum of the two laſt coppers; thoſe of the former being reſerved for making of rum.

The ſcum deſtined to make *ſugar*, is kept in a veſſel for that purpoſe, and boiled every morning in a copper ſet apart for that uſe. With the ſcum, is put into the copper a fourth part of water, to retard the boiling, and give time for its purging: when it begins to boil, the uſual lye is put in, and it is carefully ſcummed: when almoſt enough boiled, lime and allom-water are thrown in; and when it is ready to be taken out, they ſprinkle it with a little powdered allom.

SUGAR *of ſyrop*, or *treacle*.—There are three kinds of ſyrops that run from *ſugar*. The firſt from the barrels of raw *ſugar*, which is the coarſeſt of all: the ſecond, from the forms or moulds, after they are perforated, and before they receive their earth: the third, that coming from the forms after they have had their earth; which laſt is the beſt.

The coarſe ſyrops ſhould only be uſed for rum; but *ſugar* being grown dear, endeavours have been uſed to make ſome hereof, and that with tolerable ſucceſs. They are firſt clarified with lime-water, and, when boiled, are put up in barrels, with a *ſugar* cane in the middle, to make them purify themſelves. After twenty days, a quantity of coarſe earth is thrown in, to make them caſt the remainder of their ſyrop, and fit them to be returned into a crude *ſugar*. The Dutch and German refiners firſt taught the iſlanders how to turn their treacle into *ſugar*.

The ſecond ſyrop is wrought ſomewhat differently: after the copper, it is to be boiled in, is half full, eight or ten quarts of lime-water are caſt in: It is then boiled with a briſk fire, and carefully ſcummed: ſome add a lye, and others none. F. Labat takes the former method to be better, though it requires more trouble and attention. This *ſugar* may be earthed alone, or at leaſt, with the heads of loaves, the dryed tops, and ſuch other kinds of *ſugars* as may not be mixt with the true earthed *ſugar*, nor yet with the crude *ſugar*.

For the third ſyrop, after boiling and ſcumming it as the former, they put it inſtantly into the coolers, the bottoms whereof are covered half an inch thick with white *ſugar* very dry, and well pounded; and the whole is well ſtirred, to incorporate the two together. This done, they ſtrew the ſurface over with the ſame pounded *ſugar*, to the thickneſs of one fifth of an inch; this aſſiſting the *ſugar* in forming its grain. When ſettled, and the cruſt gathered at the top, a hole is made in the cruſt five or ſix inches diameter.

By this aperture, they fill the cooler with a new ſyrop, poured gently in, which inſenſibly raiſes up the former cruſt. When all the ſyrops are boiled, and the cooler is full, they break all the cruſts; and after mixing them well, put it up in forms or moulds.

The reſt is performed in the ſame manner as for the earthed *ſugar*, from which it only differs in that it falls ſhort of its gloſs and brightneſs; being, in reality, ſometimes whiter and finer, though of a flatter and duller white.

Refined SUGAR.—Crude *ſugar*, ſtrained *ſugar*, and the heads or tops of loaves that have not whitened well, are the baſis or ground of this *ſugar*.

In a refinery are uſually two coppers, the one ſerving to clarify, the other to boil the clarified liquor; tho' they ſometimes clarify in both, and boil afterwards. For the operation of refining, the ſame weight of lime-water and of *ſugar* are put in the copper; and as the ſcum is raiſed by the heat, it is taken off, and when it ceaſes to riſe any more, the ſyrop is ſtrained through a cloth.

After this, it is clarified; that is, a dozen of eggs is thrown, white, yolk, ſhell and all; after having firſt broke and beaten them well in lime-water. When the fat, and other impurities of the *ſugar*, which this compoſition gathers together on the ſurface of the ſyrop, have been ſcummed off; a few more eggs are thrown in, and it is ſcummed afreſh. This they repeat till the ſugar be ſufficiently clarified; which done, it is again ſtrained through the cloth.

When taken out of this copper, it is boiled in the ſecond; which done, it is put out into coolers, the bottoms whereof are firſt covered half an inch thick with fine white powdered *ſugar*. As ſoon as it is there, it is briſkly ſtirred about, and the ſurface ſtrewed over with pounded *ſugar*. The reſt is performed as in *ſugars* of fine ſyrops, or in earthed *ſugar*; only more care and exactneſs is uſed. See REFINING.

Royal SUGAR.—The baſis of this ſort ought to be the fineſt refined *ſugar* to be found. This they melt with a weak lime-water; and ſometimes, to make it the whiter, and prevent the lime from reddening it, they uſe allum-water. This they clarify three times, and paſs as often through a cloſe cloth, uſing the very beſt earth. When prepared with theſe precautions, it is whiter than ſnow, and ſo tranſparent, that we ſee a finger touching it, even through the thickeſt part of the loaf.

SUGAR-*candy*, *ſaccharum candum*, or *cryſtallinum*,—is *ſugar* depurated and cryſtallized. See CANDY.

This is better made of earthed *ſugar*, than refined *ſugar*, in regard the former is ſweeter.

The *ſugar* to be uſed herein, is firſt diſſolved in a weak lime-water, then clarified, ſcummed, ſtrained through a cloth, and boiled, and put in forms or moulds that are traverſed with little rods, to retain the *ſugar* as it cryſtallizes. Theſe forms are ſuſpended in a hot ſtove, with a pot underneath, to receive the ſyrop that drops out at the hole in the bottom, which is half ſtopped, that the filtration may be the gentler. When the forms are full, the ſtove is ſhut up, and the fire made very vehement.

Upon this the *ſugar* faſtens to the ſticks that croſs the forms, and there hangs in little ſplinters of cryſtal. When the *ſugar* is quite dry, the forms are broke and the *ſugar* taken out, candied. Red *ſugar*-candy they make, by caſting into the veſſel, where the *ſugar* is boiling, a little juice of the Indian fig; and if it is deſired to have it perfumed, they caſt a drop of ſome eſſence in, when the *ſugar* is putting into the forms.

This method of making *ſugar*-candy is that of F. Labat, practiſed in the Caribbees: the method in Europe, deſcribed by Pomet, is ſomewhat different.

White SUGAR-*candy* they make of white refined *ſugar*, boiled with water into a thick ſyrop, in a large pan. It is candied in a ſtove, whither it is carried, incloſed in braſs peels, croſſed with little rods, about which the cryſtals faſten as they are formed.

The fire of the ſtove is kept equable for fifteen days; after which the *ſugar* is taken out of the peels to be dried. Red or brown *ſugar*-candy is made like the white, except that they only uſe brown *ſugars* and earthen pots.

Barley SUGAR, *ſaccharum hordeatum*, is a *ſugar* boiled till it be brittle, and then caſt on a ſtone anointed with oil of ſweet almonds, and formed into twiſted ſticks, about the length of the hand, and the thickneſs of a finger.

It ſhould be boiled up with a decoction of barley, whence it takes its name; but in lieu thereof they now generally uſe common water, to make the *ſugar* the finer.—To give it the brighter amber colour, they ſometimes caſt ſaffron into it.—It is found very good for the cure of colds and rheums.

SUGAR *of roſes*, *ſaccharum roſatum*, is white *ſugar* clarified, and boiled into a conſiſtence in roſe-water: when boiled, they form it into lozenges, ſometimes into little grains, of the ſize of peas, by keeping it ſtirring till it be cold, and dry.—It is reputed good to ſoften and allay acrimonies, &c. of the breaſt. See ROSE.

Caſk of SUGAR, } See the articles { CASK.
Cheſt of SUGAR, } { CHEST.

SUGAR *of ſaturn*, } See the article LEAD.
SUGAR *of lead*,

SUGGESTION, SUGGESTIO, the act of hinting, or furniſhing another with a thought, or deſign, or of inſinuating it artfully into his mind.

In the French law, a teſtament is ſaid to be made by *ſuggeſtion*, when it is made by ſurprize, and contrary to the intention of the teſtator.

If *ſuggeſtion* be proved, the teſtament becomes null. Articles of *ſuggeſtion* are not admittable againſt a teſtament wrote with the teſtator's own hand, which is never ſuſpected. See TESTAMENT.

SUIT, SUTE, SECTA in law, (from the French *ſuite*, a following another) is uſed in divers ſenſes.—As, SUIT *in law*; which is of two kinds, *real* and *perſonal*: the ſame with what we call *real* and *perſonal actions*. See ACTION.

SUIT *of court*, or *ſuit of ſervice*; an attendance which the tenant owes the court of his lord. See SERVICE.

SUIT *covenant*; when your anceſtor hath covenanted with mine to ſue to his court.

SUIT *cuſtom*; when I and my anceſtors owe ſuit time out of mind.

Suit *real*, or *regal*; when men come to the ſheriffs turn or leet.

Suit alſo ſignifies the following one in chaſe; as *freſh ſuit.* See Fresh-suit.

Suit, again, ſignifies a petition made to the king, or any great perſon. See Petition.

SULPHUR, in natural hiſtory, a fat, unctuous ſort of mineral ſubſtance, fuſible and inflammable by fire, and not diſſoluble or miſcible in water. See Fossil.

This is particularly called *foſſil*, or *mineral ſulphur*, to diſtinguiſh it from the *ſulphur of metals*, or *of the philoſophers.* See Metal.

Sulphurs make a particular claſs of foſſils, divided into *ſolid* and *fluid*.

The *ſolid* Sulphurs are, common *ſulphur*, or *ſulphur* properly ſo called, arſenic and amber. See Arsenic and Amber.

The *liquid* Sulphurs are, aſphaltum, piſſaſphaltum, bitumen, petroleum, naphtha, and oleum terræ, &c. See Bitumen, Pissasphaltum, Petroleum, Naphtha, &c.

Sulphur, properly ſo called, or *brimſtone*, is of two kinds, viz. *vivum*, and *common ſulphur*.

Sulphur *vivum*, *native*, or *virgin ſulphur*, is that which is dug in this form out of the earth; being opake, of a yellow or aſh-colour; it eaſily takes fire, and, in burning, caſts a ſtrong ſulphurous ſmell.

It is chiefly brought from Sicily; and is but little uſed, except in ſome galenical compoſitions, and to *ſulphur* wine, in order to make it keep in carriage.

It is found in great quantities in the neighbourhood of vulcanos or burning mounrains, as Veſuvius, Ætna, &c. yet *ſulphur* has alſo its particular mines; and we have very good from ſeveral parts of Italy and Switzerland, though the beſt is that of Quitto and Nicaragua in America.

Common Sulphur, or that uſed in gunpowder, and on divers other occaſions, is ſaid by ſome to be a compoſition of the native *ſulphur* with roſin; rolled up into cylindrical pieces. —Though others aſſure us, it is procured from the native *ſulphur* by means of fire and train oil, which diſſolving it, it is poured into moulds; and thus formed into thoſe cylinders we find it in. Savary.

This common *ſulphur* is either better or worſe, according to the refinery it comes from. That of Holland has a long time had the vogue; the ſecond place has been given to that of Venice; and the third to that of Marſeilles: but the order ſeems to have been ſince changed, and that from Marſeilles is now in the firſt place.

It is choſen in large thick cylinders, of a golden yellow colour, very brittle, and when broke, appearing all brilliant, as if cryſtallized.

Beſide the uſe of *ſulphur* in the compoſition of gunpowder, whereof it is one of the three ingredients, and that which makes it take fire ſo readily, (ſee Gunpowder) it is of ſome uſe in medicine, and more in chymiſtry. It is alſo uſed in whitening ſilken and woollen ſtuffs; to which end, the vapour thereof is contrived to be received by them. See Bleaching.

Its vapour alſo whitens red roſes; and even young rooks, taken out of the neſt, and expoſed thereto, are ſaid to become perfectly white. It has the ſame effect on gold; which is to be reſtored to its colour by boiling it in water with tartar.

The chymical analyſis of *ſulphur* is very difficult; its principles being ſo volatile, and withal ſo faſt bound together, that they either riſe all together, or are diſſipated and loſt in the ſeparation.

M. Homberg, however, has at length found the ſecret of ſeparating the principles, and of ſaving them at the ſame time. He finds it to conſiſt of an acid ſalt, an earth, an oily bituminous and inflammable matter, and uſually a little metal.

The three firſt he finds, by a long ſeries of operations, are in pretty equal quantities; but the laſt, which proves to be copper, inconſiderable. The acid, he adds, is exactly the ſame with that of vitriol; the oil, which is thick and red as blood, appears to be the inflammable part, and that which conſtitutes the chymical principle *ſulphur*, only that it retains ſome heterogeneous matter in the operation. The earth is extremely fixt, and unalterable by the ſtrongeſt fire. M. Geoffroy tried the re-compoſition of *ſulphur* on M. Homberg's principles, and with ſucceſs. The pure acid ſalt of *ſulphur* being mixed with an equal quantity of the oily matter, and earthy alcali, and a little oil of tartar, and the operation conducted according to the rules of art, the mixture was converted into a pure burning *ſulphur*.

This done, he attempted the compoſition of *ſulphur*, not by recompounding it out of the ſame matters it had been reſolved into, but by uſing matters judged of the ſame nature. Thus, by ſubſtituting oil of vitriol for the acid ſalt, and oil of turpentine for the inflammable part, he ſucceeded as before.

Again, he found that fixt ſalts, as they are acids abſorbed in earth, ſerve for two principles at once, and need nothing but an inflammable oil to make *ſulphur*: and even in lieu of this oil, M. Geoffroy imployed, with equal ſucceſs, char-coal, pit-coal, and other ſolids.

Indeed Mr. Boyle and Glauber had before made common *ſulphur*, and that by mixtures, ſuch as M. Geoffroy deſcribes; but they were both miſtaken as to the reaſon thereof; the one concluding, that the *ſulphur* he thus got, had been contained in the fixed ſalts, and the other in the coal; neither of them dreamed, that it was the mixture of the three principles that produced the mixt.

Flowers of Sulphur, are the pureſt and fineſt part of common *ſulphur*, gained by evaporating *ſulphur*, by ſublimation, or burning it in pots made for that purpoſe; and gathered in the capital of the cucurbit, where the vapour ſticks. See Flower.

This preparation, as, indeed, *ſulphur*, in moſt of its forms, is found excellent for the lungs. The beſt flower of *ſulphur* is in cakes, or pieces, light, ſoft, friable, and rather white than yellow. If it be in powder it muſt be very fine, of a yellow colour, that is, both whitiſh and gilt at the ſame time.

Inſtead of this, we have frequently put upon us a vile *ſulphur*, mixed with ſtarch, or wheat flour; and ſometimes only *ſulphur-duſt* well ſifted.

By adding fixed nitre, or ſal polychreſt, to the flowers of *ſulphur*, we have the *white flowers of ſulphur*.

Magiſtery, *balm*, or *milk of* Sulphur, is *ſulphur* diſſolved in a ſufficient quantity of water, with ſalt of tartar; and precipitated by means of ſpirit of vinegar, or ſome other acid. See Magistery.

It is called *milk of ſulphur* from its whiteneſs; and *balm of ſulphur*, or *of the lungs*, from its excellent uſe in diſeaſes of the lungs and breaſt. See Balsom, &c.

Salt of Sulphur, is a chymical preparation, very improperly thus called: as being no other than the ſal polychreſton, impregnated with ſpirit of *ſulphur*, and reduced to an acid ſalt, by evaporating the humidity thereof. Some hold it a powerful febriſuge. See Salt.

Spirit of Sulphur. See the article Spirit.

Sulphur *of antimony*, is a diaphoretic tincture drawn from antimony and ſalt of tartar or nitre by divers operations. See Antimony.

That drawn from the fæces of crocus metallorum, is by ſome called *golden ſulphur*. See Antimony.

Sulphur *metallorum*, or *ſulphur of metals*, called alſo, *ſulphur figens*, is uſed among chymiſts and alchymiſts for a peculiar matter, which enters the compoſition of all metals. See Metal.

Metals are ſuppoſed to conſiſt of two eſſential parts, or principles; mercury, as the baſis, or metallic matter; and *ſulphur*, as the binder, or cement, which fixes the fluid mercury into a coherent malleable maſs. See Metal, and Mercury.

Some of the lateſt and beſt chymiſts, particularly Monſ. Homberg, will have this *ſulphur* to be no other than fire. See Fire, Gold, and Burning-*glaſs*.

SULPHURATED *wine*. See the article Wine.

SULTAN, or Soldan, a title, or appellation given the emperor of the Turks.

It had its riſe under Mahmoud, ſon of Sebecteghin, the firſt emperor of the dynaſty of the Gaznevides, towards the cloſe of the fourth century of the æra of the Hegira: when that prince going to Segeſtan to reduce Kalaf, governor of that province, who affected the ſoveraignty; Kalaf was no ſooner advertiſed of his coming, than he went out to meet him, delivered the keys of his fortreſs, and owned him his *ſultan* *, that is, his lord or commander. The title pleaſed Mahmoud ſo well, that he aſſumed it ever afterwards; and from him it paſſed to his deſcendants, and to other Mahometan princes.

* Vattier will have the word Turkiſh, and to ſignify king of kings; adding that it was firſt given the Turkiſh princes Angrolipex and Maſgud, about the year 1055; others will have it originally Perſian, alledging, in proof hereof, an ancient medal of Coſroe; others derive it from *ſoldanus*, *quaſi ſolus dominus*; others from the Hebrew שלט, *ſchalat*, to rule, reign.

In the Roman ceremonial, we alſo find mention made of a Soldan, or marſhal, who is to attend the pope when he marches in ſtate. He is alſo to apprehend malefactors.

SULTANA, the wife of a ſultan. The favourite *ſultana* is called *Hhaſeki-ſultana*, *i. e.* private *ſultana*.

The *ſultana* queen is the emperor's chief wife. The old *ſultana*, mother of the emperor reigning, is called *ſultana valide*.

Sultana alſo denotes a ſtrong Turkiſh veſſel of war.

SULTZ, or Sulz. See the article Salz.

SUM, Summa, in mathematics, ſignifies the quantity that ariſes from the addition of two or more magnitudes, numbers, or quantities together. See Addition.

This is ſometimes called the *aggregate*; and, in algebra, is ſometimes denoted by the letter Z, which ſtands for *zuma*, or *ſuma*; and ſometimes by the letter S.

Sum *of an equation*, is when the abſolute number being brought over to the other ſide, with a contrary ſign, the whole becomes

comes equal to 0: this Des Cartes calls the *ſum of the equation* propoſed. See Equation.

SUMACH, a drug uſed to dye in green; as alſo in the preparation of black morocco, and other leather. See Morocco.

It conſiſts of the leaves and young branches of a ſhrub, not unlike the little ſervice-tree: the leaves are longiſh, pennated and hairy: the flowers grow in cluſters, and are red, like our roſes. Its fruit is a kind of grape, of a very aſtringent quality; and its ſeed almoſt oval, and incloſed in capſulæ of the like figure.

The ancients uſed them, inſtead of ſalt, to ſeaſon their meat withal; whence the Latins call the tree, *rhus obſoniorum*: from its uſe in the dreſſing of leather, it is alſo called *rhus coriaria*.

SUMMARY, an abridgment, containing the ſum and ſubſtance of a thing in a few words. See Abridgment.

The *ſummary* placed at the head of a book, a chapter, a law, or the like, is very uſeful to the reader, to facilitate the underſtanding thereof. See Argument.

A recapitulation, is to contain a *ſummary* of the whole preceding diſcourſe. See Recapitulation.

SUMMATORIUS *calculus*, the method of ſumming differential quantities; that is, from any differential given, to find the quantity from whoſe differencing the given differential reſults. See Differential.

This method we more uſually call *the inverſe method of fluxions*; and foreigners, *integralis calculus*. See Calculus, and Fluxions.

SUMMER, one of the ſeaſons of the year, commencing in theſe northern regions, on the day the ſun enters cancer; and ending when he quits virgo. See Season.

Or, more ſtrictly and univerſally, the *ſummer* begins on the day when the ſun's meridian diſtance from the zenith is the leaſt. It ends on the day when his diſtance is a mean betwixt the greateſt and ſmalleſt. See Sun.

The end of *ſummer* coincides with the beginning of winter. See Winter.

Summer *flowers*, } See the articles { Flowers.
Summer *ſolſtice*, } { Solstice.

Summer *, in architecture, is a large ſtone, the firſt that is laid over columns and pilaſters, in beginning to make a croſs vault; or it is the ſtone which being laid over a piedroit or column, is hollowed, to receive the firſt haunce of a platband.

* The word is formed from the French, *ſommier*, which ſignifies the ſame thing.

Summer, in carpentry, is a large piece of timber, which being ſuppported on two ſtone peers, or poſts, ſerves as a lintel to a door, window, &c.

There are alſo *ſummers* uſed in various engines, &c. ſerving to ſuſtain the weight, &c.

Summer *tree*, denotes a beam into which the ends of joyſts are faſtened, and to which the girders are framed. See Brest-Summer, and Girder.

Summer of an organ. See the article Sound-*board*.

SUMMET *, the vertex, or point of any body, or figure; as of a triangle, a pyramid, a pediment, &c. See Apices, Vertex.

* The word is formed from the French, *ſommet*, which ſignifies the ſame.

SUMMONER, Summonitor, an apparitor, or petty officer who is to cite perſons to appear at a certain time and place, to anſwer to the charge exhibited againſt them. See Apparitor and Summons.

SUMMONS, Summonitio, in law, a citing or calling a perſon to any court, to anſwer a complaint, or even to give in his evidence, &c. See Citation, and Resummons.

This is the ſame with the *vocatio in jus*, or the *citatio* of the civilians: hence alſo our old word *ſumner*, or *ſummoner*. See Summoner.

Summons *in terra petita*, is that made on the land which the party, at whoſe ſuit the ſummons is ſent out, ſeeks to have.

Summons *ad warrantizandum*, is a proceſs, whereby the vouchee in a common recovery is called. See Vouchee.

Summons, in war.—To *ſummons* a place, is to ſend a drum, or trumpet, to command the governor to ſurrender; or, in defect thereof to proteſt to make an aſſault, and to lay all in fire and blood.

SUMMUM *bonum*, in ethics, the chief good of human nature; or that, which, by its enjoyment, renders men truly and compleatly happy. See Good.

The ſchools diſtinguiſh this chief good of man, into that which is ſimply and adequately ſo, and beyond which there can be no other; and an inferior and ſubordinate ſort, which is in ſome meaſure attainable in this imperfect ſtate.

This laſt they call *fœlicitas viatorum*; and the former, *fœlicitas comprehenſorum*.

Summum *genus*. See the article Genus.

SUMPTER *horſe*, is an horſe that carries proviſions, and neceſſaries for a journey. Ruſt.

SUMPTUARY *laws*, *leges* Sumptuariæ, are laws made to reſtrain exceſs in apparel, coſtly furniture, eating, &c. See Law.

Moſt ages and nations have had their *ſumptuary* laws; and ſome retain them ſtill, as the Venetians, French, &c. But it is obſerved, that no laws are worſe executed thrn *ſumptuary* laws.

The *ſumptuary* laws of that ancient Locrian legiſlator Zaleucus, are famous: by theſe it was ordained, that no woman ſhould go attended with more than one maid in the ſtreet, except ſhe were drunk: that ſhe ſhould not go out of the city in the night, unleſs ſhe went to commit fornication: that ſhe ſhould not wear any gold or embroidered apparel, unleſs ſhe propoſed to be a common ſtrumpet. That men ſhould not wear rings, or tiſſues, except when they went a whoring, &c.

The Engliſh have had their ſhare of *ſumptuary* laws, though all repealed by a ſtatute 1° Jac. I. or obſolete.

Under King Henry IV. Camden tells us, pride was got ſo much into the foot, that it was proclaimed, That no man ſhould wear ſhoes above ſix inches broad at the toes. And their other garments were ſo ſhort, that it was enacted, 25 Ed. IV. That no perſon under the condition of a lord, ſhould, from that time, wear any mantle or gown, unleſs of ſuch length, that, ſtanding upright, it might cover his privy members and buttocks.

Among the Romans, the *ſumptuary* and cibary laws were very numerous: by the lex Orchia, the number of gueſts at feaſts was limited, though without limitation of the charges thereof. By the Fannian law, made twenty-two years afterwards, it was enacted, That more than ten as's ſhould not be ſpent at any ordinary feaſt: for the ſolemn feaſts, as the ſaturnalia, &c. an hundred as's were allowed; ten of which, Gellius informs us, was the price of a ſheep, and an hundred of an ox.

By the Didian law, which was preferred eighteen years after, it was decreed, that the former *ſumptuary* laws ſhould be of force, not only in Rome, but throughout Italy: and that for every tranſgreſſion, not only the maſter of the feaſt, but all the gueſts too, ſhould be liable to the penalty.

SUN, Sol, in aſtronomy, the great luminary which enlightens the world, and by his preſence conſtitutes day. See Day.

The *ſun* is uſually reckoned among the number of planets; but that he ought rather to be numbered among the fixed ſtars, will be ſhewn in its place. See Star, and Planet.

According to the Copernican hypotheſis, which is now generally received, and which has even demonſtration on its ſide, the *ſun* is the centre of the planetary and cometary ſyſtem; round which all the planets and comets, and our earth among the reſt, revolve, in different periods, according to their different diſtances from the *ſun*. See this motion illuſtrated and demonſtrated under the article Planet.

But the *ſun*, though thus eaſed of that prodigious motion, whereby the ancients imagined him to revolve daily round our earth; yet is not perfectly a quieſcent body.

From the phænomena of his maculæ or ſpots, it evidently appears, that he has a rotation round his axis; like that of the earth whereby the natural day is meaſured; only flower.—Some of theſe ſpots have made their firſt appearance near the edge or margin of the *ſun*, and have been ſome time after on the oppoſite edge; whence, after a ſtay of about fourteen days, they have re-appeared in their firſt place, and taken the ſame courſe over again; finiſhing their entire circuit in twenty-ſeven days time: which is hence deduced to be the period of the *ſun*'s rotation round his axis. This motion of the ſpots, is from weſt to eaſt, whence we conclude that of the *ſun*, to which the other is owing, to be from eaſt to weſt.—For the various appearance of the ſolar ſpots, their cauſe, &c. ſee Maculæ, and Spots.

For the apparent annual motion of the Sun *round the earth*; it is eaſily ſhewn by aſtronomers, that the annual motion of the earth will occaſion ſuch an appearance, though it be demonſtrated that there is no ſuch thing.

A ſpectator in the *ſun*, would ſee the earth move from weſt to eaſt, for the ſame reaſon as we ſee the *ſun* move from eaſt to weſt. And all the phænomena reſulting from this annual motion, in whichſoever of the bodies it be, will appear the ſame from either.

Let S, for inſtance (*Tab. Aſtron.* fig. 39. repreſent the *ſun*, ABCD the earth's orbit, which it paſſes through from weſt to eaſt, in the ſpace of a year.—Now, a ſpectator in S, viewing the earth at A, will refer it to the point of the ſphere of the ſtars, ♈: when arrived in B, the ſpectator will ſee it, as in the point ♋: when in C, as in the point ♎, &c. till after its whole circuit, it will be again ſeen in ♈. Thus will the earth appear to deſcribe the whole ecliptic, and to paſs, ſucceſſively, from ſign to ſign.

Suppoſe, now, the ſpectator removed from the *ſun* to the earth, which imagine in C; the diſtance of the fixed ſtars, we have ſhewn, is ſo vaſt, that that of the *ſun* is but a point to it. The ſpectator, therefore, now ſituate on the earth, will ſee the ſame face of the heavens, the ſame ſtars, &c. as before; the only difference will be, that as before he imagined the earth in the heavens, and the *ſun* in the centre; he will now ſuppoſe the *ſun* in the heavens, and the earth in the centre.

The earth, therefore, being in C, the ſpectator will ſee the *ſun* in ♈; and the ſpectator being carried along with the earth, and partaking of his annual motion, will not perceive either his own motion, or that of the earth; but obſerving the *ſun*, when the earth is arrived at D, the *ſun* will be ſeen at ♋. Again, while the earth proceeds to A, the *ſun* will ſeem to have moved through the ſigns ♋, ♌, and ♍: and while the earth deſcribes the ſemi-circle A B C, the *ſun* will appear to have moved in the concave ſurface of the heavens, through the ſix ſigns, ♎, ♏, ♐, ♑, ♒, ♓. So that an inhabitant of the earth will ſee the *ſun* go through the ſame orbit or circle in the heavens, and in the ſame ſpace of time, as a ſpectator in the *ſun* would ſee the earth deſcribe the ſame.

Hence ariſes that apparent motion of the *ſun*, whereby he is ſeen to advance, inſenſibly, towards the eaſtern ſtars: inſomuch, that if any ſtar near the ecliptic, riſe any time with the *ſun*; after a few days, the *ſun* will be got more to the eaſt of the ſtar, and the ſtar will riſe and ſet before him.

For the ſeveral phænomena reſulting from the *ſun*'s apparent motion, or the earth's real motion, as the diverſity of day and night, of ſeaſons, *&c.* ſee EARTH.

Nature, properties, figure, &c. *of the* SUN.—1°. As the ſolar ſpots are ſometimes found to ſtay three days longer behind the *ſun*, than they ſpend in paſſing over the hemiſphere viſible to us; we eaſily deduce, that they do not adhere to the ſurface of the *ſun*, but are at ſome diſtance therefrom.

2°. As the ſpots frequently riſe and vaniſh, even in the midſt of the *ſun*'s diſk; and undergo ſeveral changes, both with regard to bulk, and figure, and denſity; it follows, that they frequently riſe de novo, about the *ſun*, and are again diſſipated.

3°. Hence it ſhould follow, that they are formed out of the exhalations of the *ſun*; and are no other than ſolar clouds. See VAPOUR, CLOUD, *&c.*

4°. Since, then, exhalations proceeding from the *ſun*, riſe above him, and ſtop at a certain altitude; it is evident there is ſome fluid incompaſſing the *ſun*, to urge the exhalations to riſe: and this fluid muſt be denſer at bottom, and rarer a-top, like our atmoſphere. See ATMOSPHERE.

5°. Since the ſpots frequently diſſolve and diſappear in the middle of the *ſun*'s diſk; the matter of the ſpots, that is, the ſolar exhalations, fall back again to the *ſun*: whence it follows, that there muſt ariſe various alterations in the *ſun*'s atmoſphere, and the *ſun* himſelf. See RAIN, HAIL, METEOR, *&c.*

6°. Since the revolution of the ſpots round the *ſun* is found very regular, and the ſpots very near the *ſun*; it follows, that the ſpots do not revolve round the *ſun*, but that the *ſun*, together with his atmoſphere, wherein the maculæ are, move round their common axis, in an interval of about twenty-ſeven days: and hence it is, that the ſpots near the limb, being viewed obliquely, appear narrow and oblong.

7°. Since the *ſun*, in every ſituation, appears like a circular diſk; its figure, as to ſenſe, muſt be ſpherical; though we ſhall hereafter ſhew, that it is really ſpheroidical.

Beſides the maculæ or dark ſpots, ſeveral authors make mention of faculæ, or ſpots brighter than the reſt of the *ſun*'s diſk; and thoſe generally larger, and very different from the maculæ, both in figure, duration, *&c.*

The faculæ, Kircher, Scheiner, *&c.* ſuppoſe to be eruptions of flames; and hence take occaſion to repreſent the face of the *ſun* as full of volcano's, *&c.* But Huygens, uſing the beſt teleſcopes, could never find any ſuch things, though he has ſometimes ſpied certain places in the maculæ themſelves, more lucid than the reſt. But theſe do not ſeem owing to any kindled matter, which were ſcarce conſiſtent with their duration, and their frequent change into maculæ; but to the refraction of the *ſun*'s rays through the thinner exhalations, when as the groſſer, in their neighbourhood, intercept the ſame. See FACULÆ.

8°. That the ſubſtance of the *ſun* is fire, we thus prove: the *ſun* ſhines, and his rays, collected by concave mirrors, or convex lens's, burn, conſume, and melt the moſt ſolid bodies, or elſe convert them into aſhes, or glaſs. Wherefore, as the force of the ſolar rays is diminiſhed by their divergency, in a duplicate ratio of the diſtances reciprocally taken: it is evident, their force and effect is the ſame, when collected by a burning lens or mirror, as if we were at ſuch diſtance from the *ſun*, where they were equally denſe. The *ſun*'s rays, therefore, in the neighbourhood of the *ſun*, produce the ſame effects, as might be expected from the moſt vehement fire; conſequently, the *ſun* is of a fiery ſubſtance. See FIRE.

Hence it follows, that its ſurface is every where fluid; that being the condition of flame. See FLAME and FLUIDITY. Indeed, whether the whole body of the *ſun* be fluid, as ſome think, or ſolid, as others; we do not determine: but as there are no other marks, whereby to diſtinguiſh fire from other bodies, but light, heat, a power of burning, conſuming, melting, calcining, and vitrifying; we do not ſee what ſhould hinder, but that the *ſun* may be a globe of fire, like ours, inveſted with flame.

9°. Since the maculæ are formed out of the ſolar exhalations, it appears, that the *ſun* is not pure fire, but that there are heterogeneous particles mixed along with it.

10°. The figure of the *ſun* is a ſpheroid, higher under its equator than about the poles. This we prove thus: the *ſun* has a motion about its own axis, and therefore the ſolar matter will have an endeavour to recede from the centres of the circles wherein it moves; and that, with the greater force, as the peripheries of the circles are greater. But the equator is the greateſt circle, and the reſt, towards the poles, continually decreaſe; therefore the ſolar matter, though at firſt in a ſpherical form, will endeavour to recede from the centre of the equator, further than from the centres of the parallels. See CENTRAL *force*.

Conſequently, ſince the gravity whereby it is retained in its place, is ſuppoſed to be uniform throughout the whole *ſun*; it will really recede from the centre, more under the equator than under any of the parallels. And hence the *ſun*'s diameter, drawn through the equator, will be greater than that paſſing through the poles, *i. e.* the *ſun*'s figure is not perfectly ſpherical, but ſpheroidical. See SPHEROID.

For the parallax of the SUN, ſee PARALLAX.

For the SUN'*s diſtance*; as the determination thereof depends on that of the parallax, and as the *ſun*'s parallax is not found without a long operoſe calculus; ſo aſtronomers do not agree much about either of them.

The mean diſtance of the *ſun* from the earth, ſome make 7490 diameters of the earth; others 1000, others 12000, others 15000; but allowing M. de la Hire's parallax of 6″, the *ſun*'s mean diſtance will be 17188 diameters of the earth; and allowing that of Caſſini, only 14182. See DISTANCE.

The apparent diameter of the *ſun*, is not always the ſame. Ptolemy makes it, when greateſt, 33′ 20′; Tycho 32′; Kepler, 31′ 4″; Ricciolus, 32′ 8′; Caſſini, 32′ 20″; de la Hire, 32 43″. Its mean, apparent diameter, according to Ptolemy, is 32′ 18′; according to Tycho, 31′; according to Kepler, 30′ 30′; according to Ricciolus, 31′ 40″; according to Caſſini, 31′ 40′; according to de la Hire, 32′ 10″. Its leaſt diameter, Ptolemy makes, 31′ 20′; Tycho, 30′; Kepler 30; Ricciolus, 31′; Caſſini, 31′ 8″; de la Hire, 31′ 38″.

The true diameter of the *ſun* to that of the earth, is computed to be, as 10000 to 208. See DIAMETER.

For the eclipſes of the SUN, ſee the article ECLIPSE.

Cycle of the SUN. See the article CYCLE.

Meridian altitude of the SUN. See the article MERIDIAN.

Angle at the SUN,	See	ANGLE.
Diurnal arch of the SUN,		ARCH.
Height of the SUN,		HEIGHT.
Nadir of the SUN,		NADIR.
Nocturnal arch of the SUN,		ARCH.
Place of the SUN,		PLACE.
Retrogradation of the SUN,		RETROGRADATION.
Vertical of the SUN,		VERTICAL.
Raiſins of the SUN,		RAISIN.

SUNDAY, the firſt day of the week; thus called by our idolatrous anceſtors, becauſe ſet apart for the worſhip of the ſun. See DAY and WEEK.

It is now called the *Lord's-day*, *dies dominicus*, becauſe kept as a feaſt in memory of our Lord's reſurrection on this day; and *ſabbath-day*, becauſe ſubſtituted under the new law, in the place of the ſabbath, in the old law. See SABBATH.

In the Breviary, and other offices, we meet with *ſundays* of the *firſt* and *ſecond claſs*.—Thoſe of the firſt claſs, are *Palm*, *Eaſter*, *Advent* and *Whit-ſunday*, thoſe of *quaſimodo* and *quadrageſima*; each whereof ſee under its proper article.—Thoſe of the ſecond claſs, are the common *ſundays*.

Anciently, each *ſunday* in the year had its particular name, which was taken from the introit of the day; which cuſtom has only been continued to ſome few in Lent: as, *reminiſcere*, *oculi*, *lætare*, *judica*.

It was Conſtantine the Great, who firſt made a law for the obſervation of *ſunday*; and who, according to Euſebius, appointed it ſhould be regularly celebrated throughout the Roman empire.

Before him, and even in his time, they obſerved the Jewiſh ſabbath as well as *ſunday*; both to ſatisfy the law of Moſes, and to imitate the apoſtles, who uſed to meet together on the firſt day.

Indeed, ſome are of opinion that the Lord's-day, mentioned in the Apocalypſe, is our *ſunday*; which they will have to have been ſo early inſtituted by the apoſtles.—Be this as it will, it is certain, a regard was had to this day, even in the earlieſt ages of the church; as appears from the firſt apology of Juſtin Martyr, where he deſcribes the exerciſe of the day, not much unlike to ours.

By Conſtantine's laws, made in 321; it was decreed, that for the future, the *ſunday* ſhould be kept a day of reſt in all cities and towns; but he allowed the country people to follow their work.—In 538, the council of Orleans prohibited this country labour; but in regard there were ſtill abundance of Jews in the Gauls, and that the people gave into a good many ſuperſtitious uſages in the celebration of the new ſabbath, like thoſe of the Jews among that of the old; the council declares, that to hold it unlawful to travel with horſes, cattle, and carriages, to prepare foods, or to do any thing neceſſary to the cleanlineſs and decency of houſes or perſons, ſavours more of Judaiſm than Chriſtianity.

Quinquageſima SUNDAY,	See	QUINQUAGESIMA,
Trinity SUNDAY,		TRINITY.

SUNDAY *letter*. See the article DOMINICAL *letter*.

SUN-*flower*. See the article TURNESOL.

SUONATA. See the article SONATA.

SUOVETAURILIA, or SOLITAURILIA, a ſolemn ſacrifice among the ancient Romans; wherein they offered three victims, of three different kinds, *viz.* a bull, a ram, and a boar.

Livy deſcribing it, calls it *ſuovetaurilia*, as compoſed of *ſus*, *ovis*, and *taurus*, the names of the three victims ſacrificed. Dion. Halicarnaſſeus deſcribing the ſame, calls it *ſolitaurilia* in regard it was required, that the victims were perfect, and without any defect; *ſollus*, or *ſolus*, in the language of the Oſci, ſignifying *integer*, entire.

SUPERBIPARTIENS. See the article RATIO.

SUPERCARGO, a perſon employed by merchants to go a voyage, and overſee their cargo or lading, and diſpoſe of it to the beſt advantage.

SUPERCILII *corrugator*. See the article CORRUGATOR.

SUPERCILIUM, in anatomy, the eye-brow. See EYE.

SUPERCILIUM, in the ancient architecture, denotes the uppermoſt member of the corniche, called by the moderns, *corona*, *crown*, or *larmier*. See LARMIER.

Mr. Evelyn conceives, it ſhould rather have been called *ſtillicidium*, or *drip*, to denote its office of ſheltering the order from rain, *&c.* See CORONA and CORNICHE.

SUPERCILIUM, is alſo uſed for a ſquare member under the upper tore in ſome pedeſtals.

Some authors confound it with the tore itſelf. See TORE.

SUPEREROGATION, in theology, what a man does beyond his duty, or more than he was commanded to do.

The Romaniſts ſtand up ſtrenuouſly for works of *ſupererogation*; and maintain, that the obſervance of evangelical councils is ſuch. By means hereof, a ſtock of merit is laid up; which the church has the diſpoſal of, and which ſhe diſtributes in indulgences to ſuch as need. See INDULGENCE.

The reformed church do not allow of any work of *ſupererogation*; but hold with the apoſtle, That when we have done our beſt, we are but unprofitable ſervants. See MERIT.

SUPERFETATION*, SUPERFOETATIO, in medicine, an after or ſecond conception; happening, when the mother, already pregnant, conceives, of a latter coition; ſo that ſhe bears at once two fœtus's of unequal age and bulk, and is delivered of them at different times. See BIRTH, CONCEPTION, FOETUS, *&c.*

* The word is formed from the Latin, *ſuper*, over, and *fœtus*, embryo.

We meet with inſtances of *ſuperfetations* of women in Hippocrates, Ariſtotle, Pliny, du Laurens, *&c.*—But they are much more frequent in hares, and ſows.

An inſtance of an extraordinary kind of *ſuperfetation*, we have in Bartholine; who tells us, that a Daniſh girl was born big with child.

Mentzelius, a German phyſician, adds, that in 1672, the wife of a phyſician, in Thuringia, was delivered of a girl big with another; whereof ſhe was delivered in eight days time; and which was baptized, and died a day after her mother.

The naturaliſts hold, that female rats are frequently born with young rats in their wombs.—In the king of Denmark's cabinet, is ſeen an egg, in the middle whereof is another egg perfectly formed. See EGG.

We meet with ſomething like a *ſuperfetation* in plants too; there being a kind of lemon found to grow incloſed in the body of another.

In the *Hiſtory of the royal academy of ſciences*, for the year 1709, mention is made of a letter from a very conſiderable magiſtrate, to the academy, containing a very remarkable inſtance of a *ſuperfetation*; a butcher's wife of Aix being delivered in that year of nine children, each about two days after other, all well formed and alive.

SUPERFICIAL *content*. See SUPERFICIES, AREA and MEASURING.

SUPERFICIES, or SURFACE, in geometry, a magnitude, conſidered as having two dimenſions; or extended in length and breadth; but without thickneſs or depth. See DIMENSION.

In bodies, the *ſuperficies* is all that preſents itſelf to the eye. See BODY.—A *ſuperficies* is chiefly conſidered, as the external part of a ſolid: when we ſpeak of a ſurface ſimply, and without any regard to body, we uſually call it *figure*. See FIGURE.

Rectilinear SUPERFICIES, is that comprehended between right lines.

Curvilinear SUPERFICIES, is that comprehended between curve lines. See CURVE.

Plane SUPERFICIES, is that which has no inequality, but lies evenly between its boundary lines. See PLANE.

Convex SUPERFICIES, is the exterior part of a ſpherical or ſpheroidical body. See CONVEX.

Concave SUPERFICIES, is the internal part of an orbicular or ſpheroidical body. See CONCAVE.

The meaſure or quantity of a ſurface, is called the *area* thereof. See AREA and MEASURING.

The finding of this meaſure or area, is called the *quadrature* thereof. See QUADRATURE.

To meaſure the ſurfaces of the ſeveral kinds of bodies, as ſpheres, cubes, parallelepipeds, pyramids, priſms, cones, *&c.* ſee SPHERE, CUBE, PARALLELEPIPED, *&c.*

Line of SUPERFICIES, a line uſually found on the ſector, and Gunter's ſcale.—The deſcription and uſe hereof, ſee under the articles SECTOR and GUNTER's *ſcale*.

SUPERFINE, in the manufactories, a term uſed to expreſs the ſuperlative fineneſs of a ſtuff. See FINE.

Thus a cloth, a camlet, *&c.* are ſaid to be *ſuperfine*, when made of the fineſt wool, *&c.* or when they are the fineſt that can be made.

The term is particularly uſed among gold wier-drawers, for the gold or ſilver wier which after being drawn through an infinite number of holes, each leſs and leſs, is, at length, brought to be no bigger than a hair. See GOLD-*wier*.

SUPERINCESSUS *radens*,	See	SLIDING.
SUPERINCESSUS *volvens*,		ROLLING.

SUPERINSTITUTION, SUPERINSTITUTIO, denotes one inſtitution upon another.—As, if A be admitted and inſtituted to a benefice upon one title, and B be admitted, inſtituted, *&c.* by the preſentation of another. See INSTITUTION.

SUPERINTENDENT, in the French cuſtoms, an officer who has the prime management and direction of the finances or revenues of the king.

The term is alſo uſed for the firſt officer in the queen's houſhold, who has the chief adminiſtration thereof.

They have alſo a *ſuperintendent* of the buildings, anſwering to the ſurveyor of the works among us. See SURVEYOR.

The cardinal de Richelieu made himſelf *ſuperintendent* of commerce.

SUPERINTENDENT, alſo denotes an eccleſiaſtical ſuperior in ſeveral reformed churches where epiſcopacy is not admitted; particularly among the Lutherans in Germany, and the Calviniſts in ſome other places.

The *ſuperintendent* is, in effect, little other than a biſhop; only his power is ſomewhat more reſtrained than that of our dioceſan biſhops. See BISHOP.

He is the chief paſtor, and has the direction of all the inferior paſtors within his diſtrict, or dioceſe.

In Germany they had formerly SUPERINTENDENTS *general*, who were ſuperior to the ordinary *ſuperintendents*.—Theſe, in reality, were archbiſhops; but the dignity is ſunk into diſuſe; and at preſent, none but the *ſuperintendent* of Wirtemberg aſſumes the quality of *ſuperintendent general*.

SUPERIOR, or SUPERIOUR, ſomething raiſed above another, or that has a right to command another.—Thus an abbot is called the *ſuperior* of an abbey; and a prior the *ſuperior* of a convent. See ABBOT, PRIOR, *&c.*

The canoniſts hold, that a perpetual ſuperiority conſtitutes a title: but a *ſuperior* may be continued by thoſe who conſtituted him ſuch, yet without the ſuperiority's being rendered, by that means, perpetual.

The church of France allow the ſuperiority and primacy of the pope; not his infallibility, as all the other Romiſh churches do. See POPE.

SUPERIOR *capitis obliquus*,	See	OBLIQUUS.
SUPERIOR *maxilla*,		MAXILLA,
SUPERIOR *oculi obliquus*,		OBLIQUUS.
SUPERIOR *planets*,		PLANET.
SUPERIOR *poſticus ſerratus*,		SERRATUS.
SUPERIOR *reſpondeat*,		RESPONDEAT.
SUPERIOR *ſcapularis*,		SUPRASPINATUS.
SUPERIORIS *labii elevator*,		ELEVATOR.

SUPERJURARE.—Anciently, when a criminal endeavoured to excuſe himſelf by his own oath, or by that of one or more witneſſes; and yet the crime was ſo notorious, that he was convicted by the oaths of many more witneſſes; this was called *ſuperjurare*. See OATH, PURGATION, *&c.*

SUPERLATIVE, in grammar, an inflexion of nouns adjective, ſerving to augment and heighten their ſignification, and ſhew the quality of the thing denoted to be in the higheſt degree. See DEGREE.

In Engliſh, the *ſuperlative* is uſually formed by the addition of *eſt*; as richeſt, holieſt, *&c.* rarely by the addition of *iſſimo*, as generaliſſimo; more frequently by the prefixing of *moſt*; as *moſt* honourable, *moſt* amiable, *&c.*

The French are generally forced to form their *ſuperlatives*, by prefixing of *le plus*, ſometimes of *tres*, and ſometimes of *fort*.

The Italians and Spaniards have great advantages over them in this reſpect; their language abounding with magnificent words to exaggerate things withal, without auxiliary particles: yet the Hebrews are more poor than the French in this reſpect, as having neither comparatives nor *ſuperlatives*. They uſe to expreſs theſe degrees by the particles *joter* and *meod*, ſometimes by the prepoſition *min*, and ſometimes by re-doubling the words; of which we find frequent inſtances in the bible.

SUPERNATURAL *grace.* See the article Grace.

Supernatural *theology.* See the article Theology.

SUPERNUMERARY, ſomething over and above a fixed number.—In ſeveral of the offices are *ſupernumerary* clerks, to be ready on extraordinary occaſions.

There are alſo *ſupernumerary* ſurveyors of the exciſe, to be ready to ſupply vacancies when they fall: theſe have but half pay.

In muſic, the *ſupernumerary*, called by the Greeks *proſlambanomenos*, is the loweſt of the chords of their ſyſtem; anſwering to a, mi, la, of the loweſt octave of the moderns. See Diagram.

SUPERPARTICULARIS,
SUPERPARTIENS, } See Ratio.

SUPER-PURGATION, *hypercatharſis*, in medicine, an exceſſive, over-violent purging. See Purgation.

A man who had taken powder of diarcathamum inwardly, was ſent by it to ſtool an hundred times; and was cured of the *ſupur-purgation* by a pound of capon-broth, an ounce of ſaccarum roſatum, five grains of laudanum, and the yolk of an egg.—In lieu of laudanum, they ſometimes uſe a drachm and a half of new venice-treacle. Burnet.

SUPERQUADRIPARTIENS. See the article Ratio.

SUPERSCAPULARIS *inferior*, called alſo *infraſpinatus*; a muſcle that helps to draw the arm backwards. It covers all the ſpace that is between the ſpine, and the teres minor; and is inſerted into the neck of the humerus.

Superscapularis *ſuperior*, in anatomy, a muſcle, called alſo *ſupraſpinatus*. See Supraspinatus.

SUPERSEDEAS, a writ iſſued in divers caſes, importing, in general, a command to ſtay, or forbear ſome ordinary proceedings at law, which, in appearance, ought to be done, or purſued, were it not for the cauſe, whereon this writ is granted.

Thus, a man, regularly, is to have a ſurety of peace, againſt him of whom he will ſwear he is afraid; and the juſtice required hereunto cannot deny it him: yet if the party be formerly bound to the peace, either in chancery, or elſewhere, this writ lies, to ſtay the juſtice from doing that, which otherwiſe he ought not to deny.

Clerk of the Supersedeas. See the article Clerk.

SUPERSTITION, extravagant devotion, or religion wrong directed, or conducted. See Religion.

It was a piece of *ſuperſtition* in the ancient Romans, to obſerve the flight of birds, the entrails of victims, &c. See Augury, Auspicium, &c.

The Romiſh prieſts make a fine penny of the *ſuperſtition* of the people: Monſ. Thiers has an expreſs treatiſe *de ſuperſtitions populaires.* Women, he obſerves, are naturally more inclined to *ſuperſtition* than impiety. Plutarch has endeavoured to ſhew, that *ſuperſtition* is worſe than atheiſm. The puniſhment allotted by ſeveral councils for the ſuperſtitious, is, to faſt a month in priſon.

SUPERSTITIOUS *magic.* See Magic.

SUPERVISOR, ſignifies a ſurveyor, or overſeer. See Surveyor, &c.

It was formerly, and ſtill remains a cuſtom among ſome, eſpecially of the better ſort, to make *ſupervisor* of wills; to overlook the executors, and ſee their wills truly performed: but it is to little purpoſe; as being now ſo careleſly executed. See Will, Executor, &c.

SUPINATION, Supinatio, in anatomy, the action of a ſupinator muſcle; or the motion whereby it turns the hand, ſo as that the palm is lifted upwards towards heaven. See Supinator.

SUPINATOR, in anatomy, a denomination given to two muſcles of the arm; the one called *ſupinator longus*, the other *ſupinator brevis*: both ſerving to turn the palm of the hand upwards.

The firſt ariſes by a fleſhy beginning, three or four fingers breadth above the external protuberance of the humerus. It lies along all the radius, to whoſe inferior and external part it is inſerted by a pretty broad tendon.—See *Tab. Anat.* (Myol.) fig. 1. n. 20. fig. 2. n. 19. fig. 6. n. 16. fig. 7. n. 44.

The ſecond comes from the external and upper part of the ulna, and paſſing round the radius, is inſerted into its upper and forepart, below the tendon of the biceps.—See *Tab. Anat.* (Myol.) fig. 7. n. 10, 10. and 45.

SUPINE, in the Latin grammar, a part of the conjugation of a verb, of like effect with the infinitive mood. See Verb, Mood, &c.

There are two kinds of *ſupines*, the one in *um*, whoſe ſignification is active, and marks a motion, as *dare nuptum*; the other in *u*, having a paſſive ſignification, as *horrendum auditu*, &c.—The *ſupines* have neither number nor perſon.

They have their name, ſays Probus, and after him Voſſius, *quod ad inſtar* ſupinorum & *otioſorum hominum omnia habent confuſa.* Or, according to Priſcian, *quod naſcantur a participiis paſſivis, quæ* ſupina *apellata ſunt, quia in infimo loco ſita, totam conjugationis molem ſuſcipiant.*

SUPPLANTALIA, or Suppedanea, among phyſicians, plaiſters, or other medicaments applied to the ſoles of the feet; generally made of leaven, muſtard, horſe-radiſh, ſalt, ſoap, gunpowder, &c.

SUPPLEMENT *of an arch*, in geometry or trigonometry, is the number of degrees that it wants of being an intire ſemicircle: as *complement* ſignifies what an arch wants of being a quadrant. See Quadrant, Complement, &c.

Supplement, in matters of literature, an appendage to a book, to ſupply what is wanting therein. See Appendix, and Parergon.

Frenſheimius has wrote divers *ſupplements*, to reſtore the books of ſeveral ancient authors, part whereof had been loſt.

The French alſo uſe the word *ſupplement* for a kind of tax, or after-payment charged on lands, offices, &c. that are pretended to have been ſold beneath their value.

SUPPLICAVIT, a writ iſſuing out of chancery, for taking ſurety of the peace when one is in danger of being hurt in his body by another. See Surety.

It is directed to the juſtices of the peace, and ſheriff of the county; and is grounded on the ſtatute 1 Ed. III. which appoints, that certain perſons ſhall be aſſigned by the lord chancellor to take care of the peace. See Peace.

SUPPORTED, in heraldry, a term applied to the uppermoſt quarters of a ſhield, when divided into ſeveral quarters; theſe ſeeming, as it were, *ſupported*, or ſuſtained, by thoſe below. See Quartering.

The chief is alſo ſaid to be *ſupported* when it is of two colours, and the upper colour takes up two thirds of it: in this caſe it is *ſupported* by the colour underneath.

SUPPORTERS, in heraldry, figures in an atchievement, placed by the ſide of the ſhield, and ſeeming to *ſupport*, or hold up the ſame. See Atchievement, Escutcheon, &c.

Supporters are chiefly figures of beaſts; figures of human creatures uſed for the like purpoſe are more properly called *tenants.* See Tenant.

Some make another difference between *tenant* and *ſupporter*: when the ſhield is bore by a ſingle animal, it is called *tenant*; when by two, they are called *ſupporters.*

The figures of things inanimate, ſometimes placed aſide of eſcutcheons, but not touching, or ſeeming to bear them; though ſometimes called *ſupporters*, are more properly called *cotiſes.* See Cotice.

The *ſupporters* of the Engliſh arms are a lion and an unicorn; ſome of the former kings had a leopard and an unicorn; others griffons; others eagles. See Arms.

The *ſupporters* of the French arms are angels; which are ſaid to have been firſt introduced by Philip VI. his device being an angel over-throwing a dragon: the dragon being at that time the device of the king of England.

Thoſe of the Prince of Monaco, are Auguſtine monks: Thoſe of the family of the Urſini, bears, in alluſion to their names.

In England, none below the degree of a banneret are allowed *ſupporters*, which are reſtrained to thoſe called the *high nobility.* The Germans permit none but princes and noblemen of rank to bear them. Among the French the uſe is more promiſcuous.

SUPPOSITI *medium.* See the article Medium.

SUPPOSITION, in muſic, is when one of the parts dwells on a note, while another part makes two or more leſſer notes equivalent to it, by conjoint degrees. See Harmony, and Counterpoint.

Suppoſition is defined by a late author the uſing of two ſucceſſive notes, of the ſame value, as to time; the one whereof being a diſcord, *ſuppoſes* the other a concord. See Harmony.

The harmony, Mr. Malcolm obſerves, is always to be full on the accented parts of the bar, or meaſure, but on the unaccented, diſcords may tranſiently paſs, without any offence to the ear. This tranſient uſe of diſcords, followed by concords, make what we, after the French, call *ſuppoſition.* See Concord, and Discord.

There are ſeveral kinds of *ſuppoſition*: the firſt is, when the parts proceed gradually from concord to diſcord, and diſcord to concord; the intervening diſcord ſerving only as a tranſition to the following concord.

Another kind is, when the parts do not proceed gradually from the diſcord to the concord, but deſcend to it by the interval of a third.

A third kind, like the ſecond, is, when the riſing to the diſcord is gradual; but the deſcending from it to the following concord, is by the diſtance of a fourth.

A fourth kind, very different from all the reſt, is, when the diſcord falls on the accented parts of the meaſure, and the riſing to it is by the diſtance of a fourth. In which caſe it is abſolutely neceſſary to follow it immediately, by a gradual deſcent into a concord, that has juſt been heard before the harmony; to make the preceding diſcord paſs without offence, and only ſeem a tranſition to the concord.

Supposition, in arithmetic. See Position.

SUPPOSITORY *, Suppositorium, in pharmacy, a ſolid medicine thruſt up the fundament, in lieu of a liquid one, or clyſter, where that would not be ſo convenient. See Clyster.

* The Latins call it *balanus*, becauſe anciently made in figure of an acorn.

It is uſually compoſed of common honey, mixed up with either ſoap, or oil, and formed into pieces of the length and thickneſs of the little finger, only pyramidal.—To the compoſition is ſometimes alſo added powder of ſcammony, euphorbium, colocynthis, *&c.*

On ſome occaſions *ſuppoſitories* are only a cut of bacon, the ſtem of a leek, or the like matter, thruſt, like a tent, up the anus, to irritate the ſphincter muſcle, and oblige it to extrude the excrements.

The *ſuppoſitory* was invented for the convenience of ſuch as have an averſion to the taking of clyſters; or to be uſed where the diſeaſe does not allow thereof. See CLYSTER.

SUPPRESSION *, in law, the extinction, or annihilation of an office, right, rent, or the like. See EXTINGUISHMENT.

* The word is formed from the Latin *ſub*, and *premo*, I preſs under.

SUPPRESSION, in grammar, denotes an omiſſion of certain words in a ſentence, which yet are neceſſary to a full and perfect conſtruction.—As, "I come from my father's;" that is, "from my father's houſe." See ELLIPSIS.

Suppreſſion is a figure of ſpeech very frequent in our language; chiefly uſed for brevity and elegance. Some rules relating hereto, are as follow:

1°. Whenever a word comes to be repeated in a ſentence oftner than once, it is to be ſuppreſſed: thus we ſay, "this is my maſter's horſe;" not, "this horſe is my maſter's horſe."

2°. Words that are neceſſarily implied may be ſuppreſſed.

And, 3°. All words that uſe and cuſtom ſuppreſs in other languages, are to be ſuppreſſed in Engliſh; unleſs there be particular reaſons for the contrary.

SUPPRESSION, in medicine, is applied to the humours that are retained in the body by ſome obſtruction or ſtoppage of the uſual out-lets. See RETENTION.

We ſay, a *ſuppreſſion* of urine, of the menſes, *&c.* See ISCHURIA, URINE, MENSES, *&c.*

Fire by **SUPPRESSION**, in chymiſtry. See FIRE.

SUPPURATION *, in medicine, the action whereby extravaſated blood, or other humours in the body are ripened, or changed into pus. See PUS.

* The word is formed from the Latin, *ſub*, under, and *pus*, *puris*.

The change is begun by a diſſipation of the moſt ſubtile and ſpirituous parts of the blood: what is left behind, thickens and purifies by little and little; that is, its ſalts and ſulphurs diſengage themſelves from the groſſer parts wherein they were embarraſſed. Theſe parts thus diſengaged, and acting on one another, bruiſe and break each other, and thus excite a fermentation, which increaſes the heat of the part; whereby the matter is further digeſted, and a pain and tenſion produced. At length the blood loſes its natural colour, and becomes quite white, by the mixture of its acid, ſulphurous and acrimonious particles; as we ſee happens to ſulphurous alcalies, when mixed with acids. See DIGESTION.

SUPPURATIVES, or SUPPURATING *medicines*, are ripeners, or medicines that promote ſuppuration. See SUPPURATION.

Suppuratives are all hot; by which means increaſing the warmth of the part, they reſolve the humour into a pus. See DIGESTIVE.

Such are mallows, melilot, lily-roots, diachylion, pellitory, figs, aromatic gums, meals, *&c.*

SUPPUTATION. See the article COMPUTATION.

SUPRALAPSARY, in theology, a perſon who holds that God, without any regard to the good or evil works of men, has reſolved, by an eternal decree, to ſave ſome, and damn others. See REPROBATION.

Theſe are alſo called *antelapſaries*; and are oppoſed to ſublapſaries and infralapſaries. See SUBLAPSARY.

According to the *ſupralapſaries*, the object of predeſtination, is *homo creabilis & labilis*; and according to the ſublapſaries, *homo creatus & lapſus*. See PREDESTINATION.

The *ſupralapſaries* ſeem, in one ſingle abſolute decree, to confound two ſeveral ones which ought to be diſtinguiſhed: the one, the conditional decree preceding the foreſight of man's obedience, or diſobedience to the grace of God; the other, the abſolute decree following this foreſight. See PRESCIENCE.

The predeterminants alſo, admit an abſolute decree prior to the foreſight of original ſin, in common with the *ſupralapſaries*; but diſtinguiſh themſelves from theſe, as alſo from the infralapſaries and janſeniſts, in that their abſolute decree includes the offering of a ſufficient means of ſalvation to the reprobate; ſo that, as to the point of power, nothing hinders but that they might be ſaved. See GRACE.

SUPRASPINATUS, in anatomy, a muſcle thus called from its fleſhy origination at the upper end of the baſis of the ſcapula *above the ſpine*, to the upper part whereof it is connected, as alſo to the ſuperior edge of the ſcapula; whence marching along the upper interſcapulium, or thin part of the ſcapula, which it fills, it paſſes under the acromium and articulation of the humerus.—It helps to lift the arm upwards. See *Tab. Anat.* (Myol.) fig. 7. n. 32.

SUPREMACY, in the Engliſh polity, the ſuperiority or ſovereignty of the king over the church as well as ſtate of England, whereof he is eſtabliſhed head. See KING.

The king's *ſupremacy* was firſt eſtabliſhed, or, as others ſay, recovered by king Henry VIII. in 1534, after breaking with the pope.—It is ſince confirmed by ſeveral canons, as well as by the articles of the church of England; and is paſſed into an oath, which is required as a neceſſary qualification for all offices and employments both in church and ſtate, from perſons to be ordained, from the members of both houſes of parliament, *&c.* See OATH.

This right of *ſupremacy* conſiſts chiefly in the following articles, 1°. That the archbiſhops of either province cannot ſummon the biſhops and clergy to convocation, nor enact any canons without the king's expreſs conſent, by 25 Hen. VIII. c. 19. Whereas before that act the convocation was often called, and laws made by it for governing the church, without any authority from the crown. See CONVOCATION.

2°. In that there lies now an appeal from the archbiſhop to the king in chancery; and on ſuch an appeal, a commiſſion under the great ſeal is to be directed to certain perſons, whereof commonly half are laymen, and half clergymen, which is called *the court of delegates*, and which finally determine all eccleſiaſtical cauſes, by 25 Hen. VIII. c. 19. though ſometimes a review is granted. Before this ſtatute, the appeal from the archbiſhop's court lay to the pope only. See DELEGATE, APPEAL, *&c.*

3°. The king can grant commiſſions for viſiting ſuch places as are exempt from the juriſdiction of biſhops, or archbiſhops; and appeals lie from thence to the king in chancery: whereas before 25 Hen. VIII. the pope only could viſit them, and receive appeals from thoſe courts.

4°. Perſons in holy orders are not, as formerly, exempt from the king's temporal laws, any more than laymen. See EXEMPTION, IMMUNITY, *&c.*

5°. The biſhops and clergy do not ſwear, or pay any obedience to the pope; but muſt take the oaths of allegiance and ſupremacy to the king.

SURA, in anatomy, the calf, or fleſhy part of the leg.

The word is alſo uſed by ſome for the ſhin-bone, or fibula. See FIBULA.

SURALIS. See the article MUSCLE.

SURBATING, among farriers, is when the ſole of a horſe's foot is wore, bruiſed, or ſpoiled, by beating the hoof againſt the ground in travelling without ſhoes, or going in hot ſandy lands, or with a ſhoe that hurts the ſole, lies too flat to it, or the like.

Sometimes it alſo happens by over-riding a horſe while young, before his feet are hardened; and ſometimes by the hardneſs of the ground, and high lifting his feet.

The ſigns hereof, are his halting on both fore-legs, and going ſtiffly, and creeping as if half foundered.

In the general, there is nothing better for *ſurbated* feet than tar melted into the foot; or vinegar boiled with ſoot to the conſiſtence of a broth, and put into the foot boiling hot, with hurds over it, and ſplints to keep it in.

SURCHARGE of the foreſt, is when a commoner puts more beaſts in the foreſt than he has a right to. See FOREST.

SURCINGLE, a girdle, wherewith the clergy of the church of England uſually tie their caſſocks. See GIRDLE.

SURCOAT, a coat of arms, to be wore over body armour. See COAT *of arms*.

The *ſurcoat* is properly a looſe thin taffaty coat, with arms embroidered, or painted on it.—Such as are worn by heralds, anciently alſo uſed by military men over their armour, to diſtinguiſh themſelves by. See ARMS.

SURD, in arithmetic, denotes a number that cannot be expreſſed; or a number that is incommenſurate to unity. See NUMBER.

This is otherwiſe called an *irrational*, or *incommenſurable number*. See IRRATIONAL and INCOMMENSURABLE.

When any number or quantity hath its root propoſed to be extracted, and yet is not a true figurate number of that kind; that is, if its ſquare root be demanded, and it is not a true ſquare: if its cube root be required, and itſelf be not a true cube, *&c.* then it is impoſſible to aſſign, either in whole numbers or in fractions, any exact root of ſuch number propoſed. See ROOT, SQUARE, *&c.*

And whenever this happens, it is uſual in mathematics to mark the required root of ſuch numbers or quantities, by prefixing before it the proper mark of radicality, which is $\surd$: thus $\surd$: 2 ſignifies the ſquare root of 2, and $\overset{3}{\surd}$: 16, or $\surd$: (3) 16, ſignifies the cubic root of 16: which roots, becauſe they are impoſſible to be expreſſed in numbers exactly, (for no effable number, either integer, or fraction, multiplied into itſelf, can ever produce 2; or being multiplied cubically, can ever produce 16) are properly called *ſurd roots*.

There is alſo another way of notation now much in uſe, whereby roots are expreſſed without the radical ſign, by their indexes:

2

indexes: thus, as x^2, x^3, x^5, *&c.* ſignify the ſquare, cube, and fifth power of x; ſo $x^{\frac{1}{2}}$, $x^{\frac{1}{3}}$, $x^{\frac{1}{5}}$, ſignify the ſquare root, cube, *&c.* of x.

The reaſon of which is plain enough; for ſince $\surd : x$ is a geometrical mean proportional between 1 and x, ſo $\frac{1}{2}$ is an arithmetical mean proportional between 0 and 1; and therefore as 2 is the index of the ſquare of x, $\frac{1}{2}$ will be the proper index of its ſquare root, *&c.*

Obſerve alſo, that for convenience, or brevity's ſake, quantities or numbers, which are not *ſurds*, are often expreſſed in the form of *ſurd* roots. Thus, $\surd : 4$, $\surd : \frac{9}{4}$ $\overset{3}{\surd} : 27$, *&c.* ſignify, 2, $\frac{3}{2}$, 3, *&c.*

But though theſe *ſurd* roots (when truly ſuch) are inexpreſſible in numbers, they are yet capable of arithmetical operations, (ſuch as addition, ſubſtraction, multiplication, diviſion, *&c.*) which how readily to perform, the algebraiſt ought not to be ignorant.

Surds are either *ſimple* or *compound*.

Simple SURDS are thoſe which are expreſſed by one ſingle term. —As $\overset{3}{\surd}\, c$.

Compound SURDS are thoſe formed by the addition or ſubſtraction of ſimple *ſurds*: as $\surd : 5 + \surd : 2 : \surd : 5 - \surd : 2$, or $\overset{3}{\surd} : \overline{7 + \surd : 2}$: which laſt is called an *univerſal* root, and ſignifies the cubic root of that number, which is the reſult of adding 7 to the ſquare root of 2.

To reduce rational quantities to the form of any SURD *roots aſſigned.*—Involve the rational quantity according to the index of the power of the *ſurd*, and then prefix before it the radical ſign of the *ſurd* propoſed. Thus to reduce $a = 10$; to the form of $\surd : 15 = : b$, you muſt ſquare $a = 10$; and prefixing the ſign, it will ſtand thus, $\surd : aa = \surd : 100$, which is the form of the *ſurd* deſired.

So alſo, if 3 were to be brought to the form of $\overset{4}{\surd} : 12$, you muſt raiſe 3 up to its fourth power, and then prefixing the note of radicality to it, it will be $\overset{4}{\surd} : 81$, or $81^{\frac{1}{4}}$, which is the ſame form with $\overset{4}{\surd} : 12$.

And this way may a ſimple *ſurd* fraction, whoſe radical ſigns refers only to one of its terms, be changed into another, which ſhall reſpect both numerator and denominator. Thus $\frac{\surd : 2}{25}$ is reduced to $\surd : \frac{2}{25}$ and $\frac{5}{\overset{3}{\surd} : 4}$, to $\overset{3}{\surd} : \frac{125}{4}$; where the radical ſign affects both numerator and denominator.

To reduce ſimple SURDS, *having different radical ſigns, (which are called* heterogeneal ſurds) *to others that may have one common radical ſign, or which are homogeneal.*—Divide the indexes of the powers by their greateſt common diviſor, and ſet the quotients under the dividends; then multiply thoſe indexes croſs-ways by each other's quotients, and before the product ſet the common radical ſign $\surd$: with its proper index: then involve the powers of the given roots alternately, according to the index of each other's quotient; and before thoſe products, prefix the common radical ſign before found.

To reduce $\overset{2}{\surd} : aa$ and $\overset{4}{\surd} : bb$

$$2)\ \surd : aa\ 2)\ \overset{4}{\surd} : bb$$

$$_1\mathrm{X}_2$$

$$\overset{4}{\surd} : bb \quad \overset{4}{\surd} : aaaa.$$

To reduce SURDS *to the loweſt terms poſſible.* — Divide the *ſurd* by the greateſt ſquare, cube, biquadrate, *&c.* or any other higher power, which you can diſcover is contained in it, and will meaſure it without any remainder; and then prefix the root of that power before the quotient, or *ſurd*, ſo divided; this will produce a new *ſurd* of the ſame value with the former, but in more ſimple terms. Thus, $\surd : 16\,aab$, by dividing by $16\,aa$, and prefixing the root $4\,a$, will be reduced to this, $4\,a\,\surd : b$, and $\surd : 12$, will be depreſſed to $2\,\surd : 3$. Alſo $\overset{3}{\surd} : c\,b^3\,r$ will be brought down to $b\,\overset{3}{\surd} : c\,r$.

This reduction is of great uſe whenever it can be performed: but if no ſuch ſquare, cube, biquadrate, *&c.* can be found for a diviſor, find out all the diviſors of the power of the *ſurd* propoſed; and then ſee whether any of them be a ſquare, cube, *&c.* or ſuch a power as the radical ſign denotes: and if any ſuch can be found, let that be uſed in the ſame manner as above, to free the *ſurd* quantity in part from the radical ſign. Thus, if $\surd : 288$ be propoſed; among its diviſors will be found the ſquares, 4, 9, 16, 36, and 144; by which, if 288 be divided, there will ariſe the quotients 72, 32, 18, 8, and 2; wherefore inſtead of $\surd : 288$, you may put $2\,\surd : 72$, or $3\,\surd : 32$, or $4\,\surd : 18$, or $6\,\surd : 8$, or laſtly, $12\,\surd : 2$, and the ſame may be done in ſpecies.—But for the entire arithmetic of *ſurds*, ſee Kerſey's *Algebra*, and others on the ſame ſubject.

Commenſurable SURDS, } See { COMMENSURABLE.
Heterogeneous SURDS, } See { HETEROGENEOUS.
Homogeneous SURDS, } See { HOMOGENEOUS.

SURDESOLID. See the article SURSOLID.

SURETY *of the peace*, an act whereby a perſon in danger of hurt from another, is ſecured by a bond, or recognizance, acknowledged by the other to the king, and bail bound with him, for keeping the peace. See SUPPLICAVIT, and SECURITATE *pacis*.

This ſecurity, a juſtice of the peace may command, either as a miniſter, when commanded thereto by higher authority; or as a judge, when he doth it of his own power, derived from his commiſſion. See PEACE, and JUSTICE.

It differs from *ſurety of good abearing*, in that whereas the peace is not broken without an affray, or ſuch like; the *ſurety de bono geſtu* may be broken by the number of a man's company, or by his or their weapon, or harneſs.

SURFACE, in geometry, *&c.* See SUPERFICIES.

SURFEIT, an indiſpoſition cauſed by exceſs in eating or drinking, that is, by over-charging the ſtomach: uſually attended with eruptions, and ſometimes with a fever. See PLENITUDE.

SURFEIT *water*, is a water diſtilled from poppies, and other herbs, proper to cure indigeſtions. See WATER.

SURGE. The ſailors call a wave, or billow of the ſea, a *ſurge*. See WAVE.

Alſo, when they are heaving at the capſtan, if the cable happen to ſlip back a little, they ſay, *the cable ſurges.*

SURGERY. See the article CHIRURGERY.

SURMOUNTED, in heraldry, is when one figure is laid over another. As the pile ſurmounted of a chevron, in *Tab. Herald.* fig. 48.

SURNAME, or SIRNAME, a name added to the proper or baptiſmal name, to denominate the perſon of ſuch a family. See NAME.

It was the Romans firſt introduced the uſe of hereditary names; and that on occaſion of their league with the Sabines; for the confirmation whereof, it was agreed, that the Romans ſhould prefix Sabine names, and the Sabines, Roman names, to their own.

Theſe new names became family names, or *ſurnames*, and the old ones continued perſonal names. The former they called *cognomina*, and *gentilitia nomina*; and the latter *prænomina*. See PRENOMEN.

When the former came to be uſed among the French and Engliſh, they were called *ſurnames*, or *ſirnames*, not becauſe they are the names of the ſire, or father; but, according to Camden, becauſe they are ſuper-added to the perſonal name; or, rather, with Du Cange, becauſe at firſt, this family name was wrote over (*Sur*) the other name, thus:

de Bourbon
Louis.

In lieu of *ſurnames*, the Hebrews, to keep up the memory of their tribes, uſed the name of their father, with the addition of *Ben*, ſon; as *Melchi Ben-Addi*, *Addi Ben-Coſam*, &c. ſo the Greek, Ικαρος τȢ Δαιδαλȣ; Icarus, the ſon of Dædalus; Dædalus, the ſon of Eupalmus, *&c.*

So, alſo, the ancient Saxons, *Ceonred*, *Ceolwalding*, *Ceolwald Cuthing*, that is, Ceonred, ſon of Ceolwald, ſon of Cuth: and in the ſame ſenſe, the Welſh uſe *ap* for *mab*, ſon; as, *ap Owen*, *Owen ap Harry*, *Harry ap Rheſe*; and the Iriſh, *Mac*, as *Donald Mac Neal*, *Neal Mac Con*, &c. and the old Normans, *Fitz*, as *John Fitz Robert*, *Robert Fitz Ralph*, &c.

Scaliger adds, that the Arabs uſed their father's name, or *ſurname*, without their perſonal name; as, *Aven-Pace*, *Aven-Zoar*, &c. *q. d.* ſon of Pace, ſon of Zoar, *&c.* As, if Pace had a ſon at his circumciſion called *Haly*, he would be called *Aven-Pace*, concealing Haly; but his ſon, however he were named, would be called *Aven-Haly*, &c.

The Romans, in time, multiplied their *ſurnames*: beſides the general name of the race, or family, called *gentilitium*; they took a particular one, to diſtinguiſh the branch of the family, called alſo *cognomen*; and ſometimes a third, on account of ſome perſonal diſtinction; as that of *Africanus*, by Scipio; of *Torquatus*, by Manlius.

Theſe three different kinds of *ſurnames* had alſo their different names, *viz. nomen*, alſo *cognomen*, *agnomen*: but theſe laſt were not hereditary; being, in effect, a kind of ſobriquets, or nick-names, if that word be indifferent with reſpect to good and evil. See the ſubject of the Roman names and *ſurnames* accurately treated of by Spanheim, *de Præſt. & uſu Numiſm.* Diſſ. 10. See alſo AGNOMEN.

In theſe, too, they have been imitated by later times: thus, in our Engliſh hiſtory, we find that Edgar was called the *Peaceable*; Ethelred, the *Unready*; Edmond, *Iron-ſide*; Harold, *Hare-foot*; William, *the Baſtard*; Henry I. *Beauclerk*;

John, *Lackland*, &c.—But as theſe names were never bore by the ſons, Camden, and others, think it ſtrange, that *Plantagenet* ſhould be accounted the *ſurname* of the royal family of England, till Henry VII; or *Tydur*, or *Tudor*, that from Henry VII. to king James I. or that of *Steward* from king James I. to king George; or, that *Valoys* ſhould be eſteemed the *ſurname* of the late family of French kings; or *Bourbon* of the preſent; or *Oldenburg* of the kings of Denmark; or *Hapſbourg* of the emperors. See PLANTAGENET.

Du Cheſne obſerves, that *ſurnames* were unknown in France before the year 987; when the lords began to aſſume the names of their demeſnes.—Camden relates, that they were firſt taken up in England, a little before the conqueſt, under king Edward the confeſſor: but he adds, they were never fully eſtabliſhed among the common people, till the time of Edward II. till then they varied with the father's name; if the father, *e. gr.* was called *Richard*, or *Roger*, the ſon was called *Richardſon*, or *Hodgſon*; but from that time they were ſettled, ſome ſay, by act of parliament.

The oldeſt *ſurnames*, are thoſe we find in *Domeſday-Book*, moſt of them taken from places, with the addition of *de*: as Godefridus *de* Mannevilla, Walterus *de* Vernon, Robert *de* Oyly, *&c.* others from their fathers, with *filius*, as Gulielmus *filius* Oſberni; others from their offices, as Eudo *Dapifer*, Gulielmus *Camerarius*, Giſlebertus *Cocus*, &c. But the inferior people are noted, ſimply, by their chriſtian names; without any *ſurnames* at all.

In Sweden, till the year 1514, no body took *ſurnames*; and the common people there, have none to this day; nor even the native Iriſh, Poles, and Bohemians, *&c.*—It is very late that the Welſh have had any; and thoſe they have, are generally only formed, by leaving out the *a* in *ap*, and annexing the *p* to their father's name; as in lieu of *Evan ap Rice*, they now ſay *Evan Price*; for *ap Howel*, *Powel*, &c.

Du Tillet maintains, that all *ſurnames* were originally given by way of ſobriquets, or nick-names; and adds, that they are all ſignificant and intelligible to thoſe who underſtand the ancient dialects of the ſeveral countries.—The greateſt part of our *ſurnames*, and thoſe of greateſt account, Camden ſhews, are local, and borrowed from the places in Normandy, *&c.* where the reſpective perſons, who came over with the conqueror, and firſt bore them, had their poſſeſſions, or their births: ſuch as *Mortimer*, *Warren*, *Albigny*, *Piercy*, *Devereux*, *Tankervil*, *Nevil*, *Tracy*, *Montfort*, &c. He adds, that there is not a village in Normandy, but gives name to ſome family in England.—Others were taken from places in England, as *Aſton*, *Sutton*, *Wotton*, &c.

The Saxon common people generally took their father's or mother's chriſtian name, with the addition of *ſon*: though many were *ſurnamed* from their trade, as *Smith*, *Carpenter*, *Taylor*, *Weaver*, *Fuller*, &c. others from their offices, as *Porter*, *Shepherd*, *Carter*, *Cook*, *Butler*, &c. others from their complexions, as *Fairfax*, i. e. fair hair; *Blunt or Blond*, i. e. flaxen, or yellow; others from birds, as *Wren*, *Finch*, &c. others from beaſts, as *Lamb*, *Hare*, *Hart*, &c. others from the winds; others from ſaints, *&c.*

SURPLUSAGE, in common law, ſignifies a ſuperfluity, or addition of more than needeth; which ſometimes is the cauſe that a writ abateth.—But in pleading it is frequently ſet aſide; the reſt remaining good.

SURPLUSAGE is ſometimes alſo applied to matters of accounts and denotes a greater diſburſement than the charge of the accomptant amounteth to. See ACCOUNT.

SURREBUTTER, in law, a ſecond rebutter; or the replication of the plaintiff to the defendant's rebutter. See REBUTTER.

SURREJOYNDER, is a ſecond defence of the plaintiff's declaration; by way of anſwer to the defendant's rejoynder. See REJOYNDER.

SURRENDER, in common law, an inſtrument in writing, teſtifying, that the particular tenant of lands and tenements for life or years, doth ſufficiently conſent and agree, that he, who has the next or immediate remainder or reverſion thereof, ſhall have the preſent eſtate of the ſame in poſſeſſion; and that he hereby yields and gives up the ſame to him. See REVERSION, and REMAINDER.

There may alſo be a *ſurrender* without writing: whence, *ſurrender* is uſually divided into that in *deed*, and that in *law*.

SURRENDER *in deed*, is that which is really made by expreſs words in writing.

SURRENDER *in law*, is that wrought by operation of the law, and which is not actual.—As if a man have a leaſe of a farm for life, or years; and during the term, he accepts of a new leaſe: this act is in law, a *ſurrender* of the former. There is alſo a cuſtomary *ſurrender* of the copy-hold, as may be ſeen in Coke ſup. Littlet. ſect 74.

SURREPTITIOUS. See the article SUBREPTITIOUS.

SURROGATE, SURROGATUS, a perſon ſubſtituted or appointed in room of another; moſt commonly of a biſhop, or biſhop's chancellor. See SUBSTITUTE, SUFFRAGAN, COMMISSARY, *&c.*

SURROGATION. See the article SUBROGATION.

SURSOLID, or SURDESOLID, in arithmetic, the fifth power of a number, or the fourth multiplication of a number, conſidered as a root. See POWER.

The number 2, for inſtance, conſidered as a root, and mu tiplied by itſelf, produces 4, which is the ſquare, or ſecon power of 2; and 4 multiplied by 2, produces 8, the thi power, or cube, or ſolid number of 2; 8, again, multi plied by 2, produces 16, the fourth power, or quadrat quadratum of 2; and 16 multiplied once more by 2, pro duces 32, the fifth power, or *ſurſolid*, or *ſurdeſolid* numbe of 2.

SURSOLID *problem*, is that which cannot be reſolved, but b curves of an higher kind than the conic ſections. See PROBLEM.

Thus, *e. gr.* to deſcribe a regular endecagon, or figure o eleven ſides in a circle, it is required to deſcribe an iſoſcele triangle on a right line given, whoſe angles at the baſe, ſhal be quintuple to that at the vertex; which may eaſily be don by the interſection of a quadratrix, or any other curve of th ſecond gender, as they are by ſome called, but not by an lower curve. See QUADRATRIX, CURVE, *&c.*

SURVEYING, the art or act of meaſuring lands; *i. e.* o taking the dimenſions of any tract of ground, laying dow the ſame in a map or draught; and finding the content o area thereof. See MEASURING, MAP, *&c.*

Surveying, called alſo *geodæſia*, is a very ancient art; it i even held to have been the firſt, or primitive part of geometry, and that which gave occaſion to, and laid the foundation of all the reſt. See GEOMETRY.

Surveying conſiſts of three parts or members; the firſt, is th taking of the neceſſary meaſures, and making the neceſſar obſervations on the ground itſelf: the ſecond, is the laying down of theſe meaſures and obſervations on paper: and th third, the finding the area or quantity of the ground thu laid down.

The firſt is what we properly call *ſurveying*: the ſecond w call *plotting* or *protracting*, or *mapping*: and the third *caſting up*.

The firſt, again, conſiſts of two parts, *viz.* the making o obſervations for the angles, and the taking of meaſures fo the diſtances.

The former of theſe is performed by ſome one or other o the following inſtruments, *viz.* the theodolite, circumferentor, ſemi-circle, plain-table, or compaſs: the deſcription and manner of uſing each whereof, ſee under its reſpective article, THEODOLITE, CIRCUMFERENTOR, PLAIN-TABLE, COMPASS, *&c.*

The latter is performed by means either of the chain or th perambulator: the deſcription and manner of applying eac whereof, ſee under its reſpective article, CHAIN, and PERAMBULATOR.

The ſecond branch of *ſurveying* is performed by means o the protractor, and plotting ſcale: the uſe, *&c.* whereof, ſee under PROTRACTOR, PLOTTING *ſcale*, &c. See alſo MAP.

The third is performed by reducing the ſeveral diviſions, incloſures, *&c.* into triangles, ſquares, trapeziums, parallelograms, *&c.* but eſpecially triangles; and finding the areas o contents of theſe ſeveral figures, by the rules delivered unde the articles AREA, TRIANGLE, SQUARE, *&c.*

SURVEYING *croſs*, is an inſtrument little known, and leſs uſed in England; though in France, *&c.* it ſerves in lieu of a theodolite or the like inſtrument: it conſiſts of a braſs circle, or rather a circular limb, graduated, and again divided into four equal parts, by two right lines cutting each other at right angles in the centre. At each of the four extremities of the lines, and in the centre are fixed ſights. The whole is mounted on a ſtaff. See CROSS.

SURVEYING *quadrant*. See the article QUADRANT.

SURVEYING *wheel*. See the article PERAMBULATOR.

SURVEYOR, one that hath the overſight and care of conſiderable works, lands, or the like. See SUPERVISOR.

Such are the *ſurveyor* general of the king's manors; *ſurveyor* of the king's exchange; *ſurveyor* general of the works; *ſurveyor* general of the crown lands, *&c.*

SURVEYOR *of the melting*, is an officer of the mint, whoſe buſineſs is to ſee the bullion caſt out; and that it be not altered after the delivery of it to the melter. See MINT, and COINAGE.

SURVEYOR *of the navy*, is an officer, whoſe buſineſs is to know the ſtate of all ſtores, and ſee the wants ſupplied; to ſurvey the hulls, maſts and yards of ſhips; to audit the boatſwains and carpenters accounts, *&c.* See NAVY.

SURVEYOR *of the ordinance*, is an officer, whoſe charge is to ſurvey all the king's ordinance, ſtores, and proviſions of war, in the cuſtody of the ſtore-keeper of the tower of London; to allow all bills of debts, to keep checks on labourers and artificers works, *&c.* See ORDINANCE.

SURVEYOR is alſo uſed for a gauger.—And alſo for a perſon who meaſures and makes maps of lands. See SURVEYING, and GAUGING.

SURVIVOR, in law, ſignifies the longer liver of two joint tenants; or of any two perſons joined in the right of any thing.

SUSPENSE, SUSPENSIO, in common law, denotes a tempo-

In

temporary ſtop or ceſſation of a man's right for a time.

As, when the rent, or other profits of land, by reaſon of the unity of poſſeſſion of the rent, and the land out of which it iſſues, is not *in eſſe* for a certain time, but *tunc dormit*, or remains aſleep: but ſo as it may be revived or awaked.—By which, *ſuſpenſion* differs from *extinguiſhment*, where the right dies for ever. See EXTINGUISHMENT.

SUSPENSION, SUSPENSIO, the act of preventing the effect, or courſe of any thing, for a certain time.

The principal point urged in the philoſophy of the Scepticks and Pyrrhonians, is a *ſuſpenſion* of mind. See SCEPTICKS, PYRRHONIANS, ACATALEPSY, &c.

SUSPENSION *of arms*, in war, is a ſhort truce which the contending parties agree on, for the burial of their dead, the waiting for ſuccours, or the order of their maſters, &c.

In rhetoric, *ſuſpenſion* is a keeping the hearer attentive and doubtful, in expectation of what the ſpeaker will conclude in: as, "O God! darkneſs is not more oppoſite to light, "tempeſts to calms, pain to pleaſure, or death to life, than "ſin to thee."

SUSPENSION, in mechanics.—*Points of* SUSPENSION in a ballance, are thoſe points in the axis or beam wherein the weights are applied; or from which they are ſuſpended. See BALLANCE.

SUSPENSION, in the common law, is what we otherwiſe call the *minor excommunication*, viz. a cenſure inflicted by way of puniſhment, on an eccleſiaſtic, for ſome conſiderable fault. See CENSURE, and EXCOMMUNICATION.

It is of two kinds, *viz. ab officio*, and *à beneficio*.

SUSPENSION *ab officio*, is that whereby a miniſter is, for a time, forbidden to execute the office of a miniſter.

SUSPENSION *à beneficio*, is when a miniſter is, for a time, deprived of the profits of his benefice. See BENEFICIO.

Where the fault is more notorious, the two kinds of *ſuſpenſion* are ſometimes joined; and the perſon both *ſuſpended ab officio* and *à beneficio*. See DEPRIVATION, &c.

SUSPENSOR *Teſticuli*, in anatomy, a muſcle called alſo *cremaſter*. See CREMASTER.

SUSPIRAL, a ſpring of water, paſſing under ground towards a conduit or ciſtern.—Alſo a breathing hole, or ventiduct. See VENTIDUCT.

SUTE, SUYTE, or *ſuite*. See the article SUITE.

SUTH-DURE, in ancient cuſtoms, denotes the ſouth door of a church; mentioned in old authors, as the uſual place where canonical purgation was performed.—That is, when a fact could not be proved by ſufficient evidence, the party accuſed, came to the ſouth door of the church; and there, in the preſence of the people, made oath that he was innocent. See PURGATION.

This was called *judicium dei*.—And it is for this reaſon that large porches were anciently built at the ſouth doors of churches. See PORCH.

SUTTON's *quadrant*. See the article QUADRANT.

SUTURE, SUTURA, in anatomy, a peculiar kind of juncture, or articulation, of certain bones in the animal body; thus called, as reſembling a ſeam. See ARTICULATION.

There are two kinds of *ſuture*; one called the *true* or *genuine ſuture:* wherein bones are indented like ſaws, and reciprocally received into each other.

The other, called *falſe*, *ſpurious*, or *ſquammous ſuture*; wherein the bones are laid over each other, like the ſcales of fiſhes. See SQUAMMOUS.

The bones of the cranium are uſually joined by three genuine *ſutures:* the *coronal*, reaching acroſs from one temple to the other. See *Tab. Anat.* (Oſteol.) fig. 1. lit. g. fig. 2. lit. h. and the article CORONAL.—The *ſagittal*, joining the *oſſa parietalia*. See *Tab. Anat.* (Oſteol.) fig. 1. lit. f. fig. 2. lit. i. and the article SAGITTAL.—And the *lambdoidal*; thus called from its reſembling the Greek Λ, lambda. See LAMBDOIDES.

Beſides theſe, is a fourth *ſuture*, of the ſpurious or ſquammous kind, ſuppoſed, though falſely, to have no indentures: it joins the oſſa temporum to the os ſphenoides, occipitis, &c. and is alſo called the *temporal ſuture*.—See *Tab. Anat.* (Oſteol.) fig. 2. lit. k. See alſo SQUAMMOUS.

Natural hiſtorians tell us, that in Perſia it is frequent to have people without any *ſutures* at all in the ſkull; but the whole one ſolid bone; yet without any apparent inconvenience: and M. Flechier, in his life of cardinal Ximenes, affirms the ſame of that cardinal: yet it ſhould ſeem that great diſorders muſt ariſe therefrom; as the perſpiration can be but very imperfectly effected; whence heavineſs and ſwimming in the head. See CRANIUM.

Sphenoidal SUTURE. See the article SPHENOIDAL.

SUTURE, in chirurgery, denotes a ſeam made to cloſe the lips of a wound, in order to its healing. See WOUND.

The ancients invented a great variety of *ſutures*, which they reduced to three kinds; *incarnatives*, *reſtrictives*, and *conſervatives*.

Incarnative SUTURE, is thus called, becauſe, by rejoining the edges of a wound, and keeping them together by means of a thread run acroſs them with a needle, they grow together, and incarnate as before. See INCARNATIVE.

This they ſubdivided into five kinds, *viz.* the *interrupted*, *intertwiſted*, *penned* or *feathered*, *with claſps*, and the *dry ſuture*.

Of theſe five, two are perfectly diſuſed, *viz.* the *feathered ſuture*, and the *ſuture with claſps*, as being too barbarous, and at the ſame time unneceſſary. The firſt was called *pinned*, when little pins were made uſe of; and *feathered* when the barrels of feathers or quills.

To perform it, two or three needles threaded with a double thread, were paſſed through the lips of the wound, at a finger's breadth from each other, and a pin or feather put in the ſtitch; and another pin or feather bound with the ends of the ſame thread, that the feathers might keep the lips of the wound cloſe together.

To perform the ſecond, they had large, crooked claſps, pointed at each end; one of which they thruſt into the upper part of the wound, the other into the lower, to bring the lips together.

Theſe *ſutures*, cruel as they were, are yet known to be uſeleſs; for in the only caſes where they ſhould ſeem ſerviceable, *viz.* in deep wounds, where the contraction of the fleſhy parts keeps the lips far aſunder, and in wounds of tendons; they expoſe the patient to terrible convulſions and ſhudderings, which are avoided, by diminiſhing the dilatation of the wounds, by moderate compreſſions, and waiting till the fibres relax.

Reſtrictive SUTURES, were thoſe wherewith they endeavoured to ſtop the flux of blood from large wounds, where any conſiderable veſſels were cut.

To this end, they invented ſeveral kinds, in the number whereof, were the *ſhoe-makers*, *taylors*, *ſkinners*, and other *ſeams*, each more impertinent than other. It is evident, the very deſign of ſuch a *ſuture* is blameable: for ſuppoſing the wound ſo exactly ſewed up, that no blood could eſcape through the lips thereof; yet will it ſtill flow out of the veſſels; and will thus be forced to make its way between the laminæ of the muſcles, by which means the part will ſwell, rot, and gangrene. Yet the *ſkinners ſuture*, *ſutura pellionem*, is ſtill in uſe for wounds of the inteſtines: it is thus called, becauſe the ſkinners uſe the like, in ſewing up the holes made by the butchers, in fleaing off the ſkin.

Conſervative SUTURE, is that kind of ancient *ſuture*, whereby the lips of large wounds, wherein there was a loſs of ſubſtance, were prevented from receding too far. But a bandage, now, ſuffices.

Intertwiſted SUTURE, is thus called, becauſe the needles being left ſticking in the wound, the thread is wound around them; much after the ſame manner as the taylors do the threaded needles they keep in their ſleeves, &c. This *ſuture* is performed two ways; for either the needles are paſſed acroſs the wound, or they are ſtuck on the ſides thereof.

All the *ſutures* hitherto mentioned, are made with needle and thread: beſide which, there is another kind called *dry ſutures*, which are performed with glue or ſize; or other proper viſcous matter.

The *dry* SUTURE is ordinarily made with ſmall pieces of leather, on linnen cloth, indented like a ſaw, ſo that the teeth may fall between each other, and the whole row may be cloſed. The cloth, before it is cut into this form, is ſpread with ſome proper plaiſter, in order to its firm adheſion.

The plaiſters thus prepared, being cut into the form, are applied on the firm fleſh, according to the length of the wound, reaching from it to the diſtance of ſome inches; and after they are dried, or well faſtened to the part, the lips of the wound being approached, they may conveniently be held together by the *ſuture* in that poſture.

This kind of *ſuture* is principally uſed for wounds in the face, to prevent unſightly ſcars: it is likewiſe convenient when the fibres of the muſcles are cut a-croſs; and where it is difficult or impoſſible to apply a bandage.

In the other kinds of *ſutures*, the ſtitches ought always to be taken of a depth proportionable to that of the wound; care being had to avoid the nerves as much as poſſible. In long wounds they are beſt begun at the ends; but in ſhort ones at the middle.

SWABBER, the title of an inferior officer on board a man of war, whoſe office is to take care the ſhip be kept neat and clean.

In order to this, he is to ſee her waſhed well once or twice a week at leaſt; eſpecially about the gun-wales and chains. He ought alſo to burn pitch, or ſome ſuch thing, now and then between decks, to prevent infection; and to acquaint the captain with ſuch of the men as are naſty and offenſive.

SWAIN, } See { BOATSWAIN and COCKSWAIN.
SWAINMOTE, } See { SWANIMOTE.

SWALLOWING. See the article DEGLUTITION.

Among the rarities in the anatomy hall at Leyden, is preſerved a knife ten inches long, *ſwallowed* by a peaſant, and cut out of his ſtomach; after which he lived eight years.

A lady, mentioned by Mr. Greenhill in the *Philoſophical Tranſactions*, got a large and painful tumour in the umbilicus, with *ſwallowing* pruneſtones; which upon the tumour's breaking of itſelf, came out in great quantity: yet, notwithſtanding all imaginable care, ſhe died of it.—A lad, ſixteen years of age, near Hall in Saxony, playing with a knife ſix inches and half long, accidentally *ſwallowed* it. The curioſity of the caſe led Wolfgang Chriſt. Weſenon, phyſician of the elector of Brandenbourg, to take care of him. The knife was felt to have changed its poſition ſeveral times, and in a few months ceaſed to be very troubleſome; and in a year was ſo much diminiſhed, as ſcarce to be felt from without. At length it was drawn out (exceedingly diminiſhed every way) through an abſceſs which its point occaſioned, three fingers breadth below the pit of the ſtomach, and the boy was perfectly well; *Philoſophical Tranſactions*, N°. 219.

"Some people, (ſays Dr. Sloan, from an inſtance of an unhappy perſon who had *ſwallowed* great quantities of pebbles to eaſe him of the wind, and which remaining in his ſtomach to the number of two-hundred, had brought him into a very ſad condition,) "from their ſeeing birds languiſh, "unleſs they ſwallow gravel, or ſmall ſtones, take up an "opinion, that the *ſwallowing* of ſtones helps the ſtomach to "digeſt its food; but I have been always againſt that pra"ctice: for though the ſtomachs, or gizzards of birds (they "wanting teeth to grind their food) are made very ſtrong, "muſculous, and defended on the inſide with a coat, by the "help whereof, and theſe ſtones, their victuals are ground; "yet the ſtomachs of men being very different, it is not "reaſonable to think they ſhould be of uſe (or even inof"fenſive) to them.

"I knew, adds he, one Mr. K———, who for many "years ſwallowed nine or ten ſtones every day, nearly as "large as wallnuts, and without any apparent harm, as they "always paſſed; but he afterwards died ſuddenly."

SWALLOWS-TAIL, in fortification, a kind of out-work only differing from a ſingle *tenaille*, in that its ſides are not parallel as thoſe of the tenaille, but narrower towards the fortified place, than towards the country. See QUEUED'ARONDE, and TENAILLE.

SWALLOWS-TAIL, in joinery and carpentry, denotes a particular way of faſtening together two pieces of timber, ſo ſtrongly as they cannot fall aſunder. See DOVE-*tail*.

SWANIMOTE, or SWAINMOTE, a court touching matters of the foreſt, kept, by the charter of the foreſt, thrice in every year, before the verderers, as judges. See FOREST. This court is as incident to a foreſt, as a court of pie-powder to a fair. See COURT.

SWITH, *faſcia*, among ſurgeons, a long and broad band to bind up any diſeaſed member, or part. See BANDAGE.

SWEAT, a ſenſible moiſture iſſuing out of the pores of the ſkins of animals, through too much heat, exerciſe, or weakneſs; or through the action of certain medicines called *ſudorifics*. See SUDORIFIC.

Sweat is either the conſequence of an acceleration of the blood's motion, by ſtimuli, or exerciſe; or of a relaxation of the pores of the cutis; by means of either whereof, the matter which before perſpired inſenſibly, is now rendered ſenſible. See PERSPIRATION.—The former is the caſe in natural and medicinal *ſweats*, and the latter in morbid, fainting, and cold *ſweats*. See SUDOR.

The principal organs of *ſweat* are the miliary glands; which are ſpread over the whole ambit of the body; and furniſhed, each, with a vein, artery, and nerve, beſides an excretory duct, through the orifice whereof the *ſweat* is caſt out under the cuticle. This duct is covered with a little round valve, lying immediately under the cuticle, whereby the *ſweat* is occaſionally either retained or tranſmitted. See MILIARY *gland*.

The *ſweat* thus ſecreted, is various, according to the variety of the weather, ſoil, ſex, age, temperament, emunctory, diet, time of digeſtion, &c. as in the urine. See URINE.

In a ſound body, *ſweat* is ſcarce ever found, but from a fault in ſome of the ſix non-naturals: its immediate effect is always hurtful; by accident ſometimes it does good.

The phyſicians order *ſweats* in cold and inveterate diſeaſes, as the palſy, rheumatiſm, ſciatica, and many other diſeaſes. Diſeaſes alſo frequently have their criſes in *ſweats*.

Sweating is indicated by the beginning of a critical *ſweat*, to carry off the diſeaſe; by the tenuity of the morbid matter diſperſed through all the veſſels, as in the plague, a venomous bite, or the French diſeaſe, before yet fixed; by the particular temperature of the patient, and by various obſtructions to be removed in the ſeveral parts of the body; particularly in ſubcutaneous diſeaſes, the itch, pſora, leproſy, &c.

Matthiolus tells us, that the *ſweat* of all quadrupedes, as horſes, aſſes, &c. is venomous; and that that of other beaſts is unwholſome.—Tachenius adds, that the *ſweat* of horſes, particularly, is ſo acid, that it pierces the ſtrongeſt and firmeſt boots, which are proof againſt all water.—Some naturaliſts affirm, that dogs and cats never *ſweat*, how hot ſoever they be, becauſe they are not found to have any pores in the cuticle. See PORE.

Engliſh SWEAT, or the SWEATING *ſickneſs*. See SUDOR *Anglicanus*.

SWEDISH *allum*,	See the articles	ALLUM.
SWEDISH *coins*,		COIN.
SWEDISH *meaſures*,		MEASURE.

SWEDISH *moneys*. See the article MONEY.

SWEEP, among refiners, the almond furnace. See ALMOND and FURNACE.

SWEEP, among goldſmiths, moniers, &c. See WASHING.

SWEEP, in the ſea-language.—The ſeamen call the mould of a ſhip, when ſhe begins to compaſs in at the rung-heads, the *ſweep* of her, or the *ſweep* of the futtock.

SWEEPING at ſea, ſignifies dragging along the ground, at the bottom of the ſea or channel, with a three fluked grapnel, to find ſome hawſer or cable which is ſlipped from an anchor.

SWEET *almonds*,	See	ALMOND.
SWEET *ſublimate of mercury*,		MERCURY.
SWELLED *columns*,		COLUMN.
SWELLED *hoof*,		HOOF.

SWELLING.—*Diameter of the* SWELLING. See DIAMETER.

SWIFTEST.—*Line of the* SWIFTEST *deſcent*. See LINE.

SWIMMING, the act or art of ſuſtaining the body in water, and of advancing therein by the motion of the arms, legs, &c. See ANIMAL.

Man alone learns to *ſwim*; all other perfect animals ſeem to take it naturally; though ſeveral of the imperfect *ſwim* not at all.

Among the ancient Greeks and Romans, *ſwimming* made ſo eſſential a part of the diſcipline of their youth, that to repreſent a man perfectly rude and uneducated, they uſed to ſay proverbially, he had neither learned to read nor to *ſwim*.

In fiſhes, it is the tail that is the grand inſtrument of *ſwimming*, not the fins, as is generally imagined: for this reaſon fiſhes are more ſtrong and muſculous in that part, than in all the reſt of their body; according as we find it in all other animals; the motive parts whereof are ſtill the ſtrongeſt, as the thighs of men for walking, the pectoral muſcles of birds for flight, &c. See FLYING, &c.

The manner wherein fiſhes row themſelves forwards by the tail, is well explained by Borelli *de Motu Animal.* part I. cap. 23.—The fins of fiſhes ſerve only to keep the body well poiſed and ballanced, and prevent vacillation. See FIN and TAIL.

M. Thevenot has publiſhed a curious piece in French, called *L' Art de Nager*, the art of *ſwimming* demonſtrated by figures. Before him, Everard Digby, an Engliſhman, and Nicholas Winman, a Dutchman, had laid down the rules of this art: Thevenot has done little more than copy from them.—Had he but read, with half that application, Borelli's treatiſe *de Motu animalium*, he would ſcarce have maintained, as he has done, that men would *ſwim* naturally, like other animals, were they not prevented by fear, which magnifies their danger.

We have abundant experience againſt this: Throw any brute, newly born, into a river, and it *ſwims*: throw an infant in, before it is yet capable of fear, and it *ſwims* not, but is drowned. The reaſon is, that the human machine differs very notably in its ſtructure and configuration from that of brutes; and particularly, which is very extraordinary, in the ſituation of its centre of gravity. In man, the head is exceedingly heavy, with regard to the reſt of the body; by reaſon the head is furniſhed with a very great quantity of brain, and has, beſides, a deal of fleſh and bones, and no cavities only filled with air: ſo that the head immerging under water by its own gravity, the noſe and ears are ſoon filled: thus the heavy carrying down the light, the man ſoon drowns, and is loſt.

But in brutes it is otherwiſe: for the head, here, having but little brain, and there being abundance of ſinus's therein; its weight, with regard to the reſt of the body, is much leſs conſiderable; ſo that they are eaſily able to keep their noſe above water, and thus reſpiring freely, are out of danger of drowning, on the principles of ſtatics.

In effect, the art of *ſwimming*, which is no otherwiſe to be acquired but by exerciſe, conſiſts principally in keeping the head above water, ſo, that the noſe and mouth being at liberty, reſpiration may be carried on: for, as to the feet and hands, it is enough to ſtir them, and to uſe them as oars to conduct the veſſel.

SWIMMING-*bladder*, popularly called SWIM, a veſicle of air incloſed in the bodies of fiſhes, by means whereof they are enabled to ſuſtain themſelves at any depth of water. See AIR, and FISH.

For the air in that bladder being more or leſs compreſſed, according to the depth the fiſh *ſwims* at, takes up more or leſs ſpace; and conſequently the body of the fiſh, part of whoſe bulk this bladder is, is greater or leſſer, according to the ſeveral depths; and yet retains the ſame abſolute weight. Now the rule *de inſidentibus humido*, is, that a body heavier than ſo much water as is equal in quantity to the bulk of it, will neceſſarily ſink; a body that is lighter, will *ſwim*; and a body of equal weight, will reſt in any part of the water. See FLUID, SPECIFIC *gravity*, &c.

By this rule, if the fiſh in the middle region of the water be of equal weight with water, bulk for bulk; the fiſh will reſt there without any natural tendency either upwards or downwards.

And if the fiſh be deeper in the water, its bulk becoming leſs by the greater compreſſion of the bladder; it will ſtill remain commenſurate to the gravity of the water in that part.

If the fiſh be higher than the middle region; the air dilating itſelf, and the bulk of the fiſh conſequently increaſing, but not the weight; the fiſh will riſe upwards, and reſt atop of the water.

It is probable the fiſh, by ſome action, can emit air out of its bladder, and take freſh in. Mr. Ray obſerves, that in moſt fiſhes, there is a manifeſt channel leading from the gullet to the *ſwimming* bladder, which doubtleſs ſerves for the conveyance; and that there is a muſculous power in the coat of the bladder, whereby the fiſh can contract it when it liſts. The ſame author adds, in confirmation of this doctrine, that it is found, if the *ſwimming* bladder of any fiſh be pricked or broke, the fiſh immediately ſinks to the bottom, and can neither ſupport nor raiſe itſelf. And that in flat fiſhes, as ſoles, plaiſe, *&c.* which lie always groveling at the bottom, there is no *ſwimming* bladder at all.

SWINE-*pox*. See the article POX.

SWOONING, a kind of lipothymia, or fainting, wherein the patient loſes all his ſtrength, as well as ſenſe, and underſtanding. See LIPOTHYMIA, DELIQUIUM, *&c.*

Swooning may be occaſioned by any thing that alters, corrupts, or diſſipates the vital ſpirits; as, long watching, violent pains, great and ſudden evacuations, putrid vapours ariſing from abſceſſes in the noble parts, *&c.*

SWORD, an offenſive weapon, worn at the ſide, ſerving either to prick, or cut, or both. See FENCING, ARMS, *&c.*

Its parts are the blade, guard, hand, or graſp, and pummel; to which may be added, the bow, ſcabbard, hook and chape. —The maſters of defence divide the *ſword* into the *upper*, *middle*, and *lower* part; or the *fort*, *middle*, and *foible* or ſmall, and weak part.

Anciently, there were a kind of two-handed *ſwords*, called *ſpado's*, and which were to be managed with both hands; which in thoſe days they could brandiſh ſo nimbly, as to cover the whole body therewith.

The ſavages of Mexico, when firſt viſited by the Spaniards, had a kind of wooden *ſwords*, which would do as much execution as ours.—In Spain, *ſwords* are only allowed of ſuch a length, determined by authority.—The ancient cavaliers gave names to their *ſwords*; *joyeuſe* was that of Charlemaign; *durandal* that of Orlando, *&c.*

SWORD-*bearers*,	See	PORTEGLAIVE.
Mills for SWORD *blades*,		MILL.
Pleas of the SWORD,		PLEA.
S. James of the SWORD,		JAMES.

SYCOPHANT*, ΣΥΚΟΦΑΝΤΗΣ, a Greek term, originally uſed at Athens, for perſons who made it their buſineſs to inform againſt thoſe who ſtole figs, to the owners; or againſt thoſe who, contrary to the law which prohibited the exportation of figs, practiſed the thing, and deceived the officers, the inſpectors of the ports, *&c.*

* The word is formed from συκον, a fig, and φαινω, *indico*, I ſhow, diſcover.

At length, the term became uſed in the general for all informers, tale-bearers, paraſites, flatterers, *&c.* eſpecially thoſe in the courts of princes: and at laſt, for lyer, impoſtor, *&c.*

SYCOPHANTIC *plants*. See the article PARASITES.

SYLLABIC, in the Greek grammar.—There are two kinds of augments; the firſt called *ſyllabic*, which is when the word is increaſed by a *ſyllable*; the other *temporal*, which is when a ſhort ſyllable becomes long. See AUGMENT.

SYLLABLE*, SYLLABA, in grammar, a part of a word, conſiſting of one or more letters which are pronounced together. See LETTER and WORD.

* The word is derived from the Greek, συλλαβη, which literally denotes comprehenſion, or aſſemblage.

Or, a *ſyllable* is a compleat ſound, uttered in one breath, conſiſting either of a vowel alone, or of a vowel and one or more conſonants, not exceeding ſeven. See VOWEL, CONSONANT, *&c.*

Scaliger defines a *ſyllable* to be an element under one tone or accent, that is, which can be pronounced at once.

Priſcian, more intelligibly, calls it a comprehenſion of ſeveral letters falling under one accent, and produced at one motion of the breath.—But ſome grammarians reject this definition, as excluding all *ſyllables* of one letter.

Another defines *ſyllable*, a literal or articulate voice, of an individual ſound. See VOICE.

In every word, therefore, there are as many *ſyllables* as there are vocal ſounds; and as many vocal ſounds, as there are ſimple or compound vowels; each whereof requires a diſtinct motion of the pectoral muſcles.—Thus, *a*, *a*, *a*, make three *ſyllables*, formed by ſo many motions, diſtinguiſhed by ſmall ſtops betwixt each expiration.

In the Hebrew, all the *ſyllables* begin with conſonants; allowing aleph to be one; nor has any *ſyllable* more than a ſingle vowel. See VOWEL and POINTS.

From the number of *ſyllables* in words they become denominated *monoſyllables*, *biſſyllables*, *triſſyllables*, and *polyſyllables*, q. d. words of one *ſyllable*, two *ſyllables*, three *ſyllables*, and many *ſyllables*. See WORD, MONOSYLLABLE, *&c.*

As it is the number of *ſyllables* that conſtitutes the meaſure of Engliſh verſe; it were to be wiſhed, we had fixed and ſettled rules to determine the preciſe number of *ſyllables* in each word: for we have words very dubious in that reſpect; and there are even ſome which have more *ſyllables* in verſe, than in proſe. Many of the words ending in *ious*, give a deal of embaraſs to ſuch as pique themſelves on exactneſs; as odious, precious, *&c.* See FOOT, QUANTITY, MEASURE, *&c.*

SYLLABUB, a kind of compound beverage, moſt affected in the ſummer-ſeaſon; ordinarily made of white-wine, and ſugar, into which is ſquirted new milk with a ſyringe, or wooden cow.

Sometimes it is made of canary, in lieu of white-wine; in which caſe the ſugar is ſpared, and a little lemon and nutmeg added in lieu of it.

To prepare it the beſt way, the wine and other ingredients, excepting the milk, are to be mixed over night, and the milk or cream added in the morning. The proportion is, a pint of wine to three of milk. For

Whipt SYLLABUB, to half a pint of white wine or rheniſh, is put a pint of cream, with the whites of three eggs. This they ſeaſon with ſugar, and beat with birchen rods. The froth is taken off as it riſes, and put into a pot; where, after ſtanding to ſettle two or three hours, it is fit to eat. Ruſt.

SYLLEPSIS, in grammar, *conceptio*, a figure whereby we conceive the ſenſe of words otherwiſe than the words import; and thus make our conſtruction, not according to the words, but the intention of the author.

The *ſyllepſis*, ſays an ingenious author, is a figurative conſtruction, which agrees rather with our ideas, than with the words; and expreſſes rather the ſenſe of our mind, than the ſenſe of the terms themſelves.

SYLLEPSIS is alſo uſed for the agreement of a verb, or adjective, not with that word next it, but with the moſt worthy in the ſentence: as, *rex & regina beati.*

Some authors call the *ſyllepſis*, *ſyntheſis*; others *ſubſtitution.* See SUBSTITUTION.

It is a figure of conſiderable uſe for the well underſtanding of of authors.—Scioppius divides it into two kinds, *ſimple* and *relative.*

Simple SYLLEPSIS, is when the words of a diſcourſe either diſagree in gender, or number, or both.

Relative SYLLEPSIS, is when the relative is referred to an antecedent which is not expreſſed; but which we conceive by the ſenſe of the whole period.

SYLLOGISM, ΣΥΛΛΟΓΙΣΜΟΣ, in logic, an argument, or form of reaſoning, conſiſting of three propoſitions; having this property, that the concluſion neceſſarily follows from the two premiſes: ſo that if the firſt and ſecond propoſitions be granted, the concluſion muſt be granted in like manner; and the whole allowed for a demonſtration. See ARGUMENT, PREMISES, CONCLUSION, *&c.* See alſo PROSYLLOGISM.

If the premiſes be only probable, or contingent, the *ſyllogiſm* is ſaid to be *dialectical*; if they be certain, *apodictical*; if falſe, under an appearance of truth, *ſophiſtic*, or *paralogiſtic.* See DIALECTICAL, APODICTICAL, SOPHISM, *&c.*

As often as the mind obſerves any two notions to agree to a third, which is done in two propoſitions; it immediately concludes that they agree to each other: or if it find that one of them agrees, and the other diſagrees, which is likewiſe done in two propoſitions; it immediately pronounces that they diſagree to each other.—And ſuch is a *ſyllogiſm*; which, it hence appears, is nothing but a mental diſcourſe, or reaſoning, whereby, from any two propoſitions granted, a third is neceſſarily deduced. See PROPOSITION, REASON, *&c.*

Hence, as the Greeks call it *ſyllogiſm*, the Latins call it *collectio*, or *ratiocinatio*, as being a kind of computation, which, either by adding, or ſubſtracting, gathers either the ſum or the remainder: for, as if we add two or three, we thence collect five; ſo if to this propoſition, "man is an animal," you add this, "every animal thinks;" you thence deduce this, "therefore man thinks." See REASONING.

Of the three propoſitions whereof a *ſyllogiſm* conſiſts; the firſt is by way of eminence, called the *propoſition*, as being propoſed for the baſis of the whole argument; the ſecond is called the *aſſumption*, as being aſſumed to aſſiſt in inferring the third: though they are both called *ſumptiones*, becauſe aſſumed for the ſake of the third; and both *premiſes*, as being premiſed to it; and for the ſame reaſon both are called *antecedents*, only the firſt the *major*, and the latter the *minor.* See ASSUMPTION, PREMISES, MAJOR, MINOR, *&c.*

The third is called the *concluſion*, as being the cloſe of the whole argumentation; and ſometimes *complexio*, as including the two notions, before ſeparately compared; and *conſequens*, becauſe it follows from the antecedents; and laſtly, *illatio*, becauſe inferred from the premiſes by means of the illative particle *ergo*, therefore, *&c.* See CONCLUSION, CONSEQUENCE, *&c.*

As the concluſion is the principal part of a *ſyllogiſm*, it hence ariſes, that tho' both the propoſition and aſſumption conſiſt each of its ſubject and attribute ; yet the ſubject and attribute of a *ſyllogiſm*, are properly underſtood of thoſe of the concluſion. See SUBJECT and ATTRIBUTE.

Again, in the inſtance above-mentioned, *animal* being uſed both as ſubject and attribute, it is held a kind of intermediate between the two, and frequently called *medium* ; in reſpect to which, both the ſubject and attribute, *man* and *thinks* are called *extremes*, or *terms* ; only the ſubject *the greater extreme*, and the attribute *the leſs*. See MEDIUM, EXTREME, TERM, &c.

A *ſyllogiſm*, whether ſimple, or compound, may either be *categorical* : as that already inſtanced, wherein both premiſes are poſitive.

Or, *hypothetical*, wherein one or both of the premiſes are only ſuppoſed : as, " if the ſun ſhines, it is day : but the ſun does ſhine, therefore it is day." See HYPOTHETICAL.

Or, *analogical* : as, " the baſe is to the column ; ſo is juſtice to the commonwealth : but if the baſe be withdrawn, the column is overturned ; therefore if juſtice be taken away, the commonwealth is overturned." See ANALOGY.

Or, *diazeutic* or *disjunctive* ; as, " either they mean to pleaſe or to profit, but they do not aim to pleaſe ; therefore they aim to profit." See DISJUNCTIVE.

The moſt convenient form of a perfect *ſyllogiſm*, is to have the medium in the middle, placed between the ſubject and the attribute ; as in the inſtance above-mentioned.

Of this form there are two figures,—the one *coherent*, or *conjunct* and *affirmative* ; founded on this canon, " that what agrees with any thing, likewiſe agrees with that wherewith this neceſſarily agrees."

The other *incoherent* or *disjunct*, and *negative* ; founded on this canon, " that what agrees with any thing, diſagrees with that wherewith this diſagrees."

Of each of theſe figures there are three modes, *viz. general*, *particular*, and *mixed*. See MOOD and FIGURE.

A *ſyllogiſm*, wherein one of the premiſes is ſuppreſſed, but ſo as to be underſtood ; is called an *enthymeme* ; *e. gr.* " every animal thinks, therefore man thinks ;" wherein the propoſition, " man is an animal," is underſtood. See ENTHYMEME.

The demonſtrations of mathematicians, it is obſerved, are only ſeries's of enthymemes : ſo that every thing in mathematics is concluded or proved by *ſyllogiſm* ; only omitting ſuch premiſes as occur of their own accord, or as are referred to by the citations. See DEMONSTRATION.

For *the uſe* SYLLOGISM *is of to reaſon*, Mr. Locke obſerves, that of four things, which reaſon is employed about, *viz.* the finding out of proofs, the regular diſpoſition of them ſo as their connexion may appear, the perceiving their connexion, and the making a right concluſion ; *ſyllogiſm* only aſſiſts in one, *viz.* ſhewing the connexion of the proofs in any inſtance. Nor is it of any great uſe even here ; ſince the mind can perceive ſuch connexion, where it really is, as eaſily, nay, perhaps, better, without it. We ſee men reaſon very ſtrongly, who do not know how to make a *ſyllogiſm*.

Indeed, *ſyllogiſm*, the ſame author adds, may ſerve to diſcover a fallacy in a rhetorical flouriſh, or by ſtripping an abſurdity of the cover of wit and good language, ſhew it in its natural deformity. But it only ſhews the weakneſs or fallacy of ſuch a diſcourſe by the artificial form it is put into, to thoſe who have thoroughly ſtudied mood, and figure, and have ſo examined the many ways three propoſitions may be put together in, as to know which of them does certainly conclude right, and which not, and upon what grounds they do ſo.

The mind is not taught to reaſon by theſe rules : it has a native faculty of perceiving the coherence or incoherence of its ideas, and can range them right, without ſuch perplexing repetitions.—Add, that to ſhew the weakneſs of an argument, there needs no more, than to ſtrip it of the ſuperfluous ideas, which, blended and confounded with thoſe on which the inference depends, ſeem to ſhew a connexion where there is none ; or at leaſt hinder the diſcovery of the want of it : and then to lay the naked ideas, on which the force of the argumentation depends, in their due order. In this poſition, the mind taking a view of them, ſees what connexion they have, and ſo is able to judge of their inference, without any need of *ſyllogiſm* at all.

Nor muſt it be admitted, that *ſyllogiſms* are as liable to fallacies, as the plainer ways of argumentation ; for which one might appeal to common obſervation, which has always eſteemed theſe artificial methods of reaſoning, more adapted to catch and intangle the mind, than to inſtruct and inform the underſtanding. And if it be certain that fallacy can be couched in a *ſyllogiſm*, as no body will deny but it may ; it muſt be ſomething elſe, and not a *ſyllogiſm*, that muſt diſcover it.

The ſame author proceeds to ſhew, that this way of reaſoning diſcovers no new proofs, nor makes any diſcoveries ; but is wholly converſant in the marſhalling and ranging thoſe we already have : a man muſt know, before he be able to prove *ſyllogiſtically* ; ſo that the *ſyllogiſm* comes after knowledge, when we have but little need of it. See REASON and LOGIC.

Reduction of SYLLOGISMS. See the article REDUCTION.

SYLLOGISTIC *form*. See the article FORM.

SYLVA, or SILVA, in poetry, a poetical piece compoſed, as it were, at a ſtart ; in a kind of rapture or tranſport, without much thought or meditation.—Such are the *ſylvæ* of Statius, which, he aſſures us, were all compoſed after this manner.

Quintilian extends the uſe of the word *ſylva* to any writing done in haſte, and on the ſpot.

The word is Latin, and literally ſignifies *foreſt* ; whence its chief uſe, in our language is, metaphorically, to expreſs certain collections of poetical pieces, of various kinds, and on various ſubjects ; as a foreſt is an aſſemblage of trees of different ſorts.

SYMBOL*, SYMBOLUM, a ſign, or repreſentation of any moral thing, by the images or properties of natural things. See SIGN, FIGURE, IMAGE, &c.

* The word is formed from the Greek, συμϐολον, a mark, ſign, or badge, and that from the verb συμϐαλλειν, *conferre*, to compare.

Thus we ſay, the lion is the *ſymbol* of courage ; the pellican of paternal love, &c.—*Symbols* were in great repute among the ancient Hebrews, and eſpecially among the Egyptians ; and ſerved to cover a great part of their moral myſteries ; being uſed not only to repreſent moral things by natural ; but even natural by natural. See HIEROGLYPHIC.

Symbols are of various kinds ; as types, ænigma's, parables, fables, allegories, emblems, hieroglyphics, &c. each whereof, ſee under its reſpective article, TYPE, ÆNIGMA, PARABLE, FABLE, &c.

The Chineſe letters are moſt of them *ſymbols*, or ſignificative. See LETTER.—The *ſymbols* in algebra, &c. are arbitrary. See CHARACTER.

Medaliſts alſo apply the term SYMBOL to certain marks or attributes peculiar to certain perſons, or deities.—The thunder-bolt, for inſtance, accompanying the heads of certain emperors, is a ſign or *ſymbol* of the ſovereign authority, and of a power equal to that of the gods : the trident is the *ſymbol* of *Jupiter* ; the peacocks, of Juno ; a figure ſeated on an urn, of a river, &c. See ATTRIBUTE.

SYMBOL, among chriſtians, is particularly uſed for the creed, or the articles of religion which every chriſtian is to know, and believe. See CREED.

Fleury obſerves, that till the time of St. Gregory, the *ſymbol* was never uſed to be rehearſed in the office of the Roman church ; in regard that church, having never been infected with any hereſy, did not need to make any profeſſion of faith. Suicer notes, that ſeveral words and clauſes have been occaſionally added to the *ſymbol*, upon the riſing of new hereſies.

Though it be a common opinion, that the *ſymbol* is the work of the apoſtles ; and though, on the footing of ſuch opinion, we call it the *apoſtles creed* ; yet, du Pin obſerves, there are ſeveral very cogent arguments to render the opinion highly improbable.

In the emperor's library is a Greek MS of the *ſymbol* of the apoſtles, divided into twelve articles, with the names of the reſpective apoſtles, who are ſaid to have compoſed each article. The firſt is attributed to St. Peter, and the reſt ſucceſſively to Andrew, James major, John, Thomas, James minor, Philip, Bartholomew, Matthew, Simon, Thaddeus, and Matthias.

But the teſtimony of that MS does not much confirm the opinion, that each apoſtle compoſed an article of the *ſymbol* ; yet the opinion is, at leaſt, as old as St. Leo, who ſeems to have believed it.

Authors are in doubt why the name *ſymbol* ſhould be given to this compendium of the articles of the chriſtian faith : ſome ſay, it is thus called, as being the mark or characteriſtic of a chriſtian.—Others derive it from an aſſembly or conference of the apoſtles, where each expreſſing his ſenſe of the faith, and what each had chiefly preached, the creed was framed, and called by the Greek word συμϐολον, which ſignifies *collation* or *conference*.—It is added, that St. Cyprian is the firſt who appears to have uſed the word *ſymbol* in this ſenſe.

SYMBOLICAL *characters*,	See	CHARACTER.
SYMBOLICAL *column*,		COLUMN.
SYMBOLICAL *fountain*,		FOUNTAIN.
SYMBOLICAL *freezes*,		FREEZE.
SYMBOLICAL *philoſophy*,		HIEROGLYPHIC.
SYMBOLICAL *phyſics*,		PHYSICS.

Clemens Alexandrinus, Euſebius, &c. obſerve, that the Ægyptians had two ways of repreſenting their *ſymbolical* myſteries ; one by the virtues of animals, herbs, &c. the other by geometrical figures.—Thus, the ſun and moon were repreſented, in the firſt manner, by the beetle and Ibis ; and in the latter, by their own figures.—Again, the four elements they repreſented, after the firſt manner, by four animals which have qualities correſponding thereto ; and after the ſecond manner by +. See HIEROGLYPHIC.

SYMMETRY*, ΣΥΜΜΕΤΡΙΑ, the relation of parity, both in reſpect of height, length, and breadth of the parts neceſſary to compoſe a beautiful whole.

* The word is formed from the Greek, συν, with, and μετρον, meaſure.

Symmetry, according to Vitruvius, conſiſts in the union and conformity of the members of a work, to their whole, and of the beauty of each of the ſeparate parts to that of the entire work; regard being had to ſome certain meaſure: ſo that the body is framed with *ſymmetry*, by the due relation which the arm, elbow, hand, fingers, *&c.* have to each other, and to their whole.

Symmetry ariſes from that proportion which the Greeks call *analogy*, which is the relation of conformity of all the parts of a building, and of their whole, to ſome certain meaſure; whereupon depends the nature of *ſymmetry*. See ANALOGY.

Uniform SYMMETRY, in architecture, is that where the ſame ordonnance reigns throughout the whole pourtour.

Reſpective SYMMETRY, is that where only the oppoſite ſides are equal to each other.

SYMPATHETIC, ΣΥΜΠΑΘΗΤΙΚΟΣ, ſomething that has a ſympathy; or that acts, or is acted on by ſympathy. See SYMPATHY.

SYMPATHETIC, is particularly applied to all diſeaſes which have two cauſes; the one remote, the other near.

In which ſenſe, the word is oppoſed to *idiopathetic*. See IDIOPATHY.

Thus, an epilepſy is ſaid to be *ſympathetic* when produced by a remote cauſe; *i. e.* when the diſorder in the brain, embarraſſed with blood, is preceded and produced by ſome other diſeaſe. See EPILEPSY.

There is a *ſympathetic* palpitation of the heart, and an idiopathetic one.—There is but one idiopathetic cauſe of the palpitation; but there are ſeveral *ſympathetic* ones. See PALPITATION.

Among chymiſts and alchymiſts, the term *ſympathetic* is principally applied to a kind of powder, and of ink.

SYMPATHETIC *inks*, are ſuch as can be made to appear and diſappear very ſuddenly, by the application of ſomething which ſeems to work by ſympathy. See INK.

Of theſe we have ſome very curious inſtances and experiments, given us by Lemery and Mr. Boyle; to the following effect.

1°. To two or three parts of unſlaked lime put one of yellow orpiment; powder and mix the two, adding fifteen or ſixteen times as much water as there was orpiment; ſtop up the vial with a cork and bladder, and ſet it in warm embers. Shake the vial now and then for five hours, and warily decant the clear part, or rather filtrate it. In the mean time, burn a piece of cork thoroughly, and when well inflamed, quench it in common water, or rather in brandy. Being thus reduced into a friable coal, grind it with fair water, wherein gum arabic has been diſſolved; and it will make a liquor as black as the common ink.

While theſe are doing, diſſolve in three times as much diſtilled or ſtrong vinegar, over warm embers, a quantity of red lead; or of ſaccharum ſaturni, in thrice the quantity of water; for three or four hours, or till the liquor have a ſweet taſte. This liquor will be as clear as common water.

The liquors thus prepared: write any thing on paper with this laſt ſort, dry it, and nothing will appear. Over the place, write what you pleaſe with the ſecond liquor; it will appear as if written with common ink: when dry, dip a ſmall piece of rag or ſpunge in the firſt liquor, rub it over the written place, and the black writing will vaniſh; and that wrote with the inviſible ink, appear black and legible. Again, take a book four or five inches thick, and on the firſt leaf write any thing with the laſt liquor: turn to the other end of the book, and rub there with a rag, dipt in the firſt liquor, on that part, as near as you can gueſs, oppoſite to the writing; and leave alſo the rag there, clapping a paper over it; then nimbly ſhutting the book, ſtrike four or five ſmart ſtrokes thereon with your hand, and turning the other ſide uppermoſt, clap it into a preſs, or lay it under a good weight for a quarter of an hour, or even half that time: then will the writing done with the inviſible ink be found white and legible.

2°. Diſſolve white or green vitriol in water, and writing with the ſolution, nothing will appear. Boil galls in water, and dip a linen rag in the decoction, and with it rub the place before writ, and it will appear black and legible. Rub it over again with ſpirit of vitriol, or its oil, and the writing will diſappear again: rub it over again with oil of tartar per deliquium, the letters will appear again, but of a yellow colour.

SYMPATHETIC *powder*, a powder once very much famed; ſuppoſed to have this wonderful property, that if ſpread on a cloth dipt in the blood of a wound, the wound will be cured, though the patient be any number of miles off. See WEAPON-*ſalve*.

This powder, M. Lemery tells us, is nothing but Roman vitriol, opened by the ſun-beams penetrating it, and imperfectly calcining it, in the middle of ſummer. See VITRIOL.

But it is now generally allowed a mere piece of charletanery, whatever Sir Kenelm Digby, and others before him, and after, plead in its favour.

Sir Kenelm, in an expreſs treatiſe on the ſubject, where he gives inſtances of cures performed by it, accounts for the manner of its operation thus: the ſun's rays, ſays he, attract and draw the ſpirits of the blood at a great diſtance; by which means the atoms thereof are driven and diſperſed far and near in the air. Now, the ſpirits of vitriol, incorporated with the blood, fly along with them, and the two together form a kind of train of corpuſcles. On the other ſide there is continually iſſuing and exhaling from the wound abundance of fiery ſpirits, which attract the neighbouring air; and this air, by a continued concatenation, attracting ſtill the next air, at length, meets the atoms, with the ſpirits of the blood and vitriol. Thus the ſpirits of the blood finding their ſource again, re-enter into their primitive ſeat, and being joined with the vitriolic ſpirits, the wound is comforted and healed, imperceptibly.

But, to the confuſion of all this fine reaſoning, it is found by experience, that the powder is ſo far from this effect at a great diſtance, that it is ſcarce perceived, if done in the ſame room with the patient. Though it is poſſible, as the parts of the vitriol are in continual motion, if the cloth be applied juſt by the patient, ſome of the effluvia thereof may enter the wound, and help to ſtop the bleeding. See VITRIOL.

SYMPATHY*, ΣΥΜΠΑΘΕΙΑ, an agreement of affections and inclinations; or a conformity of natural qualities, humours, temperaments, *&c.* which make two perſons pleaſed and delighted with each other. See ANTIPATHY.

* The word is formed from the Greek, συν, with, and παθος, paſſion, *q. d.* compaſſion, fellow-feeling.

SYMPATHY is alſo uſed with regard to inanimate things; intimating ſome propenſion they have to unite, or to act on one another. See CONSENT *of parts*.

In this ſenſe, naturaliſts ſay, there is a *ſympathy* between the vine and the elm; between the loadſtone and iron; the two poles of a loadſtone, *&c.*

Several authors have wrote on the *ſympathies* and antipathies between animals; but the greateſt part of what they ſay is fabulous: Such, *e. gr.* is that antipathy between chords made of ſheeps and wolfs guts; a lute, they ſay, being ſtrung with theſe two kinds of chords, they can never be brought into tune with each other: ſuch alſo is that of eagles feathers, which mixed with thoſe of other birds, are ſaid to devour and conſume them. See ANTIPATHY.

The alchymiſts talk much of the powder of *ſympathy*. See SYMPATHETIC *powder*.

SYMPATHY, in medicine, an indiſpoſition befalling one part of the body, through the defect or diſorder of another; whether it be from the affluence of ſome humour, or vapour ſent from elſewhere; or from the want of the influence of ſome matter neceſſary to its action. See CONSENT *of parts*. —For the force and effect of *ſympathy*, in the production of monſters, ſee MONSTER.

SYMPHONIACO *ſtylo*. See the article STYLE.

SYMPHONY*, ΣΥΜΦΩΝΙΑ, in muſic, properly denotes a conſonance, or concert of ſeveral ſounds agreeable to the ear; whether they be vocal or inſtrumental, or both; called alſo *harmony*. See HARMONY and CONSONANCE.

* The word is formed from the Greek, συν, with, and φωνη, ſound.

Some authors reſtrain *ſymphony* to the ſole muſic of inſtruments: in this ſenſe, ſay they, the recitativo's in ſuch an opera were intolerable, but the *ſymphonies* excellent. See OPERA.

The *ſymphony* of the ancients went no further than to two or more voices or inſtruments ſet to uniſon; for they had no ſuch thing as muſic in parts; as is very well proved by M. Perrault: at leaſt, if ever they knew ſuch a thing, it muſt be allowed to have been loſt. See SYNAULIA.

It is to Guido Aretine we owe the invention of compoſition: it was he firſt joined in one harmony ſeveral diſtinct melodies; and brought it even the length of four parts, *viz.* baſs, tenor, counter-tenor and treble. See HARMONY and MELODY.

SYMPHYSIS*, in medicine, one of the manners of articulating, or jointing the bones. See ARTICULATION.

* The word is Greek, συμφυσις, and ſignifies a natural coherence or connexion.

Symphyſis is a natural union, whereby two ſeparate bones coaleſce, and grow together; ſo as neither retains any proper, diſtinct motion.

Such are moſt of the junctures of the epiphyſes, and many others of bones, which in children are ſeparate, but with age grow together; as the os ethmoides, the bones of the cranium, os ſacrum, *&c.* See BONE, EPIPHYSES, *&c.*

The *ſymphyſis*, or natural union of bones, is of two kinds; either *with a medium*, or *without*.

SYMPHYSIS *without a medium*, is where two bones unite, and grow together of themſelves without the intervention of any third thing.—Such are the *ſymphyſes* of the epiphyſes with the principal bones; ſuch alſo are thoſe of the lower jaw.

This union is effected much after the ſame manner as that of a graft and a tree. See ENGRAFTING.

The SYMPHYSIS *with a medium*, is of three kinds, called *ſynneuroſis*, *ſyſſarcoſis*, and *ſynchondroſis*; each whereof ſee under its proper arricle, SYNNEUROSIS, *&c.*

SYMPOSIAC*, ΣΥΜΠΟΣΙΑΚΟΝ, a conference or converſation of philoſophers at a banquet.

* The word is formed from the Greek, *συμποσιον*, *convivium*, feaſt.

Plutarch has nine books which he calls *ſympoſiacs*; or, *ſympoſiac* queſtions, *q. d.* diſputations at table.

SYMPTOM, ΣΥΜΠΤΩΜΑ, in medicine, is ordinarily confounded with *ſign*, and defined an appearance, or aſſemblage of appearances, in a diſeaſe, which ſhew or indicate its nature and quality; and from which one may judge of the event thereof. See SIGN.

In which ſenſe, a delirium is held a *ſymptom* of a fever.—Pain, waking, drowſineſs, convulſions, ſuppreſſion of urine, difficulties of breathing and ſwallowing, coughs, diſtaſtes, nauſeas, thirſt, ſwoonings, faintings, looſeneſs, coſtiveneſs, drineſs, and blackneſs of the tongue, are the principal *ſymptoms* of diſeaſes.

Boerhaave gives a more juſt notion of *ſymptom:* every præternatural thing ariſing from a diſeaſe, as its cauſe, in ſuch manner, however, as that it may be diſtinguiſhed from the diſeaſe itſelf, and from its next cauſe, is properly a *ſymptom* of that diſeaſe. See DISEASE.

If it ariſe, after the ſame manner, from the cauſe of the diſeaſe, it is called a *ſymptom of the cauſe*. See CAUSE.—If it ariſe from ſome former *ſymptom* as its cauſe, it is properly called a *ſymptom of a ſymptom.*

Whatever happens to a diſeaſe, from any other cauſes than thoſe mentioned, is more properly called an *epigennema.*

Hence it appears, that the *ſymptoms* above-recited are really diſeaſes themſelves.—They are various as to number, effect, *&c.* Though, after the ancients, they may be conveniently enough reduced to faults in the functions, excretions, and retentions.

Under the firſt come all diminutions, abolitions, increaſes, and depravations of animal actions, particularly with regard to hunger and thirſt, ſleeping and waking. See HUNGER, THIRST, *&c.*

Under the ſecond come nauſea's, vomitings, lienteries, cœliac affections, diarrhœas, dyſenteries, illiac paſſions, *&c.*

Under the third come the jaundice, ſtone, dropſy, fever, iſchuria, ſtrangury, aſthma, catarrh, *&c.* Each whereof ſee under its reſpective article, HUNGER, NAUSEA, LIENTERY, DIARRHOEA, JAUNDICE, DROPSY, STONE, FEVER, *&c.*

Critical SYMPTOMS. See the article CRITICAL.

SYMPTOMATICAL, in medicine, is a term often uſed to denote the difference between the primary and ſecondary cauſes in diſeaſes.—As, a fever from pain is ſaid to be *ſymptomatical*, becauſe it riſes from pain only; and therefore the ordinary means in fevers are not, in ſuch caſes, to be had recourſe to; but to what will remove the pain; for when that ceaſes, the fever will ceaſe, without any direct means taken for it. See FEVER.

SYNÆRESIS, ΣΥΝΑΙΡΕΣΙΣ, *contraction*; in grammar, a figure, whereby two ſyllables are united in one.—As, *vemens* for *vehemens*. See CONTRACTION.

SYNAGOGUE*, SYNAGOGA, a particular aſſembly of Jews, met to perform the offices of their religion.—Alſo, the place wherein they meet. See JUDAISM.

* The word is Greek, *συναγωγη*, which literally imports aſſembly, congregation.

Some authors take the uſe of *ſynagogues* to be of no old ſtanding among the Jews; and maintain, that it was not till after their return from the Babyloniſh captivity, that the opinion firſt got footing, that the worſhip of God was not ſo reſtrained to the temple at Jeruſalem, that it could not be held any where elſe. The conſequence of which new opinion was, that the Jews began to build them *ſynagogues* in all their cities.

Others hold, that there were *ſynagogues* even in the time of David.—But be this as it will, no aſſemblies of the Jews appear to have been called *ſynagogues* till a little before the coming of Jeſus Chriſt; who is ſaid to have preached in the middle of the *ſynagogue.*

There were reckoned four hundred and eighty *ſynagogues* in the ſingle city of Jeruſalem.—There are ſtill *ſynagogues* ſubſiſting at London, Amſterdam, Rotterdam, Avignon, Metz, *&c.*

SYNALŒPHA, ΣΥΝΑΛΟΙΦΗ, in grammar, a contraction of ſyllables, performed principally, by ſuppreſſing ſome vowel or diphthong at the end of a word, on account of another vowel or diphthong at the beginning of the next.—As, *ill' ego*, for *ille ego*, &c. See ELISION.

SYNANCHE*, ΣΥΝΑΓΧΗ, in medicine, a kind of quinzy, wherein the internal muſcles of the fauces, or pharynx, are attacked. See ANGINA and QUINZY.

* The word is formed from the Greek, *συν*, with, and *αγχειν*, to conſtringe, ſuffocate.

When the external muſcles of the ſame part are ſeized, it is called a *paraſynanche*. See PARASYNANCHE.

SYNARTHROIDALIS *diarthroſis*. See the article DIARTHROSIS.

SYNARTHROSIS*, ΣΥΝΑΡΘΡΩΣΙΣ, in anatomy, a kind of articulation, or jointure of the bones of the body; wherein they remain without any, at leaſt apparent motion. See ARTICULATION.

* The word is formed from the Greek, *συν*, with, and *αρθρον*, *articulus*, joint.

The *ſynarthroſis* is when the bones are bound ſo faſt together, that they are rendered immoveable with regard to each other.—In which view it ſtands oppoſed to *diarthroſis*. See DIARTHROSIS.

It is divided into three kinds: the firſt, *ſutura*; which is ſometimes in form of two combs, or ſaws, the teeth whereof enter into one another; and ſometimes in form of ſcales, one ledge lapping over the other. See SUTURE.

The ſecond kind is called *harmonia*; which is when the bones meet in an even line, whether it be right or circular. See HARMONIA.

The third, called *gomphoſis*, is when one bone is fixed into another, like a nail or peg into a hole. See GOMPHOSIS.

To theſe three kinds of *ſynarthroſis*, ſome add ſeveral others, as *ſymphyſis*, *ſyntenoſis*, and *ſynneuroſis*. See SYMPHYSIS, *&c.*

SYNAULIA, ΣΥΝΑΥΛΙΑ, in the ancient muſic, a conteſt of pipes, or flutes, performing alternately, without voices.

Mr. Malcolm, who doubts whether the ancients had properly any ſuch thing as inſtrumental muſic, that is, muſic compoſed wholly for inſtruments, without any ſinging; yet quotes the practice of the *ſynaulia* from Athenæus. See SYMPHONY, HARMONY, MUSIC, *&c.*

SYNCATEGOREMA, ΣΥΓΚΑΤΗΓΟΡΗΜΑ, in logic, denotes a word, which ſignifying little or nothing of itſelf, yet when joined with others, adds force thereto: as, *all*, *none*, *certain*, &c. See CATEGOREMA.

SYNCELLUS*, or SINCELLUS, an ancient officer in the family of the patriarchs, and other prelates of the eaſtern church.

* The word, in the corrupt Greek, *συγκελλος*, ſignifies a perſon who lies in the chamber with another: a chamber-fellow, or chum.

The *ſyncellus* was an eccleſiaſtic, who lived with the patriarch of Conſtantinople, to be a witneſs of his conduct; whence it is, that the *ſyncellus* was called the *patriarch's eye*, becauſe his buſineſs was to obſerve and watch.

The other prelates had alſo their *ſyncelli*, who were clerks living in the houſe with them, and even lying in the ſame chamber, to be witneſſes of the purity of their manners.

Afterwards the office degenerated into a mere dignity; and there were made *ſyncelli* of churches.—At laſt it became a title of honour, and was beſtowed by the emperor on the prelates themſelves; whom they called *pontifical ſyncelli*, and *ſyncelli auguſtales.*

There were alſo *ſyncelli* in the weſtern church, particularly in France. The ſixth councel of Paris ſpeaks with a deal of indignation of ſome biſhops who aboliſhed the office of *ſyncelli*, and lay alone; and ſtrictly enjoins them, that, for the future, to take away all occaſion of ſcandal, they make the office of *ſyncelli* inſeparable from that of biſhops.

SYCHONDROSIS*, ΣΥΓΧΟΝΔΡΩΣΙΣ, in anatomy, a kind of articulation of the bones of the body; being a ſpecies of ſymphyſis. See SYMPHYSIS.

* The word is formed from the Greek, *συν*, with, and *χονδρος*, cartilage. See CARTILAGE.

The *ſynchondroſis* ſignifies the union of two bones by means of a cartilage: in which manner the ribs are joined to the ſternum, and the parts of the os pubis to one another.

SYNCHRONISM*, ΣΥΓΧΡΟΝΙΣΜΟΣ, the being or happening of ſeveral things in the ſame time. See CONTEMPORARY and TIME.

* The word is formed from the Greek, *συν*, and *χρονος*, time.

The happening or performing of ſeveral things in equal times, as the vibrations of pendulums, *&c.* is more properly called *iſochroniſm:* though ſome authors confound the two. See ISOCHRONAL.

SYNCOPATION, in muſic, denotes a ſtriking or breaking of the time; whereby the diſtinction of the ſeveral times or parts of the meaſure is interrupted. See TIME, MEASURE, *&c.*

SYNCOPATION, or SYNCOPE, is more particularly uſed for the connecting the laſt note of one meaſure or bar with the firſt of the following meaſure; ſo as only to make one note of both.

A *ſyncope* is ſometimes alſo made in the middle of a meaſure.

SYNCOPATION, is alſo uſed when a note of one part ends or terminates on the middle of a note of the other part.

This is otherwiſe denominated *binding*.

SYNCOPATION is alſo uſed for *driving a note*; that is, when ſome ſhorter note at the beginning of a meaſure or half meaſure is followed by two, three, or more longer notes, before another ſhort note occurs, equal to that which occaſioned the driving, to make the number even—*e. gr.* when an odd crotchet comes before two or three minims, or an odd quaver before two, three, or more crotchets.

In *ſyncopated* or driving notes, the hand or foot is taken up, or put down while the note is ſounding.

SYNCOPE*, ΣΥΓΚΟΠΗ, in medicine, a deep, and ſudden ſwooning, wherein the patient continues without any ſenſible heat, motion, ſenſe, or reſpiration; is ſeized with a cold ſweat over the whole body, and all the parts turn pale, and cold, as if dead. See DELIQUIUM.

* The word is formed from the Greek, συν, with, and κοπτειν, to cut, or ſtrike.

There are ſeveral cauſes of *ſyncopes:* 1°. Too great an exhauſtion of ſpirits; as after long diets, exceſſive evacuations, violent exerciſes, long bathings, *&c.*—2°. The irregular motion of the ſpirits preventing their due influx into the parts; as ſometimes happens in fear, wrath, and other violent paſſions.—3°. Immoderate hæmorrhages.—4°. An ill conſtitution of blood; as in cacochymias, or in perſons who have taken ſomething that either diſſolves or coagulates the blood.—5°. Secret diſeaſes, as abſceſſes, or polypus's of the heart, worms, *&c.*

In very numerous, crouded aſſemblies, people ſometimes fall into *ſyncopes*, through the hot, thick, impure air, they breathe.—Some women are liable to them upon the ſmell of muſt, civet, *&c.*

For *ſyncopes*, give volatile ſpirits, and aromatics. Heurnius recommends treacle-water, and cinnamon-water; and Etmuller the volatile ſalt of vipers, ſpirit of ſal armoniac, oil of amber, and ſometimes bleeding.

SYNCOPE, in grammar, denotes an eliſion, or retrenchment of one or more letters, or ſyllables from a word.

As when we ſay *virûm* for *virorum*; and *manet alta mente repoſtum*, for *repoſitum.*

SYNDESMUS*, in anatomy, is ſometimes uſed for a ligament. See LIGAMENT.

* The word in the original Greek, συνδεσμος, ſignifies a joining together.

In grammar, *ſyndeſmus* is uſed for a conjunction. See CONJUNCTION.

SYNDIC*, in government and commerce, an officer in divers countries, intruſted with the affairs of a city, or other community; who calls meetings, makes repreſentations and ſolicitations to the miniſtry, magiſtracy, *&c.* according to the exigency of the caſe.

* The word is formed from the Latin, *ſyndicus*, and that from the Greek, συνδικος, which ſignifies the ſame.

The *ſyndic* is appointed to anſwer and account for the conduct of the body; makes and receives propoſals for the advantage thereof; controuls and corrects the failings of particular perſons of the body, or, at leaſt, procures their correction at a public meeting.—In effect, the *ſyndic* is, at the ſame time, both the agent and cenſor of the community.

Almoſt all the companies in Paris, *&c.* as the univerſity, companies of arts and trades, have their *ſyndics*; and ſo have moſt of the cities of Provence and Languedoc.

SYNDIC is alſo uſed for a perſon appointed to ſollicit ſome common affair, wherein he himſelf has a ſhare; as happens particularly among ſeveral creditors of the ſame debtor, who fails, or dies inſolvent. See ADVOCATE, *&c.*

The chief magiſtrate of Geneva is alſo called *ſyndic.* There are four *ſyndics* choſe every year; the eldeſt of whom preſides in the council of twenty-five, which is the chief council of the city, wherein all affairs are diſpatched both civil and political: thus the other three elect cannot all come at the office till the four years end; ſo that the ſyndicate rolls among ſixteen perſons, all choſen out of the council of twenty-five.

SYNDROME, ΣΥΝΔΡΟΜΗ, the concourſe or combination of ſymptoms in any diſeaſe. See SYMPTOM.

SYNECDOCHE*, ΣΥΝΕΚΔΟΧΗ, in rhetoric, a kind of figure, or rather trope, frequent among orators, and poets. See FIGURE.

* The word is Greek, formed of συνεκδεχομαι, I take together.

There are three kinds of *ſynecdoches:* by the firſt, a part is taken for the whole; as the point for the ſword; the roof for the houſe; the ſails for the ſhip, *&c.*

By the ſecond, the whole is uſed for a part.—By the third, the matter whereof the thing is made, is uſed for the thing itſelf; as ſteel for ſword, ſilver for money, *&c.*

To which may be added another kind, where the ſpecies is uſed for the genus, or the genus for the ſpecies.—As, he bore the ſin of many, *i. e.* of all.

SYNECPHONESIS, or SYMPHONESIS, in grammar, a coalition, whereby two ſyllables are pronounced as one. See SYLLABLE.

It is much the ſame thing as *ſynalœpha*, or *ſynæreſis.* See SYNALOEPHA, SYNÆRESIS, *&c.*

SYNEDRIN, or SYNEDRION. See SANHEDRIN.

SYNEMMENON *note.* See the article NOTE.

SYNNEUROSIS*, in anatomy, a kind of articulation, or jointure of the bones. See ARTICULATION.

* The word is formed from the Greek, συν, with, and νευρον, nerve.

The *ſynneuroſis* is reckoned a branch of the ſymphyſis; and is when the bones are connected together by a ligament: as is the os femoris, to the os iſchium; the patella to the tibia. See SYMPHYSIS.

SYNOCHA, a name given by ſome to a continual fever, which admits of intentions and remiſſions. See FEVER and CONTINUAL.

SYNOCHUS, ΣΥΝΟΧΟΣ, denotes a continent fever, which proceeds without any remiſſion to the end. See CONTINENT and FEVER.

SYNOD*, in aſtronomy, a conjunction, or concourſe of two or more ſtars, or planets in the ſame optical place of the heavens. See CONJUNCTION.

* The word is formed from the Greek, συνοδος, convention, aſſembly; compounded of συν, with, and οδος, *via*, way.

SYNOD, SYNODUS, in church hiſtory, a council; or a meeting, or aſſembly of eccleſiaſtics, to conſult of matters of religion. See COUNCIL.

Of theſe there are four kinds, *viz.*

General, or *oecumenical*, where biſhops, *&c.* meet from all nations. See OECUMENICAL.

National; where thoſe of one nation only come together.

Provincial; where they of one only province meet. And

Dioceſan; where thoſe of but one dioceſe meet. See CONVOCATION.

SYNODALS, or SYNODIES, were pecuniary rents (commonly of two ſhillings) paid to the biſhop, or archdeacon, at the time of their Eaſter viſitation, by every pariſh prieſt.

They were thus called becauſe uſually paid in ſynods: for that anciently biſhops uſed to viſit and hold their dioceſan ſynods at once.—For the ſame reaſon, they are ſometimes alſo denominated *ſynodalica*, but more uſually *procurations.* See PROCURATION.

SYNODALES *teſtes*, an appellation anciently given to the urban and rural deans; from their informing againſt, and atteſting the diſorders of the clergy and people in the epiſcopal ſynod. See DEAN.

When theſe ſunk in their authority, in their ſtead roſe another ſort of *ſynodal* witneſſes, who were a ſort of impanelled jury, conſiſting of a prieſt, and two or three laymen for every pariſh: though at length two for every dioceſe were annually choſen; till at laſt the office came to be devolved on the churchwardens. See CHURCHWARDEN.

Some think our queſt-men, who are aſſiſtants to the churchwardens, were called *ſideſmen*, quaſi, *ſynodſmen.* See SIDES*men*, and QUEST-*men.*

SYNODALE *inſtrumentum*, a ſolemn oath or engagement that theſe ſynodical witneſſes took; as our churchwardens now are ſworn to make juſt preſentments.

SYNODICAL, ΣΥΝΟΔΙΚΟΣ, ſomething belonging to a ſynod. See SYNOD.

SYNODICAL *epiſtles*, are circular letters wrote by ſynods to the abſent prelates and churches; or even thoſe general ones directed to all the faithful, to inform them of what had paſſed in the ſynod.

In the collection of councils are abundance of theſe *ſynodical* epiſtles. See COUNCIL.

SYNODICAL *month*, is the period or interval of time, wherein the moon, departing from the ſun at a ſynod or conjunction, returns to him again. See MOON.

Kepler found the quantity of the mean *ſynodical* month, twenty-nine days, twelve hours, forty-four minutes, three ſeconds, eleven thirds. See MONTH.

This period is alſo called a *lunation*; in regard, in the courſe hereof, the moon puts on all her phaſes or appearances. See LUNATION.

SYNODIES. See the article SYNODALS.

SYNOD's-*men*, *teſtes ſynodales.* See SYNODALES, and SIDES*men.*

SYNOECIA, ΣΥΝΟΙΚΙΑ, in antiquity, a feaſt celebrated at Athens, in memory of Theſeus's having united all the petty communities of Attica, into one ſingle commonwealth; the ſeat whereof was Athens; where all the aſſemblies were to be held.

The feaſt was dedicated to Minerva; and, according to the ſcholiaſt of Thucydides, was held in the month Metagitnion.

SYNONYMOUS, SYNONYMUS, is applied to a word or term that has the ſame import, or ſignification with another. See SYNONYMY.

Some ſevere critics condemn all uſe of *ſynonymous* terms in the ſame period; but this is to condemn all antiquity: ſo far is the uſe thereof from being vicious, that it is frequently neceſſary; as ſynonyma's contribute both to the force and clearneſs of the expreſſion. If the firſt word ſketch out the reſemblance of the thing it repreſents, the ſynonym that follows, is, as it were, a ſecond touch of the pencil, and finiſhes the image.

Indeed they muſt be uſed with a deal of diſcretion and œconomy. The ſtile muſt be raiſed and brightened, not ſtuffed or loaded with *ſynonymous* terms. They muſt be uſed as ornaments, and to render the expreſſion the more forcible, without making a ſhew of the riches thereof, or heaping ſynonyma's on ſynonyma's.

But, though *ſynonymous* words be laudable; *ſynonymous* phraſes are inexcuſable: the reaſon is, that two *ſynonymous* phraſes keep the mind at reſt, and let it flag, and languiſh.

SYNONYMY*, SYNONYMIA, in rhetoric, a figure whereby ſynonyms, or ſynonymous terms, that is, various words of the ſame ſignification, are made uſe of, to amplify the diſcourſe. See SYNONYMOUS and AMPLIFICATION.

* The word is formed from the Greek, συν, with, and ονομα, name.

Such is that paſſage in Cicero, *abiit*, *evaſit*, *effugit*, *erupit*, he went off, he eſcaped, he run away, &c. See SYNONYMOUS.

SYNOVIA, or SINONIA, in medicine, a term uſed by Paracelſus and his ſchool, for the nutritious juice proper and peculiar to each part. See NUTRITION.

Thus they talk of the *ſynovia* of the joints of the brain, &c.

Others uſe *ſynovia* for the gout, and other diſeaſes in the joints, ariſing from a vice in the nutritious juice.

Others reſtrain it to the oozing out of the nutritious juice through a wounded part; eſpecially a joint.

Van Helmont defines *ſynovia*, a kind of tranſparent mucilage, like ſeed, ſuch as iſſues from the legs of a calf upon cutting off the feet.

SYNTAGMA, ΣΥΝΤΑΓΜΑ, the diſpoſing or placing of things in an orderly manner. See COMPOSITION.

SYNTAX, ΣΥΝΤΑΞΙΣ, in grammar, the conſtruction or connexion of the words of a language into ſentences, or phraſes. See WORD, SENTENCE, PHRASE, &c.

F. Buffier more accurately defines *ſyntax*, the manner of conſtructing one word with another, with regard to the different terminations thereof, preſcribed by the rules of grammar. See CONSTRUCTION.

Some authors, as M. Vaugelas, &c. confound *ſyntax* with ſtyle; but there is a real difference. See STYLE.

The office of *ſyntax*, is to conſider the natural ſuitableneſs of words with reſpect to one another; in order to make them agree in gender, number, perſon, mood, &c. See CONCORD.

To offend in any of theſe points, is called to offend againſt *ſyntax*: and ſuch kind of offence, when groſs, is called a *ſoleciſm*; and when more ſlight, a *barbariſm*. See SOLECISM and BARBARISM.

The ſeveral parts of ſpeech, are, with regard to language, what materials are with regard to a building. How well prepared ſoever they may be, they will never make a houſe, unleſs they be placed conformably to the rules of architecture.

It is properly the *ſyntax* that gives the form to language; and it is that on which turns the moſt eſſential part of grammar. See GRAMMAR, LANGUAGE, &c.

There are two kinds of *ſyntax*; the one of *concord*, wherein the words are to agree in gender, number, caſe, and perſon. See CONCORD.

The other, of *regimen* or *government*, wherein one word governs another, and occaſions ſome variation therein. See REGIMEN.

The firſt, generally ſpeaking, is the ſame in all languages, as being the natural ſeries of what is uſed almoſt every where, the better to diſtinguiſh diſcourſe. Thus, the diſtinction of two numbers, ſingular and plural, has rendered it neceſſary to make the adjective agree with the ſubſtantive in number; that is, to make the one ſingular or plural, when the other is ſo: for, as the ſubſtantive is the ſubject confuſedly, though directly, marked by the adjective; if the ſubſtantive expreſs ſeveral, there muſt be ſeveral ſubjects expreſſed in that form by the adjective; and by conſequence it ought to be in the plural: as *homines docti*, learned men: but there being no variety of termination in the adjective in Engliſh to diſtinguiſh the number, it is only implied. See NUMBER.

The diſtinction of maſculine and feminine gender, obliges the languages which have diſtinct terminations, to have a concordance or agreement between the ſubſtantive and adjective, in gender as well as number: and for the ſame reaſon, the verbs are to agree with the nouns and pronouns in number and perſon. If at any time we meet with any thing that ſeems to contradict theſe rules, it is by a figure of ſpeech, *i. e.* by having ſome word underſtood, or by conſidering the thoughts rather than the words themſelves. See GENDER.

The *ſyntax* of government, on the contrary, is generally arbitrary; and, on that account, differs in moſt languages. One language, for inſtance, forms their regimen by caſes; as the Latin and Greek: others uſe particles in lieu thereof; as the Engliſh, French, Italian, Spaniſh, &c. See CASE and PARTICLE.

One or two general rules, however, may be here noted, which obtain in all languages. 1°. That there is no nominative caſe, but has a relation to ſome verb, either expreſſed or underſtood; ſince we do not only ſpeak to expreſs what we perceive, but to expreſs what we think of what we perceive, which is done by the verb. See NOMINATIVE.

2°. That there is no verb but has its nominative caſe either expreſſed or underſtood; for the office of the verb being to affirm, there muſt be ſomething to affirm of; which is the ſubject or nominative caſe of the verb; except before an infinitive, where it is an accuſative; as *ſcio Petrum eſſe doctum*, I know Peter to be learned. See VERB.

3°. That there is no adjective but has a relation to ſome ſubſtantive; in regard the adjective marks confuſedly the ſubſtantive, which is the ſubject of the form or quality diſtinctly marked by the adjective. See ADJECTIVE.

4°. That there never comes any genitive caſe but what is governed by ſome other noun. See GENITIVE.

5°. The government of verbs is frequently taken from various ſorts of references, included in the caſes, according to the caprice of cuſtom or uſage; which yet does not change the ſpecific relation of each caſe, but only ſhews that cuſtom has made choice of this or that.—Thus, the Latins ſay, *juvare aliquem & opitulari alicui*; the French, *ſervir quelqu' un & ſervir a quelque choſe*; and in the Spaniſh, the generality of verbs govern indifferently a dative and an accuſative caſe.

SYNTEXIS, ΣΥΝΤΕΞΙΣ, in medicine, an attenuation or colliquation of the ſolids of the body; ſuch as frequently happens in atrophies, inflammations of the bowels, colliquative fevers, &c. wherein a fatty uliginous matter is voided with the excrements by ſtool. See COLLIQUATION, ATTENUATION, &c.

SYNTHESIS*, ΣΥΝΘΕΣΙΣ, *compoſition*, or the putting of ſeveral things together: as in making a compound medicine of ſeveral ſimple ingredients, &c. See COMPOSITION.

* The word is formed from the Greek, συν, with, and θεσις, *poſitio*.

SYNTHESIS, in logic, denotes a branch of method, oppoſite to analyſis. See METHOD.

In the *ſyntheſis*, or *ſynthetic method*, we purſue the truth by reaſons drawn from principles before eſtabliſhed, or aſſumed, and propoſitions formerly proved; thus proceeding by a regular chain, till we come to the concluſion.

Such is the method in Euclid's *Elements*, and moſt demonſtrations of the ancient mathematicians, which proceed from definitions and axioms, to prove propoſitions, &c. and from thoſe propoſitions proved, toprove others.

This method we alſo call *compoſition*, in oppoſition to *analyſis* or *reſolution*. See COMPOSITION.

SYNTHESIS, in grammar. See SYLLEPSIS.

SYNTHESIS, in chirurgery, an operation, whereby divided parts are re-united; as in wounds, fractures, &c.

SYNTHETIC *method*. See SYNTHESIS and METHOD.

SYNUSIASTS*, SYNUSIASTÆ, ΣΥΝΟΥΣΙΑΣΤΑΙ, a ſect of heretics, who maintained, that there was but one nature, and one ſingle ſubſtance in Jeſus Chriſt.

* The word is formed from the Greek, συν, with, and ουσια, ſubſtance.

The *Synuſiaſts* denied, that the word aſſumed a body in the womb of the virgin; but held, that a part of the divine word being detached from the reſt, was there changed into fleſh and blood.—Thus they taught, that Jeſus Chriſt was conſubſtantial to the Father, not only as to his divinity, but even as to his humanity and very body.

SYPHILIS*, is a term uſed by ſome writers for the lues venerea. See VENEREAL.

* Some derive it from συν, *cum*, with, and φιλια, *amor*, or *amicitia*, love, or friendſhip; becauſe it proceeds from the infectious intercourſe of lovers in coition. Others will have it come from the name of a ſhepherd ſo called, who was remarkably afflicted with this diſeaſe.---However, divers authors of note uſe the term; particularly Fracaſtorius, a famous Italian phyſician, who uſes it for the title of a fine poem, which he wrote upon that diſtemper.

SYPHON, or SIPHON. See the article SIPHON.

SYRENS, SIRENES, in antiquity. See SIREN.

SYRIAC *bibles*. See the article BIBLE.

SYRIAN *year*. See the article YEAR.

SYRINGE*, an inſtrument ſerving to imbibe, or ſuck up a quantity of any fluid, and to ſquirt or expel the ſame with violence. See SUCTION, &c.

* The word is formed from the Greek, συριγξ, or Latin, *ſyrinx*, pipe.

The *ſyringe* is made of a hollow cylinder, as ABCD (*Tab. Hydroſtatics*, *fig.* 26.) furniſhed with a little tube at bottom, EF. In this cylinder, is an embolus, K, made, or at leaſt covered with leather, or other matter that eaſily imbibes moiſture; and ſo filling the cavity of the cylinder, as that no air or water may paſs between the one and the other.

If, then, the little end of the tube F be put in water, and the embolus drawn out; the water will aſcend into the cavity left by the embolus: and upon thruſting back the embolus, it will be violently expelled again through the ſame tube EF: and ſtill, the greater impetus will the water be expelled withal, and to the greater diſtance, as the embolus is thruſt down with the greater force, or the greater velocity.

This aſcent of the water, the ancients, who ſuppoſed a plenum, attributed to nature's abhorrence of a vacuum: but the moderns, more reaſonably, as well as more intelligibly, attribute it to the preſſure of the atmoſphere on the ſurface of the fluid. See AIR and VACUUM.

For, by drawing up the embolus, the air left in the cavity of the cylinder muſt be exceedingly rarified; ſo that being no longer a counter-balance to the air incumbent on the ſurface

face of the fluid; that prevails, and forces the water through the little tube, up into the body of the *ſyringe*.

In effect, a *ſyringe* is only a ſingle pump, and the water aſcends in it on the ſame principle, as in the common ſucking pump; whence it follows, that water will not be raiſed in a *ſyringe*, to a height exceeding thirty-one feet. See PUMP and SUCTION.

Syringes are of conſiderable uſe in medicine and chirurgery. By them clyſters are adminiſtred: injections of medicinal waters, *&c.* made into wounds, *&c.* They alſo ſerve to inject coloured liquors, melted wax, *&c.* into the dried veſſels of the parts of animals, to ſhew the diſpoſition, texture, ramifications, *&c.* thereof. See INJECTION.

SYROP*, SYRUPUS, or SIRUPUS, in pharmacy, an agreeable liquor, or compoſition of a moderately thick conſiſtence, made of juices, tinctures, or waters of fruits, flowers, or herbs boiled up, and ſweetened with ſugar, or honey; and taken either for health or pleaſure.

> * Menage derives the word from the Arabic, *elſchorab*, potion, formed from the root *ſcherebe*, to drink.---Others derive it from the Greek, συρω, I draw, and οπος, juice. Eſthius, from συρια οπον, in regard theſe kind of liquors were much in uſe among the Syrians, a very delicate people. According to d' Herbelot, the words *ſyrop*, and *ſherbet* or *ſorbet*, come both from the Arabic, *ſcharab*, which ſignifies any kind of drink in the general.

There are various kinds of *ſyrops*, denominated from the various fruits, *&c.* they are extracted from; as *ſyrop* of violets, of elder, of wormwood, of poppies, *&c.* emetic *ſyrops*, lienteric, and antinephritic *ſyrops*, &c. chologogue, phlegmagogue *ſyrops*, &c.

SYROP *of Sapor*, is an ancient medicament, the baſe whereof is apples, with juices of bugloſs, aniſe, ſaffron, *&c.* thus called from Sapor king of Perſia, who overcame the emperor Valerian, ſuppoſed to be the inventor thereof.

SYROP *of ſugar*. See the article SUGAR.

SYSSARCOSIS*, in anatomy, a particular ſpecies of the kind of articulation called *ſymphyſis*. See SYMPHYSIS.

> * The word is Greek, compounded of συν, with, and σαρξ, fleſh.

The *ſyſſarcoſis* is a natural union of two bones, by means of fleſh or muſcles: ſuch is that of the os hyoides, and omoplata.

SYSTEM*, SYSTEMA, in the general, denotes an aſſemblage, or chain of principles, and concluſions: or the whole of any doctrine, the ſeveral parts whereof are bound together, and follow or depend on each other.

> * The word is formed from the Greek, συϛημα, compoſition, compages.

In this ſenſe, we ſay, a *ſyſtem* of philoſophy; a *ſyſtem* of motion; a *ſyſtem* of fevers, *&c.*—Divines have framed abundance of *ſyſtems* of grace: the *ſyſtems* of intermediate ſcience, and predetermination, are invented to explain that of grace. See GRACE, *&c.*

Among phyſicians, ſome follow the *ſyſtem* of alkali and acid; others that of the four qualities, *&c.*—Dr. Woodward accounts for moſt things on his *ſyſtem* of the bile. See HYPOTHESIS, ACID, ALCALI, BILE, *&c.*

Des Cartes's *ſyſtem* is held deſtructive to religion. See CARTESIANISM, CAUSE, OCCASIONAL, *&c.*—Gaſſendus renewed the ancient *ſyſtem* of atoms; which was that of Democritus, followed by Epicurus, Lucretius, *&c.* See CORPUSCULAR, ATOMIC, *&c.*—Sir Iſaac Newton's doctrine of colours, M. Leibnitz's *protogæa*, and ſome diſcourſes of M. Juſſieu, in the academy of ſciences, to ſhew that there are bodies whoſe parts are not to be deſtroyed by any natural agents; are very favourable to the *ſyſtem* of Gaſſendi. See ATOM, PARTICLE, HARDNESS, MATTER, *&c.*

Experiments and obſervations are the materials of *ſyſtems*: an infinity are required to build one. See EXPERIMENT and EXPERIMENTAL.

SYSTEM, in aſtronomy, denotes an hypotheſis or ſuppoſition of a certain order, and arrangement of the ſeveral parts of the univerſe; whereby aſtronomers explain all the phænomena or appearances of the heavenly bodies, their motions, changes, *&c.* See ASTRONOMY, COELESTIAL, STAR, PLANET, *&c.*

This is more peculiarly called *the ſyſtem of the world*, and ſometimes the *ſolar ſyſtem*. See WORLD, SOLAR, *&c.*

Syſtem and *hypotheſis* have much the ſame ſignification; unleſs, perhaps, hypotheſis be a more particular *ſyſtem*; and *ſyſtem* a more general hypotheſis. See HYPOTHESIS.

Some late authors indeed, furniſh a freſher diſtinction: an hypotheſis, ſay they, is a mere ſuppoſition, or fiction; founded rather on imagination, than reaſon: a *ſyſtem* is only built on the firmeſt ground, and raiſed by the ſevereſt rules: it is founded on aſtronomical obſervations, and phyſical cauſes, and confirmed by geometrical demonſtrations.

The moſt celebrated *ſyſtems* of the world, are the *Ptolemaic*, and the *Copernican*; to which may be added, the *Tychonic*: the œconomy of each whereof, is as follows.

Ptolemaic **SYSTEM** places the earth at reſt, in the centre of the univerſe; and makes the heavens revolve round the ſame from eaſt to weſt, and carry all the heavenly bodies, ſtars, and planets along with them. See PTOLEMAIC.

For the order, diſtances, *&c.* of the ſeveral bodies in this *ſyſtem*, ſee *Tab. Aſtron. fig.* 43.

The principal aſſerters of this *ſyſtem* are Ariſtotle, Hipparchus, Ptolemy, and many of the old philoſophers, followed by the whole world, for a great number of ages; and ſtill adhered to in divers univerſities, and other places, where free philoſophizing is excluded: but the late improvements have put it out of all countenance; and we do not even want demonſtration againſt it. See EARTH, *&c.*

Copernican **SYSTEM** places the ſun at reſt, nearly in the centre of the *ſyſtem*; excepting for a vertiginous motion about his own axis. See SUN.

Around him move, from weſt to eaſt, in ſeveral orbits, firſt Mercury, then Venus, the Earth, Mars, Jupiter, and Saturn. See PLANET.

About the earth, in a peculiar orbit, moves the moon; accompanying the earth, in its whole progreſs, round the ſun. See MOON.

And after the ſame manner do four ſatellites move round Jupiter; and five round Saturn. See SATELLITES.

A-thwart the planetary ſpace do the comets move round the ſun; only in very excentric orbits, probably parabola's, in one of whoſe foci is the ſun. See COMET.

At an immenſe diſtance beyond the planetary and cometary ſpaces, are the fixed ſtars, which have all a proper motion from weſt to eaſt. See STAR.

The *ſolar*, or *planetary* **SYSTEM**, is uſually confined to narrower bounds: the ſtars, by their immenſe diſtance, and the little relation they appear to bear to us, being reputed no part thereof. It is highly probable, that each ſtar, is, itſelf, a ſun; and the centre of a particular *ſyſtem*, ſurrounded with a company of planets, *&c.* which, in different periods, and at different diſtances, perform their courſes round their reſpective ſuns; and are enlightened, warmed, and cheriſhed thereby: hence we have a very magnificent idea of the world, and the immenſity thereof: hence alſo ariſes a kind of *ſyſtem* of *ſyſtems*. See UNIVERSE and PLANETARY.

The planetary *ſyſtem*, here deſcribed, is the moſt ancient in the world. It was the firſt that we know of, introduced into Greece and Italy by Pythagoras; whence, for many ages, it was called the *Pythagorean ſyſtem*. It was followed by Philolaus, Plato, Archimedes, *&c.* but loſt under the reign of the peripatetic philoſophy; till happily retrieved above two hundred years ago by Nic. Copernicus; whence its new appellation of *Copernican ſyſtem*.—For the œconomy of this *ſyſtem*, ſee the ſcheme thereof, *Tab. Aſtron. fig.* 44. See alſo COPERNICAN.

Tychonic **SYSTEM**, in moſt reſpects, coincides with the Copernican; except in this, that, ſuppoſing the earth to be fixed, its orbit is omitted, and in lieu thereof, the ſun's orbit is drawn round the earth, and made to interſect the orbit of Mars; that Mars may be nearer the earth than the ſun.—But as there is not any reaſon, or foundation in nature, for ſuch a manifeſt ſhift; and as the author was only led thereto from a ſuperſtitious perſuaſion, that to ſuppoſe the ſun at reſt, and the earth to move, is contrary to ſcripture; the true *ſyſtem* is not much prejudiced hereby. See EARTH.—For the order and œconomy of the Tychonic *ſyſtem*, ſee the ſcheme in *Tab. Aſtron. fig.* 45. See alſo TYCHONIC.

SYSTEM, in poetry, denotes a certain hypotheſis, or ſcheme of religion, from which the poet is never to recede.—*E. gr.* Having made his choice either in the heathen mythology, or in chriſtianity, he muſt keep the two apart; and never mix ſuch different ideas in the ſaid poem. See INVOCATION, MUSES, *&c.*

Thus, after invoking Apollo and the Muſes, he muſt bid adieu to the language of chriſtianity, and not confound the two *ſyſtems*.—The fabulous ſtile, indeed, is the richer and more figurative; but a pagan god makes but a miſerable figure in a chriſtian poem.—The *ſyſtem* of poetry, Bouhours obſerves, is itſelf wholly fabulous and pagan.

SYSTEM, in muſic, denotes a compound interval; or an interval compoſed, or conceived to be compoſed of ſeveral leſſer.—Such as is the *octave*, *&c.* See INTERVAL.

The word is borrowed from the ancients; who call a ſimple interval, *diaſtem*, and a compound one *ſyſtem*. See DIASTEM.

As there is not any interval in the nature of things; ſo we can conceive any given interval, as compoſed of, or equal to, the ſum of ſeveral others. This diviſion of intervals, therefore only relates to practice; ſo that a *ſyſtem* is properly an interval which is actually divided in practice, and where, along with the extremes, we conceive always ſome intermediate terms.

The nature of a *ſyſtem* will appear plain, by conceiving it as an interval whoſe terms are in practice, taken either in immediate ſucceſſion; or the ſound is made to riſe and fall, from the one to the other, by touching ſome intermediate degrees: ſo that the whole is a *ſyſtem* or compoſition of all the intervals between one extreme and the other.

Syſtems of the ſame magnitude, and conſequently of the ſame degree of concord and diſcord, may yet differ in reſpect of their compoſition; as containing and being actually divided into more, or fewer intervals: and when they are equal in that reſpect, the parts may differ in magnitude. Laſtly, when they conſiſt of the ſame parts, or leſſer intervals, they may differ as to the order and diſpoſition thereof between the two extremes.

There are ſeveral diſtinctions of *ſyſtems*; the moſt remarkable is, into *concinnous* and *inconcinnous*.

Concinnous SYSTEMS, are thoſe conſiſting of ſuch parts as are fit for muſic; and thoſe parts placed in ſuch an order between the extremes, as that the ſucceſſion of ſounds, from one extreme to the other, may have a good effect. See CONCINNOUS.

Inconcinnous SYSTEMS, are thoſe, where the ſimple intervals are inconcinnous, or ill diſpoſed betwixt the extremes.

Syſtems, again, are either *particular* or *univerſal*.

Univerſal SYSTEM, is that which contains all the particular *ſyſtems* belonging to muſic; and makes what the ancients call the *diagramma*, and we the *ſcale of muſic*. See DIAGRAMMA, SCALE, GAMMUT, &c.

The ancients alſo diſtinguiſh *ſyſtems* into *perfect* and *imperfect*.—The diſdiapaſon, or double octave, was reckoned the perfect *ſyſtem*, becauſe within its extremes are contained examples of all the ſimple and original concords, and in all the variety of order wherein their concinnous part ought to be taken; which variety conſtitutes what they call the *ſpecies*, or *figures of conſonances*. See DISDIAPASON.—All the *ſyſtems*, leſs than the diſdiapaſon, were reckoned imperfect.

The double octave was alſo called *ſyſtema maximum*, and *immutatum*; becauſe they took it to be the greateſt extent or difference of time that we could go in making melody; though ſome added a fifth to it, for the greateſt *ſyſtem*: but the diapaſon, or ſimple octave, was reckoned the moſt perfect, with reſpect to the agreement of its extremes; ſo that how many octaves ſoever were put into the greateſt *ſyſtem*, they were all to be conſtituted or ſub-divided the ſame way as the firſt: ſo that when we know how the octave is divided, we know the nature of the diagramma or ſcale: the varieties whereof, conſtituted the genera melodiæ, which were ſubdivided into ſpecies. See GENUS and SPECIES.

SYSTOLE, ΣΥΣΤΟΛΗ, in medicine, the contraction of the heart of an animal; whereby the blood is driven out of its ventricles into the arteries. See HEART, BLOOD, ARTERY, &c.

The *ſyſtole* of the heart is well accounted for by Dr. Lower, who ſhews, that the heart is a true muſcle, the fibres whereof are acted on like thoſe of other muſcles, by means of certain branches of the eighth pair of nerves inſerted into it, which bring the animal ſpirits from the brain hither. By a flux of theſe ſpirits, the muſcular fibres of the heart are inflated, and thus ſhortened; the length of the heart diminiſhed, its breadth or thickneſs increaſed, the capacity of the ventricles cloſed, the tendinous mouths of the arteries dilated, thoſe of the veins ſhut up by means of their valves, and the contained juice forcibly expreſſed into the orifices of the arteries. See MUSCLE.

And this we call συϛολη, or contraction of the heart; the oppoſite ſtate to which is called the *diaſtole*, or dilatation of the heart. See DIASTOLE and PULSE.

Dr. Drake adds to Dr. Lower's account, that the intercoſtal muſcles and diaphragm, contribute to the *ſyſtole*, by opening the blood a paſſage from the right ventricle of the heart to the left through the lungs, to which it could not otherwiſe paſs: by which means, the oppoſition the blood contained in that ventricle muſt neceſſarily have made to its conſtriction, is taken off. See CONTRACTION.

Lower and Drake make the *ſyſtole* the natural ſtate or action of the heart, and the diaſtole the violent one: Boerhaave, on the contrary, makes the *ſyſtole* the violent, and the diaſtole the natural ſtate.

SYXHINDEMEN, or SIXHINDEMEN, a term purely Saxon, literally ſignifying ſix-hundred-men, or men worth ſix-hundred ſhillings a-piece.

In the time of our anceſtors, all men were ranked into three claſſes; the *loweſt*, the *middle*, and the *higheſt*; and were valued according to their claſs: that if any injury were done, ſatiſfaction might be made to the value, or worth of the man it was done to. See HINDENI.

The *loweſt* were called *twyhindemen*, *q. d.* valued at two hundred ſhillings; the *middle*, *ſixhindemen*, *q. d.* valued at ſix hundred ſhillings; and the *higheſt*, *twelveindemen*, *i. e.* valued at twelve hundred ſhillings. See TWIHINDI and TWELVEHINDI.

SYZYGY *, SYZYGIA, in aſtronomy, a term equally uſed for the conjunction and oppoſition of a planet with the ſun. See CONJUNCTION and OPPOSITION.

* The word is formed from the Greek, συζυγια, which properly ſignifies *conjunctio*.

On the phænomena and circumſtances of the *ſyzygies*, a great part of the lunar theory depends. See MOON.

For, 1°. It is ſhewn in the phyſical aſtronomy, that the force which diminiſhes the gravity of the moon in the *ſyzygies*, is double that which increaſes it in the quadratures: ſo that in the *ſyzygies*, the gravity of the moon from the action of the ſun is diminiſhed by a part, which is to the whole gravity as 1 to 89, 36; for in the quadratures, the addition of gravity is to the whole gravity as 1 to 178, 73. See QUADRATURE.

2°. In the *ſyzygies*, the diſturbing force is directly as the diſtance of the moon from the earth, and inverſely as the cube of the diſtance of the earth from the ſun. And at the *ſyzygies*, the gravity of the moon towards the earth receding from its centre, is more diminiſhed, than according to the inverſe ratio of the ſquare of the diſtance from that centre. Hence, in the motion of the moon from the *ſyzygies* to the quadratures, the gravity of the moon towards the earth is continually increaſed, and the moon is continually retarded in its motion; and in the motion from the quadratures to the *ſyzygies*, the moon's gravity is continually diminiſhed, and its motion in its orbit accelerated. See GRAVITY.

3°. Further, in the *ſyzygies* the moon's orbit or circle round the earth is more convex than in the quadratures; for which reaſon the moon is leſs diſtant from the earth at the former than the latter. When the moon is in the *ſyzygies*, her apſides go backwards, or are retrograde. See ORBIT, ABSIS, and RETROGRADATION.

When the moon is in the *ſyzygies*, the nodes move in antecedentia faſteſt; then ſlower and ſlower, till they become at reſt when the moon is in the quadratures. See NODE.

Laſtly, when the nodes are come to the *ſyzygies*, the inclination of the plane of the orbit is leaſt of all. See INCLINATION.

Add, that theſe ſeveral irregularities are not equal in each *ſyzygy*, but all ſomewhat greater in the conjunction than the oppoſition. See PLANET, MOON, &c.

T

T, A conſonant, and the nineteenth letter in the alphabet. See Letter and Consonant.

The *T*, in ſound, bears a near reſemblance to the D, for which reaſon they are often put for each other; and Quintilian even rallies thoſe who made any ſcruple of writing the one indifferently for the other: as, *at* for *ad*, *ſet* for *ſed*, *haut* for *haud*, &c. See D.

The *T* is one of the five conſonants which the abbot de Dangeau calls *Palatal*, and which are *D-T*, *G-K*, and *N*: the four firſt whereof have the ſame relation to each other, as the labials *B-P* and *V-F* have. *D*, for inſtance, having the ſame relation to *T*, that *B* has to *P*, or *V* to *F*.

The *T*, the ſame author obſerves, is a letter of a ſtrong ſound; ſo that a feeble one cannot be heard before it: hence, to form the ſupine of *rego*, the *T* of *tum* changes the *g*, and ſtrengthens it to the ſound of a *c*; ſo that we ſay *rectum*; as in the preterperfect tenſe *rexi*, which we pronounce *rekſi*.

T among the ancients was uſed as a numeral letter, ſignifying 160; according to the verſe,

T quoque centenos & ſexaginta tenebit.

When a daſh was added a-top, thus, T̄, it ſignified 160 thouſand. When the tribunes approved of the decrees of the ſenate, they teſtified their conſent by ſubſcribing a *T*.

T, in muſic, is ſometimes uſed to mark the tenor part or pitch. See Tenor.

T is alſo a mark, or brand, which by ſtatute 4 Hen. VII. every perſon convicted of any felony, ſave murder, and admitted to the benefit of the clergy, ſhall be marked withal, on the brawn of the left thumb. See Clergy.

T, or Tau, in heraldry, is a kind of croſs potent, or truncated; found in all the armories of the commanders of the order of St. Antony. See Cross.

The azure *T*, or *Tau*, is ſeen in arms above 400 years old: its origin, according to ſome authors, is taken from the Apocalypſe; where the ſame is a mark that the angel impreſſes on the foreheads of the elect. Others take it to repreſent a crutch; a ſymbol proper enough for this order, which was ſworn to hoſpitality. But the truth, F. Meneſtrier obſerves, is, that it is the top of a Greek crozier.

The biſhops and abbots of the Greek church wear it ſtill; and if it be found on the habit of St. Antony, it is only to ſhew that he was an abbot.

TABACCO. See the article Tobacco.

TABBY, in commerce, a kind of coarſe taffety, watered.

It is manufactured like the common taffety, excepting that it is ſtronger and thicker both in the woof and warp. See Taffety.

The watering is given it by means of a calender, the rolls whereof are of iron or copper, variouſly engraven, which bearing unequally on the ſtuff render the ſurface thereof unequal, ſo as to reflect the rays of light differently. See Calender.

TABBYING, the paſſing a ſtuff under the calender, to make a repreſentation of waves thereon, as on a tabby. See Calender, and Tabby.

It is uſual to *tabby* mohairs, ribbands, *&c.*—*Tabbying* is performed without the addition of any water or dye; and furniſhes the modern philoſophers with a ſtrong proof, that colours are only appearances. See Colour.

TABELLA, or Tablet, Tabulatum, in pharmacy, a ſolid kind of electuary, or confection, made of dry ingredients, uſually with ſugar, and formed into little flat morſules, or ſquares; more uſually called *Lozenges*, and ſometimes *Morſelli*, *Troches*, &c. See Lozenge, Morsellus, Troche, *&c.*

Powders, fruits, ſalts, *&c.* are diſſolved in ſugar, and made into *Tabulæ*; as thoſe of the juice of liquorice for colds, *&c.* See Conserve, *&c.*

We have *cordial*, *ſtomachic*, *aperitive*, and *hepatic Tablets*. Jellies and broths are ſometimes reduced into *Tablets*, to be carried in the pocket.

Tabellæ Manus Chriſti, are made of ſugar of roſes pearled.

Tabellæ Magnanimitatis, are thoſe taken by feeble old men, when matched with young wives, to aſſiſt and bear them out in the affair of generation.

TABELLIO, Tabularius, in the Roman law, a *Scrivener*; a kind of officer often confounded with *notary*, *notarius*. Yet did the two differ in this; that the notaries only drew up, and kept the minutes of acts and inſtruments on paper, and in notes, or ſhort-hand; whereas the *Tabelliones* delivered them engroſſed fair on parchment, in full executory form.--The ſame alſo put the ſeals to contracts, and rendered them authentic.

The domeſtic clerks of theſe *Tabelliones*, who, at firſt, wrote under them, in proceſs of time came to be called notaries. See Notary.

Paſquier obſerves, that the *Tabelliones* at Rome were public ſlaves, appointed for the keeping of contracts made between private perſons.—According to Loyſeau, a contract wrote by a notary, was not perfect or obligatory, till the *Tabellio* had wrote it fair: after which the parties ſubſcribed, *i. e.* they wrote at bottom that they approved the contents; for ſignatures were not then in uſe *. See Signature.

* *Quoniam* Tabellionum *uſus in regno Angliæ non habetur, propter quod magis ad ſigilla authentica credi eſt neceſſe, ut eorum copia facilius habeatur, ſtatuimus ut ſigillum habeant non ſolum archiepiſcopi, & epiſcopi, ſed eorum officiales.* See Seal.

TABERNACLE *, Tabernaculum, among the Jews, the place wherein the ark of the covenant was lodged; both while they were in tents, during their journey from Egypt; and when fixed in Jeruſalem, and the ark kept in the temple. See Ark.

* The word is formed from the Latin *Tabernaculum*, a tent.

Philo deſcribes the Jewiſh *Tabernacle* thus: it was a fabric compoſed of 48 cedar boards, lined with maſſive gold; under each whereof was a ſilver ſtand, or foot, and at the top a capital of gold: it was encompaſſed with ten pieces of rich tapeſtry, of different colours, purple, ſcarlet, hyacinth, *&c.*—The length of the *Tabernacle* was 30 cubits; its breadth 10, *Joſephus* ſays 12.

The ark was placed in a ſecret oratory, in the middle of this *Tabernacle*; and was gilt both within ſide and without: the top whereof, being a kind of lid, was called *propitiatory*, becauſe it appeaſed the wrath of God. See Propitiatory.

The *Tabernacle* was encompaſſed with ſeveral veils, or curtains, ſtretched over it, with hooks, and buckles of gold.

Feaſt of Tabernacles. See Scenopegia.

Tabernacle is alſo uſed of late for a ſort of temporary church, or chapel, contrived to ſerve the immediate purpoſe of the pariſhioners, *&c.* while their proper church is repairing, rebuilding, or the like.

TABES, in medicine, a general name for conſumptions of all kinds. See Consumption, Phthisis, Atrophy, Marasmus, *&c.*

Tabes *Dorſalis*, is a kind, or rather a degree, of conſumption, proceeding ſometimes from an exceſſive application to venery.

The patient has neither a fever, nor loſs of appetite; but a ſenſation, as if there were a number of piſmires running from the head down the ſpinal marrow; and when he evacuates, either by urine or ſtool, there flows a liquid matter like ſemen. After any violent exerciſe his head is heavy, and his ears tingle; and at length he dies of a lipyria, *i. e.* a fever, where the external parts are cold, and the internal burn at the ſame time.

TABLATURE, in anatomy, a diviſion or parting of the ſcull into two tables. See Table and Cranium.

Tablature, Tablatura, in muſic, in the general, is, when, to expreſs the ſounds, of notes of a compoſition, we uſe letters of the alphabet, or cyphers, or any other characters, not uſual in the modern muſic. See Score.

Tablature, in its ſtricter ſenſe, is the manner of writing a piece for a lute, theorba, guitarre, baſs-viol, or the like—which is done by writing on ſeveral parallel lines (each whereof repreſents a ſtring of the inſtrument) certain letters of the alphabet; whereof, A marks that the ſtring is to be ſtruck open, *i. e.* without putting the finger of the left hand on the head; B ſhews, that one of the fingers is to be put on the firſt ſtop; C on the ſecond; D on the third, *&c.* See Viol, Theorba, *&c.*

The *Tablature* of the lute is uſually wrote in letters of the alphabet; that of the harpſicord in the common notes. See Lute, Harpsicord, *&c.*

TABLE, Tabula, a moveable, uſually made of wood, or ſtone, ſupported on pillars, or the like; for the commodious reception of things placed thereon.

Moſes made a *Table* in the tabernacle, for laying the ſhew-bread upon, deſcribed by Philo Judæus as two cubits long, one broad, and one and half high.

Among Chriſtians, the *Table*, or *Lord's Table*, ſignifies the Sacrament of the Supper. See Eucharist.

Round Table—*Knights of the Round* Table, a military order, ſuppoſed to have been inſtituted by Arthur the firſt king of the Britons, in the year 516. See Knight.

They are ſaid to have been 24 in number; all picked from among the braveſt of the nation.

The *Round Table*, which gave them their title, was an invention of that prince, to avoid diſputes about the upper and lower end; and to take away all emulation as to places.

Leſly aſſures us, he has ſeen the *Table* at Wincheſter; at leaſt, ſays he, if we may believe the keepers thereof, who ſtill ſhew it with a deal of ſolemnity. He adds, that the names of a great number of knights wrote around it, ſeem to confirm the truth of the tradition.

Larrey, and ſeveral other authors, make no ſcruple to relate this fable as matter of hiſtory: but that it is a fable is certain; F. Papebroch having ſhewn, that there was no ſuch thing as an order of knights before the VIth century. See Knight, Order, *&c.*

Camden obſerves, that the *Table* at Wincheſter is of a ſtructure much more modern than the VIth century. It is added, that Arthur himſelf is no more than a fabulous prince.

In effect, the *Round Table* does not appear to have been any military order, but rather a kind of juſt, or military exerciſe, between two perſons, armed with lances. Several authors ſay, that Arthur, duke of Bretagne, renewed it. See Matthew Paris, the abbot Juſtiniani, and F. Helyot.

Paulus Jovius ſays, it was under the empire of Frederic Barbaroſſa, that the knights of the *Round Table* firſt began to be talked of: others attribute their origin to the factions of the Guelphs and Gibellins.—K. Edward built a houſe called the *Round Table*, the court whereof was 200 foot in diameter.

TABLE, in architecture, a ſmooth, ſimple member, or ornament, of various forms; but moſt uſually in that of a long ſquare. See the article PLATBAND, *&c.*

Projecting TABLE, is ſuch a one as ſtands out from the naked of the wall, pedeſtal, or other matter it adorns.

Raked TABLE, is that which is hollowed in the die of a pedeſtal, or elſewhere, and which is uſually encompaſſed with a moulding. See RAKING.

Razed TABLE, an emboſſment in a frontiſpiece, for the putting an inſcription or other ornament in ſculpture. This is what M. Perrault underſtands by *Abacus* in Vitruvius.

Crowned TABLE, that covered with a cornice, and wherein is cut a baſſo relievo, or a piece of black marble incruſtated for an inſcription.

Ruſticated TABLE, that which is picked, and whoſe ſurface ſeems rough, as in grotto's, *&c.*

Water TABLE. See the article WATER.

Plain TABLE, a ſurveying inſtrument. See PLAIN *Table*.

TABLE, in perſpective, denotes a plain ſurface, ſuppoſed to be tranſparent, and perpendicular to the horizon. See PERSPECTIVE.

It is always imagined to be placed at a certain diſtance between the eye and objects, for the objects to be repreſented thereon by means of viſual rays paſſing from every point thereof through the *Table* to the eye. See PERSPECTIVE.

Whence it is alſo called *Perſpective Plane*. See PLANE.

TABLE, in anatomy.—The cranium is ſaid to be compoſed of two *Tables*, or laminæ, *i. e.* it is double, as if it conſiſted of two bones laid one over another. See CRANIUM.

TABLE *of Pythagoras*, called alſo *Multiplication Table*, is a ſquare, formed of an hundred leſſer ſquares, or cells, containing the products of the ſeveral digits, or ſimple numbers, multiplied by each other. See MULTIPLICATION.

As it is abſolutely neceſſary, thoſe who learn arithmetic have the ſeveral multiplications contained in this *Table* off by heart, we have thought fit to ſubjoin it here; with an example, to ſhew the manner of uſing it.

Table of Pythagoras, *or* Multiplication *Table*.

1	2	3	4	5	6	7	8	9	10
2	4	6	8	10	12	14	16	18	20
3	6	9	12	15	18	21	24	27	30
4	8	12	16	20	24	28	32	36	40
5	10	15	20	25	30	35	40	45	50
6	12	18	24	30	36	42	48	54	60
7	14	21	28	35	42	49	56	63	70
8	16	24	32	40	48	56	64	72	80
9	18	27	36	45	54	63	72	81	90
10	20	30	40	50	60	70	80	90	100

Example: Suppoſe it were required to know the product of 6, multiplied by 8, look for 6 in the firſt horizontal column, beginning with 1; then look for 8 in the firſt perpendicular column, beginning likewiſe with 1; the ſquare or cell wherein the perpendicular column from 6, meets with the horizontal one from 8, contains the product required, *viz.* 48.

Laws of the Twelve TABLES, were the firſt ſet of laws of the Romans; thus called, either by reaſon the Romans then wrote with a ſtyle on thin wooden *Tablets*, covered with wax; or rather, becauſe they were engraven on *Tables*, or plates of copper, to be expoſed in the moſt noted part of the public forum. See LAW.

After the expulſion of the kings, as the Romans were then without any fixed, certain ſyſtem of law; at leaſt had none ample enough to take in the various caſes that might fall between particular perſons; it was reſolved to adopt the beſt and wiſeſt laws of the Greeks.

One Hermodorus was firſt appointed to tranſlate them; and the Decemviri afterwards compiled and reduced them into ten *Tables*. After a world of care and application, they were at length enacted and confirmed by the ſenate, and an aſſembly of the people, in the year of Rome 303. The following year they found ſome things wanting therein, which they ſupplied from the laws of the former kings of Rome, and from certain cuſtoms, which long uſe had authorized; theſe being engraven on two other *Tables*, made the *Law of the Twelve Tables*, ſo famous in the Roman Juriſprudence; the ſource and foundation of the civil or Roman law. See CIVIL *Law*.

The laws of the twelve *Tables* were alſo called *Decemviral Laws*, from the officers entruſted with the compoſing them. See DECEMVIR.

It is great pity, this ſyſtem of law ſhould have periſhed through the injuries of time: we have now nothing of it, but a few fragments diſperſed in divers authors. J. Gothofred has collected them together, and we have them in Roſinus, and ſome other authors.—The Latin is very old and barbarous, and remarkably obſcure.

New TABLES, TABULÆ *Novæ*, an edict occaſionally publiſhed in the Roman commonwealth, for the aboliſhing all kinds of debts, and annulling all obligations.

It was thus called, in regard all antecedent acts being deſtroyed, there were nothing but new ones to take place.

TABLE, among jewellers. A TABLE *Diamond*, or other precious ſtone, is that whoſe upper ſurface is quite flat, and only the ſides cut in angles: in which ſenſe a diamond cut *Tablewiſe* is uſed in oppoſition to a roſe-diamond. See DIAMOND.

TABLE *Glaſs*. See the article GLASS.

TABLE is alſo uſed for an index or repertory, put at the beginning or end of a book, to direct the reader to any paſſage he may have occaſion for.

Thus we ſay, *Table of Matters*; *Table of Authors quoted*; *Table of Chapters*, &c.——*Tables*, of themſelves, ſometimes, make large volumes; as that of *Dravitz* on the civil and canon laws.

TABLES *of the Bible*, are called *Concordances*. See CONCORDANCE.

TABLE *Rents*. See the article BORD *Lands*.

TABLE *of Houſes*, among aſtrologers, are certain *Tables* ready drawn up for the aſſiſtance of practitioners in that art, for the erecting or drawing of figures or ſchemes. See HOUSE, *&c.*

TABLES, in mathematicks, are ſyſtems of numbers, calculated to be ready at hand for the expediting aſtronomical, geometrical, *&c.* operations. See CANON.

Aſtronomical TABLES, are computations of the motions, places, and other phænomena of the planets, both primary and ſecundary. See PLANET, SATELLITE, and MOON.

The oldeſt *Aſtronomical Tables* are the Ptolemaic, found in Ptolemy's *Almageſt*; but theſe no longer agree with the heavens. See ALMAGEST.

In 1252, Alphonſo XI. king of Caſtile, undertook the correcting them, chiefly by the aſſiſtance of Iſaac Hazan, a Jew; and ſpent 400 thouſand crowns therein. Thus aroſe the *Alphonſine Tables*, to which that prince himſelf prefixed a preface. But the deficiency of theſe was ſoon perceived by Purbachius and Regiomontanus; upon which Regiomontanus, and after him Waltherus and Warnerus, applied themſelves to cœleſtial obſervation, for the further amending them: but death prevented any progreſs therein.

Copernicus, in his books of the cœleſtial revolutions, inſtead of the *Alphonſine Tables*, gives others of his own calculation, from the latter, and partly from his own obſervations.

From Copernicus's obſervations and theories, Eraſ. Reinholdus afterwards compiled the *Prutenic Tables*, which have been printed ſeveral times, and in ſeveral places.

Tycho de Brahe, even in his youth, became ſenſible of the deficiency of the *Prutenic Tables*; which was what determined him to apply himſelf with ſo much vigour to cœleſtial obſervation. Yet all he did thereby, was to adjuſt the motions of the ſun and moon; though Longomontanus, from the ſame, to the theories of the ſeveral planets publiſhed in his *Aſtronomia Danica*, added *Tables* of their motions, now called the *Daniſh Tables*; and Kepler likewiſe, from the ſame, in 1627, publiſhed the *Rudolphine Tables*, which are now much eſteemed. Theſe were afterwards, *Anno* 1650, turned into another form, by Maria Cunitia, whoſe aſtronomical *Tables*, comprehending the effect of Kepler's phyſical hypotheſis, are exceedingly eaſy, and ſatisfy all the phænomena, without any trouble of calculation, or any mention of logarithms; ſo that the *Rudolphine* calculus is here greatly improved.

Mercator made a like attempt in his *Aſtronomical inſtitution*, publiſhed in 1676; and the like did J. Bap. Morini, whoſe abridgment of the *Rudolphine Tables* was prefixed to a Latin verſion of Street's *Aſtronomia Carolina*, publiſhed in 1705. Lanſbergius, indeed, endeavoured to diſcredit the *Rudolphine Tables*, and framed *Perpetual Tables*, as he calls them, of the heavenly motions; but his attempt was never much regarded by the aſtronomers; and our countryman Horrox gave an abundant check to his arrogance, in his defence of the Keplerian aſtronomy.

Nor was the authority of the *Rudolphine Tables* impaired by the *Philolaic Tables* of Bullialdus, the *Britannic Tables* of Vincent Wing, calculated on Bullialdus's hypotheſis; or the *Britannic Tables* of Newton; or the French ones of the count de

Pagan, or the *Caroline Tables* of Street, all calculated on Dr. Ward's hypotheſis, or the *Novalmageſtic Tables* of Ricciolus. Among theſe, however, the *Philolaic* and *Caroline Tables* are eſteemed the beſt; inſomuch, that Mr. Whiſton, by the advice of Mr. Flamſteed (a perſon of undoubted authority in ſuch caſes) thought fit to ſubjoin the *Caroline Tables* to his aſtronomical lectures.

The lateſt *Tables* are the *Ludovician*, publiſhed in 1702, by M. de la Hire, wholly from his own obſervations, and without the aſſiſtance of any hypotheſis; which, before the invention of the micrometer, teleſcope, and the pendulum-clock, was held impoſſible.

Another ſet of *Tables*, the aſtronomical world is in daily expectation of from Dr. Halley, aſtronomer royal, *&c.* It were needleſs to prepoſſeſs the public in their favour: the author's name, and the preſent ſtate of aſtronomy, will leave no doubt on any body but that they will have the laſt degree of juſtneſs and preciſion, and ſuch as poſterity itſelf ſhall ſcarce be able to amend. They have been in the preſs ſeveral years, and what it is retards their publication is not known, unleſs it be the rendring them more ample. See ASTRONOMY.

Sexagenary TABLES. See the article SEXAGENARY.

For TABLES *of the Stars*, ſee CATALOGUE.

TABLES *of Sines*, *Tangents*, and *Secants*, of every degree and minute of a quadrant, uſed in trigonometrical operations, are uſually called *Canons*. See CANON. See alſo SINE, TANGENT, *&c.*

TABLES *of Logarithms*, *Rhumbs*, *&c.* uſed in geometry, navigation, *&c.* See LOGARITHM, RHUMB, SAILING, TRAVERSE, *&c.*

Loxodromick TABLES, are *Tables* wherein the difference of longitude and quantity of the way run in any rhumb, are exhibited to every ten minutes of every degree of the quadrant variation of the latitude. See RHUMB.

TABLE, in heraldry. Coats, or eſcutcheons, containing nothing but the mere colour of the field, and not charged with any bearing, figure, moveable, *&c.* are called *Tables d' Attente*, *Tables of Expectation*, or *Tabulæ Raſæ*.

TABLET, in pharmacy, *&c.* See TABELLA.

TABLING *of Fines*, is the making a table for every county, where his majeſty's writs run; containing the contents of every fine paſſed each term. See FINE.

It is to be done by the chirographer of fines of the common-pleas, who every day of the next term, after engroſſing any ſuch fine, fixes one of the ſaid *Tables* in ſome open place of the ſaid court, during its ſitting; and likewiſe delivers to the ſheriff of each county, a content of the ſaid *Tables* made for that reſpective county, the term before the aſſizes, to be affixed in ſome place in the open court, while the juſtices ſit, *&c.* See CHIROGRAPHER.

TABOR, TABOURIN, a ſmall Drum. See DRUM.

Privilege of the TABOURET, in France, is a privilege ſome great ladies enjoy, to ſit or have a ſtool in the queen's preſence.

TABORITES, or THABORITES, a branch or ſect of the ancient Huſſites. See HUSSITE.

The Huſſites, towards the cloſe of the XVth century, dividing into ſeveral parties, one of them retired to a little mountain or rock, ſituate in Bohemia, 15 leagues from Prague, and there put themſelves under the conduct of Ziſca; building themſelves a fort or *caſtle*, which they called *Tabor*, or *Thabor*, either from the general word *Thabor*, which in the Sclavonic language ſignifies caſtle; or from the mountain *Tabor*, mentioned in ſcripture: and hence they became denominated *Thaborites*.

Theſe carried the point of reformation farther than Huſs had done; rejected purgatory, auricular confeſſion, the unction at baptiſm, tranſubſtantiation, *&c.*

They reduced the ſeven ſacraments of the Romaniſts to four, *viz.* baptiſm, the euchariſt, marriage, and ordination.

They maintained a ſtout war with the emperor Sigiſmund. Pope Martin V. was obliged to publiſh a croiſade againſt them. Nor did this ſucceed: at length, however, in 1544, their caſtle of *Thabor* was taken, and they diſperſed.

TABULARIUS. See the article TABELLIO.

TABULARUM *Apertura*, } See the articles { APERTURA.
TABULATUM, TABELLA.

TACAMAHACA, or TACAMACHA, a kind of reſinous gum, diſtilling from the trunk of a very large tree, growing in New Spain; but, in greateſt abundance, in the iſland of Madagaſcar. See GUM.

It is not unlike our poplar-tree, only bigger and taller, its leaves ſmall and green, its fruit red, of the ſize of our wallnuts, exceedingly reſinous, and containing a ſtone like our peaches.

The wood of the tree makes good timber for ſhips, and the gum it yields ſerves for their caulking; though its chief uſe is in medicine.

There are three kinds of *Tacamahaca*; the *Sublime*, called alſo *Tacamacha* in the pod; *Tacamacha* in the maſs, and *Tacamacha* in tears.

The firſt is the natural reſin, as it oozes of itſelf, without any inciſion made in the tree: the good is dry, reddiſh, tranſparent, of a bitter taſte, and a ſtrong ſmell reſembling that of lavender. The iſlanders gather it in little gourds divided in two, and covered with a palm leaf.

The *Tacamacha's* in tears, and in the maſs, are thoſe which flow from the tree by inciſions: they muſt be choſen dry and clear, and their ſmell reſembling that of the firſt kind.

Gum *Tacamacha* is found good for digeſting and reſolving tumours, and aſſuaging pains.—Burnt upon coals, it is reckoned good for hyſteric fits in women, and likewiſe applied to the belly in form of a plaiſter. Some apply it to the temples in the ſame manner, and to the nape of the neck, for pains in the head, defluxions of rheum upon the throat, and inflammations of the eyes, as alſo in the tooth-ach. It is of ſo ſubtle and penetrating a nature, that it is greatly uſed in external applications, to ſuppurate and diſperſe tumours; and is accounted effectual, even in thoſe which are ſcrophulous.

It is likewiſe uſed externally in arthritical pains, with ſucceſs; in effect, the Indians uſe it for all kinds of pains. Schroder affirms, that he has ſeen intolerable pains in the leg removed by it.

TACHYGRAPHY, * the art of faſt, or ſhort writing. See BRACHYGRAPHY.

* The word is formed from the Greek ταχυς, *ſwift*, and γραφη, *writing*.

There have been various kinds of *Tachygraphy* invented: among the Romans, there were certain notes uſed, each whereof ſignified a word. See NOTE, and NOTARY.

The Rabbins have a kind of *Tachygraphy* formed by abbreviations, which make a kind of technical words; wherein each conſonant ſtands for a whole word, as, ר'מ'בם, *Rambam*; which expreſſes *Rabbi Moſes*, *Son of Maiemon*; ר'שי, *Raſchi*; which ſtands for *Rabbi Schelomoh Jarri*. See ABBREVIATION.

In France, *&c.* the only *Tachygraphy* uſed is the retrenching of letters, or even whole ſyllables of words; as in *ſdm* for *ſecundum*, *aut* for *autem*, *d* for *ſed*, *o* for *non*, *participaon* for *participation*, &c.

The firſt printers imitated theſe abbreviations: at preſent they are almoſt laid aſide, except among ſcriveners, *&c.*

In England, we have great variety of methods of *Tachygraphy*, or ſhort-hand; more by far, and thoſe too, much better, eaſier, ſpeedier, and more commodious, than are known in any other part of the world: witneſs Shelton's, Wallis's, Webſter's, and Weſton's ſhort-hands.

TACIT *Acceptance*, } See the articles { ACCEPTANCE.
TACIT *Community*, COMMUNITY.

TACK *about*, in navigation, a term uſed at ſea when a ſhip's head is brought about, ſo as to lie the contrary way.

To effect this, they firſt make her *ſtay*; which done, ſhe is ſaid to be *paid*.—They then let *riſe*, and *hale*, *i. e.* let the lee-tack riſe, and hale aft the ſheets, and ſo trim all the ſails by a wind as they were before.

TACKLE, or TACKLING, in navigation, includes all the ropes or cordage of a ſhip, with their furniture, whereby the ſails are managed.—See *Tab. Ship. fig.* 1. See alſo the articles CORDAGE and ROPE.

TACKLES, are more particularly uſed for ſmall ropes running in three parts, having at one end a pendant with a block faſtened to them, or elſe a lannier; and at the other end, a block and hook, to hang goods upon, that are to be heaved into the ſhip, or out of it.

There are ſeveral kinds of theſe *Tackles*: as the *Boat Tackles*, ſerving to hoiſt the boat, *&c.* in and out: the *Tackles* belonging to the maſts, ſerving as ſhrouds to keep the maſts from ſtraining: the *Gunner's Tackles*, with which the ordnance are hoiſted in and out.—See *Tab. Ship. fig.* 1. *n.* 39, 40, 59, 61, 82, 93, and 103.

Ground TACKLE, } See the articles { GROUND.
Wind TACKLE *Blocks*, WIND.

TACTICKS, * the art of diſpoſing forces in form of battle, and of performing the military motions and evolutions. See EVOLUTION.

* The word is Greek, τακτικα, formed from ταξις, *order*.

The Greeks were very ſkilful in this part of the military art, having public profeſſors of it, called *Tactici*, who taught and inſtructed their youth therein. Ælian hath a particular book on this ſubject; and there is a great deal of it in Arrian, in his hiſtory of Alex. M. and in Mauritius, and Leo Imperator. Voſſius *de ſcient. Mathemat.* mentions 24 ancient authors on the ſubject of *Tacticks*.

TACTICKS is alſo uſed for the art of inventing, and making machines for throwing of darts, arrows, ſtones, fire-balls, *&c.* by means of ſlings, bows, and counter-poiſes. See MACHINE. Vegetius, Hero, *&c.* have wrote on theſe machines; and we have them deſcribed, and figured by Lipſius. See ARIES, BALLISTA, CATAPULTA.

TACTILE, or TANGIBLE, in the ſchools, ſomething that may fall under the ſenſe of feeling. See FEELING.

Though atoms be corporeal, yet are they not either *tactile* or viſible, by reaſon of their ſmallneſs. See CORPUSCLE.

The principal *tangible* qualities are heat, cold, dryneſs, hardneſs, and humidity. See each under its proper article, HEAT, COLD, HARDNESS.

TACTION, in the ſchools. See FEELING.

TACTION, in geometry. See TOUCHING, and TANGENT.

TÆNIA, or **TENIA** *, in architecture, a member of the Doric architrave, reſembling a ſquare fillet, or reglet; and ſerving in lieu of a cymatium. See DORIC and CYMATIUM.

* The word is Greek, ταινια, which literally denotes, a *ſwath*, *bandage*, *fillet*, or the like.---Barbaro renders it by *liſtel*: but Palladio uſes the old name *Tænia*. See LISTEL.

Leon Baptiſt. Alberti calls the *Tæniæ*, Regulæ, and Faſciolæ; and Daviler, Bandelettes. See REGLET, BANDELET, &c. Philander ſays, there are two kinds, *viz.* that above-mentioned, which he calls the *lower*; and an *upper*, which ſerves as a capital to the triglyphs.

TAFFAREL, or **TAFFEREL**, in a ſhip, the uppermoſt part, frame, or rail, abaſt, over the poop.—See *Tab. Ship. fig.* 2. *n.* 97. *fig.* 1. *lit.* See alſo the article SHIP.

TAFFETY, or **TAFFATY**, in commerce, a kind of fine, ſmooth, ſilken ſtuff; having, uſually, a remarkable luſtre, or gloſs. See SILK, &c.

ALAMODE, }
LUSTRING, } the Taffetas Noirs of Lyons,

TAFFETAS noir luſtré is our Alamode.—Non luſtré is our Luſtring.

There are *Taffaties* of all colours, ſome plain, others ſtriped with gold, ſilver, ſilk, &c. others chequered, others flowered, others in the Chineſe point, others the Hungarian; with various others, to which the mode, or the caprice of the workmen give ſuch whimſical names, that it would be as difficult, as it is uſeleſs, to rehearſe them; beſides that, they ſeldom hold beyond the year wherein they firſt roſe. The old names of Taffeties, and which ſtill ſubſiſt, are *Taffeties* of Lyons, of Spain, of England, of Florence, of Avignon, &c. The chief conſumption of *Taffeties* is in ſummer-dreſſes for women, in linings, ſcarves, coifs, window-curtains, &c.

There are three things which contribute chiefly to the perfection of *Taffeties*, *viz.* the ſilk, the water, and the fire. The ſilk is not only to be of the fineſt kind, but it muſt be worked a long time, and very much, before it be uſed. The watering, beſide that it is only to be given very lightly, ſeems only intended to give that fine luſtre, by a peculiar property not found in all waters. Laſtly, the fire, which is paſſed under it to dry the water, has its particular manner of application, whereon the perfection of the ſtuff depends very much.

Octavio May, of Lyons, is held the firſt author of the manufacture of gloſſy *Taffeties*; and tradition tells us the occaſion of it.—Octavio, it ſeems, going backwards in the world, and not able to retrieve himſelf by the manufacture of *Taffeties*, ſuch as were then made, was one day muſing on his misfortunes, and, in muſing, chanced to chew a few hairs of ſilk which he had in his mouth. His reverie being over, the ſilk he ſpit out ſeemed to ſhine, and on that account engaged his attention. He was ſoon led to reflect on the reaſon; and, after a good deal of thought, concluded, that the luſtre of that ſilk muſt come, 1*ſt*, From his having preſſed it between his teeth. 2*dly*, From his having wet it with his ſaliva, which had ſomething glutinous in it: and, 3*dly*, From its having been heated by the natural warmth of his mouth. All this he executed upon the next *Taffeties* he made; and immediately acquired immenſe riches to himſelf, and to the city of Lyons the reputation it ſtill maintains, of giving the gloſs to *Taffeties*, better than any other city in the world.

It will not, we conceive, be leſs uſeful than curious, to give here the deſcription of the engine contrived by Octavio to give the gloſs to *Taffety*; to add the manner of applying it, and the compoſition of the water uſed therein.

The machine is much like a ſilk loom, except that inſtead of iron points, here are uſed a kind of crooked needles, to prevent the *Taffety* from ſlipping: at the two extremities, are two beams; on one of which is rolled the *Taffety*, to take the gloſs; and on the other, the ſame *Taffety* as faſt as it has received it. The firſt beam is kept firm by a weight of about 200 pounds; and the other turned by means of a little lever paſſing through mortiſes at each end. The more the *Taffety* is ſtretched, the greater luſtre it takes; care, however, is to be uſed it be not over-ſtretched.

Beſides this inſtrument for keeping the ſtuff ſtretched, there is another to give it the fire: this is a kind of carriage, in form of a long ſquare, and the breadth of the *Taffeties*. It moves on trundles, and carries a charcoal fire under the *Taffety*, at the diſtance of about half a foot.

The two machines prepared, and the *Taffety* mounted, the luſtre is given it by rubbing it gently with a ball, or handful of liſts of fine cloth, as it rolls from one beam to the other; the fire, at the ſame time, being carried underneath it to dry it. As ſoon as the piece has its luſtre, it is put on new beams to be ſtretched, a day or two; and the oftner this laſt preparation is repeated, the more it increaſes the gloſs.

For black *Taffeties*, the gloſs is given with double beer, and orange or lemon juice; but this laſt is the leaſt proper, as being apt to whiten. The proportion of the two liquors is a gallon of orange juice to a pint of beer, to be boiled together to the conſiſtence of a broth. For coloured *Taffeties* they uſe gourd-water, diſtilled in an alembic.

TAIL, *Cauda*, that part of an animal which terminates its body behind. See ANIMAL, &c.

The *Tail* is different both in figure, and uſe, in the various ſpecies: in land-animals, it ſerves to rid them of flies, and is uſually covered with hair, and ſtrengthened with bones: in fiſhes it is cartilaginous, and ſerves them as a helm to ſteer their courſe withal in ſwimming. See FISH and SWIMMING. In birds it is covered with feathers, and greatly aſſiſts in all aſcents and deſcents in the air; as alſo to render their flight ſteady, by keeping the body upright in that ſubtile and yielding medium, by its readily turning and anſwering to every vacillation of the body. See BIRD, and FLYING.

TAIL, in anatomy, is uſed for that tendon of a muſcle which is fixed to the moveable part.—In oppoſition to which the tendon fixed to the immoveable part is called the *Head*. See MUSCLE.

Dove-**TAIL**, or *Swallow's*-**TAIL**, among carpenters, is one of the ſtrongeſt manner of jointing; wherein a piece of wood that grows larger towards the end is inſerted into another piece; ſo that it cannot ſtir out, by reaſon the hole in the one is narrower than the lower end of the other: as in the figure of a *Dove's-Tail*. See QUEUE *d' Aronde*, SWALLOW'S-*Tail*, DOVE-*Tail*, and COUNTER-*Swallow-Tail*.

Peacock's **TAIL**, a term applied to all circular compartiments, which go enlarging from the centre to the circumference; imitating, in ſome meaſure, the feathers of a peacock's *Tail*, when ſpread.

Dragon's **TAIL**, *Cauda Draconis*, in aſtronomy, the deſcending node of a planet; thus characterized ☋. See NODE. The aſtrologers take care to put it in all their horoſcopes. See HOROSCOPE.

Horſe's **TAIL**, among the Tartars and Chineſe, is the enſign or flag under which they make war. See ENSIGN, FLAG, &c. Among the Turks it is the ſtandard bore before the grand viſier, the baſhaws, and ſangiacs; in order to which, it is fitted on the end of a half-pike, with a gold button, and is called *Toug*.

There are baſhaws of *one*, others of *two*, others of *three Horſe's Tails*.—The *Horſe's Tail* placed on a general's tent, is a ſignal of battle. For the original of this cuſtom, it is related, that in a certain battle, the ſtandard being taken by the enemy, the general of the army, or, as others ſay, a private horſeman, cut off the *Tail* of his horſe, and faſtening it to the end of a half-pike, encouraged the troops, and gained the victory. In memory of which noble action, the grand ſignior appointed that ſtandard to be bore for the future, as a ſymbol of honour. *Ricaut.*

TAIL, in heraldry, &c. is particularly uſed for the tail of an hart; thoſe of ſeveral other creatures having peculiar and diſtinct names.

As, that of a buck, roe, or any other deer, is called the *Single*; of a boar, the *Wreath*; of a fox, the *Buſh*; of a wolf, the *Stern*; and of a hare and coney, the *Scut*.

TAIL *of a comet*. When a comet darts his rays forwards, or towards that part of the heavens, whither his proper motion ſeems to be carrying him, thoſe rays are called its *Beard*: on the contrary, when its rays are ſhot behind, towards that part from whence it appears to move, the rays are called the *Tail of the Comet*. The various phænomena whereof, with their phyſical cauſes, ſee under the article COMET.

TAIL *of the trenches*, in the military art, is the poſt or place where the beſiegers begin to break ground, to cover themſelves from the fire of the town. See APPROACHES.

The *Tail* of the trench is the firſt work which the beſiegers make at the opening of the trenches; as the head of the attack is that carried on toward the place. See TRENCH.

TAIL, or **TAILE**, in common law, ſignifies a limited fee; as oppoſite to fee-ſimple. See FEE.

It is thus called from the French *tailler*, to cut, by reaſon ſuch fee is ſo minced, or parted, as it were, that it is not in the owner's free power to diſpoſe of; but is by the firſt giver *cut*, *taille*, and divided from all others, and tied to the iſſue of the donee.

The limitation of *Tail* is either *general* or *ſpecial*.

TAIL *General*, is that whereby lands and tenements are limited to a man, and to the heirs of his body begotten, or to be begotten.

This is called *general*, becauſe how many wives ſoever the tenant holding by this title ſhall have, one after another, in lawful marriage, his iſſue by them all have a poſſibility to inherit one after another.

TAIL *Special*, is when lands or tenements are limited to a man and his wife, and the heirs of their two bodies together.

It is called *ſpecial*, becauſe if the man bury his wife before iſſue, and take another; the iſſue by his ſecond wife cannot inherit the land, &c. See DOCKING, FINE, RECOVERY, &c.

Alſo, if the land be given to a man and his wife, and their ſon *R.* for ever, this is called *Tail Special*.

TAIL *after poſſibility of iſſue extinct*, is where land being given to a man and his wife, and the heirs of their two bodies, and the one over-lives the other, without iſſue between them begotten: upon which the ſurvivor ſhall hold the land for term of his own life in quality of tenant in *Taile after the poſſibility of iſſue extinct*; and notwithſtanding he does waſte, ſhall not be impeached of it.—And if he alien, he in the reverſion ſhall not have a writ of entry in conſimili caſu, but may enter, and his entry is lawful.

Fee TAIL, } See the articles { FEE *Tail*.
Several TAIL, } See the articles { SEVERAL.

TAIL, or TAILE, is alſo uſed for what we vulgarly call a *Tally*, *Taille de Bois*, or a cloven piece of wood to nick up an account on. See TALLY.

TAILLE', or TAILLEE, in heraldry. See TRANCHE'.

TAILLOIR, in architecture, a term which ſome of our writers, after the French, uſe for *Abacus*. See ABACUS.

TAINT, in law, ſignifies either, ſubſtantively, a conviction; or, adjectively, a perſon convicted of felony, treaſon, *&c.* See ATTAINT.

TAKE *and Leave*, in the ſea language.—The ſailors ſay, a ſhip can *take and leave upon her when ſhe will*; when ſhe ſails ſo well that ſhe can come up with another, or out-ſail her at pleaſure.

Thiſtle-TAKE, } See the articles { THISTLE.
TAKERS—*Carr*-TAKERS, } See the articles { CARR.

TALBOT, a ſort of dog, frequent in coat-armour, noted for its quick ſcent, finding out the tracks, lodgings, and forms of beaſts, and purſuing them with open mouth, and continual cry, with ſuch eagerneſs, that if not taken off by the huntſmen he is often ſpoiled. See HOUND, and HUNTING.

TALC, or TALK *, in natural hiſtory, a ſhining ſquamous, fiſſile, ſpecies of ſtone, eaſily ſeparable into thin tranſparent ſcales or leaves. See STONE.

* The word is German, where it ſignifies the ſame.

Anciently, *Talc* was only found in Spain; but ſince, mines thereof have been found in Cyprus, Cappadocia, and ſince that in Arabia and Africa: at preſent, they dig it in the Alps and Appennines, ſeveral mountains in Germany and even in England, particularly in Northamptonſhire.

We uſually diſtinguiſh two kinds of *Talc*, *viz. White Talc of Venice*, and *Red of Muſcovy*: to which may be added *Parget*, or the *Engliſh Talc*. See GYPSUM, and PLASTER.

That from Venice is the moſt eſteemed: it is brought in large ſhining greeniſh ſtones; but becomes white, and exceedingly tranſparent, when wrought. It appears greaſy to the touch, though there is ſcarce any ſtone dryer; yet, in ſpite of its dryneſs, it pulverizes with difficulty; nor is it eaſily calcined. Its chief uſe is as a ſcreen or cover for paintings in miniature and crayons; to which purpoſe thin ſlices thereof are uſed: it is ſometimes alſo uſed for a fucus; in order to which, by reaſon of the difficulty of pulverizing it, *&c.* they content themſelves to raſp it with the ſkin of a ſea-dog, and to paſs the raſping through a ſieve.

Pliny, in his *Natural Hiſtory*, *lib.* 36. *cap.* 22. obſerves, that the Romans not only uſed it for window-lights, but they alſo paved the circus with the ſame. See SPECULARIS.

The *Talc* brought from Muſcovy is reddiſh when in the ſtone; but it ſeldom comes to us otherwiſe than in leaves, which are very hard, ſmooth, gloſſy, and exceedingly tranſparent: it is found in quarries in Muſcovy and Perſia, and is uſed to make lanterns, to cover paintings, *&c.*

Some chymiſts, and other empirics, have held, that *Talc* might be uſed for many more important purpoſes; and pretend to draw from it that precious oil, ſo much boaſted of by the ancients, particularly the Arabs, called *Oil of Talc*, which is ſuppoſed a wonderful coſmetic, and preſerver of the complexion: but the truth is, the word *Talc*, among them, ſignified no more than an equal diſpoſition of the humours, which keep the body in good temperament and perfect health. Now, as nothing contributes more than health to the preſerving of beauty, this has given occaſion to the chymiſts to ſearch this *Oil of Talc*, which is to maintain the body in this diſpoſition, and to engage the ladies to be at the expence of the ſearch.

Some have alſo pretended, that yellow or ruddy *Talc* contained the ſeeds of gold, and that a menſtruum might be drawn from it to tranſmute metals into gold or ſilver, to fix mercury, *&c.* but this is mere charletanery.

TALENT, TALENTUM, a weight, and a coin, both very famous among the ancients; but very different in different countries. See COIN, and WEIGHT.

The value of the *Talent* is very hard to aſſign in Engliſh money, as being uſed among all the people throughout the eaſt; and its value, and the manner of computation, different among each. A difficulty abundantly ſhewn by Budæus, in his learned treatiſe *de Aſſe*.

There were various kinds of *Talents*, both with regard to weight and to ſpecies; the value of theſe laſt ſtill increaſing, as the metal whereof it conſiſted was purer: tho' the *Talent* weights did all contain the ſame number of pounds and drachms.

For as the French have a livre pariſis, and a livre tournois, each whereof contains alike 20 ſols; yet theſe compared together, the Paris livre contains 25 ſols of the Tournois livre; the Paris ſol exceeding that of Tours by one fifth; ſo all *Talent* weights were equally 60 minæ, and the mina 100 drachmæ; but the drachma of one place exceeding that of another, there hence aroſe a difference in the *Talents*. See WEIGHT.

The Attic drachma, for inſtance, was 60 Attic oboli, and that of Ægina 10 of the ſame oboli; whence the Æginean *Talent*, computed on the foot of the Attic weight, was 100 minæ; whereas, reckoned on the foot of its own drachma, it was no more than 60. See DRACHMA.

The common Attic *Talent* then (the *Talent* weight we mean) contained 60 Attic minæ, or 62 and half Attic pounds, or 6000 Attic drachmæ; equal, according to Dr. Arbuthnot's reduction, to 56 pounds 11 ounces Engliſh Troy weight. Some authors, as Priſcian, mention another Attic *Talent* of 100 minæ; but this is to be underſtood of antient minæ, as they ſtood before Solon, each only worth 75 drachmæ.

The Syrian *Talent* contained 15 Attic minæ; that of Alexandria 96 Attic minæ, or 91 lib. Troy. The Babylonic, Perſian, and Antiochic *Talents*, were the ſame with the Ægyptian.

Among the Romans there were two kinds of *Talents*, the *little*, and the *great Talent*: the little was the common *Talent*; and whenever they ſay, ſimply, *Talentum*, they are to be underſtood of this: the little *Talent* was 60 minæ, or Roman pounds; the mina, or pound, eſtimated at 100 drachmæ, or denarii: it was alſo eſtimated at 24 great ſeſterces, which amounted to 60 pounds.

The great *Talent* exceeded the leſs by one third part. Budæus computes, that the little *Talent* of ſilver was worth 75 pounds ſterling; and the greater, 99 *l.* 6 *s.* 8 *d.* ſterling.—The greater *Talent* of ſilver he makes worth 99 *l.* ſterling.—The greater of gold worth 1125 *l.* ſterling.

TALENT, *as a ſpecies, or money*, among the Hebrews, was ſometimes uſed for a gold coin, the ſame with the ſhekel of gold, called alſo *Stater*, and weighing only 4 drachms. See SHEKEL.

The Hebrews reckoned by theſe *Talents* as we do by pounds, *&c.* Thus a million of gold, or million of *Talents* of gold, among them, was a million of ſhekels, or nummi; the nummus of gold being the ſame weight with the ſhekel, *viz.* 4 drachms.

Yet the Hebrew *Talent* weight of ſilver, which they called *Cicar*, was equivalent to that of 3000 ſhekels, or 113 pounds Engliſh Troy weight, according to Arbuthnot's computation.

TALES, in law, a ſupply or addition of men impannelled on a jury of inqueſt, and not appearing, or at their appearance challenged by either party as not indifferent. See JURY.

In ſuch caſe, the judge, upon motion, grants a ſupply to be made by the ſheriff, of one or more *Tales*, ſuch as are preſent in court, equal in reputation to thoſe impannelled.—This act of ſupplying is called a *Tales de circumſtantibus*: and the perſons thus ſupplied, *Taleſmen*.

He that has had one ſuch *Tales*, either upon default, or challenge, may not have another containing ſo many as the former: for the firſt *Tales* muſt be leſs than the principal pannel, except in a cauſe of appeal; and ſo every *Tales* leſs than another, till the number be made up of ſuch as are unexceptionable.

TALIO, *Lex* TALIONIS, or *Pœna* TALIONIS, a retribution, or puniſhment, whereby an evil is returned perfectly like that committed againſt us by another—which is what we uſually expreſs by the words *eye for eye, tooth for tooth*.

The *Pœna Talionis* was enjoined by the law of Moſes, juſt as it is in the goſpel: it was eſteemed a natural piece of juſtice, and yet the Romans ſet it aſide, inaſmuch as ſuch a parity or equality of puniſhment could not always be obſerved. For this reaſon, the prætor allowed ſuch as had ſuffered any injury to make an eſtimate thereof in money, that juſtice might be done him that way; only reſerving to himſelf the power of moderating the ſame. And this was what was conſtantly practiſed, and thus the *Pœna Talionis* became quite diſuſed—except in the caſe of falſe witneſſes and accuſers.

TALISMANS, * magical figures engraven, or cut under certain ſuperſtitious obſervances of the characteriſms and configurations of the heavens; to which ſome aſtrologers, hermetical philoſophers, and other adepts, attribute marvellous virtues, particularly that of calling down cœleſtial influences. See THERAPHIM.

* The word is pure Arabic; though Menage, after Salmaſius, thinks it may come from the Greek τελεσμα, *operation*, or *conſecration*. Borel ſays, it is Perſian, and ſignifies literally an *engraven conſtellation*. Others derive it a *Talamaſcis literis*, which are myſterious characters, or cyphers uſed by ſorcerers; thus called from *Talamaſca*, a *fantom*, or *illuſion*.

The author of a book entitled *Taliſmans Juſtifiez*, ſays, a *Taliſman* is the ſeal, figure, character, or image of a heavenly ſign, conſtellation or planet, engraven on a ſympathetic ſtone, or on a metal correſponding to the ſtar, *&c.* in order to receive its influences.

The *Taliſmans* of the Samothracians, ſo famous of old, were pieces of iron, formed into certain images, and ſet in rings, *&c.*

They were held preſervatives againſt all kinds of evils.—There were other *Taliſmans* taken from vegetables, and others from minerals.

In the general, we uſe to diſtinguiſh three kinds of *Taliſmans*: *Aſtronomical*, which are known by the ſigns, or conſtellations of the heavens engraven thereon, with other figures, and ſome unintelligible characters.—*Magical*, which bear very extraordinary figures, with ſuperſtitious words and names of angels unheard-of.—And *Mixt*, which conſiſt of ſigns and barbarous words, but have no ſuperſtitious ones, or names of angels.

Some rabbins maintain, that the brazen ſerpent, raiſed by Moſes in the wilderneſs, for the deſtruction of the ſerpents that annoyed the Iſraelites, was a *Taliſman*.

All the miraculous things wrought by Apollonius Tyanæus are attributed to the virtue and influence of *Taliſmans*: that wizard is even ſaid to have been the inventor of *Taliſmans*.

Some authors take ſeveral Runic medals, at leaſt medals whoſe inſcriptions are in Runic characters, for *Taliſmans*; it being notorious, that the northern nations, in their heathen ſtate, were much devoted thereto. M. Keder, however, has ſhewn, that the medals here ſpoke of are quite otherguiſe things than *Taliſmans*. See Runic.

TALK. See the article Talc.

TALKING. See Speaking, Speech, and Voice.

TALLAGE, Tallagium, a certain rate, according to which barons and knights were anciently taxed by the king towards the expences of the ſtate, and inferior tenants by their lords, on certain occaſions. See Tax.

This latter *Tallage* of the cuſtomary tenants was ſometimes fixed and certain, and ſometimes at the pleaſure of the lord; and was alſo ſometimes compounded for. See Subsidy.

Tallages were anciently called *Cuttings*; which name is ſtill retained in *Ireland*, though in a different ſignification.

Tallage, ſays Sir Ed. Coke, is a general name including all taxes. See Tax.

TALLOW, a ſort of animal fat, melted down, and clarified. See Fat, and Suet.

There are ſcarce any animals but a ſort of *Tallow* may be prepared from; but thoſe which yield the moſt, and whereof the moſt uſe is made, are the horſe, bullock, ſheep, hog, goat, deer, bear, and viper.—Some of which *Tallows*, or fats, are uſed in medicine. See Axungia.

Moſt of the reſt are uſed in the making of ſoap, the dreſſing of leather; but chiefly in the making of candles. See Soap, Currying, &c.

For candles, the beſt compoſition is half ſheeps *Tallow*, and half cows or bullocks *Tallow*, without any mixture of other kinds of fat, which only ſerve to turn the candles yellow, make them run, and ſpoil the clearneſs of their light. See Candle.

Tallow-Tree, in China, is a tree growing in great plenty in that country, which produces a ſubſtance like our *Tallow*, and ſerving for the ſame purpoſe.

It is about the height of a cherry-tree; its leaves in form of a heart, of a deep, ſhining, red colour, and its bark very ſmooth. Its fruit is incloſed in a kind of pod, or cover, like a cheſnut, and conſiſts of three round white grains, of the ſize and form of a ſmall nut, each having its peculiar capſula, and within a little ſtone.

This ſtone is encompaſſed with a white pulp, which has all the properties of true *Tallow*, both as to conſiſtence, colour, and even ſmell: and accordingly the Chineſe make their candles of it; which would, doubtleſs, be as good as thoſe in Europe, if they knew how to purify their vegetable *Tallow*, as well as we do our animal *Tallow*.

All the preparation they give it, is to melt it down and mix a little oil with it, to make it ſofter, and more pliant.—It is true, their candles made of it yield a thicker ſmoak, and a dimmer light, than ours; but thoſe defects are owing, in a great meaſure, to the wicks, which are not of cotton, but only a little rod, or ſwitch of dry light wood, covered with the pith of a ruſh, wound round it; which being very porous, ſerves to filtrate the minute parts of the *Tallow*, attracted by the burning ſtick, which by this means is kept alive.

TALLY, or Talie, Taille, a piece of wood, whereon retail traders uſe to ſcore or mark, by notches or inciſions, the ſeveral quantities of goods they deliver out on credit, to ſave the trouble of writing down ſo many little articles in books. See Tail.

Each ſcore conſiſts of two pieces of wood, or rather of a ſingle piece cleft length-wiſe, the parts whereof falling in with one another, the things delivered are ſcored on both at the ſame time; the ſeller keeping one and the buyer the other.

Tallies are taken as evidences in courts of juſtice, as much as books. The ancient way of keeping all accounts was by *Tallies*; the debtor ſtill keeping one part, and the creditor the other. See Account, and Book-Keeping.

There are three kinds of *Tallies* mentioned in our ſtatutes, and long uſed in the Exchequer—*viz.*

Tallies *of Loans*, one part whereof is kept in the Exchequer, and the other part given to particular perſons, in lieu of an obligation for the monies they have lent to the government on acts of parliament.—This laſt part is called the *Stock*, and the former the *Counter-ſtock*, or counter-tail. See Teller.

The *Tallies* are numbered, bear the perſon's name, and the ſum lent: thus we ſay, the *Tallies*, No. have been paid, diſcharged: *Tallies* are riſen, fallen 4, 5, &c.

Tallies, or Tailes *of Debt*, which are a kind of acquittances for debts paid the king.

E. gr. the univerſity of Cambridge pays yearly 10 *l.* for ſuch things as are by charter granted them in fee-farm. He that pays this, receives a *Taile* or *Tally* for his diſcharge, with which, or a note of it, he repairs to the clerk of the pipe, and there for the *Tally* receives a full diſcharge on parchment. See Pipe-*Office*.

Tallies *of Reward*, or allowance, made to ſheriffs, for ſuch matters as (to their charge) they have performed in their office, or ſuch money as is by courſe caſt on them in their accounts, but which they cannot levy.

Counter-Tally,	See the articles	Counter.
Cutter of the Tallies,		Cutter.
Petty Tally,		Petty.
Writer of Tallies,		Writer.

TALMUD, or Thalmud, a Jewiſh book, wherein is collected all that relates to the explication of their law. See Judaism.

The *Talmud* is the body of the Hebrew law; a compilation of expoſitions of the duties impoſed on that people, either in ſcripture, or by tradition, or by authority of their doctors, or by cuſtom, or even by ſuperſtition: to ſpeak more plainly ſtill, it is the courſe of caſes of conſcience, or of moral theology, wherein the duties are explained, and the doubts cleared, not by reaſoning, but generally by authority, by the cuſtom of the nation, and by the deciſions of the moſt approved of the ancient doctors.

The *Talmud* conſiſts of two general parts: the one called the *Miſchna*, the other the *Gemara*; which ſecond part is alſo frequently called abſolutely *the Talmud*, the general name of the whole work. See Mischna, and Gemara.

The Jews divide their law into *written*, which is that contained in the books of Moſes; and *unwritten*, which is that conveyed by tradition.—This latter is, in effect, no other than a gloſs or interpretation of the former, given by the ancient Rabbins. See Tradition, and Rabbin.

The *Talmud* then contains the traditions of the Jews, their polity, doctrine and ceremonies, which they obſerve as religiouſly as the law of God itſelf: they would never put it in writing till they were compelled to it by the deſtruction of Jeruſalem, and till they ſaw themſelves diſperſed throughout the world.

They had two famous ſchools; the one at Babylon, and the other at Jeruſalem: in theſe they made two ſeveral collections of thoſe traditions; the firſt at Jeruſalem, the other at Babylon; but both called *Talmud*, and both exceedingly reverenced, eſpecially the Babylonian, though full of extravagancies. It was compiled by the Jews of Meſopotamia, about 500 years after Chriſt.

The *Talmud* of Jeruſalem is the leaſt eſteemed.—It was compiled by the Jews of that City 300 years after Chriſt.

The Babylonian *Talmud* conſiſts of two parts; the one the text, the other the gloſs or comment; the comment, called the *Gemara*, contains the deciſions of the Jewiſh doctors, and their expoſitions of the text.——This we find ſtuffed with dreams and chimæra's; a deal of ignorance, and a world of impertinent queſtions and diſputations: the ſtyle very coarſe.—On the contrary: the text, called the *Miſchna*, is wrote in a pretty pure ſtyle, and the reaſonings generally much more ſolid.

The Jews pretend it was compoſed by Rabbi Juda, ſurnamed the *Saint*; and that God revealed to him the doctrine and the chief myſteries thereof.—But this is only to be underſtood of the *Miſchna*, not of the *Gemara*, the compilation whereof was not begun till the VIth Century after the deſtruction of the ſecond temple.

Rabbi Juda is ſaid to have compoſed the *Miſchna* under the empire of Antoninus, in the IId century; but they do not all agree about this antiquity, ſome carrying it back much further.

It is the *Talmud* of Babylon that is uſually read, and moſt frequently conſulted among the Jews; ſo that when they ſay ſimply the *Talmud*, they always mean this: never quoting the other without the addition of Jeruſalem.

Rabbi Moſes, Son of Maiemon, has made an abridgment of the *Talmud*, which *Scaliger* prefers to the *Talmud* itſelf; as being purged of many of the fables wherewith the other is full. It is a ſyſtem of the laws and cuſtoms of the Jews, both their civil and their canon law, and the beſt of their traditions.

About the year 1236, a Jew of Rochel, well verſed in the Hebrew, becoming Chriſtian, made a journey to pope Gregory IX. and diſcovered to him a number of errors in the *Talmud*: theſe the pope ſends, in 39 articles, to the archbiſhops of France, with a letter, appointing them to ſeize the books of the Jews, and to burn all ſuch as ſhould contain thoſe errors; in conſequence of which order, about 20 cart-loads of

Hebrew books were burnt. He wrote to the ſame effect to the kings of England, France, Arragon, Caſtile, &c. His ſucceſſor, Innocent IV. giving commiſſion to his legate Eudes de Chateauroux to examine the *Talmud*, and other Jewiſh books more carefully, and to tolerate ſuch errors as were not contrary to the Chriſtian religion; the legate wrote to the pope, that to tolerate them was to approve them; and the 15th of May, 1248, he condemned them juridically to the flames.

TALON *, in architecture, a kind of moulding, conſiſting of a cymatium, crowned with a ſquare fillet; frequently found to terminate ornaments of joyners-work, as thoſe of doors, &c. See CYMATIUM.

* The word is French, and literally ſignifies *heel*.

The *Talon*, more properly ſo called, is a moulding concave at the bottom, and convex a-top; having an effect juſt oppoſite to the doucine.—See *Tab. Archit. fig.* 26. *lit. p. fig.* 28. *lit. c. g. n. fig.* 32. *lit. l. n. fig.* 40. *lit. d.* See alſo DOUCINE.

When the concave part is a-top, it is called an *Inverted Talon*. See *Tab. Archit. fig.* 7.

The *Talon* is uſually called by our Engliſh workmen *Ogee*, or *O. G.* and by others an *upright* or *inverted Cymatium*. See OGEE.

TALPA, in medicine and chirurgery, a tumour of the œdematous kind, called alſo *Teſtudo*. See TESTUDO.

The *Talpa*, and *Nata*, chiefly ariſe about the head, as the conſequence of ſome venereal diſorder. See NATTA.

The *Talpæ* elevate the ſkin from the pericranium, and generally denote a foulneſs in the ſubjacent bone of the ſkull.

TALUS, in anatomy, a bone of the foot, called alſo *Aſtragalus*. See ASTRAGALUS, and FOOT.

The *Talus*, in its upper part, has a convex head, which is articulated with the two fociles of the leg by ginglymus, it being divided by a little ſinus, which receives the ſmall protuberance in the middle of the ſinus of the tibia.—Without this articulation, we muſt always, in going, have trode on the heel with our fore-foot, and our toes with the hind-foot. See TIBIA.

The fore-part of the *Talus*, which is alſo convex, is received into the ſinus of the os naviculare. See NAVICULARE.

Below, towards the hind-part of its under-ſide, it has a pretty large ſinus, which receives the upper and hind-part of the os calcis: and towards the fore-part of the ſame ſide it has a protuberance, which is received into the upper and fore-part of the ſame bone.—Betwixt this ſinus, and this protuberance, there is a cavity, which anſwers to another in the os calcis; in which is contained an oily and mucous ſort of ſubſtance, for moiſtening the ligaments, and facilitating the obſcure motion of theſe bones when we go.

TALUS, or **TALUT**, in architecture, the inclination or ſlope of a work; as of the outſide of a wall, when its thickneſs is diminiſhed by degrees, as it riſes in height, to make it the firmer. See TALL.

TALUS, in fortification.—*Talus of a Baſtion*, or *Rampart*, is the ſlope or diminution allowed to ſuch a work; whether it be of earth, or ſtone; the better to ſupport its weight. See RAMPART.

The *exterior Talus* of a work, is its ſlope on the ſide towards the country; which is always made as little as poſſible, to prevent the enemies ſcalado; unleſs the earth be bad, and then it is abſolutely neceſſary to allow a conſiderable *Talus* for its parapet. The *interior Talus* of a work, is its ſlope on the inſide, towards the place.

TAMARINDS, TAMARINDI, a kind of medicinal fruit, of a tart agreeable taſte, brought from the Eaſt as well as Weſt-Indies, and called by ſome *Indian Dates*, and by others the *Indian Acacia*.

The tree which yields it, called by the Indians *Tamarinds*, and the Portugueſe *Tamarindos*, is not unlike our aſh, or wallnut-tree; its leaves reſemble thoſe of female fern: its flowers are joined eight or ten together, like thoſe of the orange-tree. Its fruit is in a pod the length of a finger, and the thickneſs of the thumb, covered at firſt with a green rind, which afterwards becomes brown, and contains a blackiſh acid pulp, among which are found ſeeds reſembling lupines.—It is this pulp alone that is brought to us, and uſed in medicine.

Tamarinds muſt be choſen big, of a jet colour, a briſk taſte, not too dry, and ſuch as have not been laid in the cellar, nor falſified with molaſſes of ſugar and vinegar.

They are found laxative, cooling, and good to quench thirſt. In burning fevers they are preſcribed to moiſten, and cool the mouth.

TAMBAC, or TAMBAQUA, a mixture of gold and copper, which the people of Siam hold more beautiful, and ſet a greater value on, than gold itſelf.

Some travellers ſpeak of it as a metal found in its peculiar mines; but upon what authority we do not know. The abbé de Choiſy, in his *Journal of Siam*, doubts whether it may not be the *electrum*, amber, of Solomon.

The embaſſadors of Siam brought ſeveral works in *Tambac* to Paris, in the reign of Louis XIV. which were not found ſo beautiful as was expected.

TAMBOUR, in architecture, a term applied to the Corinthian and compoſite capitals, as bearing ſome reſemblance to a drum, which the French call *Tambour*.—See *Tab. Archit. fig.* 22. *lit. a.* See alſo CAPITAL, and COLUMN.

Some chuſe to call it the *Vaſe*, and others *Campana*, or the bell. See VASE, &c.

TAMBOUR is alſo uſed for a little box of timber-work, covered with a cieling, within-ſide the porch of certain churches; both to prevent the view of perſons paſſing by, and to keep off the wind, &c. by means of folding-doors, &c.

TAMBOUR alſo denotes a round courſe of ſtone, ſeveral whereof form the ſhaft of a column, not ſo high as a diameter.

TAMPION, TOMPION, TAMKIN, or TOMKIN *, a kind of plug or ſtopple, ſerving to cloſe a veſſel; particularly to keep down the powder in a fire-arm, &c. See WADDING.

* The word is formed from the French, *tampon*, a *bung*, *ſtopple*, &c. Some derive it from the Engliſh, *tap*.

In charging a mortar, or the like, over the powder is uſually put a thin round piece of wood to keep the ſhot, ball, ſhell, or the like, from the gun-powder. This piece is called a *Tampion*, and by means hereof the ſhot is exploded with the greater vehemence. See CHARGE, &c.

TAN, the bark of the oak, chopped, and ground, by a tanning-mill, into a coarſe powder; to be uſed in the *tanning* or dreſſing of ſkins. See BARK, and TANNING.

New Tan is the moſt eſteemed; when old and ſtale, it loſes a deal of its effect, which conſiſts in condenſing or cloſing the pores of the ſkins; ſo that the longer the ſkins are kept in *Tan*, the greater ſtrength and firmneſs they acquire.

In effect, not only the bark, but every part of the oak-tree, of what age or growth ſoever, all oaken coppice, &c. cut in barking-time, makes good *Tan*; as good, at leaſt, as the beſt bark.

This, when got, is to be well dried in the ſun, houſed dry, and kept ſo. To uſe it, the greater wood may be ſhaved ſmall, or cleft, fit to be cut ſmall by a *tanning* engine for the purpoſe; which done, it is well dried again on a kiln, and then ground by the mill. See MILL.—Where oak is ſcarce, thorns may ſupply the defect.

TANGENT, in geometry, a right line, which touches a circle, that is, meets it in ſuch manner, as that though infinitely produced, it would never cut the ſame; that is, never come within the circumference. See CIRCLE, and TOUCHING.

Thus the line A D (*Tab. Geom. fig.* 50.) is a *Tangent* to the circle, in D.

It is demonſtrated in geometry; 1. That if a *Tangent* A D, and a ſecant A B, be both drawn from the ſame point A; the ſquare of the *Tangent* will be equal to the rectangle, under the whole ſecant A B, and that portion thereof A C, which falls without the circle. See SECANT.

2. That if two *Tangents* A D, A E, be drawn to the ſame circle from the ſame point A, they will be equal to each other.

TANGENT, in trigonometry.—*A* TANGENT *of an arch*, is a right line, raiſed perpendicularly on the extreme of the diameter, and continued to a point, where it is cut by a ſecant, that is by a line, drawn from the centre through the extremity of the arch whereof it is a *Tangent*. See ARCH.

A Tangent of an Arch E A (*Tab. Trigonom. fig.* 1.) is a part of a *Tangent* of a circle (that is, of a right line which touches a circle without cutting it) intercepted between two right lines, drawn from the centre C, through the extremes of the arch E and A.

Hence, the *Tangent* F E is perpendicular to the radius E C.

And hence the *Tangent* F E is the *Tangent of the angle* A C E, as alſo of that A C I; ſo that two adjacent angles have only the ſame common *Tangent*.

Co-TANGENT, or TANGENT *of the Complement*, is the *Tangent* of an arch which is the complement of another arch to a quadrant. See COMPLEMENT.

Thus, a *Tangent* of the arch A H, is the *Co-tangent* of the arch A E, or the *Tangent* of the complement of the arch A E.

To find the length of the TANGENT *of any arch*; the ſine of the arch being given: ſuppoſe the arch, A E; the given ſine, A D; and the *Tangent* required, E F. Since both the ſine and *Tangent* are perpendicular to the radius E C, they are parallel to each other. Wherefore, as the coſine D C is to the ſine A D, ſo is the whole ſine to the *Tangent* E F. See SINE.

Hence, a canon of ſines being had, a *Canon of Tangents* is eaſily conſtructed therefrom. See CANON.

Artificial TANGENTS, are the logarithms of the *Tangents* of arches. See LOGARITHM.

Line of TANGENTS, is a line uſually placed on the ſector and Gunter's ſcale; the deſcription and uſes whereof, ſee under the articles SECTOR and GUNTER's *Scale*.

TANGENT *of a Conic Section*, as of a parabola, is a right line, which only touches or meets the curve in one point, and does not cut or enter within the curve. See CONIC *Section*, CURVE, &c.

Method of TANGENTS, a method of determining the quantity of the *Tangent* of any algebraic curve; the equation defining that curve being given.

This method is one of the great reſults of the *Calculus Differentialis.* See DIFFERENTIAL.

Its uſe is very great in geometry; becauſe in determining the *Tangents* of curves, we determine at the ſame time the quadratures of the curvilinear ſpaces: on which account it well deſerves to be here particularly inſiſted on. See QUADRATURE, and SUB-TANGENT.

To find the SUB-TANGENT *in any Algebraic Curve.*—Let the ſemiordinate pm be infinitely near another PM (*Tab. Anal. fig.* 13.) then will P p be the differential of the abſciſs; and letting fall the perpendicular M R=P p; R m will be the differential of the ſemiordinate. Draw, therefore, the *Tangent* TM: the infinitely little arch M m, will not differ from a right line; and therefore M m R will be a right-lined, right-angled triangle, uſually called the *Characteriſtic Triangle of the Curve*, in regard curve lines are diſtinguiſhed from each other hereby. See CHARACTERISTIC.

Now, by reaſon of the parallelism of the right lines PM and pm; the angle M m R=T M P. Wherefore the triangle M m R is ſimilar to the triangle T M P. Let therefore A P=x, P M=y, then will P p= M R=dx, and R m=dy. Conſequently,

$$Rm : MR :: PM : PT$$

$$dy : dx :: y : \frac{ydx}{dy}$$

If, then, from the given equation of any curve, you ſubſtitute the value of dx to $ydx : dy$, in the general expreſſion of the *Sub-tangent*, P T; the differential quantities will vaniſh, and the value of the *Sub-tangent* come out in common quantities; whence the *Tangent* itſelf is eaſily determined.—This we ſhall illuſtrate in a few examples:

1° The equation defining the common parabola, is,

$$ax = y^2$$

Hence, $$adx = 2ydy$$

$$dx = 2ydy : a$$

$PT = ydx : dy = 2y^2dy : ady = 2y^2 : a = 2ax : a = 2x.$ That is, the *Sub-tangent* is double the abſciſs.

2° The equation defining a circle is,

$$ax - xx = yy$$

$$adx - 2xdx = 2ydy$$

$$dx = 2ydy : (a - 2x)$$

$PT = dx : ydy = 2y^2dy : (a - 2x)\,dy = 2y^2 : (a - 2x) = (2ax - 2xx) : (a - 2x) = (ax - xx) : (\frac{1}{2}a - x)$ that is, P C : P B : : A P : P T.

Therefore $AT = (ax - xx) : (\frac{1}{2}a - x) - x = (ax - xx - \frac{1}{2}ax + xx) : (\frac{1}{2}d - x) = \frac{1}{2}ax : (\frac{1}{2}a - x)$ that is, P C : P A : : C A : A T.

3° The equation defining an ellipſis, is;

$$ay^2 = abx - bx^2$$

Hence, $$2aydy = abdx - 2bxdx$$

$$2aydy : (ab - 2bx) = dx$$

$PT = ydx : dy = 2ay^2 : (ab - 2bx) = (2abx - 2bx^2) : ab - 2bx) = (2ax - 2ax^2) : (a - 2x)$ that is, as the diſtance of the ſemiordinate from the centre, is to the half axis, ſo is the abſciſs, to the portion of the *Sub-tangent* intercepted between the vertex of the ellipſis and the *Tangent*.

Laſtly, for all algebraic curves, the equation being,

$$aym + bx^n + cy^r x^ſ + d = 0$$

$$may^m - 1dy + nbx^n - 1dx + ſcy^r x^ſ - 1dx + rcy^r - 1x^ſ dy = 0$$

$$nbx^n - 1dx + ſcy^r x^ſ - 1dx = -may^m - 1dy - rcy - 1x^ſ dy$$

$$dx = \frac{-may^m - 1dy - rcy^r - 1x^ſ dy}{nbx^n - 1 + ſcy^r x^ſ - 1}$$

$$PT = \frac{ydx}{dy} = \frac{-may^m - rcy^r x^ſ}{nbx^n - 1 + ſcy^r x^ſ - 1}$$

Suppoſe, *e. gr.* $y^2 - ax = 0$; then by comparing with the general formula,

$$ay^m = y^2 \qquad bx^n = -ax$$

$$a = 1 . m = 2 \qquad b = -a . n = 1$$

$$cy^r x^ſ = 0 \qquad f = 0$$

$$c = 0,\ r = 0,\ ſ = 0$$

Theſe values being ſubſtituted in the moſt general formula of the *Sub-tangent*, we have the *Sub-tangent* of the parabola of the firſt kind, $(-2 . 1y^2 - 0 . 0y^0 x^0) : (1 - ax1 - 1 + 0 . 0y^0 x^0) = -2y^2 : a = 2y^2 : a.$

Suppoſe $y^3 - x^3\,axy = 0$, then will

$$ay^m = y^3 \quad bx^n = -x^3$$

$$a = 1 \quad m = 3 \quad b = 1 \quad n = 3$$

$$cyrx^ſ = -axy \quad f = 0$$

$$c = -a \quad r = 1 \quad ſ = 1$$

Theſe values being ſubſtituted in the general formula of the *Sub-tangent*, we have the *Sub-tangent* of the curve, whoſe equation is given, $PT = (-3 . 1y^3 - 1 . -ayx) : (3 . -1x^3 - 1 + 1 . -ayx^1 - 1) = (-3y^3 + ayx) : (-$

1

$3x^2 - ay) = (3y^3 - axy) : (3x + ay.)$ Conſequently, $AT = (3y^3 - axy) : (3x^2 + ay) - x = (3y^3 - axy - 3x^3 - axy) : (3x^2 + ay) = (3axy - 2axy) : 3x^2 + ay.$ The value of $y^3 - x^3$, that is, $axy : (3x^2 + ay)$ being ſubſtituted from the equation to the curve.

In the *Philoſophical Tranſactions*, we have the following method of drawing *Tangents* to all geometrical curves, without any labour, or calculation, by M. Sluſius.

Suppoſe a curve, as D Q (*fig.* 14.) whoſe points are all referable to any right line given, as E A B, whether that right line be the diameter or not; or whether there be more given right lines than one, provided their powers do but come into the equation. In all his equations he puts v for the line D A, y for B A; and for E B, and the other given lines, he puts b d, *&c.* that is, always conſonants.

Then, ſuppoſing D C to be drawn touching the curve in D, and meeting with E B produced in C; he calls the ſought line C A, by the name of a.

To find which, he gives this general method: 1. Reject out of the equation all members, which have not either v or y in them; then put all thoſe that have y, on one ſide; and all thoſe which have v, on the other; with their ſigns + or −; and the latter, for diſtinction and eaſe ſake, he calls the right, the former, the left ſide. 2. On the right ſide, let there be prefixed to each member, the exponent of the power, which v hath there; or, which is all one, let that exponent be multiplied into all the members. 3. Let the ſame be done alſo on the left ſide, multiplying each member there by the power of the exponent of y. Adding this moreover, that one y muſt, in each part, be changed into a. This done, the equation thus reformed, will ſhew the method of drawing the required *Tangent* to the point D; for, that being given; as alſo y, v, and the other quantities expreſſed by conſonants, a cannot be unknown, Suppoſe an equation $by - yy = vv$, in which E B is called b; B A=y, D A=v, and let a, or A C be required ſo as to find the point C, from whence C D being drawn, ſhall be a true *Tangent* to that curve Q D in D. In this example, nothing is to be rejected out of the equation, becauſe y or v are in each member: it is alſo diſpoſed, as required by the rule 1; to each part therefore, there muſt be prefixed the exponent of the powers of y or v, as in rule 2; and on the left ſide, let one y be changed into a, and then the equation will be in this form, $ba - 2ya = 2vv$, which equation reduced, gives eaſily the value of $a = \frac{2vv}{b - 2y} = AC.$

And ſo the point C is found, from whence the *Tangent* D C may be drawn.

To determine which way the *Tangent* is to be drawn, whether towards B or E, he directs to conſider the numerator and denominator of the fraction. For, 1. If in both parts of the fraction, all the ſigns are affirmative; or if the affirmative ones are more in number; then the *Tangent* is to run towards B. 2. If the affirmative quantities are greater than the negative in the numerator, but equel to them in the denominator, the right line drawn through D, and touching the curve in that point, will be parallel to A B: for in this caſe, a is of an infinite length. 3. If in both parts of the fraction, the affirmative quantities are leſs than the negative, changing all the ſigns, the *Tangent* muſt be drawn now alſo towards B: for this caſe, after the change, comes to be the ſame as the firſt. 4. If the affirmative quantities are greater than the negative in the denominator, but in the numerator are leſs, or *vice verſa*, then changing the ſigns in that part of the fraction where they are leſs, the *Tangent* muſt be drawn a contrary way; that is, A C muſt be taken towards E. 5. But whenever the affirmative and negative quantities are equal in the numerator, let them be how they will in the denominator, a will vaniſh into nothing: and, conſequently, the *Tangent* is either A D itſelf, or E A, or parallel thereto; as will eaſily be found by the data. This he gives plain examples of, in reference to the circle; thus: let there be a ſemicircle, whoſe diameter is E B; in which there is given any point; as D, (*fig.* 15.) from which the perpendicular D A is let fall to the diameter. Let D A = v, B A = y, B E = b: then the equation will be $by - yy = vv$, and drawing the *Tangent* D C, we have A C, or $a = \frac{2vv}{b - 2y}$. Now, if b be greater than $2y$, the *Tangent* muſt be drawn towards B; if leſs, towards E; if it be equal to it, it will be parallel to E B, as was ſaid in the firſt, ſecond, and fourth rules.

Let there be another ſemicircle inverted; as N D D, (*fig.* 16.) the points of whoſe periphery are referred to the right line B E, parallel and = to the diameter. Let N B be called d; and all things elſe as before; then the equation will be $by - yy = dd + vv - 2dv$; which being managed according to his rules, you have $a = \frac{2vv - 2dv}{b - 2y}$. Now, ſince v here is ſuppoſed to be always leſs than d; if b be greater than $2y$, then the *Tangent* muſt be drawn towards E; if equal, it will be parallel to B E; if leſs, changing all the ſigns, the *Tangent* muſt be drawn towards B, as by rules fourth, fifth, and third. But there could be no *Tangent* drawn, or at leaſt E B would be it, if N B had been taken equal to the diameter. Let there be another ſemicircle, whoſe diameter N B (*fig.* 17.) is perpendicular to E B, and to which its points are ſuppoſed to be refer'd. Let N B be called *b*, and all things elſe as above; the equation will be $y\,y = b\,v - v\,v$, and $a = \dfrac{b\,v - 2\,v\,v}{2\,y}$. If, now, *b* be greater than 2 *v*, the *Tangent* muſt be drawn towards B, if leſſer, towards E, if equal, D A will be the *Tangent*, as by rules 1, 4, and 5, appears.

Inverſe Method of TANGENTS, is a method of finding the equation, or the conſtruction, of any curve; from the *Tangent* or any other line whoſe determination depends on the *Tangent*, given.

This method is one of the great reſults of the new *Calculus Integralis.* See CALCULUS.

Its application we ſhall give in what follows.—The differential expreſſions of the *Tangent*, *Sub-tangent*, &c. being delivered under the laſt article: if you make the given value equal to the differential expreſſion, and either ſum up the differential equation, or, if that cannot be, conſtruct it, the curve required, is had.—For example:

1° *To find the curve line, whoſe* Sub-tangent $= 2\,y\,y : d$

Since the *Sub-tangent* of an algebraic line is $= y\,d\,x : d\,y$ we have

$$\begin{array}{c} y\,d\,x : d\,y = 2\,y\,y : a \\ \hline a\,y\,d\,x = 2\,y^2\,d\,y \\ \hline a\,d\,x = 2\,y\,d\,y \\ \hline a\,x = y^2 \end{array}$$

The curve ſought, therefore, is a parabola; whoſe conſtruction is ſhewn under the article PARABOLA.

2° *To find the curve, whoſe* Sub-tangent *is a third proportional io* $r - x$ *and* y.

Since
$$r - x : y = y : \frac{y\,d\,x}{d\,y}$$

We have
$$\begin{array}{c} r - x : y = d\,y : d\,x \\ \hline r\,d\,x - x\,d\,x = y\,d\,y \\ \hline r\,x - \tfrac{1}{2}\,x^2 = \tfrac{1}{2}\,y^2 \\ \hline 2\,r\,x - x\,x = y^2 \end{array}$$

The curve ſought therefore, is a circle.

3° *To find a line wherein the* Sub-tangent *is equal to the ſemi-ordinate.*

Since
$$\begin{array}{c} y\,d\,x : d\,y = y \\ \hline y\,d\,x = y\,d\,y \\ \hline d\,x = d\,y \\ \hline x = y \end{array}$$

Hence it appears, that the line ſought, is a right line, which reſpects the cathetus of an equicrural triangle, as an axis or the hypotheneuſe of an equicrural, rectangled triangle. If *x* had been taken for the arch of a circle, the ſought line had been a cycloid. See CYCLOID.

TANGERE—*Noli me* TANGERE. See NOLI.

TANGIBLE. See the article TACTILE.

TANISTRY, TANISTRIA, an ancient municipal law, or tenure, which allotted the inheritance of lands, caſtles, &c. held by this tenure, to the oldeſt and moſt worthy and capable perſon of the deceaſed's name and blood; without any regard to proximity *.—This, in reality, was giving it to the ſtrongeſt; which naturally occaſioned bloody wars in families: for which reaſon it was aboliſhed under K. James I.

* Sir John Davis deſcribes it thus; *Quant aſcun perſon moruſt ſeiſie des aſcuns caſtles, manors, terresou tenements del* nature & tenure de taniſtry; *que donques meſmes les caſtles,* &c. *doent deſcender, & de temps dont memory ne court ont uſe de deſcender,* Seniori & digniſſimo viro ſanguinis & cognominis *de tiel perſon*, &c.

TANNED *Hide.* See the article HIDE.

TANNING, the preparing of ſkins or hides in a pit, with *Tan* and water, after having firſt taken off the hair, by ſteeping them in lime-water. See TAN, SKIN, HIDE, &c.

Method of TANNING cows, calves, and horſe-hides—The ſkin being flead off the carcaſs, if it is intended to be kept, it is ſalted with ſea ſalt and allum, or with a kind of ſaltpetre, called *natron*; if it is not for keeping, the ſalting is ſaved, as being of no uſe, but to prevent the hide from corrupting before it can be conveniently carried to the *Tan-houſe*.

Whether the hide have been ſalted or not, the *Tanner* begins with taking off the horns, the ears, and the tail; after which it is thrown into a running water for about 30 hours, to waſh off the blood, and other impurities adhering to the inſide.

This done, it is laid over-night in a lime-pit, already uſed; whence it is taken, and left to drain three or four days on the edge of the pit.

This firſt and ſlighteſt preparation over, it is returned into a ſtrong lime-pit for two days, then taken out for four more; and thus for 6 weeks alternately, taken out and put in, twice a week.

At the ſix weeks end, it is put into a freſh pit, where it continues eight days, and is taken out for ſo many; and this alternately for a year or eighteen months, according to the ſtrength of the leather, or the weather: for in great heats, they put in freſh lime twice a week; and in froſt they ſometimes do not touch them for three months. Every freſh lime-pit they throw them into, is ſtronger and ſtronger.

At four, five, or ſix weeks ends the *Tanner* ſcrapes off the hair on a wooden leg, or horſe, with a kind of knife for that purpoſe. And after a year or eighteen months, when the hair is perfectly gone, he carries it to a river to waſh, pares off the fleſh on the leg with a kind of cutting-knife, and rubs it briſkly with a kind of whet-ſtone, to take off any remains of fleſh or filth on the ſide of the hair.

The ſkin is now put into *Tan*; that is, covered over with *Tan*, as it is ſtretched in the pit, and water let in upon it: if the ſkin be ſtrong, five coverings of *Tan* will be required; for weaker, three or four may ſuffice. When the ſkin has not been kept long enough in lime, or the *Tan-pit*, upon cleaving it in the middle, is ſeen a whitiſh ſtreak, called the *horn*, or crudity of the ſkin; and it is this is the reaſon why the ſoals of ſhoes, boots, &c. ſtretch ſo eaſily, and take water.

When the hides are ſufficiently *tanned*, they are taken out of the pit, to be dried, by hanging in the air: then the *tan* is cleaned off them, and they are put in a place neither too dry, nor too moiſt; they are well ſtretched over one another, with weights a-top, to keep them tight and ſtraight; and in this condition are ſold, under the denomination of *bend leather*.

This is the method of *tanning* bullocks or oxes hides.

Cows, calves, and horſes ſkins are *tanned* much after the ſame manner as thoſe of oxen, except that the former are only kept four months in the lime-pit; and that before they be put in the *tan*, there is a preparation required, thus: cold water is poured into a wooden fat or tub, wherein the ſkins are put, which are kept ſtirring while ſome other water is warming in a kettle; and as ſoon as that water is a little more than lukewarm, it is poured gently into the fat, and upon this is caſt a baſket of *tan*; during which time, the ſkins are ſtill kept turning, that the water and *tan* may not ſcorch them.

After an hour, they are taken out, and caſt for a day in cold water, then returned into the former fat, and the ſame water they had been in before; and here they are left eight days; which expired, they are put in the *tan-pit*, and three coverings of *tan* given them, the firſt of which laſts five weeks, the ſecond ſix, and the third two months.

The reſt of the proceſs is in all reſpects the ſame as that above delivered. In ſome countries, as in Champagne, &c. the *Tanners* give the firſt preparation with barley inſtead of lime.

TANTAMOUNT, ſomething that amounts to, or is equivalent to ſome other. See EQUIVALENT.

TANTUM *decies.* See the article DECIES.

TAP, among hunters:—a hare is ſaid to *tap*, or beat, when ſhe makes a particular noiſe at rutting-time. See RUT.

TAPASSANT, among hunters, denotes *lurking* or *ſquatting*. Hence alſo, to *tappy*, is to lie hid, as a deer may do.

TAPER, TAPERING, is underſtood of a piece of timber, or the like, when broad at one end, and gradually diminiſhing to the other;—as is the caſe in pyramids, cones, &c. See PYRAMID.

To meaſure *taper* Timber, &c. See the articles TIMBER, SLIDING-*Rule*, &c.

TAPER-BORED, is applied to a piece of ordnance, when it is wider at the mouth than towards the breech. See ORDNANCE.

TAPER, alſo denotes a kind of tall wax candle, placed in a candleſtick, and burnt at funeral proceſſions, and in other church-ſolemnities. See CANDLE.

Tapers are made of different ſizes: in ſome places, as Italy, &c. they are cylindrical; but in moſt other countries, as England, France, &c. they are conical, or *taper*, whence, poſſibly, the name: unleſs we rather chuſe to derive *taper* in the adjective ſenſe from the ſubſtantive *Taper*, in the Saxon, Tapeꞃ, or Tapoꞃ, *cereus*, a wax candle.

Both kinds are pierced at bottom, for a pin in the candleſtick to enter. See CANDLE.

The uſe of lights in religious ceremonies, is of a long ſtanding: the ancients, we know, uſed flambeaux in their ſacrifices, and particularly in the myſteries of Ceres; and they had *Tapers* placed before the ſtatues of their Gods.

Some ſuppoſe, that it was in imitation of this heathen ceremony, that lights were firſt introduced into the Chriſtian church; others take it, that the Chriſtians borrowed the practice from the *Jews*: but recourſe need not be had to the one or the other.

Doubtleſs, as in the firſt days of Chriſtianity they had their meetings in obſcure ſubterraneous vaults, there was a neceſſity for *Tapers*, &c. and there was even occaſion for them after they had the liberty of building churches; thoſe being contrived in ſuch manner, as only to receive very little light, that they might inſpire the greater awe and reſpect by the obſcurity.

This original of *Tapers* in churches is the moſt natural; but it is now a long time ſince the uſe of *Tapers*, which neceſſity at firſt introduced, is become a mere ceremony. St. Paulinus, who lived at the beginning of the fifth century, obſerves that the Chriſtians of his days were ſo fond of *Tapers*, that they even painted them in their churches.

There are two ways of making TAPERS: the firſt with the *ladle*, the ſecond by *hand*.

In the firſt, after the wicks (which are uſually half cotton, half flax) have been well twiſted, and cut of the due length; a dozen of them are hung, at equal diſtances, around an iron hoop, directly over a large copper baſon full of melted wax.

Then taking an iron ladle-full of the wax, they pour it gently over the wicks, a little below the tops thereof, one after another; ſo that the wax running down them, they become quite covered therewith, and the ſurplus returns into the baſon, under which is a pan of coals to keep it in fuſion.

Thus they continue to caſt on more and more wax for ten or twelve times, till the *Tapers* be brought to the required dimenſions. The firſt caſt only ſoaks the wick, the ſecond begins to cover it, and the reſt give it the form and thickneſs; in order to which, they take care that every caſt, after the fourth, be made lower and lower below the wicks, to make them *taper*.

The *Tapers* thus formed, are laid, while yet hot, one againſt another, in a feather-bed folded double to preſerve them ſoft; and taken out thence, one after another, to be rolled on a long ſmooth table, with an oblong inſtrument of box, poliſhed at bottom, and furniſhed with a handle above.

The *Taper* thus rolled and poliſhed, a piece of its big end is cut off, and a conical hole bored therein, with a boxen inſtrument, into which the pin, or point of the candleſtick is to be received.

While the broach is yet in the hole, they uſe to ſtamp the maker's name, and the weight of the *Taper*, with a boxen ruler, whereon proper characters are cut. The *Taper* is then hung up to dry, and harden; after which it is fit for uſe.

Making of TAPERS *by hand*. The wicks being diſpoſed, as in the former manner, they begin to ſoften the wax by working it in hot water, in a narrow, deep copper veſſel. They then take a quantity of this wax out with the hand, and apply it gradually on the wick, which is faſtened to a hook in the wall by the end oppoſite to the wick: ſo that they begin to form the *Taper* by the big end; and proceed, ſtill leſſening the thickneſs, to the neck or collet.

The reſt is performed after the ſame manner as in *Tapers* made with the ladle, except that they do not lay them in the feather-bed, but roll them on the table as faſt as formed.

Two things there are to be obſerved in the two kinds of *Tapers*: the firſt, that in the whole proceſs of *Tapers* with the ladle, they uſe water to moiſten the table, and other inſtruments uſed therein, that the wax may not ſtick; and that in the other, they uſe oil of olives or lard for the ſame end.

Paſchal TAPER, among the Romaniſts, is a large *Taper*, whereon the deacon applies five bits of frankincenſe, in holes made for the purpoſe, in form of a croſs; and which he lights with new fire in the ceremony of Eaſter Saturday.

The Pontifical makes pope Zoſimus the author of this uſage; but Baronius will have it more ancient, and quotes a hymn of Prudentius to prove it. That pope he ſuppoſes to have only eſtabliſhed the uſe thereof in pariſh churches; which, till then, had been reſtrained to the greater churches.

F. Papebroch explains the origin of the paſchal *Taper* more diſtinctly in his *Conatus Chronico-Hiſtoricus*, &c. It ſeems, though the council of Nice regulated the day whereon Eaſter was to be celebrated, it laid it on the patriarch of Alexandria to make a yearly canon thereof, and to ſend it to the pope. As all the other moveable feaſts were to be regulated by that of Eaſter, a catalogue of them was made every year, and wrote on a *Taper*, *Cereus*, which was bleſſed in the church with much ſolemnity.

This *Taper*, according to the abbot Chaſtelain, was not a wax candle, made to be burnt: it had no wick: nor was it any thing more than a kind of column of wax, made on purpoſe to write the liſt of moveable feaſts on, and which would ſuffice to hold it for the ſpace of a year.

For among the ancients, when any thing was to be wrote to laſt for ever, they engraved it on marble or ſteel; when it was to laſt a long while, they wrote it on Egyptian paper; and when it was only to laſt a ſhort time, they contented themſelves to write it on wax. In proceſs of time, they came to write the liſt of moveable feaſts on paper, but they ſtill faſtened it to the paſchal *Taper*; which practice is obſerved to this day at Notre-Dame in Rouen, and throughout the order of Cluny. —Such is the original of the benediction of the paſchal *Taper*.

TAPESTRY, or TAPISTRY, a curious kind of manufacture, ſerving to adorn a chamber, or other apartment, by hanging, or lining the walls thereof.

Some uſe *Tapeſtry* as a general name for all kinds of hangings, whether woven, or wrought with the needle; and whether ſilken, woollen, linnen, leathern or of paper; (in which they are countenanced by the etymology of the word, formed from the French *tapiſſer*, to line, of the Latin *tapes*, a cover of a bed, &c.) But in the common uſe of our language, the term is now appropriated to a kind of woven hangings, of wooll and ſilk, frequently raiſed and enriched with gold and ſilver, repreſenting figures of men, animals, landſkips, &c.

The invention of *Tapeſtry* ſeems to have come from the Levant; and what makes this the more probable is, that formerly the workmen concerned herein, were called, at leaſt in France, *Sarazins*, or *Sarazinois*.

It is ſuppoſed that the Engliſh and Flemiſh, who were the firſt that excelled therein, might bring the art with them from ſome of the croiſades, or expeditions againſt the Sarazens. See CROISADE.

Be this as it will, it is certain thoſe two nations, particularly the Engliſh, were the firſt who ſet on foot this noble and rich manufacture in Europe; now one of the fineſt ornaments of palaces, baſilicæ, churches, &c.

Hence, if they be not allowed the inventors, they have, at leaſt, the glory of being the reſtorers of ſo curious and admirable an art, as gives a kind of life to woolls and ſilks, in no reſpect inferior to the paintings of the beſt maſters.

It was late before the French applied themſelves to *Tapeſtry*: the firſt eſtabliſhment of that kind, was under Henry IV. in the year 1607, in the Fauxbourg, S. Michael. But this fell with the death of that prince. Under Lewis XIV. the manufacture was retrieved by the care and addreſs of the great M. Colbert, to whom the eſtabliſhment of the Gobelins is owing, a royal *Tapeſtry* manufacture, which has produced works in this kind ſcarce inferior to the fineſt Engliſh or Flemiſh *Tapeſtry*, either with regard to the deſign, the colours, or the ſtrength. See GOBELINS.

The *Tapeſtry-men* diſtinguiſh two kinds of work, *viz. Tapeſtry* of the *high*, and the *low warp*; though the difference is rather in the manner of working, than in the work itſelf, which is, in effect, the ſame in both; only the looms, and conſequently the warps, are differently ſituate: thoſe of the *low warp* being placed flat, and parallel to the horizon; and thoſe, on the contrary, of the *high warp*, erected perpendicularly.

The Engliſh anciently excelled all the world in their *Tapeſtry* of the *high warp*; and they ſtill retain their former reputation, though with ſome little change: their *low warps* are ſtill admired; but as for the *high ones*, they are quite laid aſide in our nation. See COMMERCE, WOOLLEN *Manufacture*, &c.

The French have three conſiderable *Tapeſtry* manufactures beſides that of the Gobelins; the firſt at Aubuſſon in Auvergne, the ſecond at Felletin in the Upper Marche, and the third at Beauvois: they were all equally eſtabliſhed for the *high* and the *low warp*, but have all laid aſide the former, excepting the Gobelins.

There are admirable *low warps* in Flanders, generally exceeding thoſe of France; the chief, and almoſt only Flemiſh manufactories, are at Bruſſels, Antwerp, Oudenard, Liſle, Tournay, Bruges, and Valenciennes.

At Bruſſels and Antwerp they ſucceed both in human figures, in animals, and landſkips; and that both with reſpect of the deſigning, and the workmanſhip. At Oudenard their landſkips and animals are good, but their human figures naught. Liſle, and the other cities named, come behind Oudenard. The French manufacture of Felletin does tolerably well in landſkips, Aubuſſon in figures, and Beauvois in both.

The uſual widths of *Tapeſtries*, are from two ells to three ells and half, Paris meaſure.

The manufacture of *Tapeſtry* of each kind, is too curious to be here paſſed over, without a ſhort deſcription.—We ſhall give each under its ſeparate article.

Manufacture of TAPESTRY *of the high Warp.*——The loom whereon it is wrought, is placed perpendicularly: it conſiſts of four principal pieces; two long planks or cheeks of wood, and two thick rollers or beams. The planks are ſet upright, and the beams acroſs them, one a-top, and the other at bottom, a foot diſtance from the ground. They have each their trunnions, by which they are ſuſpended on the planks, and are turned with bars. In each roller is a groove, from one end to the other, capable of containing a long round piece of wood, faſtened therein with hooks. Its uſe is to tie the ends of the warp to. The warp, which is a kind of worſted, or twiſted woollen thread, is wound on the upper roller; and the work, as faſt as wove, is wound on the lower.

Within-ſide the planks, which are ſeven or eight foot high, fourteen or fifteen inches broad, and three or four thick, are holes pierced from top to bottom, in which are put thick pieces of iron, with hooks at one end, ſerving to ſuſtain the coat-ſtave: theſe pieces of iron have alſo holes pierced; by putting a pin in which, the ſtave is drawn nearer, or ſet farther off; and thus the coats, or threads, are ſtretched or looſened at pleaſure. The coat-ſtave is about three inches diameter, and runs all the length of the loom: on this are fixed the coats, or threads, which makes the threads of the warp croſs each other. It has much the ſame effect here, as the ſpring-ſtave and treddles have in the common looms. The coats are little threads faſtened to each thread of the warp, with a kind of ſliding-knot, which forms a ſort of marſh, or ring. They ſerve to keep the warp open, for the paſſage of broaches wound with ſilks, woollens, or other matters uſed in the piece of *Tapeſtry*.

Laſtly, there are a number of little ſticks, of different lengths, but all about an inch diameter, which the workman keeps by him in baſkets, to ſerve to make the threads of the warp croſs each other, by paſſing them a-croſs: and that the threads thus croſſed may retain their proper ſituation, a packthread is run among the threads, above the ſtick.

The loom thus formed, and mounted with its warp, the firſt thing the workman does, is to draw, on the threads of this warp, the principal lines and ſtrokes of the deſign to be repreſented on the piece of *Tapeſtry*; which is done by applying cartoons made from the painting he intends to copy, to the ſide that is to be the wrong ſide of the piece; and then with a black-lead pencil following and tracing out the contours thereof on the thread of the right ſide; ſo that the ſtrokes appear equally both before and behind. As to the original deſign the work is to be finiſhed by, it is hung, up behind the workman, and wound on a long ſtaff; from which a piece is unrolled from time to time, as the work proceeds.

Beſides the loom, &c. here deſcribed, there are three other principal inſtruments required for working the ſilk, or wooll of the woof within the threads of the warp. Theſe are a broach, a reed, and an iron needle.

The broach is of hard wood, 7 or 8 inches long, and two-thirds of an inch thick, ending in a point, with a little handle. It ſerves as a ſhuttle, the ſilks, woollens, gold or ſilver, to be uſed in the work, being wound on it. The reed or comb is alſo of wood, eight or nine inches long, and an inch thick at the back; whence it uſually grows leſs and leſs, to the extremity of the teeth, which are more or leſs a-part, according to the greater or leſs degree of fineneſs of the intended work.

Laſtly, the needle is in form of a common needle, only bigger and longer. Its uſe is to preſs cloſe the wooll and ſilks, when there is any line or colour that does not fit well.

All things being prepared for the work, and the workman ready to begin, he places himſelf on the wrong ſide the piece, with his back towards the deſign; ſo that he works, as it were, blindfold, ſeeing nothing of what he does, and being obliged to quit his poſt, and go to the other ſide the loom, whenever he would view and examine the piece, to correct it with his preſſing-needle.

To put any ſilk, &c. in the warp, he firſt turns, and looks at his deſign: then taking a broach full of the proper colour, he places it among the threads of the warp, which he brings acroſs each other with his fingers, by means of the coats or threads faſtened to the ſtaff: this he repeats every time he is to change his colour.

The ſilk or wooll being placed, he beats it with his reed or comb; and when he has thus wrought in ſeveral rows over each other, he goes to ſee the effect they have; in order to reform the contours with his needle, if there be occaſion.

As the work advances they roll it up on the lower beam, and unroll as much warp from the upper beam, as ſuffices them to continue the piece: the like they do of the deſign behind them. When the pieces are wide, ſeveral workmen may be employed at once.

We have but two things to add: the firſt, that this *high warp Tapeſtry* goes on much more ſlowly than the *low warp*, and takes almoſt double the time and trouble. The ſecond, that all the difference the eye can obſerve between the two kinds conſiſts in this, that in the *low warp* there is a red fillet, about one twelfth of an inch broad, running on each ſide, from top to bottom; which is wanting in the *high warp*.

Manufacture of Tapestry *of the low warp*.—The loom or frame whereon the low warp is wrought, is much like that of the weavers: the principal parts thereof are two ſtrong pieces of wood forming the ſides of the loom, and bearing a beam or roller at each end: they are ſuſtained at bottom with other ſtrong pieces of wood, in manner of treſtles; and, to keep them the firmer, are likewiſe faſtened to the floor with a kind of buttreſſes, which prevent any ſhaking, though there are ſometimes four or five workmen leaning on the fore-beam at once.

The rollers have each their trunnions, by which they are ſuſtained: they are turned by large iron pins, three foot long. Along each beam runs a groove, wherein is placed the wich, a piece of wood of above two inches diameter, and almoſt the length of the roller: this piece fills the groove entirely, and is faſtened therein, from ſpace to ſpace, by wooden pins. To the two wiches are faſtened the two extremities of the warp, which is wound on the further roller; and the work, as it advances, on the nearer.

A-croſs the two ſides, almoſt in the middle of the loom, paſſes a wooden bar, which ſuſtains little pieces of wood, not unlike the beam of a ballance: to theſe pieces are faſtened ſtrings, which bear certain ſpring-ſtaves, wherewith the workman, by means of two treddles under the loom whereon he ſets his feet, gives a motion to the coats, and makes the threads of the warp riſe and fall alternately. Each loom has more or fewer of theſe ſpring-ſtaves, and each ſtaff more or fewer coats, as the *Tapeſtry* conſiſts of more or fewer threads. See Loom.

The deſign, or painting the *Tapeſtry-man* is to follow, is placed underneath the warp; where it is ſuſtained from ſpace to ſpace with ſtrings, by which the deſign is brought nearer the warp. See Design.

The loom being mounted, there are two inſtruments uſed in working of it, *viz.* the reed, and the flute. The flute does the office of the weavers ſhuttle: it is made of a hard, poliſhed wood, three or four lines thick at the ends, and ſomewhat more in the middle, and three or four inches long. On it are wound the ſilks, or other matters to be uſed as the woof of the *Tapeſtry*. The comb or reed is of wood, or ivory; it has uſually teeth on both ſides; it is about an inch thick in the middle, but diminiſhes each way to the extremity of the teeth: it ſerves to beat the threads of the woof cloſe to each other, as faſt as the workman has paſſed and placed them with his flute among the threads of the warp.

The workman is ſeated on a bench before the loom, with his breaſt againſt the beam, only a cuſhion or pillow between them; and in this poſture, ſeparating, with his fingers, the threads of the warp, that he may ſee the deſign underneath, and taking a flute, mounted with the proper colour, he paſſes it among the threads, after having raiſed or lowered them, by means of the treddles moving the ſpring-ſtaves and coats.

Laſtly, to preſs and cloſe the threads of the ſilk or yarn, &c. thus placed, he ſtrikes each courſe (*i. e.* what the flute leaves in its paſſing and coming back again) with the reed.

What is very remarkable in the manufacture of the *low warp* and which is common to it with the *high*, is, that it is all wrought on the wrong ſide; ſo that the workman cannot ſee the right ſide of his *Tapeſtry*, till the piece be finiſhed and taken off the loom.

TAPIS. See Tunica.

TAPPING, the act of piercing a hole in a veſſel, and applying a tube, or cannula in the aperture, for the commodious drawing off the liquors contained therein.

Tapping, in agriculture, is the making an inciſion in the bark of a tree, and letting out the juice. See Bark.

To *tap* a tree at the root, is to open it round about the root. See Tree, Root, &c.

Ratray, the learned Scot, affirms that he has found by experiment, that the liquor which may be drawn from the birch in the ſpring-time, is equal to the whole weight of the tree, branches, roots and all together.

In the *tapping* of trees, the juice certainly aſcends from the root, and after it is concocted and aſſimilated in the branches, &c. deſcends like a liquor in an alembic, to the orifice or inciſion where it iſſues out.

One of the moſt effectual ways of *tapping*, ſo as to obtain the greateſt ſtore of ſap in the ſhorteſt time, is, not only to pierce the bark, nor yet to cut the body of the tree almoſt to the pith, with a chiſſel (as ſome have directed) but quite through all the circles, and the inner rind itſelf, on both ſides the pith; leaving only the outermoſt circle, and the bark on the north-eaſt ſide unpierced.

But this hole is to be bored ſloping upwards, as large as the largeſt augre you can get will make; and that alſo through and under a large arm, near the ground. So will it not need any ſtone to keep open the orifice, nor *tap* to direct the ſap into the receiver.

This way, the tree will, in ſhort time, afford liquor enough to brew withal; and with ſome of this ſweet ſap, one buſhel of malt will make as good ale as four buſhel of malt with ordinary water. Sycamore is ſaid to yield the beſt brewing ſap, being very ſweet and wholeſome.

To preſerve the Sap for brewing.—Inſolate it by a conſtant expoſure to the ſun in glaſſes or other veſſels, till the reſt be gathered and ready; otherwiſe it will contract an acidity: when you have enough, put into it as much very thin cut, and hard toaſted rye-bread, as will ſerve to ferment it; and when it works, take out the bread, and bottle up the liquor. A few cloves in each veſſel that receives the ſap, as it oozes from the tree, will certainly preſerve it a twelve-month. Dr. Tonge in the *Philoſophical Tranſactions*.

Tapping, in chirurgery. See the articles Paracentesis, Dropsy, &c.

Tap-too. See the article Tat-too.

TAR, or **Tarr**, a groſs, pitchy liquor, iſſuing from the trunks of old pines, or firrs. See Pitch.

When theſe trees are on the turn, and only fit for burning, they cut off the bark all around towards the root, and through theſe inciſions, there continues flowing, for a conſiderable time, a blackiſh liquor, which is the *Tar*.—When this ceaſes, it is a ſure indication the pine is quite dead, and only fit for the fire.

The chief uſe of *Tar*, is for the coating and caulking of ſhips. See Caulking, &c.—Of *Tar* is alſo made roſin. See Rosin.

TARANTISMUS, in medicine, the diſeaſe or affection of thoſe bit by the *Tarantula*. See Tarantula.

The patients under this malady are denominated *Tarantati*.

Dr. Cornelio, in the *Philoſophical Tranſactions*, repreſents this as an imaginary diſeaſe; and tells us, that the *Tarantati*, or thoſe who think themſelves ſeized with it (excepting ſuch as for particular ends feign themſelves ſo) are moſt of them young wanton girls, whom the Italian writers call *Donne di ſale*, who falling, from ſome particular indiſpoſition, into melancholy madneſs, perſuade themſelves, according to the vulgar prejudice, that they have been ſtung by a tarantula.

But the evidence on the other ſide the queſtion, is too ſtrong to be thus overturned, as will appear from the following article.

TARANTULA, or TARENTULA, in natural hiſtory, a venomous inſect, whoſe bite gives name to a new diſeaſe. See TARANTISMUS.

The *Tarantula* is a kind of ſpider, denominated from the city of Tarentum, in Apulia, where it is chiefly found: it is about the ſize of an acorn; and is furniſhed with eight feet, and as many eyes; its colour various; but it is ſtill hairy: from its mouth ariſes two horns, or trunks, made a little crooked, with the tips exceedingly ſharp, through which it conveys its poiſon.

Theſe horns, M. Geoffroy obſerves, are in continual motion, eſpecially when the animal is ſeeking for food; whence he conjectures they may be a kind of moveable noſtrils.

The *Tarantula* is found in ſeveral other parts of Italy, and even in the iſle of Corſica; but thoſe of Apulia alone are dangerous: even theſe, when removed thence, are ſaid to become harmleſs: it is added, that even in Apulia, none but thoſe found on the plains are much to be feared; the air being hotter there, than on the mountains.

M. Geoffroy adds it as an opinion of ſome, that the *Tarantula* is never venomous but in the coupling ſeaſon; and Baglivi, that it is never ſo but in the heat of ſummer, particularly in the dog-days, when, becoming enraged, it flies on all that paſs by.

The bite occaſions a pain, which at firſt appears much like that felt on the ſtinging of a bee, or an ant: in a few hours, the patient feels a numbneſs, and the part affected becomes marked with a little livid circle, which ſoon after riſes into a very painful tumour: a little longer, and he falls into a profound ſadneſs, breaths with much difficulty, his pulſe grows feeble, his ſenſe fails; at length he loſes all ſenſe and motion, and dies, unleſs relieved. But theſe ſymptoms come ſomewhat differently, according to the nature of the *Tarantula*, and the diſpoſition of the patient. An averſion for black and blue; and, on the contrary, an affection for white, red, and green, are other unaccountable ſymptoms of this diſeaſe.

All the aſſiſtance medicine has been able to diſcover by reaſoning, conſiſts in ſome chirurgical applications on the wound, cordials, and ſudorificks; but theſe are of little efficacy: a thing that avails infinitely more, is, what reaſon could never have thought of, muſic. See MUSIC.

As ſoon as the patient has loſt his ſenſe and motion, a muſician tries ſeveral tunes on an inſtrument; and when he has hit on that, the tones and modulations whereof agree to the patient, he is immediately ſeen to make a faint motion: his fingers firſt begin to move in cadence, then his arms, then his legs, by degrees his whole body: at length he riſes on his feet, and begins to dance; his ſtrength and activity ſtill increaſing. Some will continue the dance for ſix hours without intermiſſion.

After this, he is put to bed; and when he is judged ſufficiently recruited of his firſt dance, he is called out of bed, by the ſame tune, for a ſecond.

This exerciſe is continued for ſeveral days, ſix or ſeven at moſt; in which time the patient finds himſelf exceedingly fatigued, and unable to dance any longer; which is the characteriſtic of his being cured: for as long as the poiſon acts on him, he would dance, if one pleaſed, without any diſcontinuation, till he died of the mere loſs of ſtrength.

The patient perceiving himſelf weary, begins to come to himſelf; and awakes, as out of a profound ſleep; without any remembrance of what had paſſed in his paroxyſm, not even of his dance.

Sometimes the patient, thus recovering from his firſt acceſs, is quite cured; if he be not, he finds a melancholy gloom hanging on him; he ſhuns the ſight of men, and ſeeks water; and if he be not carefully looked to, throws himſelf into ſome river. If he do not die, the fit returns at that time twelvemonth, and he is driven to dancing again. Some have had theſe returns regularly for 20 or 30 years.

Every *Tarantatus* has his particular and ſpecific tune; but, in the general, they are all very briſk, ſprightly tunes, that work cures. See TUNE.

This account was given into the royal academy of ſciences, by M. Geoffroy, at his return from Italy, in 1702; and confirmed by letters from F. Gouye. The like hiſtory is given us by Baglivi, in an expreſs diſſertation on the *Tarantula*, publiſhed in 1696.

To ſuch extraordinary facts, it is no wonder a few fables ſhould be added; as, for inſtance, that the patient is no longer affected than while the inſect lives; and that the *Tarantula* itſelf dances, all the while, the ſame air with the perſon bitten.

Theory of the effects of the Tarantula*'s bite, by* M. Geoffroy.—The poiſonous juice injected by the *Tarantula*, M. Geoffroy conceives, may give the nerves a degree of tenſion, greater than is natural to them, or than is proportionate to their functions: and hence ariſes a privation of knowledge and motion. But, at the ſame time, this tenſion, equal to that of ſome ſtrings of an inſtrument, puts the nerves in uniſon to certain tones, and obliges them to ſhake, after being agitated by the undulations, and vibrations of the air proper to thoſe tones. And hence this wonderful cure by muſic: the nerves thus reſtored to their motion, call back the ſpirits thither, which before had abandoned them. See UNISON and CONCORD.

It may be added, with ſome probability, and on the ſame principles, that the patient's averſion for ſome colours ariſes hence, that the tenſion of his nerves, even out of the paroxyſm, being ſtill different from what it is in the natural ſtate, the vibrations thoſe colours occaſion in the fibres of the brain, are contrary to their diſpoſition, and occaſion a kind of diſſonance, which is pain.

Theory of the effects of the Tarantula*'s bite, by* Dr. Mead.—The malignity of the poiſon of the *Tarantula* ſeems to conſiſt in its great force and energy, whereby it immediately raiſes an extraordinary fermentation in the whole arterial fluid; by which its texture and craſis is conſiderably altered: the conſequence of which alteration, when the ebullition is over, muſt neceſſarily be a change in the coheſion of its parts, by which the globules, which did before with equal force preſs each other, have now a very differing and irregular niſus, or action; ſo that ſome of them do ſo firmly cohere together, as to compoſe moleculæ, or ſmall cluſters: upon this account, as there is now a greater number of globules contained in the ſame ſpace, than before, and the impulſe of many of theſe, when united together, differing according to the conditions of their coheſion, as to magnitude, figure, &c. the impetus, with which this fluid is drove towards the parts, will not only be at ſome ſtrokes greater than ordinary, but the preſſure upon the blood-veſſels muſt be very unequal, and irregular; and this will be particularly felt in thoſe which are moſt eaſily diſtended, as thoſe of the brain, &c.

Upon this the nervous fluid muſt neceſſarily be put into various undulatory motions, ſome of which will be like thoſe, which different objects acting upon the organs or paſſions of the mind do naturally excite in it; whereupon ſuch actions muſt follow in the body, as are uſually the conſequences of the ſeveral ſpecies of ſadneſs, joy, deſpair, or the like determinations of thought. See PASSIONS.

This, in ſome degree, is a coagulation of the blood, which will the more certainly, when attended with uncommon heat, as is the caſe in thoſe countries where theſe creatures abound, produce ſuch like effects as theſe: becauſe the ſpirits ſeparated from the blood thus inflamed, and compounded of hard, fixed and dry particles, muſt unavoidably ſhare in this alteration; that is, whereas their fluid conſiſts of two parts, one more active and volatile, the other more viſcid and glutinous, which is a kind of vehicle to the former; their active part will bear too great a proportion to the viſcid; conſequently they muſt have more than ordinary volatility and force, and will therefore, upon the leaſt occaſion imaginable, be irregularly determined to every part.

Whereupon will follow, tumblings, anger, or fear, upon a light cauſe; extreme pleaſure at what is trivial, as particular colours, or the like: and on the other hand, ſadneſs at what is not agreeable to the ſight; nay, laughter, obſcene talk and actions, and ſuch like ſymptoms as attend perſons bit; becauſe in this conſtitution of the nervous fluid, the moſt ſlight occaſion will make as real a reflux and undulation of it to the brain, and preſent as lively ſpecies there, as the ſtrongeſt cauſe and impreſſion can produce in its natural ſtate and condition; nay, in ſuch a confuſion, the ſpirits cannot but ſometimes, without any manifeſt cauſe at all, be hurried towards thoſe organs, to which at other times they have been moſt frequently determined; and every one knows which theſe are in hot countries.

The effects of muſic on perſons touched with this poiſon, confirms the doctrine above delivered.—For muſcular motion, we know, is no other than a contraction of the fibres, from the arterial fluid's making an effervеſcence with the nervous juice, which, by the light vibration and tremor of the nerve, is derived into the muſcle. See MUSCULAR.

Thus there is a two-fold effect and operation of the muſic, that is, upon the body and the mind: a briſk harmony excites lively ſpecies of joy and gladneſs, which are always accompanied with a more frequent and ſtronger pulſe, or an increaſed influx of the liquor of the nerves into the muſcles; upon which ſuitable actions muſt immediately follow.

As for the body, ſince it was ſufficient to put the muſcles into action, to cauſe thoſe tremors of the nerves by which their fluid is alternately dropped into the moving fibres, it is all one whether it be done by the determination of the will, or the outward impreſſions of an elaſtic fluid.

Such is the air; and that ſounds are the vibrations of it, is beyond diſpute: theſe, therefore, rightly modelled, may ſhake the nerves as really, as the *imperium voluntatis* can do, and conſequently produce the like effects.

The benefit of muſic ariſes not only from their dancing to it, and ſo evacuating, by ſweat, a great part of the inflammatory fluid; but beſides this, the repeated percuſſions of the air hereby made, by immediate contact ſhaking the contractile fibres of the membranes of the body, eſpecially thoſe of the ear, which being contiguous to the brain, communicate their tremblings to its membranes and veſſels; by theſe continued ſucceſſions and vibrations, the coheſion of the parts of the blood is perfectly broken, and the coagulation prevented: ſo that the heat being removed by ſweating, and the coagulation by the contraction of the muſcular fibrillæ, the wounded perſon is reſtored to his former condition.

If any one doubts of this force in the air, he may conſider, that it is demonſtrated in mechanics, that the ſmalleſt percuſſion of the ſmalleſt body, may overcome the reſiſtance of any the greateſt weight, which is at reſt; and that the languid tremor of the air, which is made by the ſound of a drum, may ſhake the vaſteſt edifices.

But beſides this, we muſt allow a great deal to the determinate force, and particular modulation of the trembling percuſſions; for contractile bodies may be acted upon by one certain degree of motion in the ambient fluid, though a greater degree of it, differently qualified, may produce nothing at all of the like effect: this is not only apparent in two common-ſtringed muſical inſtruments, tuned both to the ſame height; but alſo in the trick which many have of finding the tone or note peculiarly belonging to any wine-glaſs, and by accommodating their voice exactly to that tone, and yet making it loud and laſting, make the veſſel, though not touched, firſt to tremble, and then to burſt; which it will not do, if the voice be either too low, or too high. See SOUND.

This makes it no difficult matter to conceive, why different perſons infected with this ſort of venom, do require a different ſort of muſic, in order to their cure; inaſmuch as the nerves and diſtractile membranes have different tenſions, and conſequently are not all alike to be acted upon by the ſame vibrations.

TARE and *Tret* in commerce, any defect, waſte or diminution in the weight, the quantity, or the quality of goods. See NEAT.

The ſeller is uſually to account to the buyer for the *Tare* and *Tret*. See TRET.

TARE is more particularly uſed for an abatement, or deduction in the price of a commodity, on account of the weight of cheſts, caſks, bags, frails, *&c.* See DISCOUNT.

The *Tare* is very different, in different merchandizes: in ſome there is none at all allowed.—It is a thing much more regarded in Holland than in England, or elſewhere: a modern author, M. Ricard, treating of the commerce of Amſterdam, obſerves, that the *Tares* are one of the moſt conſiderable articles a merchant is to be acquainted withal, if he would trade with ſecurity.

Sometimes, the *Tare* is, as it were, regulated by cuſtom; but generally, to avoid all diſpute, the buyer and ſeller make a particular agreement about it. We ſhall here add, from the fore-mentioned author, ſome inſtances of *Tares* allowed at Amſterdam, referring the reader for a more ample account to his *Negoce d'Amſterdam*, edit. 1722.

Spaniſh wools are ſubject to a kind of double *Tare*: for, firſt, they deduct the *Tare* marked on the bales; and after that, 24 pounds *Tare* for every 175 pound weight, beſides the rebate for prompt payment. Indeed, for the common wools, the ſeller will ſeldom allow above 14 *per cent.* for the whole *Tare*; for which reaſon, the bargain is to be agreed on before.

TARE of Roman alum is 4 *lib. per* ſack.
of Iriſh, *&c.* butter, 20 *per cent.*
of crude borax, 15 *lib. per cent.*
of cinnamon, 17 *lib.* the burthen.
of capers, 33 *per cent.*
of white pepper, 40 *lib. per* barrel.
of black pepper, 5 *lib.* *&c.*

TARENTULA. See the article TARANTULA.

TARGET, a *ſhield*; thus called from the Latin, *tergum*, back, becauſe originally made of leather, wrought out of the back of an ox's hide. See SHIELD, BUCKLER, and ESCUTCHEON.

TARGUM, in the ſacred literature, a name which the *Jews* give to their Chaldee gloſſes, and paraphraſes on the ſcripture. See PARAPHRASE.

As the Jews, during their long captivity in Babylon, had forgot their ancient language, the Hebrew; and now underſtood nothing but the language of their maſters, the Chaldeans: there was a neceſſity of explaining the prophets in that language; and to this neceſſity, is owing the firſt beginning of the Chaldee paraphraſe to make the ſenſe of the text underſtood. See HEBREW.

Each doctor made a paraphraſe of ſome part thereof in the vulgar tongue; and as theſe ſeveral interpretations, in time, became very voluminous, certain rabbins undertook to collect them together: and this collection they called the *Targum*.

The *Jewiſh* doctors do not agree about the antiquity of the *Targum*; for the more modern Jews having blended their own comments with thoſe of the ancients, no certain age or æra can be fixed for the whole work.

It is commonly believed, that R. Jonathan, who lived under the reign of Herod the Great, made the firſt Chaldee verſion of the prophets; and with this verſion mixed the interpretations borrowed from tradition.—Onkelos, it is certain, tranſlated the pentateuch almoſt word for word; and without any paraphraſe: and another verſion of the pentateuch is aſcribed to Jonathan, but without much certainty. See PENTATEUCH.

For the *Targum* or paraphraſe on the other books; we know little of the authors, no more than of thoſe of the *Targum* of Jeruſalem, which is another imperfect paraphraſe on the five books of Moſes: ſo that in ſtrictneſs, the *Targum* of Jonathan and Onkelos, is the only paraphraſe of any authority. See PARAPHRASE.

The account aſcribed to Scaliger, is this: the Hebrew was tranſlated under the reign of Tiberius into Chaldee, by Jonathan; the prophets by Onkelos; and the books of Moſes into good old Hieroſolymitan, which was then uſed at Jeruſalem, much as Latin is among us.

It is certain, there was a *Targum Hieroſolymitanum* ſtill extant: it was wrote in the vulgar tongue; but that being then greatly corrupted, we have now much ado to underſtand it.

Thoſe *Targumiſts* might have ſeen Jeſus Chriſt; it is certain they lived long before the taking of Jeruſalem. *Scaligerana.*

TARIF, or TARIFF, *book of rates*; a table, or catalogue, drawn, uſually, in alphabetical order, containing the names of ſeveral kinds of merchandize, with the duties or cuſtoms to be paid for the ſame, as ſettled by authority, and agreed on between the ſeveral princes and ſtates, that hold commerce together. See DUTIES, CUSTOMS, *&c.*

TARNISHING, a diminution of the natural luſtre of any thing, eſpecially a metal. See LUSTRE.

Gold and ſilver, when *tarniſhed*, reſume their brightneſs, by ſetting them over the fire with certain lies. Copper, pewter, *&c.* that are *tarniſhed*, recover their luſtre with tripoli and pot-aſhes.

The breath of women, under their monthly purgations, Ariſtotle aſſerts, *tarniſhes* all mirrors, *&c.* See MENSES.

TARPAULIN, or TARPAWLING, is a piece of canvaſs, well pitched and tarred over, to keep off the rain from any place.

The term is alſo uſed in deriſion for a perſon bred at ſea, and educated in the mariner's art.

TARPEIAN, TARPEIUS, in antiquity, an epithet given to a rock in ancient Rome, of conſiderable height; whence, by the law of the twelve tables, thoſe guilty of certain crimes were precipitated.*—It was on this rock the capitol was built. See CAPITOL.

It took its name from a veſtal, called *Tarpeia*, who betrayed the capitol, whereof her father was governor, to the Sabines; on condition they would give her all they bore on their left arms, meaning their bracelets.—But inſtead of bracelets, they threw their bucklers (which were likewiſe borne on their left arm) upon her head, and cruſhed her to death.

Others aſcribe the delivery of the capitol to her father, Spurius Tarpeius; and add, that he was precipitated down this rock by Romulus's order; and that this henceforward became the puniſhment of all criminals of the like kind.

TARPEIAN *Games*, *Ludi* TARPEII, were games inſtituted by Romulus, in honour of Jupiter Feretrius; and called alſo *Capitolini Ludi*. See CAPITOLINE.

TARRACE, TARRASE, or TERRACE, a coarſe ſort of plaiſter, or mortar, durable in the weather, chiefly uſed to line baſons, ciſterns, wells, and other reſervoirs of water. See MORTAR, CISTERN, *&c.* See alſo TERRACE.

TARSUS, ΤΑΡΣΟΣ, in anatomy, is what we vulgarly call the *inſtep*; being the beginning of the foot, or the ſpace between the ancle and the body of the foot, which is called *Metatarſus*. See FOOT, and METATARSUS.

The *Tarſus* anſwers to the wriſt of the hand.—It conſiſts of ſeven bones: the firſt whereof is called *aſtragalus*, and by the Latins *talus*, and *os baliſtæ*. See ASTRAGALUS, and TALUS. The ſecond called the *calx*, or *calcar pedis*, or *calcaneum*; the third *naviculare*, and by the Greeks *ſcaphoides*; the fourth, fifth and ſixth, are generally called *innominata*, but by Fallopius, from their figure, *cuneiformia*: laſtly, the ſeventh, the *cuboides*. See each deſcribed under its proper article, CALX, NAVICULARE, INNOMINATA, *&c.*

TARSUS is alſo a name given by ſome anatomiſts to the cartilages which terminate the palpebræ, or eye-lids; and from which the cilia, or hairs ariſe. See PALPEBRA.

They are exceedingly thin and fine, which makes them light and flexible.—Their form is ſemicircular: that of the upper eye-lid, is ſomewhat longer than that of the under: they ſerve alike to cloſe the eyes. See CILIA.

TARTANE, a kind of bark uſed for fiſhing and carriage; having neither a raiſed poop, nor prow; and alſo uſing oars.

---

* The *Tarpeian* Rock might formerly be ſteep enough on one ſide to break a man's neck; but it could never have been of that ſurprizing height mentioned by ſome writers, if any judgment can be formed from its appearance at preſent. See *Burnet*'s Letters, p. 238. and *Miſſon*'s N. Voyage, p. 103.

Tartanes are common in the Mediterranean; they have only a mainmaſt, and a mizzen: their ſails are triangular. When they put up a ſquare ſail, it is called *a ſail of fortune.*

TARTAR, TARTARUS, or TARTARUM, in chymiſtry, a kind of ſalt which riſes from wines, and ſticking to the top and ſides of the caſks, forms a cruſt, which hardens to the conſiſtence of a ſtone. See SALT, and CRYSTAL.

Tartar, ſays an ingenious author, has the juice of the grape for its father, fermentation for its mother, and the caſk for its matrix. See WINE, *&c.*

Its goodneſs rather depends on the number of repeated fermentations, which a ſucceſſion of new wines in the ſame caſk for ſeveral years makes, than on the ſoil or climate where the wine is produced.

Tartar is either *white*, or *red*, according to the colour of the wine it is raiſed from.—That brought from Germany is the beſt, as being taken out of thoſe monſtrous tuns, ſome whereof hold a thouſand pipes of wine; ſo that the ſalt has time to come to its conſiſtence, one of the chief qualities to be regarded in *Tartar*.—That of Montpelier is the next in order; then that of Lyons, Paris, *&c.*

White Tartar is preferred to red, and is really better; as containing leſs of the droſſy, or earthy part.—The marks of good *Tartar* of either kind are, its being thick, brittle, brilliant, little earthy.

Tartar is of conſiderable uſe among the dyers, as ſerving to diſpoſe the ſtuffs to take their colours the better. See COLOUR, and DYING.

The chymiſts make abundance of preparations from *Tartar*; as *Cream*, or *Cryſtal of Tartar*, which is nothing but *Tartar* powdered, and reduced by means of boiling water, a ſtraining bag, and a cellar, into little cryſtals. See CREAM *of Tartar*.

Salt of TARTAR is made of *Tartar* waſhed, ground, purified, and calcined, by a reverberatory fire; or it is made by pulverizing what remains in the retort after the diſtillation of *Tartar*, and calcining it as above by a reverberatory fire, to make it yield its ſalt when put into hot water, *&c.*—On the one or the other of theſe preparations, they pour a great quantity of hot water, to make a lye of it; this they filtrate, and evaporate the liquor by a ſand heat, till the fixed ſalt be found at the bottom of the veſſel.—This is the alkali, or fixed ſalt of *Tartar*. See SALT.

Oil of TARTAR, is the ſalt of *Tartar* expoſed to the air for ſome days, in an open veſſel, in a moiſt place, till it diſſolve into an oil; though it is improperly called an oil, being no more than a diſſolved ſalt. See DELIQUIUM.

Oil of *Tartar per deliquium*, is held the beſt counter-poiſon to corroſive ſublimate. See ANTIDOTE, *&c.*

TARTAR *Chalybeated*. See the article CRYSTAL.

TARTAR *Emetic*. See EMETIC, and CRYSTAL.

TARTAR *Foliated*, is a preparation of *Tartar* with diſtilled vinegar, which reduces it into white leaves.

TARTAR *Soluble*. See the article SOLUBLE.

TARTAR *Vitriolated*, which ſome call *Magiſtery of Tartar*, is oil of *Tartar* mixed with rectified ſpirit of vitriol: upon mixing the two, there ariſes a great evaporation, by means whereof, of liquids they become ſolids.

TARTARIZING, a term uſed by ſome writers, for the act of refining or purifying, by means of ſalt of *Tartar*. See TARTAR.

TASSEL, a ſort of pendant ornament, at the corners of a cuſhion, or the like thing.—Alſo a ſmall ribband or ſilk ſewed to a book, to be put between the leaves.

TASSELS, in a building, thoſe pieces of board that lie under the ends of the mantle-trees. See MANTLE.

TASSEL, or TIERCELET, is alſo uſed in falconry for a male hawk. See HAWK, and FALCON.

TASSELS are alſo a kind of hard burrs uſed by clothworkers in dreſſing cloth. See TEAZLE.

TASTE, *Savour*, a ſenſation, excited in the ſoul by means of the organ of *Taſte*; *viz.* the papillæ of the tongue, *&c.* See SENSATION, and TASTING.

Dr. Grew, in a lecture on the diverſity of *Taſtes*, before the Royal Society, diſtinguiſhes them into *Simple* and *Compound.*

By Simple TASTES, he underſtands ſuch as are ſimple modes of *Taſte*, although mingled with others in the ſame: thus the *Taſte* of a pippin is aci-dulcis; of rhubarb, amar-aſtringent, and therefore compounded, in both; but yet in the pippin the acid is one ſimple *Taſte*, and the ſweet another, as diſtinct as the bitter and aſtringent are in the rhubarb.

Two faults, he obſerves, have here been committed: the firſt, a defective enumerating of ſimple *Taſtes*; the ſecond, reckoning them indiſtinctly among ſuch as are compounded.

Simple Taſtes, of which we uſually only reckon ſix or ſeven ſorts, are at leaſt ſixteen: 1. *Bitter*, as in wormwood; whoſe contrary is, 2. *Sweet*, as in ſugar. 3. *Sour*, as in vinegar; whoſe contrary is, 4. *Salt.* 5. *Hot*, as in cloves; to which is oppoſite, 6. *Cold*, as in ſal prunella; for we may as properly ſay a cold *Taſte*, as an hot one, ſince there are ſome bodies which do manifeſtly impreſs the ſenſe of cold upon the tongue, though not to the touch. 7. *Aramotick*; to which is contrary, 8. *Nauſeous*, or malignant. 9. *Soft*, which are either vapid, as in water, ſtarch, whites of eggs, *&c.* or unctuous, as in oils, fat, *&c.* 10. *Hard*, of which he reckons four kinds; as, 11. *Penetrant*, which worketh itſelf into the tongue without any pungency; as is found in the root and leaves of wild cucumber. 12. *Stupefacient*, as in the root of black hellebore, which being chewed, and for ſome time retained upon the tongue, affects that organ with a numbneſs, or paralytic ſtupor. 13. *Aſtringent*, as in galls: and, 14. *Pungent*, as in ſpirit of ſal armoniac; which two laſt *Taſtes* he makes contrary to the unctuous, as penetrant and ſtupefacient are contrary to the vapid one.

The Compound TASTES are very numerous; but we have words to expreſs but ſix of them: 1. *Auſtere*, which is aſtringent and bitter, as in the green and ſoft ſtones of grapes. 2. *Acerb*, properly ſo called, which is aſtringent and acid, as in the juice of unripe grapes. 3. *Acrid*, which is pungent and hot. 4. *Muriatick*, which is ſalt and pungent, as in common ſalt. 5. *Lixivious*, which is ſaltneſs joined with ſome pungency and heat. 6. *Nitrous*, which is ſaltneſs joined with pungency and cold. See AUSTERE, ACERB, *&c.*

TASTE is alſo uſed, in a figurative ſenſe, for the judgment and diſcernment of the mind. See JUDGMENT, and DISCERNING.

We talk, and we hear talk, every day, of *Taſte*, of *good Taſte*, and of *bad Taſte*; and yet without well underſtanding what we mean by the word: in effect, a *good Taſte* ſeems at bottom to be little elſe but right reaſon, which we otherwiſe expreſs by the word *judgment*. See REASON.

To have a *Taſte*, is to give things their real value, to be touched with the good, to be ſhocked with the ill; not to be dazzled with falſe appearances; but, in ſpight of all colours, and of every thing that might deceive or amuſe, to judge ſoundly.

Taſte and judgment then ſhould be the ſame thing; and yet it is eaſy to diſcern a difference: the judgment forms its opinions from reflection; the reaſon, on this occaſion, fetches a kind of circuit to arrive at its end: it ſuppoſes principles, it draws conſequences, and it judges; but not without a thorough knowledge of the caſe: ſo that after it has pronounced, it is ready to render a reaſon of its decrees.—*Good Taſte* obſerves none of theſe formalities; before it has time to conſult, it has taken its reſolution: as ſoon as ever an object is preſented it, the impreſſion is made, the ſentiment formed; aſk no more of it. As the ear is wounded with a harſh ſound, as the ſmell is ſoothed with an agreeable odor, before ever the reaſon have meddled with thoſe objects, to judge of them; ſo the *Taſte* is ſtruck at once, and prevents all reflection.

Reflections may come afterwards to confirm it, and diſcover the ſecret reaſons of its conduct; but it was not in its power to wait for them. Frequently, it happens not to know them at all; and what pains ſoever it uſe, cannot diſcover what it was that determined it to think as it did.

This conduct is very different from that which the judgment obſerves in its deciſions; unleſs we chuſe to ſay that *good Taſte* is, as it were a firſt motion, or a kind of inſtinct of right reaſon, which hurries us on with rapidity, and conducts us more ſecurely than all the reaſonings we could uſe. It is a firſt glance of thought, which diſcovers to us the nature and relations of things as it were by intuition.

In effect, *Taſte* and judgment are one and the ſame thing, one and the ſame diſpoſition and habitude of the ſoul, which we call by different names, according to the different manners wherein it acts: when it acts by ſenſation, by the firſt impreſſion of objects, we call it *Taſte*; and when by reaſoning, after having examined the thing by all the rules of art, *&c.* we call it judgment: ſo that one may ſay, *Taſte* is the judgment of nature, and judgment the *Taſte* of reaſon. See JUDGMENT.

Good Taſte, as defined by Madem. Scudery and Madem. Dacier, in an expreſs treatiſe *of the corruption of Taſte*, is an harmony between the mind, and reaſon; and a perſon has more or leſs of this *Taſte*, as that harmony is more or leſs juſt.

One might perhaps improve on this hint, and ſay, that *good Taſte* is nothing elſe but a certain ratio or relation between the mind, and the objects preſented to it.

Right reaſon cannot but be moved and affected with things conformable thereto, and wounded by thoſe contrary: there is, then, a kind of ſympathy which unites them as ſoon as ever they meet; and their union, their good underſtanding, diſcover each other.—Make a fine diſcourſe; uſe only the richeſt and nobleſt expreſſions; if they contain an unhappy thought, or an incoherent reaſoning, that thought, this reaſoning, will immediately be felt by a perſon of *Taſte*: and the antipathy will ſhew itſelf by a movement of averſion, as ſudden, as lively, and as natural as that which nature inſpires us withal for toads or ſpiders. See BEAUTY, DEFORMITY, SENSE, *&c.*

TASTING, the ſenſe whereby we diſtinguiſh ſavours; or the perception which the ſoul has of external objects, by means of the organ of *Taſte*. See SENSE, and TASTE.

Authors differ much as to the *Organ of Taſting*: Bauhin, Bartholin, Veſlingius, *&c.* place it in the laxer fleſhy parts of the tongue; Dr. Wharton in the glands at the root of the tongue; Laurentius in the thin tunic covering of the tongue; others in the palate, *&c.* But the great Malpighi, and after him, all the lateſt writers, place it in the papillæ chiefly lying about the tip and ſides of the tongue. See TONGUE.

Theſe papillæ ariſe from the corpus nervoſum which covers the muſcular fleſh of the tongue; whence, paſſing through the corpus reticulare, they ſtand up under the external membrane of the tongue, erect, covered with vaginæ, or ſheaths of the ſaid membrane, to defend them from objects too violent. See PAPILLA.

Theſe vaginæ are porous, and ſtick out ſo far, that when the aliment is ſqueezed, they enter within the ſame, to receive the object, or the matter of *Taſte.*

Theſe papillæ, Boerhaave conjectures to ariſe from the ninth pair of nerves; and theſe, he aſſerts, are the only organ of *Taſte:* thoſe others, whether of the tongue, palate, or jaws, *&c.* he obſerves, contribute nothing thereto; though probably thoſe of the cheeks next the dentes molares may. See PALATE, *&c.*

The *object of Taſting*, is any thing, either in animals, vegebles, or minerals, from which ſalt or oil may be extracted. See SALT.

Taſting, then, is performed by the objects being attenuated, and mixed with ſaliva, warmed in the mouth, and applied to the tongue; where, inſinuating into the pores of the membranous vaginæ of the nervous papillæ, and penetrating to the ſurface of the papillæ themſelves, it affects and moves them; by which means a motion is communicated along the capillaments of the nerve to the common ſenſory, and an idea excited in the mind, of ſalt, acid, ſweet, bitter, hot, aromatic, auſtere, or the like; according to the figure of the particles that ſtrike the papillæ, or the diſpoſition of the papillæ to receive the impulſe. See SENSATION.

TATH, in old laws, a privilege which ſome lords of manors enjoyed, of having their tenants ſheep folded at night on their demeſne lands, for the improvement of the ground.

TATIANITES, TATIANITÆ, a ſect of ancient heretics; thus called from Tatian, a diſciple of Juſtin Martyr.

This Tatian, who has the character of one of the moſt learned men of all antiquity, was perfectly orthodox during the life of his maſter. He was, like him, a Samaritan, by nation, not by religion, as Epiphanius ſeems to inſinuate. They both belonged to thoſe Greek colonies ſpread throughout the country of the Samaritans.

Juſtin being dead, Tatian gave into the errors of the Valentinians; and formed a ſect called ſometimes *Tatianites*, and ſometimes *Encratitæ.* See ENCRATITÆ.

TAT-TOO, *q. d.* TAP-TO, a beat of a drum, at night, to advertiſe the ſoldiers to retreat, or repair to their quarters in a garriſon, or to their tents in a camp. See DRUM.

TAU *, in our ancient cuſtoms, ſignifies a croſs. See CROSS.

TAU, or TAW, in heraldry, an ordinary, in figure of a T, ſuppoſed to repreſent St. Andrew's croſs, or a croſs potence, the top part cut off. See CROSS.

It is thus called from the name of the Greek T, *tau.* See T.

TAUGHT, or TAU'T, *Tight*, in the ſea language, is the ſame as ſtiff, or faſt.—Thus they ſay, *ſet taught* the ſhrouds, the ſtays, or any other ropes, when they are too ſlack and looſe. See WIND-TAUGHT.

TAUNT, a ſea-term.—When the maſts of a ſhip are too tall for her, the ſailors ſay, ſhe is *taunt-maſted.*

TAURI *liberi libertas.*—In ſome ancient charters, *Taurus liber* ſignifies a common bull to all tenants within ſuch a manor, or liberty.—*Cum libertate faldiæ, liberi* Tauri, *& liberi Apri*, &c.

TAURUS, in aſtronomy, the *Bull*; one of the twelve ſigns of the zodiac, and the ſecond in order. See SIGN, and CONSTELLATION.

The ſtars in the conſtellation *Taurus*, in Ptolemy's catalogue, are 44; in Tycho's catalogue 41; in the Britannic catalogue 135. The longitudes, latitudes, magnitudes, *&c.* whereof are as follow:

TAURUS, in ſome ancient cuſtoms, ſignifies a huſband *. See HUSBAND.

* Leg. H. 1. cap. 7. *Videtur autem matris ejus, cujuſcunque* Taurus *alluſerit* —

TAUTOLOGICAL *Echo's*, are ſuch echo's as repeat the ſame ſound or ſyllable many times. See ECHO.

TAUTOLOGY, in grammar, a needleſs repetition of the ſame thing in different words. Such, *e. gr.* is that of Virgil;

——Si fata virum ſervant, ſi veſcitur aura
Ætherea, neque adhuc crudelibus occubat umbris.

Some people, particularly the Jeſuits, write and pronounce it *Taſtology*. The difference ariſes from the different pronunciation of the Greek *upſilon* in ταυ̃τολογια. The modern Greeks it is true, pronounce the *v* as *f*; and it is argued the ancients did the like: but as cuſtom is the ſtandard of a language, this plea avails but little with regard to the Engliſh.

TAW. See the article TAU.

TAWING, *Skinning*; the art or manner of preparing or dreſſing ſkins in white, to fit them for uſe in divers manufactures, particularly gloves, purſes, &c. See SKIN.

All kinds of ſkins may be *tawed*; but it is chiefly thoſe of ſheep, lambs, kids, and goats, that are uſed to be dreſſed this way; as being thoſe fitteſt for gloves. See GLOVE.

Method of TAWING, *or drawing ſkins in white.*—The wool or hair being well got off the ſkins, by means of lime, &c. (as deſcribed under the article SHAMMY) they are laid in a large vat of wood or ſtone ſet in the ground, full of water, wherein quick lime has been ſlacked; wherein they continue a month or ſix weeks, as the weather is more or leſs hot, or as the ſkins are required to be more or leſs ſoft and pliant.

While in the vat, the water and lime is changed twice, and they are taken out and put in again every day. When taken out for the laſt time, they are laid all night to ſoak in a running-water, to get out the greateſt part of the lime; and, in the morning, are laid, ſix together, on the wooden leg, to get off the fleſh, by ſcraping them ſtoutly, one after another, on the fleſh ſide, with a cutting two-handed inſtrument, called a knife; and while this is in hand, they cut off the legs, and other ſuperfluous parts about the extremes.

This done, they are laid in a vat or pit with a little water; where being well fulled with wooden peſtles for a quarter of an hour, the vat is filled up with water, and the ſkins rinſed therein. They are next thrown on a clean pavement to drain; which done, they are caſt into a freſh pit of water, where being well rinſed, they are taken out, and laid on the wooden leg, ſix at once, with the hair ſide outermoſt, over which they rub a kind of whetſtone very briſkly, to ſoften, and fit them to receive four or five more preparations given them on the leg, both on the fleſh ſide and the hair ſide, with the knife, after the manner above-mentioned.

Theſe over, they are put in a pit with water and wheat-bran, and ſtirred about therein, with wooden poles, till the bran is perceived to ſtick to them; and then they are left; as they riſe of themſelves to the top of the water by a kind of fermentation, they are plunged down again to the bottom; and, at the ſame time, fire is ſet to the liquor, which takes as eaſily as if it were brandy, but goes out the moment the ſkins are all covered.

This operation is repeated as often as the ſkins riſe above water; and when they riſe no more, they are taken out, laid on the wooden leg, the fleſh ſide outermoſt, and the knife paſſed over it to ſcrape off the bran. The bran thus cleared, the ſkins are laid in a large baſket, where they are loaden with huge ſtones to promote their draining; and when ſufficiently drained, their feeding is given them, which is performed after the following manner:

For a hundred large ſheep-ſkins, and for ſmaller in proportion, they take eight pounds of alum, and three of ſea-ſalt, and melt the whole with water in a veſſel over the fire; pouring the diſſolution out while yet lukewarm into a kind of trough, wherein is twenty pounds of the fineſt wheat flower, with eight dozen yolks of eggs; of all which is formed a kind of paſte, a little thicker than childrens pap; which, when done, is put into another veſſel, to be uſed in manner following:

A quantity of hot water being poured into the trough wherein the paſte was prepared, two ſpoonfuls of the paſte is mixed therewith; in order to which, they uſe a wooden ſpoon, which contains juſt what is required for a dozen ſkins: and when the whole is well diluted, two dozen of the ſkins are plunged therein: care being taken, by the way, that the water be not too hot, which would ſpoil the paſte, and burn the ſkins.

Having ſtaid ſome time in the trough, they are taken out, one after another, with the hand, and ſtretched out; which is repeated twice: when they have all had their paſte, they are put in tubs, where they are fulled afreſh with wooden peſtles.

Then they are put in a vat, where they remain five or ſix days, or more; and are at laſt taken out in fair weather, and hung out to dry on cords or racks; the quicker they dry the better; for if they be too long a drying, the ſalt and alum within them, are apt to make them riſe in a grain, which is an eſſential fault in this kind of dreſſing.

When the ſkins are dry, they are put up in bundles, and juſt dipt in fair water; from which being taken out and drained, they are thrown into an empty tub; and, after ſome time, are taken out, and trampled under foot.

They are then drawn over a flat iron inſtrument, the top whereof is round like a battledore, and the bottom fixed into a wooden block, to ſtretch and open them: when opened, they are hung in the air upon cords to dry; and when dry, are opened a ſecond time by repaſſing them over the ſame inſtrument.

Laſtly, they are laid on a table, pulled out, and laid ſmooth; and are thus in a condition for ſale, and uſe.

After the ſame manner are dreſſed horſes, cows, calves ſkins, &c. for the ſadlers, harneſs-makers, &c. as alſo dogs, wolves, bears-ſkins, &c. excepting that in theſe the uſe of the paſte is omitted, ſalt and alum-water being ſufficient.

TAWNY, in heraldry. See TENNE.

TAX *, a tribute ſettled on every town, after a certain rate; and paid yearly towards the expences of the government. See TRIBUTE, and IMPOST.

* The word is formed from the Greek, ταξις, *order*.

The rate, &c. of the *Tax* was anciently called *Tallage*, from the French *taille*, *Tax*. See TALLAGE, and TALLY.

The ancient *Tax* was what the ſubſidy now is; excepting that the *Tax* was fixed to a certain ſum, *v. gr.* the *fifteenth* part of what the place was anciently valued at, whereas the ſubſidy is variable according to occaſion; and that the *Tax* was levied on cities and towns, but the ſubſidy on perſons. See SUBSIDY.

Anciently, the *Tax* ſeems to have been impoſed by the king at his pleaſure; but Edward I. bound himſelf, and his ſucceſſors, from that time forward, not to levy it but by conſent of the realm. See FIFTEENTH; ſee alſo GILD and BENEVOLENCE.

The people of France were ſtrangers to *Tailles*, or *Taxes*, till the time of St. Louis, when they were firſt impoſed in form of ſubſidies neceſſary for the ſupport of the war in the Holy Land. See CROISADE.

They were then extraordinary levies, and were raiſed by capitation; but were afterwards made perpetual under Charles VII. Philip the Fair, to raiſe money without diſturbing the people, called the people, as a third eſtate, into the general councils of the realm. See ESTATE.

The name *Taille* is derived from the tally of petty tradeſmen; in regard the country people appointed to collect it, not being able to write, ſcored down what they received, on tallies. See TALLY.

TAX alſo denotes the tribute which tenants were occaſionally to pay their lord. See LORD, and TENANT.

Moſt lords had a right of *taxing* on four occaſions, *viz.* when the lord was taken priſoner in a juſt war; when he made his eldeſt ſon a knight; when he married his eldeſt daughter to a gentleman; and when he made the voyage of the Holy Land. See AID, and CROISADE.

Naude ſhews the extravagant riſe of this kind of *Taxes:* thoſe, he obſerves, which under Charles VI. only amounted to the ſum of 40000 livres, were increaſed, under Charles VII. to the ſum of 1800000 livres; under Louis XI. to 4740000 livres; under Charles VIII. to 6000000; under Louis XII. to 7640000 livres.

Taxes were diſtinguiſhed into *free*, which were thoſe due, in the four caſes, by freemen, or thoſe who held free lands; and *ſervile* and *baſe*, which were thoſe due from perſons of baſe condition.

They were alſo diſtinguiſhed into *real* and *perſonal.* The *perſonal* were impoſed on the head of the ſervant or man in main-morte, and ſo followed him where-ever he went. See Poll, Capitation, *&c.*

TAXERS, two officers yearly choſen in Cambridge, to ſee the true gauge of all weights, and meaſures obſerved.

The name took beginning from *taxing* and rating the rents of houſes, which was anciently the duty of their office.

TAXIS, ΤΑΞΙΣ, in the ancient architecture, ſignifies the ſame with *Ordonnance*, in the new, and is deſcribed by Vitruvius to be that which gives every part of a building its juſt dimenſions, with regard to its uſe. See Ordonnance, Proportion, and Symmetry.

TAYL, in heraldry, *&c.* See the article Tail.

TCHA. See the article Tea.

TCHELMINAR, or Tchilminar, or, as we pronounce it, *Chelminar*, one of the moſt celebrated piles of ruins in the world; being the remains of a palace, ſuppoſed to have ſtood in the middle of the city Eſtekhar, the ancient Perſepolis, capitol of the kings of Perſia. See Chilminar.

TEA, Thea, or as the Japaneſe call it, Tcha, the leaf of a tree or ſhrub, growing in ſeveral provinces of China, Japan, and Siam; whoſe infuſion is in general uſe as a drink.

The *Tea* plant affects valleys, and the feet of mountains, and a ſtony ſoil. Its ſeed is uſually ſown in places expoſed to the ſouth; and bears three years after ſown. The root reſembles that of the peach-tree: the leaves are green, longiſh at the point, and pretty narrow, an inch and half long, and jagged all around. The flower is much like that of the wild roſe. The fruit is of different forms, ſometimes round, ſometimes long, ſometimes triangular; of the ordinary ſize of a bean; containing two or three peas, of a mouſe colour, including each a kernel. Theſe peas are the ſeeds by which the plant is propagated.

The tree is of various heights, from one foot to an hundred: ſome there are which two men cannot fathom, while others ſcarce exceed the feebleſt ſhrub in a garden.

The beſt time to gather the leaves of *Tea*, is while they are yet ſmall, young, and juicy: when gathered, they are paſſed over the ſmoak of boiling water to moiſten them; then they are laid on copper-places, which are heated; and thus, the leaves drying, they curl up in the manner they are brought to us.

It is very rare to find *Tea* perfectly pure; the Chineſe always mixing other herbs with it, to increaſe the quantity. Indeed, the price it is ſold for among them is moderate enough; uſually it is about three-pence a pound ſterling, never more than nine-pence.

The Chineſe know nothing of *Imperial Tea*, *Flower of Tea*, and many other names, which in Europe ſerve to diſtinguiſh the goodneſs, and the price of this faſhionable commodity; and yet beſide the common *Tea*, they diſtinguiſh two other kinds, *viz.* the *Voui* and *Soumlo*, which are reſerved for people of the firſt quality, and ſick folks.

We have two kinds of *Tea* in Europe: *viz.*

Green Tea, which is the common *Tea* of the Chineſe, *&c.* F. le Compte calls it *Bing Tea*, and ſays it is gathered from the plant in April.—It is held very digeſtive, and a little corroſive: it gives a pale greeniſh tincture to water; and its leaves are much twiſted.—The ſecond is,

Bohea Tea, which is the *Voui Tea*, or *Bou Tcha* of the Chineſe.—F. le Compte makes this only to differ from the *Green Tea*, by its being gathered a month before it, *viz.* in March, while in the bud; and hence the ſmallneſs of the leaves, as well as the depth of the tincture it gives water. Others take it for the *Tea* of ſome particular province; the ſoil being found to make an alteration in the properties of the *Tea*, as much as the ſeaſon of gathering it.—It is all bought at Nanquin; and it is but lately that the Dutch have introduced it into Europe, where it begins to be much in vogue.

Savory alſo ſpeaks of a ſort of *Red Tea*, or *Tartar Tea*, called *Honan Tcha*, which tinges the water with a pale red, and which is ſaid to be extremely digeſtive: by means hereof it is that the Tartars are ſaid to be able to feed on raw fleſh. Its taſte is earthy, and much the leaſt agreeable of them all; but ſcarce known in *England*.

Tea is to be choſen green, of the briſkeſt ſmell, as whole as poſſible; and the greateſt care taken that it have not been expoſed to the air to pall, and evaporate.

The drink, *Tea*, is made in China, and throughout the greateſt part of the eaſt, after the ſame manner as in Europe; *viz.* by infuſing the leaves in boiling water, and drinking the infuſion hot.—Indeed, among us, it is uſual to temper its bitterneſs with ſugar, which the orientals uſe little or none of.

However, the Japaneſe are ſaid to prepare their liquor a ſomewhat different way, *viz.* by pulverizing it, ſtirring the powder in hot water, and drinking it as we do coffee.

The Chineſe are always taking *Tea*, eſpecially at meals: it is the chief treat wherewith they regale their friends. The moſt moderate take it at leaſt thrice a day; others, ten times, or more: and yet it is computed, the conſumption of *Tea* among the Engliſh and Dutch is as great in proportion as among the Orientals. In France, the uſe of *Tea* is much declined, and coffee is now become the prevailing liquor. See Coffee.

As to the properties of *Tea*, they are ſtrangely controverted: the eaſtern nations are at leaſt as much poſſeſſed with them as the Europeans; but it is, perhaps, becauſe imagination bears as great a ſway there as here. The reaſon why the gout and ſtone are unknown in China, is aſcribed to the uſe of this plant; which is ſaid further to cure indigeſtions of the ſtomach, to carry off a debauch, and to give new ſtrength for drinking; to diſpel wind, to cure the vapours, *&c.*

Sim. Pauli, phyſician of the king of Denmark, in an expreſs treatiſe on this plant, endeavours to ſhew, that theſe virtues aſcribed to it in the Eaſt, are local, and do not hold with the inhabitants of Europe. According to him, thoſe paſt their 40th year ſhould never uſe it, as being too deſiccative: that *Tea* has no other virtues but thoſe of betony: and adds, with Bauhin, that it is only a ſpecies of myrtle, found in Europe as well as the Indies.

But this opinion is refuted by Pechlin, in a treatiſe of *Tea*, intitled, *Theophilus Bibaculus, ſive de Potu* Theæ *Dialogus*; where he maintains, that it is good to prevent ſcorbutic diſeaſes; that its gentle aſtringent virtues ſtrengthen the tonic motion of the inteſtines, *&c.* But he blames the drinking it with milk, and eſpecially after a full meal, or after much wine.

TEAM, Theam, or Thame, in our ancient cuſtoms, ſignifies a royalty granted by the king's charter to the lord of a manor, for the having, reſtraining, and judging bondmen, neifs, and villains, with their children, goods, and chattels, in his court.

TEARS, *Lachrymæ*, a watry humour, iſſuing out at the corners of the eye, by the compreſſion of the muſcles; ſerving to moiſten the cornea, to expreſs our grief, and even to alleviate it. See Lachrymal.

The ancients had an opinion, that the *Tears* of the living were of uſe, at leaſt of pleaſure, to the dead; for which reaſon they took great care to procure them abundance at their funerals; ſo much, as to inſtitute a profeſſion or trade of weepers, as judging thoſe of their own families inſufficient. See Lachrymatory, and Funeral.

Deer, when at bay, are commonly ſaid to ſhed *Tears:* indeed, they ordinarily do yield a ſort of *Tears*, which oozing into the two clefts underneath, called *Lachrymatories*, are there condenſed into a kind of yellow liquor, or gum; which diluted in white wine or carduus water, is reputed a ſovereign remedy for fits of the mother, and the falling-ſickneſs.

Virgil makes the horſe of Pallas ſhed *Tears* at the funeral pomp of his maſter: this is one of the paſſages which the modern critics cenſure as a breach of probability. See Probability.

TEAZEL, or Teasel, *Carduus Fullonum*, or the *Fullers Thiſtle*, a kind of plant much uſed by the fullers, cloth-workers, and ſtocking-weavers, to card, or draw out the wool or nap from the thread or ground of ſeveral kinds of cloths, ſtuffs, ſtockings, *&c.* in order to render them cloſer, and warmer. See Thistle.

This plant is cultivated with great care in ſeveral parts of France, particularly Normandy; and the exportation thereof prohibited, by reaſon of the vaſt uſe thereof in the woollen manufacture.

The ſtem of the plant is very high: and its extremity, as alſo thoſe of its branches, bear an oblong prickly yellowiſh ball or bur, which is the part uſed.

The largeſt burs, and thoſe moſt pointed, are eſteemed the beſt, and are now called *Male Teazels*, moſtly uſed in the dreſſing and preparing of ſtockings and coverlets; the ſmaller kind, properly called the *Fullers* or *Drapers*, and ſometimes the *Female Teazel*, are uſed in the preparation of the finer ſtuffs, as cloths, rateens, *&c.*

The ſmalleſt kind ſometimes, called *Linnots Heads*, are uſed to draw out the nap from the coarſer ſtuffs, as bays, *&c.*

TECHNICAL, * Technicus, ſomething that relates to art. See Art.

* The word is formed of the Greek τεχνικὸς, *artificial*, of τεχνη, *art.*

In this ſenſe we ſay, *Technical Words*, *Technical Verſes*, &c.—And in this ſenſe Dr. *Harris* intitles his dictionary of arts and ſciences, *Lexicon Technicum.*

Technical, is more particularly applied to a kind of verſes, wherein are contained the rules or precepts of any art, thus digeſted to help the memory to retain them. See Memory.

Technical Verſes are uſed in chronology, *&c.*—Such, *e. gr.* are thoſe expreſſing the order and meaſures of the calends, nones, *&c.* See CALENDS.—Thoſe expreſſing the ſeaſons; ſee under AUGUST.—Thoſe expreſſing the order, *&c.* of the ſigns; ſee under SIGN.

F. Labbe has compoſed a ſet of *Technical* Latin verſes, including all the epochas in chronology; and F. Buffier, after his example, has put both chronology and hiſtory in French verſe; and ſince, geography too.

Technical Verſes are commonly compoſed in Latin: they are generally wretched ones, and often barbarous; but it is utility is all that is aimed at: to give ſome idea hereof, we will here add a few inſtances.—The caſuiſts include all the circumſtances which make us partakers with another in a theft, or other crime, in theſe two *Technical* verſes:

Juſſio, concilium, conſenſus, palpo, recurſus,
Participans, mutus, non obſtans, non manifeſtans.

The firſt of F. Buffier's *Technical* verſes of the hiſtory of France, are theſe:

Ses loix en quatre cent Pharamond introduit,
Clodion Chevelu, quAetius vanquit,
Merovee; avec lui combatit Attila;
Childeric fut chaſſee, mais on le rapella.

TECHNICAL *Words*, are what we otherwiſe call *Terms of Art.* See TERM.

TECUM *Duces*. See the article DUCES.

TE DEUM, a kind of hymn, or ſong of thankſgiving, uſed in the church; beginning with the words *Te Deum laudamus, We praiſe thee, O God.*—It is uſually ſuppoſed to be the compoſition of St. Auguſtin, and St. Ambroſe.

It is uſed to be ſung in the Romiſh church with extraordinary pomp and ſolemnity, upon the gaining a battle, or other happy event; and ſometimes even to conceal a defeat.

TEETH, *Dentes*, in anatomy. See the article TOOTH.

Canine TEETH, } See the articles { CANINE.
Wolves TEETH, } { WOLVES.

TEGUMENT. See the article INTEGUMENT.

TEINTS,* and *Semi*-TEINTS, in painting, denote the ſeveral colours uſed in a picture, conſidered as more or leſs high, or bright, or deep, or thin, or weakened, and diminiſhed, *&c.* to give the proper relievo, or ſoftneſs, or diſtance, *&c.* to the ſeveral objects. See COLOURING.

* The word is pure French, where it ſignifies the ſame.

TEIRCE, or TEIRS. See the article TIERCE.

TEKUPHÆ, or THEKUPHÆ, in the Jewiſh chronology, are the times wherein the ſun proceeds from one cardinal point to the next. See CARDINAL *Point*.

The term is alſo applied to the moments wherein the ſun enters a cardinal point: theſe four terms, or *Tekuphæ*, are obſerved among the Jews with a world of ceremony: the reaſon, as we are informed by Munſter, is this:

That people have a notion, that in each *Tekupha* the ſun has a ſeveral angel appointed to guard, and direct it; and that in the very point wherein the ſun finiſhes one *Tekupha*, and enters upon another, before the one director has taken place of the other, the devils have a power to exerciſe all kinds of tyranny in the water.

And hence, they ſay, that if any body drinks the ſmalleſt quantity of water at that time, he will infallibly have a dropſy, or ſome other grievous diſtemper.

TELAMONES,* a name given by the Romans to what the Greeks called *Atlantes, viz.* the figures of men ſupporting entablatures, and other projectures. See ATLAS.

* A late author thinks, that the word *Telamon*, which he deduces from the Greek τλημων, *a wretch that bears misfortunes with patience*, does not diſagree with thoſe ſtatues, which, in architecture, ſuſtain ſuch loads. See PERSIAN, and CARYATIDES.

TELESCOPE, an optical inſtrument, conſiſting of ſeveral glaſſes, or lens's, fitted into a tube; through which remote ſubjects are ſeen as if nigh at hand. See LENS, and OPTIC *Glaſs*.

In *Teleſcopes*, the lens or glaſs turned towards the object, is called the *Object-glaſs*; and that next the eye, the *Eye-glaſs*; and if the *Teleſcope* conſiſts of more than two lens's, all but that next the object are called *Eye-glaſſes*. See OBJECT-*Glaſs*, *&c.*

The invention of the *Teleſcope* is one of the nobleſt, and moſt uſeful theſe ages have to boaſt of: by means hereof, the wonders of the heavens are diſcovered to us, and aſtronomy brought to a degree of perfection, which former ages could have no notion of. See ASTRONOMY.

Indeed, the diſcovery is owing rather to chance, than to thought; ſo that it is the good fortune of the diſcoverer, rather than his ſkill or ability, we are indebted to: on this account it concerns us the leſs to know, who it was firſt hit on this admirable invention. It is certain it muſt be caſual, ſince the theory it depends on was not then known.

Johannes Baptiſta Porta, a noble Neapolitan, is aſſerted by Wolfius to be undoubtedly the firſt that made a *Teleſcope*; from this paſſage in his *Magia Naturalis*, printed in 1549: "If you do but know how to join the two (*viz.* the concave and convex glaſſes) rightly together, you will ſee both remote and near objects, much larger than they otherwiſe appear, and withal very diſtinct. In this way we have been of good help to many of our friends, who either ſaw remote things dimly, or near ones confuſedly; and have made them ſee every thing perfectly."

But it is certain, Porta did not underſtand his own invention, and therefore neither troubled himſelf to bring it to greater perfection, nor ever applied it to cœleſtial obſervation. What is more, the account Porta gives of his concave and convex lens's is ſo dark and indiſtinct, that Kepler, who examined it, by particular command of the emperor Rudolphus, declared to that prince, that it was perfectly unintelligible.

Fifty years afterwards, a *Teleſcope*, 12 inches long, was made and preſented to prince Maurice of Naſſau, by a ſpectacle-maker of Middlebourg; but authors are divided about his name. Sirturus, in a treatiſe of the *Teleſcope*, printed *anno* 1618, will have it to be John Lipperſein: and Borel, in an expreſs volume on the inventor of the *Teleſcope*, publiſhed in 1655, ſhews it to be Zacharis Janſen, or, as Wolfius has it, Hanſen.

Joh. Lapreius, another workman of the ſame town, paſſes for a third inventor; having made one in 1610, on the mere relation given him of that of Zachary.

In 1620, James Metius, brother of Adrian Metius, profeſſor of mathematics at Franeker, came with Drebel to Middlebourg, and there bought *Teleſcopes* of Zachary's children, who had made them public; and yet Adr. Metius has given his brother the honour of the invention; in which he is miſtakenly followed by Des Cartes.

But none of theſe artificers made *Teleſcopes* of above a foot and half: Simon Marius in Germany, and Galileo in Italy, firſt made long ones fit for cœleſtial obſervations.

Le Roſſi relates, that Galileo being then at Venice, was told of a ſort of optic glaſs made in Holland, which brought objects nearer: upon which, ſetting himſelf to think how it ſhould be, he ground two pieces of glaſs into form as well as he could, and fitted them to the two ends of an organ-pipe, and ſhewed, at once, all the wonders of the invention to the Venetian nobleſſe on the top of the tower of St. Mark. That author adds, that from this time Galileo devoted himſelf wholly to the improving and perfecting of the *Teleſcope*; and that he thereby almoſt deſerved all the honour uſually done him, of being reputed the inventor of the inſtrument, and of its being denominated from him *Galileo's Tube*.

F. Mabillon, indeed, relates, in his travels through Italy, that in a monaſtery of his own order, he ſaw a manuſcript copy of the works of Commeſtor, written by one Coradus, who lived in the XIIIth century; in the third page whereof, was ſeen a portrait of Ptolemy viewing the ſtars through a tube of four joints or draws: but that father does not ſay that the tube had glaſſes in it. In effect, it is more than probable, that ſuch tubes were then uſed for no other purpoſe, but to preſerve and direct the ſight, or to render it more diſtinct, by ſingling out the particular object looked at, and ſhutting out all the foreign rays reflected from others, whoſe proximity might have rendered the image leſs preciſe.

This conjecture is verified by experience; we having often obſerved, that without a tube, by only looking through the hand, or even the fingers, or a pin-hole in a paper, objects ſhall appear more clear and diſtinct than otherwiſe.

Be this as it will, it is certain the optical principles, whereon *Teleſcopes* are founded, are contained in Euclid, and were well known to the ancient geometricians; and it is for want of attention thereto, that the world was ſo long without that admirable invention; as, no doubt, there are numerous others lying hid in the ſame principles, only waiting for reflection or accident to bring them forth.

Teleſcopes are of ſeveral kinds, diſtinguiſhed by the number and form of their lens's, or glaſſes, and denominated from their particular uſes, *&c.* ſuch are the *Terreſtrial* or *Land Teleſcope*, the *Cœleſtial* or *Aſtronomical Teleſcope:* to which may be added, the *Galilean* or *Dutch Teleſcope*, the *Reflecting Teleſcope*, and the *Aerial Teleſcope*.

Galileo's, or the Dutch TELESCOPE, is a *Teleſcope* conſiſting of a convex object-glaſs, and a concave eye-glaſs. See CONCAVE, and CONVEX.

This, of all others, is the moſt ancient form, being the only kind made by the inventors, Galileo, *&c.* or known, before Huygens: whence its name. Its conſtruction, perfections, imperfections, *&c.* are delivered in what follows:

Conſtruction of Galileo's, or the Dutch TELESCOPE.—In a tube prepared for the purpoſe (the ſtructure whereof ſee under the article TUBE) at one end is fitted a convex object lens, either a plain convex, or convex on both ſides, but a ſegment of a very large ſphere: at the other end is fitted an eye-glaſs, concave on both ſides, and the ſegment of a leſs ſphere: ſo diſpoſed, as to be the diſtance of the virtual focus before the image of the convex lens. See FOCUS.

Theory of Galileo's TELESCOPE.—Now, in an inſtrument thus framed, all people, except myopes, or thoſe ſhort-ſighted, muſt ſee objects diſtinctly in an erect ſituation, and increaſed in the ratio of the diſtance of the virtual focus of the eye-glaſs, to the diſtance of the focus of the object-glaſs.

But for myopes to ſee objects diſtinctly through ſuch an inſtrument, the eye-glaſs muſt be ſet nearer the object-glaſs. The reaſon of theſe effects will appear from what follows:

For, 1° ſince it is far diſtant objects that are to be viewed with a *Teleſcope*, the rays proceeding from the ſame point of the object, will fall on the object-glaſs parellel, and conſequently by their refraction through the convexity, will be thrown converging on the eye-glaſs: but by their refraction through the concavity hereof, they will be again rendered parallel, and in ſuch diſpoſition will enter the eye. See RAY, CONCAVITY, CONVEXITY, and CONVERGING.

But all, excepting myopes, ſee objects diſtinctly by parallel rays. See VISION, and PARALLEL. Therefore the firſt point is clear.

2° Suppoſe A *(Tab. Optics, fig. 41.)* to be the focus of the object-glaſs; and ſuppoſe A C the furtheſt ray on the right hand of the object that paſſes through the tube: after refraction, it will become parallel to the axis B I, and conſequently after a ſecond refraction through the concave lens, will diverge from the virtual focus. Wherefore ſince all the rays coming from the ſame extreme to the eye placed behind the concave lens, are parallel to L E; and thoſe from the middle of the object, parallel to F G (as obſerved in what went before) the middle point of the object will be ſeen in the axis G A; and the right extreme, on the right ſide, *viz.* in the line L N, or parallel thereto; that is, the object will be erect: which is the ſecond point.

3° Since all right lines parallel to L N cut the axis under the ſame angle, the ſemi-diameter of the object will be ſeen through the *Teleſcope*, under the angle A F N or E F I: the rays L E and G I entering the eye in the ſame manner; as if the pupil were placed in F. If now the naked eye were in A, it would ſee the ſemi-diameter of the object under the angle c A b or C A B. But ſince the object is ſuppoſed very remote, the diſtance A F in reſpect hereto is nothing, and therefore the naked eye, even in F, would ſee the ſemi-diameter of the object under an angle equal to A.

The ſemi-diameter of the object therefore, ſeen with the naked eye, is to that ſeen through the *Teleſcope*, as I M to I E. But it is demonſtrated that I M : I E : : I F : A B; that is, the ſemi-diameter ſeen with the naked eye, is to that viewed through the *Teleſcope*; in the ratio of the diſtance of the virtual focus of the eye-glaſs F I, to the diſtance of the focus of the object-glaſs A B: which was the third point.

Laſtly, myopes have their retina too far from the cryſtallin humour; and diverging rays concur at a greater diſtance than parallel ones; and thoſe that were parallel become diverging by bringing the eye-glaſs nearer the object-glaſs; by means of ſuch approach, myopes will ſee objects diſtinctly through a *Teleſcope:* which is the fourth point.

Hence, 1° to have the whole object viſible, the ſemi-diameter of the pupil muſt not be leſs than the diſtance of the rays L E and G I; and therefore the more the pupil is dilated, the greater field or compaſs will be taken in by the *Teleſcope*, and *vice verſa*; ſo that coming out of a dark place, or ſhutting the eye for ſome time before you apply it to the glaſs, you will take in a greater field at firſt glance than afterwards, when the pupil is again contracted by the increaſe of light. See PUPIL.

2° Since the diſtance of the rays E L and I G is greater, at a greater diſtance from the lens, the compaſs taken in by the eye at one view, will be greater as the eye is nearer the concave lens.

3° Since the focus of a plano convex object lens, and the virtual focus of a plano concave eye lens, is at the diſtance of the diameter; and the focus of an object-glaſs convex on both ſides, and the virtual focus of an eye-glaſs concave on both ſides, is at the diſtance of a ſemi-diameter; if the object-glaſs be plano convex, and the eye-glaſs plano concave, the *Teleſcope* will increaſe the diameter of the object, in the ratio of the diameter of the concavity to that of the convexity; if the object-glaſs be convex on both ſides, and the eye-glaſs concave on both ſides, it will magnify in the ratio of the ſemi-diameter of the concavity to that of the convexity; if the object-glaſs be plano convex, and the eye-glaſs concave on both ſides, the ſemi-diameter of the object will be increaſed in the ratio of the diameter of the convexity to the ſemi-diameter of the concavity. And laſtly, if the object-glaſs be convex on both ſides, and the eye-glaſs plano concave, the increaſe will be in the ratio of the diameter of the concavity to the ſemi-diameter of the convexity.

4° Since the ratio of the ſemi-diameters is the ſame as that of the diameters, *Teleſcopes* magnify the object in the ſame manner, whether the object-glaſs be plano convex, and the eye-glaſs plano concave, or whether the one be convex on both ſides, and the other concave on both.

5° Since the ſemi-diameter of the concavity has a leſs ratio to the diameter of the convexity than its diameter has, a *Teleſcope* magnifies more if the object-glaſs be plano convex, than if it be convex on both ſides.

6° The greater the diameter of the object-glaſs, and the leſs that of the eye-glaſs, the leſs ratio has the diameter of the object viewed with the naked eye, to its ſemi-diameter viewed with a *Teleſcope*; and conſequently the more is the object magnified by the *Teleſcope*.

7° Since the ſemi-diameter of the object is increaſed in the ratio of the angle E F I, and the greater the angle E F I is, the leſs part of the object does it take in at one view; the *Teleſcope* exhibits ſo much a leſs part of the object, as it increaſes its diameter more.

And this is the reaſon that determined the mathematicians to look out for another *Teleſcope*, after having clearly found the imperfection of the firſt, diſcovered by chance. Nor were their endeavours vain, as appears from the *aſtronomical Teleſcope* hereafter to be deſcribed.

If the ſemi-diameter of the eye-glaſs have too ſmall a ratio to that of the object-glaſs, an object through the *Teleſcope* will not appear ſufficiently clear, by reaſon the great divergency of the rays will occaſion the ſeveral pencils repreſenting the ſeveral points of the object on the retina to conſiſt of too few rays.

This too is found, that equal object lens's will not bear the ſame eye lens's if they be differently tranſparent, or there be a difference in their poliſh. A leſs tranſparent object glaſs, or one leſs accurately ground, requires a more ſpherical eye-glaſs than another more tranſparent, &c.

Hence, though it be found by experience that a *Teleſcope* is good, if the diſtance of the focus of the object-glaſs be ſix inches, and the diameter of the plano concave eye-glaſs be one inch and one line, or of one equally concave on both ſides one inch and a half; yet is it by no means expedient to recommend to the maker either this, or any particular combination, but to try ſeveral eye-glaſſes, both greater and ſmaller, with the ſame object-glaſs, and take that through which objects appear moſt clear and diſtinct.

Hevelius recommends an object-glaſs convex on both ſides, whoſe diameter is four Dantzick feet; and an eye-glaſs concave on both ſides, whoſe diameter is 4 ½ digits or tenths of a foot. An object-glaſs, equally convex on both ſides, whoſe diameter is five feet, he obſerves, will require an eye-glaſs of five ½ digits; and adds, that the ſame eye-glaſs will alſo ſerve an object-glaſs of eight or ten feet.

Hence, as the diſtance of the object-glaſs and eye-glaſs is the difference between the diſtance of the virtual focus of the eye-glaſs, and the diſtance of the focus of the object-glaſs; the length of the *Teleſcope* is had by ſubſtracting that from this. That is, the length of the *Teleſcope* is the difference between the diameters of the object-glaſs and eye-glaſs, if that be plano convex and this plano concave; or the difference between the ſemi-diameters of the object-glaſs and eye-glaſs, if that be convex on both ſides, and this concave on both; or the difference between the ſemi-diameter of the object-glaſs and eye-glaſs, if that be convex on both ſides, and this concave on both; or the difference between the ſemi-diameter of the object-glaſs, and the diameter of the eye-glaſs, if that be convex on both ſides, and this plano concave; or the difference between the diameter of the object-glaſs, and the ſemi-diameter of the eye-glaſs, if that be plano convex, and this concave on both ſides.

Thus, *e. gr.* if the diameter of an object-glaſs on both ſides, be four foot, and that of an eye-glaſs concave on both ſides, be four foot and a half digits or tenths of a foot; the length of the *Teleſcope* will be one foot eight digits.

Aſtronomical TELESCOPE, is a *Teleſcope* conſiſting of an object-glaſs, and an eye-glaſs, both convex. See CONVEXITY.

It has its name, from its being wholly uſed in aſtronomical obſervations.

Conſtruction of the aſtronomical TELESCOPE.—The tube being prepared, an object-glaſs, either plano convex, or convex on both ſides, but to be a ſegment of a large ſphere, is fitted in at one end. At the other end, an eye-glaſs convex on both ſides, which is the ſegment of a ſmall ſphere, is fitted into the other end, at the common diſtance of the foci.

Theory of the aſtronomical TELESCOPE.—Now, an eye placed near the focus of the eye-glaſs, will ſee objects diſtinctly, but inverted, and magnified in the ratio of the diſtance of the focus of the eye-glaſs to the diſtance of the focus of the object-glaſs.

For 1° ſince it is very remote objects are viewed through *Teleſcopes*, the rays from any point of the object fall parallel on the object-glaſs; and, conſequently, after refraction, will meet in a point behind the glaſs, which point is the focus of the eye-glaſs. From this point they begin to diverge, and fall diverging on the eye-glaſs, where being refracted, they enter the eye parallel.

Hence, as all but myopes ſee diſtinctly by parallel rays, a *Teleſcope*, thus diſpoſed, will exhibit remote objects diſtinctly.

Suppoſe the common focus of the lens's in F (*Fig.* 44.) and make A B = B F. Since one of the rays A C, proceeding from the right ſide of the object, paſſes through A; the ray C E will be parallel to the axis A I, and therefore after refraction in the eye-glaſs, will fall in with it in its focus G. Since then, the eye is placed near it, and all the other rays proceeding from the ſame point of the object with E G, are refracted parallel thereto; the point in the right ſide of the object, will be ſeen in the right line E G.

After the like manner it appears, that the middle point of the object is ſeen in the axis G B, ſo that the object appears inverted.

3° From what has been already ſhewn, it appears that the ſemi-diameter of the object will be ſeen through the *Teleſcope*, under the angle E G I, which to the naked eye placed in A, is ſeen under the angle b A c. Suppoſe, now, I F equal to the diſtance of the focus I G; ſince the right angles at I are equal, E G F = E F I. Therefore drawing F M parallel to A C, we ſhall have I F M = B A C. The ſemi-diameter, therefore, viewed with the naked eye, is to that viewed through the *Teleſcope*, as I M to I E. Draw K E parallel to F M; we ſhall have I M : I E : : I F : I K. But by reaſon of the parallelism of the lens's; C E = B I = B F + F I = A B + F I; and by reaſon of the paralleliſm of the right lines C A, and E K; C E = A K, therefore B I = A K, conſequently, A B = I K. And therefore I M : I E : : I F : A B; that is, the ſemi-diameter ſeen with the naked eye, is to the ſemi-diameter view'd through the *Teleſcope*, in the ratio of the diſtance of the focus of the eye-lens I F, to the diſtance of the focus of the object-glaſs A B. *Q. e. d.*

Hence, 1°, as the *aſtronomical Teleſcope* exhibits objects inverted; it ſerves, commodiouſly enough, for obſerving the ſtars (it mattering little, whether they be ſeen erect or inverted) but for terreſtrial objects, it is much leſs proper, as the inverting frequently prevents their being known.

2° If between the eye-glaſs, and its focus G, be a plain well poliſhed metal ſpeculum L N, of the length of an inch, and of an oval figure, inclined to the axis under an angle of 45°, the rays E P and M Q will be reflected in ſuch manner, as that concurring in *g*, they make an angle P g Q, equal to P G Q: and therefore the eye being placed in *g*, will ſee the object of the ſame magnitude as before, only in an erect ſituation. By the addition therefore of ſuch a ſpeculum, the *aſtronomical Teleſcope* is rendered fit to obſerve terreſtrial objects. See MIRROR.

3° Since the focus of a glaſs convex on both ſides, is diſtant from the glaſs itſelf a ſemi-diameter; and that of a plano convex glaſs, a diameter; if the object-glaſs be convex on both ſides, the *Teleſcope* will magnify the ſemi-diameter of the object, in the ratio of the ſemi-diameter of the eye-glaſs to the ſemi-diameter of the object-glaſs; but if the object-glaſs be a plano convex, in the ratio of the ſemi-diameter of the eye-glaſs, to the diameter of the object-glaſs.

4° Wherefore, ſince the ſemi-diameter of the eye-glaſs has a greater ratio to the ſemi-diameter of the object-glaſs, than to its diameter; a *Teleſcope* magnifies the ſemi-diameter of the object more, if the object-glaſs be a plano convex, than if convex on both ſides.

5° The ratio of the ſemi-diameter of the eye-glaſs, to the diameter or ſemi-diameter of the object-glaſs, is the leſs, as the eye-glaſs is a ſegment of a leſs ſphere, and the object-glaſs of a greater. A *Teleſcope* therefore magnifies the diameter of the object more, as the object-glaſs is a ſegment of a greater, and the eye-glaſs of a leſſer ſphere.—And yet the ratio of the ſemi-diameter of the eye-glaſs to the object-glaſs muſt not be too ſmall; if it be, it will not refract rays enough to the eye from each point of the object; nor will it ſeparate thoſe coming from different points ſufficiently: by which means the viſion will be rendered obſcure and confuſed. To this may be added, what we have ſhewn, of the ratio of the object-glaſs to the eye-glaſs in the Dutch *Teleſcope*.

De Chales obſerves, that an object lens of $2\frac{1}{4}$ feet will require an eye-glaſs of $1\frac{1}{2}$ digit or tenth of a foot; and an object-glaſs of eight or ten feet, an eye-glaſs of four digits; in which he is confirmed by Euſtachio de Divinis.

Huygens's great *Teleſcope*, wherewith Saturn's true face, and one of his ſatellites were firſt diſcovered, conſiſts of an object-glaſs of 12 feet, and an eye-glaſs of a little more than three digits. Though he frequently uſed a *Teleſcope* of 23 feet long, with two eye-glaſſes joined together, each in diameter $1\frac{1}{2}$ a digit; ſo that the two were equal to one of three digits. The ſame author obſerves, that an object-glaſs of 30 foot, requires an eye-glaſs of $3\frac{3}{10}$ digits; and gives us a table of proportions, for the conſtructing of *aſtronomical Teleſcopes*; an abridgment whereof we ſhall here give the reader.

Diſt. of Foc. of Obj. Glaſs.	Diam. of Aperture	Diſt. of F. of E. Glaſs.	Mag. Diam.

If in two or more *Teleſcopes*, the ratio between the object and eye-glaſs be the ſame, the object will be magnified the ſame in both.

Hence ſome may conclude the making of large *Teleſcopes* a needleſs trouble. But it muſt be remembered, what we have already laid down: an eye-glaſs may be in a leſs ratio to a greater object-glaſs, than to a ſmaller: thus, *e. gr.* in Huygens's *Teleſcope* of 25 feet, the eye-glaſs is three digits. Now, keeping this proportion in a *Teleſcope* of 50 feet, the eye-glaſs ſhould be ſix digits; but the table ſhews four and a half are ſufficient. Hence, from the ſame table it appears, that a *Teleſcope* of 50 feet magnifies in the ratio of 1 : 141; whereas that of 25 feet, only magnifies in the ratio of 1 : 100.

Since the diſtance of the lens's is equal to the aggregate of the diſtance of the foci of the object and eye-glaſſes; and the focus of a glaſs convex on each ſide is a ſemi-diameter's diſtance, and that of a plano convex, a diameter's diſtance, from the lens; the length of a *Teleſcope* is equal to the aggregate of the ſemi-diameters of the lens's, if the object-glaſs be convex on both ſides; and to the ſum of the ſemi-diameter of the eye-glaſs, and of the diameter of the object-glaſs, if the object-glaſs be a plano convex.

But as the ſemi-diameter of the eye-glaſs is very ſmall, in reſpect of that of the object-glaſs, the length of the *Teleſcope* is uſually eſtimated from the diſtance of the object-glaſs, *i. e.* from its ſemi-diameter, if it be a convex on both ſides, or its diameter, if plano convex. Thus a *Teleſcope* is ſaid to be 12 feet, if the ſemi-diameter of the object convex-glaſs on both ſides be 12 feet, *&c.*

Since myopes ſee near objects beſt; for them the eye-glaſs is to be removed nearer the object-glaſs, that the rays refracted through it may be the more diverging.

To take in the larger field at one view, ſome uſe two eye-glaſſes, the foremoſt whereof is a ſegment of a larger ſphere than that behind: to this it muſt be added, that if two lens's be joined immediately together, ſo as one touch the other, the focus is removed to double the diſtance which that of one of them would be at.

To ſhorten the aſtronomical TELESCOPE, *i. e.* to conſtruct a *Teleſcope* ſo, as that, though ſhorter than the common one, it ſhall magnify as much:

1° Having provided a drawing tube, fit in an object lens E G (*Fig.* 43.) which is a ſegment of a moderate ſphere; let the firſt eye-glaſs B D be concave on both ſides, and ſo placed in the tube, as that the focus of the object-glaſs A may be behind it, but nearer to the centre of the concavity G. Then will the image be thrown in Q, ſo as that G A : G I : : A B : Q I. Laſtly, fit in another object-glaſs, convex on both ſides, and a ſegment of a leſſer ſphere, ſo as that its focus may be in Q.

This *Teleſcope* will magnify the diameter of the object, more than if the object-glaſs were to repreſent its image at the ſame diſtance E Q, and conſequently a ſhorter *Teleſcope* conſtructed this way, is equivalent to a longer in the common way. The demonſtration may be ſeen in Wolfius.

Sir Iſ. Newton furniſhes us with another method of contracting the *Teleſcope*, in his catoptrical or reflecting *Teleſcope*; the conſtruction whereof ſee hereafter.

Land TELESCOPE, or *Day* TELESCOPE, a *Teleſcope* conſiſting of more than two lens's, commonly of a convex object-glaſs, and three convex eye-glaſſes; or, a *Teleſcope* that exhibits objects erect, yet different from that of Galileo.

It has its name from being uſed to view objects in the day-time, on or about the earth.

To conſtruct a Land or Day TELESCOPE.—A tube being provided, fit in an object-glaſs, which is either convex on both ſides, or plano convex, and a ſegment of a large ſphere: to this add three eye-glaſſes; all convex on both ſides, and ſegments of equal ſpheres; diſpoſing them in ſuch manner, as that the diſtance of any two may be the aggregate of the diſtances of their foci.

Theory of a Land TELESCOPE.—Then will an eye applied to the laſt lens, at the diſtance of its focus, ſee objects very diſtinctly, erect, and magnified in the ratio of the diſtance of the focus of one eye-glaſs L K (*Fig.* 44.) to the diſtance of the focus of the object-glaſs A B.

For, 1° the rays, from what has been already ſaid, falling on the object parallel, the image of the object will be repreſented invertedly at the diſtance of the principal focus: wherefore, ſince this image is in the focus of the firſt eye-glaſs, the rays, after a ſecond refraction, will become parallel; and thus falling on the third lens, after a third refraction, they exhibit the inverted image invertedly, that is, an erect image of the object. Since then this image is in the focus of the third eye-glaſs, the rays, after a fourth refraction, will become parallel; and in this diſpoſition the eye will receive them, and conſequently there will be diſtinct viſion, and the object will appear erect.

2° If I Q = I K, that is, equal to the diſtance of the focus of the object-glaſs, an eye placed in M, will ſee the ſemi-diameter of the object increaſed in the ratio of L M to K I; but the ray A Q, proceeding from the focus Q of the object lens A B, after refraction becomes parallel to the axis I L, conſequently the firſt eye lens C D joins it to the axis in M the diſtance of a ſemi-diameter.

And ſince the focus of the ſecond eye-glaſs EF, is alſo in M, the ray FH, after refraction, will be parallel to the axis NO, and therefore the third eye-glaſs will join it at the axis in P; but the ſemi-diameters of the lens's GH and CD are ſuppoſed equal; therefore PO=LM. Wherefore ſince the right angles at O and L are equal, as alſo HO=CL, the angle OPH is equal to CML. The ſemi-diameter of the object therefore appears the ſame in P as in M, and is conſequently magnified in the ratio of LM, or PO to KI.

Hence, 1° an *aſtronomical teleſcope* is eaſily converted into a *land teleſcope*, by uſing three eye-glaſſes for one; and the *land teleſcope*, on the contrary, into an aſtronomical one, by taking away two eye-glaſſes, the faculty of magnifying ſtill remaining the ſame.

2° Since the diſtance of the eye-glaſſes is very ſmall, the length of the *teleſcope* is much the ſame as if you only uſed one.

3° From the conſtruction, it is evident, that the length of the *teleſcope* is found by adding five times the ſemi-diameter of the eye-glaſſes to the diameter of the object-glaſs, if a plano convex; or its ſemi-diameter, if convex on both ſides.

Huygens firſt obſerved, both in the *aſtronomical* and *land teleſcope*, that it contributes conſiderably to the perfection of the inſtrument, to have a ring of wood or metal, with an aperture, a little leſs than the breadth of the eye-glaſs, fixed in the place where the image is found to radiate upon the lens next the eye; by means hereby the colours, which are apt to diſturb the clearneſs and diſtinctneſs of the object, are prevented, and the whole compaſs taken in at a view, perfectly defined.

Some make *land teleſcopes* of three lens's, which yet repreſent objects erect and magnified as much as the former. But ſuch *teleſcopes* labour under very great inconveniencies, both as the objects herein are tinged with falſe colours, and as they are diſtorted about the margin.

Some again uſe four lens's, and even more; but ſince ſome part of the rays is intercepted in paſſing every lens, objects are hereby exhibited dim and feeble.

Reflecting, or catoptric, or cata-dioptric **TELESCOPE**, is a *teleſcope* which, inſtead of lens's, conſiſts chiefly of mirrours, and exhibits remote objects by reflection, inſtead of refraction. See CATOPTRICS, *&c.*

This inſtrument is the invention of the great Sir If. Newton: what determined him to apply his thoughts this way, was the different refrangibility, which, in his new doctrine of light and colours, he found the rays of light were of. In effect, as he found the ratio between the greateſt and leaſt refractions of the different rays to be nearly as 28 to 27, it eaſily followed, that the rays could never be all refracted parallel from any lens, but would ſome of them divaricate more, ſome leſs; beſide that the foci would be diſturbed; the focus of the moſt refrangible rays being nearer the lens than that of the leaſt refrangible ones, by a diſtance which is the 27th part of the diſtance between the object-glaſs, and the focus of the leaſt refrangible ones. See RAY, and REFRANGIBILITY.

Hence he concluded, that refraction was too unequal a principle; and that lens's, of whatever figures, whether ſpherical, parabolical, or any of the other conic ſections, and how truly ſoever ground, would never ſuffice for the perfection of *teleſcopes*.

Upon this he had recourſe to another more equable principle, *viz. reflection*; and made a *teleſcope*, conſiſting of ſpecula, or mirrours: the firſt hint whereof he owns he took from Dr. Gregory's optics.

Conſtruction of a reflecting **TELESCOPE.**—Provide a tube ABCD (*Fig.* 45.) open in AD, and cloſed in BC, well blacked within-ſide, and of a length equal to the diſtance of the focus from the concave ſpeculum EF. To the bottom BC, is to be fitted a concave metallic ſpeculum *a b*, poliſhed to the greateſt poſſible perfection; or rather, to have the objects clearer, and more diſtinct, let it be a glaſs ſpeculum, concave on its fore-ſide, and equally convex on the hind-ſide; for unleſs it be of the ſame thickneſs every where, it will reflect the images of objects tinged with a ſpurious colour, and indiſtinct. Towards the other end of the tube is fixed an iron piece HL, to which is cemented a plain metallic ſpeculum; or, which is better, a triangular priſm of glaſs or cryſtal G, whoſe upper angle G is a right angle, the two others half right; the faces or planes that meet in the angle G to be ſquare, and the third a parallelogram. The priſm is to be ſo diſpoſed, as that a ray reflected from the ſpeculum, paſſing through the middle of the face GM, may cut it at right angles; but be inclined to the rectangle MN in an angle of 45°. Its diſtance from the concave ſpeculum EF, is to be ſuch, as that the rays *a c* and *b d* reflected from the concave ſpeculum, may, after a ſecond reflection from the baſe of the priſm, concur in the point *e*; that is, the diſtance of the focus *e* from the reflecting ſurface of the priſm, and the diſtance of that from the concave ſpeculum, is to be equal to the diſtance of the focus from the concave ſpeculum. In I is placed a plano convex lens, whoſe focus is in *e*, that the reflected rays may enter the eye parallel. Laſtly, this lens is covered with a thin braſs or leaden plate, having a little round perforation therein, for the eye to look through, by which means all foreign rays are excluded, which would otherwiſe occaſion confuſion.

In the firſt *teleſcope* of this kind which the inventor made, the ſemi-diameter of the concave metallic ſpeculum was $12\frac{2}{5}$ digits, or tenths of an inch; from which, therefore, the focus was $6\frac{1}{2}$ digits diſtant. The diameter of the eye-glaſs was $\frac{1}{6}$ of a digit; ſo that it magnified the diameter of the object in the ratio of 1 to 38: but he found that objects were ſhewn ſomewhat obſcure hereby; on which account, he afterwards recommended glaſs ſpecula inſtead of metallic ones; adding, that there is nothing more required to the perfection of this *teleſcope*, but that the art of poliſhing glaſs be brought to greater perfection; for that ſome inequalities which do not hurt lens's, are found to affect ſpecula, and prevent objects being ſeen diſtinctly.

The ſame author obſerves, that if the length of the inſtrument be 6 feet, and conſequently the ſemi-diameter of the concave ſpeculum 12, the aperture of the ſpeculum is to be 6 inches; by which means the object will be increaſed in the ratio of 1 to 200 or 300.

If it be longer or ſhorter, the aperture muſt be as the cube of the quadrato quadrate root of the length, and its magnifying power as its aperture. The ſpeculum he orders to be an inch or two broader than the aperture.

Aerial **TELESCOPE**, a kind of *aſtronomical teleſcope*, the lens's whereof are uſed without a tube.

In ſtrictneſs, however, the *aerial teleſcope* is rather a particular manner of mounting and managing long *teleſcopes* for cœleſtial obſervations in the night-time, whereby the trouble of long unweildy tubes is ſaved, than a particular kind of *teleſcope*: the contrivance we owe to the noble Huygens.

Conſtruction of the aerial **TELESCOPE,**—1° A tall pole or maſt AB (*Fig.* 46. N° 2.) the length the tube ſhould be of is fixed perpendicularly in the ground. Before the erecting it, one ſide is planed ſmooth, and upon it two rulers fixed parallel to each other an inch and half apart, including a kind of groove or channel between them, reaching from top almoſt to bottom. At the top of the pole is fixed a little truckle A, moveable on its axis, and over it is drawn a cord Gg, double the length of the pole, and the thickneſs of the little finger, returning into itſelf, and furniſhed with a piece of lead, H, equal in weight to the lens and a moveable arm to be ſuſtained thereby.

Then a wooden lath CD, two foot long, is framed ſo as that it may ſlide freely in the channel; and in the middle thereof is affixed a wooden arm E, ſtanding out a foot from the pole, and on its extremity bearing another, Ff, a foot and half long, fixed to it at right angles, both of them parallel to the horizon.

2° An object-glaſs is included in a hollow cylinder IK, three inches long: to this cylinder is fixed a ſtaff KL, near an inch thick, and a foot long, which reſts on a braſs ball M, that moves freely in its cup or ſocket underneath: only, on occaſion, the ball and ſocket are fixed by a ſcrew. That the lens thus equally balanced, may be moved with a ſmall force, a weight NI of about a pound, is ſuſpended by a ſtrong wire NF, by bending of which the common centre of gravity of the weight and the lens is eaſily made to coincide with that of the ball. To the ſtaff KL is fixed a braſs ſtyle L, which is bent downwards till its point be as much below the centre of the ſtaff, as the centre of the ball is. To the point is tied a fine ſilken thread LV, which of conſequence will be parallel to the ſtaff KL.

3° An eye-glaſs O is included in a ſhort cylinder, and the ſtaff PV fixed to the ſame. To this is hung a little weight S, ſufficient to make a balance. In Q is fixed a handle R, which carries a tranſverſe axis, to be held in the obſerver's hand, and the ſtaff PV directed towards the object-glaſs, is tied to the thread LV. The thread paſſed through a hole V, is wound about a little peg T, fixed in the middle of the ſtaff, by the turning whereof the length of the thread is ſhortened or prolonged at pleaſure.

4° That the obſerver may be able to hold the eye-glaſs ſteady, he has a fulcrum or prop under his arm, the ſtructure whereof appears from inſpection of the figure. Laſtly, to keep off the feeble light flowing from the air upon the eye, it is conveniently covered with a circle Y, perforated in the middle, fitted on to a moveable and flexible arm.

Binocular **TELESCOPE.** See the article BINOCULAR.

TELESCOPICAL *ſtars* are ſuch as are not viſible to the naked eye; but diſcoverable only by the help of a *teleſcope*. See STAR.

All ſtars leſs than of the ſixth magnitude, are *teleſcopic* to a middling eye.

TELLER, an officer in the exchequer, of which there are four; whoſe buſineſs is to receive all monies due to the crown, and thereupon to throw down a bill through a pipe into the tally-court, where it is received by the auditor's clerks, who attend there to write the words of the ſaid bill upon a tally, and then deliver it to be entered by the clerk of the pells, or his clerk. See EXCHEQUER, TALLY, *&c.*

The tally is then ſplit or cloven by the two deputy-chamberlains, who have their ſeals, and whilſt the ſenior deputy reads the one part, the junior examines the other part with the other two clerks.

The *tellers* places are in the king's gift, and they have, beſides their chief clerk or deputy, four other clerks, for the diſpatch of buſineſs. See EXCHEQUER.

TELLONIUM. See the article THELONIUM.

TELLUS, *Terras*, ♁, in aſtronomy. See EARTH.

TEMPER, in a	phyſical	ſenſe.	See	TEMPERAMENT
	muſical			TEMPERAMENT *in muſic.*
	mechanical			TEMPERING.

TEMPERAMENT, TEMPERAMENTUM, TEMPERATURE, in phyſics, that habitude or diſpoſition of a body ariſing from the proportion of the four primary elementary qualities it is compoſed of. See QUALITY and ELEMENT.

The notion of *temperament* ariſes from that of mixture, where different elements, as earth, water, air and fire (or, to ſpeak more juſtly in the peripatetic way, hot, cold, moiſt and dry) are blended together; by their oppoſition, they tend mutually to weaken and encroach on each other: and from the whole ariſes a ſort of temperate craſis, or coalition of them all in this or that proportion; whence, according to the quality that prevails or predominates, we ſay a *hot* or *cold*, a *moiſt* or *dry temperament*. See MIXTURE, CRASIS, *&c.*

It is controverted among the ſchool-men, whether the *temperament* properly comprehends all the four primary qualities? or, whether thoſe do not all ceaſe, and a new one, a fifth, ſimple quality, reſult from the total alteration made in the other four, by their mutual action on each other?

Authors diſtinguiſh two kinds of *temperaments*, viz. *uniform* and *diſform*.—The firſt, wherein all the qualities are mixed in an equal degree.—The ſecond, where in an unequal one.

The uniform *temperament* can only be one; the diſform admits of eight different combinations, ſince either any one, or any two of the qualities may prevail; whence *hot* and *moiſt*, *cold* and *moiſt*, &c.—Further, ſome conſidering that the qualities which do prevail, may not be in equal degree; and the like of thoſe which do not prevail, make ſeveral other combinations or *temperaments*; and add 12 more to the number.—In effect, as there are infinite degrees between the higheſt and loweſt pitch of any one of the elements, the different *temperatures* may be ſaid to be infinite. See DEGREE.

TEMPERAMENT, in medicine, is more particularly underſtood of the natural habitude and conſtitution of the body of man, or the diſpoſition of the animal humours in any ſubject. See CONSTITUTION, and HUMOUR.

The notion of *temperament* ariſes hence, that the blood flowing in the veins and arteries, is not conceived to be a ſimple fluid, but a ſort of imperfect mixt, or an aſſemblage of ſeveral other fluids: for it does not only conſiſt of the four ſimple, or primary qualities, but of four other ſecondary ingredients compounded thereof, into which it is ſuppoſed to be reſolvable, *viz. choler*, *phlegm*, *melancholy* and *blood*, properly ſo called. See BLOOD, CHOLER, BILE, PHLEGM, *&c.*

Hence, as this or that ingredient humour prevails in a perſon, he is ſaid to be of a choleric, phlegmatic, melancholic, ſanguine, *&c. temperament*. See SANGUINE, MELANCHOLY, CHOLERIC, *&c.*

The ancient phyſicians brought theſe animal *temperaments* to correſpond with the univerſal *temperament* above deſcribed: thus the *ſanguine temperament* was ſuppoſed to coincide with *hot* and *moiſt*, the *phlegmatic* with *cold* and *moiſt*, the *melancholic* with *dry* and *cold*, &c.

Galen introduced the doctrine of *temperaments* into phyſic from the peripatetic ſchool, and made it as it were the baſis of all medicine. The whole of curing diſeaſes conſiſted in *tempering* the degrees of the qualities, humours, *&c.* See GALENICAL, DEGREE, *&c.*

On the footing medicine now ſtands, the *temperaments* are much leſs conſidered. Dr. Quincy and other mechanical writers pare away the greateſt part of the Galenic doctrine, as uſeleſs and uncertain, and conſider the *temperaments* as no other than thoſe diverſities in the blood of different perſons, whereby it becomes more apt to fall into certain combinations in one body than another, whether into choler, phlegm, *&c.* whence, according to them, people are denounced *choleric*, *phlegmatic*, &c. See BLOOD.

The ancients diſtinguiſhed two kinds of *temperaments* in the ſame body: the one *ad pondus*, in reſpect of weight; the other *ad juſtitiam*.

TEMPERAMENTUM *ad pondus*, is where the elementary qualities are found in equal quantities, and in equal proportions; ſuch as they are ſuppoſed to be in the ſkin of the fingers, without which thoſe parts would want the power of diſtinguiſhing objects with ſufficient accuracy.

TEMPERAMENTUM *ad juſtitiam*, is that which contains unequal portions of thoſe qualities, but yet in ſuch proportion as is neceſſary for the diſcharge of the function proper to the part.—Such is the *temperament* in a bone, which contains more earthy than aqueous parts, to make it more hard and ſolid for its office of ſuſtaining.

Galen obſerves, that the *temperament ad pondus* is only imaginary; and that though it were real, it could not ſubſiſt above one moment.

Dr. Pitcairn looks on the *temperaments*, or conſtitutions, as ſo many native diſeaſes; according to him, any one indued with whatever *temperament* has the ſeeds of a real diſeaſe within him; a particular *temperament* ſuppoſing that ſome ſecretions are in greater proportion than is proper for life indefinitely long.

As the diverſities of *temperaments* are no other than diverſities of proportion in the liquids, which may be diverſified infinite ways; ſo there may be an infinite number of *temperaments*: though authors have only ſuppoſed four. The ſanguine, which is uſually reckoned a *temperament*, Pitcairn ſays, is no other than a plethora. See PLETHORA.

TEMPERAMENT, TEMPERAMENTO, in muſic, denotes a rectifying or mending the falſe and imperfect concords, by transferring to them part of the beauty of the perfect ones. See CONCORD.

The degrees of the octave, which may be called its *elements*, as being the ſmalleſt intervals it is reſolvable into, are two greater ſemitones, two leſſer tones, and three greater tones. See TONE, OCTAVE, and DEGREE.

Now the different ſituation of theſe elements, with reſpect to each other, occaſions that intervals or concords of the ſame name, as thirds, fourths, *&c.* do not conſiſt of the ſame degrees or elements, though there be always the ſame number of them: but one fourth, for inſtance, is agreeable and perfect, and another not.

To mend theſe imperfect concords, the muſicians have bethought themſelves to *temper*, *i. e.* give them part of the agreeableneſs of perfect ones. In order to this, they take a medium between the two, and this they call a *temperament*, which neceſſarily produces a new diviſion of the octave, or, which amounts to the ſame, new elements.

For inſtance, whereas naturally its elements are the greater ſemitone, and the greater and leſſer tone; they take a middle tone formed of the greater and the leſs: and the only elements now are the greater ſemitone, and this mean tone, which renders the five intervals that are tones equal, and thoſe that are ſemitones leſs unequal to theſe.

One might alſo divide each of the five tones of the octave into ſemitones, which, joined to the two it naturally has, make twelve: in which caſe, the whole octave would be divided into twelve equal parts, which would be mean ſemitones.

It is eaſy to form various other kinds of *temperaments*: all the difficulty is to find ſuch as are free from two great inconveniencies, *i. e.* which do not alter either all the concords too much, or, at leaſt, ſome of them.

All ſuch diviſions of the octave are called *tempered*, or *temperative ſyſtems*. See SCALE *of Muſic*.

TEMPERATE *Zone*. See the article ZONE.

TEMPERATURE. See the article TEMPERAMENT.

TEMPERING, in the mechanic arts, the preparing of ſteel and iron, ſo as to render them more compact, hard and firm; or even more ſoft and pliant; according to the reſpective occaſions. See IRON, and STEEL.

Theſe metals are *tempered* by plunging them, while red-hot, in ſome liquor prepared for the purpoſe: ſometimes pure water is uſed for that purpoſe; and, in effect, lockſmiths, *&c.* ſcarce uſe any other.

Sometimes a compoſition of divers juices, liquors, *&c.* is uſed; which is various, according to the manner and experience of the workman; as vinegar, mouſe-ear-water, nettle, or ſpaniſh reddiſh-water, the water oozing from broken glaſſes, ſoot, ſalt, oil, diſtilled wine, ſal armoniac, *&c.*

To harden and *temper* Engliſh, Flemiſh, and Swediſh ſteel, you muſt give them a pretty high heat, then ſuddenly quench them in water to make them hard: but Spaniſh and Venice ſteel will need but a blood-red heat before it be quenched. See HEAT.

If the ſteel be too hard, or brittle for an edge-tool, *&c.* let it down by rubbing a piece of grindſtone or whetſtone hard upon the work, to take off the black ſcurf: then brighten, or heat it in the fire; and as it grows hotter, you will ſee the colour change by degrees, coming firſt to a ſtraw, or light goldiſh colour, then to a darker goldiſh colour, and at laſt to a blue colour. Chuſe ſuch of theſe colours as the work requires, then quench it ſuddenly in water.

The light gold colour is for files, cold chiſſels, and punches, that punch iron and ſteel: the dark goldiſh colour for punches to uſe on braſs, *&c.* The blue colour gives the *temper* for ſprings, *&c.*

The *tempering* of files and needles is performed in a peculiar manner. See FILE, and NEEDLE.

The ancients appear to have had ſome better method of *tempering* than any of the moderns are acquainted withal; witneſs their works in porphyry; a ſtone ſo hard, that none of our tools make any impreſſion upon it. See PORPHYRY.

TEMPEST, TEMPESTAS, a ſtorm, or violent commotion of the air, with or without rain, hail, ſnow, *&c.* See WIND, HURRICANE, WHIRLWIND, WATER-*ſpout*, EARTHQUAKE, *&c.*

TEMPLARS, TEMPLERS, or *Knights of the* TEMPLE, a religious-military order, firſt eſtabliſhed at Jeruſalem, in favour of pilgrims travelling to the Holy Land. See KNIGHT.

The original of this order, the firſt military order in the world, is this: In 1118, ſome pious noble perſons devoted themſelves to the ſervice of God, in the preſence of the patriarch of Jeruſalem; promiſing to live in perpetual chaſtity, obedience, and poverty, after the manner of canons.

The two principal perſons were Hugo de Paganis, and Geoffroy of St. Omers. Baldwin II. then king of Jeruſalem, gave them an apartment in his palace: near the temple, at Jeruſalem, nor far from the ſepulchre of our Saviour; whence their denomination *Templars*.

Soon afterwards, the canons of the temple gave them a piece of ground hard by the ſaid temple, to build them regular houſes on; and the king, the lords, the patriarch, and the prelates, each gave them ſomewhat out of their revenue, for food and cloaths.

Their firſt undertaking, and what they had firſt in view at their inſtitution, was to guard the highway againſt robbers, *&c.* chiefly for the ſafety of pilgrims and croiſes. See CROISE.

The principal articles of their rule were: That they ſhould hear the holy office throughout every day; or, that when their military duties ſhould prevent this, they would ſupply it by a certain number of pater noſters: that they would abſtain from fleſh four days in the week, and on Fridays from Eggs and milk-meats: that each knight might have three horſes, and one eſquire; and that they ſhould neither hunt, nor fowl.

Their firſt rule was that of St. Bernard. Nine years after their foundation, a particular rule was preſcribed them in the council of Troyes.

In every nation they had a particular governor, called *maſter of the temple*, or of the *militia of the temple*. Their grand maſter had his reſidence at Paris.

The order of *templars* was aboliſhed at the beginning of the XIVth century, under Clement V. Edward II. of England, and Philip the Fair of France. In 1607, thoſe in England were all arreſted, and ſeven burnt alive. And in 1312, the order was quite ſuppreſſed in the council of Vienne, and 50 burnt alive.

The crimes they were charged withal were apoſtatizing to the Saracens, and holding correſpondence with them. Some authors will have it, theſe crimes were only pretended; and that the true reaſon of the ſuppreſſion of the order, was the immenſe riches they were poſſeſſed of. But though this might be ſome reaſon for their ſuppreſſion, it could be none for burning them alive: add to this, that their effects were given to the hoſpitallers, or knights of St. John. What then did the kings of England, *&c.* get by their ſuppreſſion? And what was it to them which of thoſe orders had the effects? See HOSPITALLER.

TEMPLE,* TEMPLUM, a publick building, erected in honour of ſome deity, either true or falſe; and wherein the people meet to pay religious worſhip to the ſame. See GOD, WORSHIP, BUILDING, *&c.*

* The word is formed from the Latin, *templum*, which ſome derive from the Greek, τεμενος, ſignifying the ſame thing; and others from τεμνω, *abſcindo, I cut off, I ſeparte*, in regard a *temple* is a place ſeparated from common uſes; others with more probability derive it from the old Latin word *templare, to contemplate*. It is certain, the ancient augurs gave the name *templa* to thoſe parts of the heavens which they marked out for the obſervation of the flight of birds.—Their formula was this: *templa teſqua ſunto.* See AUGUR.

Clemens Alexandrinus and Euſebius refer the origin of *temples* to the ſepulchres built for the dead. Herodotus and Strabo will have the Ægyptians to have been the firſt who built *temples* to the gods. The firſt, erected in Greece, is aſcribed to Deucalion, by Appollonius, *Argonaut. lib.* 3.

In antiquity we meet with many people who would not build any *temples* to their gods, for fear of confining them to too narrow bounds. They performed their ſacrifices in all places indifferently, from a perſuaſion, that the whole world is the *temple* of God, and that he requires no other.—This was the doctrine of the magi, followed by the Perſians, the Scythians, the Numidians, and many other Nations mentioned by Herodotus, lib. 1. Strabo, lib. 15. and Cicero in his ſecond oration againſt Verres. See MAGI, *&c.*

The Perſians, who worſhipped the ſun, believed it would wrong his power, to incloſe him in the walls of a *temple* who had the whole world for his habitation: and hence, when Xerxes ravaged Greece, the Magi exhorted him to deſtroy all the *temples* he met with.

The Sicyonians would build no *temple* to their goddeſs Coronis; nor the Athenians, for the like reaſon, erect any ſtatue to Clemency, who, they ſaid, was to live in the hearts of men, not within ſtone-walls.

The Bithynians had no *temples*, but the mountains to worſhip on; nor the ancient Germans any other but the woods. See DRUID, *&c.*

Even ſome philoſophers have blamed the uſe and building of *temples*, particularly Diogenes, Zeno, and his followers the Stoics.—But it may be ſaid, that if God have no need of *temples*, men have need of places to meet in for the public offices of religion! Accordingly, *temples* may be traced back even into the remoteſt antiquity. See Hoſpinian, *de Origine Templorum.*

The Romans had ſeveral kinds of *temples*; whereof thoſe built by the kings, *&c.* conſecrated by the augurs, and wherein the exerciſe of religion was regularly performed, were called, by way of eminence, *templa, temples.*——Thoſe that were not conſecrated, were called *ædes.*—The little *temples*, that were covered or roofed, they called *ædiculæ.*—Thoſe open, *ſacella.*—Some other edifices conſecrated to particular myſteries of religion, they called *fana* and *delubra*.

All which kinds of *temples*, Virtruvius tells us, had other particular denominations, according to the form and manner of their conſtruction; as will be hereafter ſpecified.

Indeed, the Romans out-did all nations in the point of *temples*: they not only built *temples* to their gods, to their virtues, to their diſeaſes, *&c.* but alſo to their emperors, and that in their life-time; inſtances whereof we meet withal in medals, inſcriptions, and other monuments. Horace compliments Auguſtus hereupon, and ſets him above Hercules, and all the heroes of fable; in that thoſe were only admitted into *temples* after their death, whereas Auguſtus had his *temples* and altars while living *. See APOTHEOSIS, and CONSECRATION.

> *Præſenti tibi maturos largimur honores;*
> *Jurandaſque tuum per nomen ponimus Aras.* Epiſt. ad Aug.

* Suetonius, on this occaſion, gives an inſtance of the modeſty of that emperor, who would allow of no *temples* being erected to him in the city; and even in the provinces, where he knew it uſual to raiſe *temples* to the very proconſuls, refuſed any but thoſe erected in the name of Rome as well as his own. Vid. Suet. in Octav. c. 52.

TEMPLE, in architecture.—The ancient *temples* were diſtinguiſhed, with regard to their conſtruction, into various kinds; as,

TEMPLE *in antæ, Ædes in antis.* Theſe, according to Vitruvius, were the moſt ſimple of all *temples*, having only angular pilaſters, called *antæ*, or *paraſtatæ*, at the corners, and two tuſcan columns on each ſide the doors. See ANTA, and PARASTATA.

Tetraſtyle-TEMPLE, or ſimply *tetraſtyle*, was a *temple* that had four columns in front, and as many behind—as, the *temple* of Fortuna Virilis at Rome. See TETRASTYLE.

Proſtyle-TEMPLE, that which had only columns in its front, or fore-ſide—as that of Ceres at Eleuſis, in Greece. See PROSTYLE.

Amphiproſtyle, or double proſtyle-TEMPLE, that which had columns both before and behind, and which was alſo tetraſtyle. See AMPHIPROSTYLE.

Periptere-TEMPLE, that which had four rows of inſulated columns around, and was hexaſtyle, *i. e.* had ſix columns in front—as the *temple* of Honour at Rome. See PERIPTERE.

Diptere-TEMPLE, that which had two wings, and two rows of columns around, and was alſo octoſtyle, or had eight columns in front—as that of Diana at Epheſus. See DIPTERE.

Pſeudo Diptere TEMPLE, } See { PSEUDO *Diptere*.
Hypæthros TEMPLE, } See { HYPÆTHROS.
Monoptere TEMPLE, } See { MONOPTERE.

TEMPLES, among us, denote two inns of court, thus called, becauſe anciently the dwelling-houſe of the *knights-templars*. See TEMPLAR.

At the ſuppreſſion of that order, they were purchaſed by ſome profeſſors of the common law, and converted into hoſpitia, or inns. See INN.

They are called the *inner* and *middle temple*, in relation to Eſſex-houſe, which was alſo a part of the houſe of the *templars*, and called the *outer temple*, becauſe ſituate without Temple-Bar.

In the *middle temple*, during the time of the *templars*, the king's treaſure was kept: as was alſo that of the kings of France in the houſe of the *templars* at Paris.

The chief officer was the maſter of the *temple*, who was ſummoned to parliament in 49 Hen. III. And from him the chief miniſter of the *temple*-church is ſtill called *maſter of the temple*. See MASTER.

TEMPLERS. See the article TEMPLARS.

TEMPLES, TEMPORA, in anatomy, a double part of the head, reaching from the forehead and eyes to the two ears. See HEAD.

The *temples* are chiefly formed of two bones, called *oſſa temporis*. See TEMPORIS *Oſſa*.

Theſe parts, according to phyſicians, were called *tempora*, from their ſhewing the age or time of man, by the colour of the hair, which turns white in this part before any other; which Homer ſeems to have been aware of, by his calling men *Poliocrotaphi*, *q. d.* grey-templed.

TEMPORAL, TEMPORALIS, a term frequently uſed for *ſecular*—in which ſenſe it ſtands oppoſed to *eccleſiaſtical*. See SECULAR.

Pope Boniface wrote to Philip the Fair of France, that he was ſubject to him both in ſpirituals, and *temporals*.—At preſent all the doctors on this ſide the Alps own the ſupremacy of kings in temporals. See SUPREMACY.

TEMPORAL *Action*, } See the articles { ACTION.
TEMPORA *Augment*, } See the articles { AUGMENT.

TEMPORALIS, in anatomy, a muſcle, which ariſes by a ſemi-circular fleſhy beginning, from a part of the os frontis, the lower part of the parietale, and upper part of the temporale; from whence going under the zygoma, and gathering together, as in a centre, it is inſerted, by a ſhort and ſtrong tendon, into the proceſſus corone of the lower jaw, which it pulls upwards.—See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 12. *fig.* 6. *n.* 2. *fig.* 7. *n.* 1.

This muſcle is alſo called *crotaphytes*, and is covered with a ſtrong tendinous faſcia. See CROTAPHYTES.

TEMPORALITIES, or TEMPORALTIES, the temporal revenues of an eccleſiaſtic; particularly, ſuch lands, tenements, or lay-fees, tithes, *&c.* as have been annexed to biſhops ſees by our kings, or other perſons of high rank in the kingdom. See BISHOP, and CUSTOS.

The *temporalities* of a biſhop, *&c.* ſtand oppoſed to his ſpiritualities. See SPIRITUALITIES.

The canoniſts on the other ſide the Alps anciently gave the pope a power over the *temporalities* of kings. Yet pope Clement V. owned frankly, that his predeceſſor Boniface VIII. had exceeded the juſt bounds of his authority, in meddling with the *temporalities* of the king of France. Fevret.

TEMPORALIUM *Cuſtos*,	See	CUSTOS.
TEMPORALIUM *Reſtitutione*,		RESTITUTIONE.
TEMPORARY *Fortification*,		FORTIFICATION.
TEMPORARY *Hours*,		HOUR.

TEMPORIS *Os*, TEMPLE-*Bone*, a bone on each ſide the head: thus denominated from its ſituation in the temples. See TEMPLE.

The figure of the *os temporis* is nearly circular: the fore and upper parts are very thin, conſiſting only of one table: the lower and hind parts are thick, hard, and uneven. See CRANIUM.

It is joined to the os ſincipitis, by the ſquammous ſuture: whence, in that part, it is called *os ſquammoſum*. Its lower part is joined to the os occipitis, and ſphenoides: to which latter, as likewiſe to the bones of the upper jaw, it is joined by means of certain proceſſes, and in that part is called *os petroſum*.—See *Tab. Anat.* (Oſteol.) *fig.* 2. *lit. b.* & *fig.* 13. *lit. a.* See alſo the article PETROSUM.

Each of the *oſſa temporum* has two ſinus's; the exterior whereof is lined with a cartilage, and receives the proceſs of the lower jaw; the interior receives the lower part of the ſinus lateralis of the dura mater. Each likewiſe has four proceſſes; the *os jugale*, *proceſſus mamillaris*, *ſtyloides*, and *os petroſum*. See each deſcribed under its proper article, MAMILLARIS, *&c.*

TEMPTATION, TENTATIO, in theology, an induction, or ſolicitation to evil; whether ariſing from the world, the fleſh, or the devil.

Myſtic divines ſpeak of *profitable temptations*, which are thoſe trials the ſoul is to paſs through, before it arrive at the unitive life, and the peace within.—When it ſurmounts that dryneſs and darkneſs it falls into, through a ſuſpenſion of the effects of divine love, and can reſiſt the world, and all the allurements it preſents; thoſe *temptations* are called *tentationes utiles* and *fructuoſæ*.

TEMPTATION, TENTATIO, in our ancient law books, is uſed for a trial, proof, or aſſay.—*Tentatio panis fiat bis in anno.* Chart. Edw. I. See ASSAY, *&c.*

TENABLE,* in the military art, ſomething that may be defended, kept, and held againſt aſſailants.

* The word is French, formed from *tenir*; as that from the Latin, *tenere, to hold.*

Tenable is little uſed, but with a negative: when a place is open on all ſides, and its defences all beaten down, it is no longer *tenable*. When the enemy has gained ſuch an eminence, this poſt is not *tenable*.

TENAILLE, in fortification, a kind of out-work, conſiſting of two parallel ſides, with a front, wherein is a re-entering angle. See OUT-WORK, and ANGLE.

In ſtrictneſs, that angle, and the faces which compoſe it, are the *tenaille*. See QUEUE *d'aronde*.

The *tenaille* is of two kinds: *ſimple* and *double*.

Simple, or ſingle TENAILLE, is a large out-work, as DABCE, conſiſting of two faces or ſides AB and CB, including a re-entering angle B.—See *Tab. Fortif. fig.* 6. & *fig.* 21. *lit. d.*

Double, or flanked TENAILLE, is a large out-work conſiſting of two ſimple *tenailles*, or three ſalians, and two re-entering angles, FGH and HIK.—See *Tab. Fortif. fig.* 7. and 21. *lit. e.* See alſo FLANKED.

The great defects of *tenailles* are, that they take up too much room, and on that account are advantageous to the enemy; that the angle B is undefended; the height of the parapet hindering the ſeeing down into it, ſo that the enemy can lodge there under covert: and that the ſides AD and CE are not ſufficiently flanked.

For theſe reaſons, *tenailles* are now excluded out of fortification by the beſt engineers; and never made, but where there wants time to form a horn-work.

TENAILLE *of the Place*, is the front of the place, comprehended between the points of two neighbouring baſtions; including the curtin, the two flanks raiſed on the curtin, and the two ſides of the baſtions which face one another. See BASTION, CURTIN, *&c.* So that the *tenaille* is the ſame with what is otherwiſe called the *face of a fortreſs*. See FACE, and FORTIFIED *Place*.

TENAILLE *of the Ditch*, is a low work raiſed before the curtin, in the middle of the foſs or ditch. See DITCH.

It is of three ſorts: the firſt is compoſed of a curtin, two flanks, and two faces: the rampart of the curtin, including the parapet and talus, is but five fathom thick, but the rampart of the flanks and faces ſeven.—See *Tab. Fortif. fig.* 21. *lit. e.*

The ſecond, which Vauban ſaith he found to be of very good defence, is compoſed only of two faces, made on the lines of defence, whoſe rampart and faces are parallel.

The third ſort only differs from the ſecond in this, that its rampart is parallel to the curtin of the place.

All three ſorts are good defences for the ditch, and lie ſo low, that they cannot be hurt by the beſiegers cannon, till they are maſters of the covert-way, and have planted their artillery there.

TENANCY, a habitation or houſe to live in, or a tenement, or poſſeſſion held of another. See TENEMENT, and TENANT.

Entire TENANCY. See the article ENTIRE.

TENANT, or TENENT, TENENS, in law, one that holds or poſſeſſes lands and tenements of ſome lord or landlord, by any kind of right either in fee, for life, years, or at will. See POSSESION, TENURE, LORD, *&c.*

The term *tenant* is uſed with divers additions—thus, *Tenant in dower*, is ſhe that poſſeſſes lands by virtue of her dower. See DOWER.

Tenant per ſtatute-merchant, he that holds land forfeited to him by virtue of a ſtatute. See STATUTE-*Merchant*.

Tenant in frank-marriage, is he that holds lands or tenements by virtue of a gift thereof made to him upon marriage between him and his wife. See FRANK-*Marriage*.

Tenant by courteſy, holds for his life, by reaſon of a child begotten by him of his wife, being an inheretrix and born alive. See COURTESY.

Tenant by elegit, holds by virtue of the writ called an *elegit*. See ELEGIT.

Tenant in mortgage, holds by means of a mortgage. See MORTGAGE.

Tenant by verge, in ancient demeſne, is he who is admitted by the rod in court to lands in ancient demeſne. See VERGE, and *Ancient* DEMESNE.

Tenant by Copy of court-roll, is one admitted *tenant* of any lands, *&c.* within a manour, which time out of mind have been demiſed according to the cuſtom of the manour. See COPY-HOLD.

Tenant paravail. See the article PARAVAIL.

Tenant by charter, is he that holdeth by feoffment in writing or other deed. See CHARTER, and FREEHOLD.

Tenant in capite or chief, holdeth of the king in right of his crown. See CAPITE.

Tenant of the king, is he that holdeth of the perſon of the king.

Joint TENANTS, thoſe who have equal right in lands or tenements by virtue of one title. See JOINTENANT.

TENANTS *in common*, thoſe who have equal right, but hold by divers titles.

Particular TENANT, he that holds only for his term.

Sole TENANT, is he who hath no other joined with him. See SOLE.

TENANT *by execution*, is he who holds by virtue of an execution upon any ſtatute, recognizance, *&c.*

Cuſtomary TENANT,	See the articles	CUSTOMARY,
Terre-TENANT,		TERRE-*Tenant*,
Very TENANT, .		VERY.

Anciently, there were alſo *tenant by knight-ſervice*, *tenant in burgage*, *tenant in ſocage*, *tenant in frank-fee*, *tenant in villenage*—and there are ſtill *tenant in fee-ſimple*, *tenant in fee-tail*, *tenant upon ſufferance*, *&c.* See KNIGHTS *Service*, BURGAGE, SOCAGE, VILLENAGE, FEE-*ſimple*, TAIL, SUFFERANCE, *&c.*

TENANT, or TENAN, in heraldry, is uſed for ſomething that ſuſtains, or holds up the ſhield, or armory; and is generally ſynonymous with *ſupporter*. See SUPPORTER.

The difference which ſome authors make between the two is, that *tenants* are ſingle, and *ſupporters* double, one placed on each ſide the ſhield. But the proper diſtinction ſeems to conſiſt in this, that *tenants* are human figures, and ſupporters figures of beaſts.

There are various forms of *tenants*, as well as of ſupporters, *viz.* angels, maids, religious, ſavages, Moors, *&c.*

The firſt *tenants*, F. Meneſtrier obſerves, were trunks, or branches of trees; to which the eſcutcheons were faſtened by ſtraps and buckles. Afterwards, the knights were repreſented as holding their own eſcutcheons, which were either hung to their neck, or elſe they leaned on them.

The origin of *tenants* and ſupporters is referred to the ancient tournaments, wherein the cavaliers had their arms bore by ſervants diſguiſed like ſavages, Moors, fabulous deities, bears, lions, *&c.* See SUPPORTER.

TENAR, in anatomy. See the article THENAR.

TENCH-*Fiſhing*. See the article *Tench*-FISHING.

TENDER, in a legal ſenſe, ſignifies as much, as to offer, or endeavour the performance of any thing, in order to ſave the penalty or forfeiture incurred by non-performance. See UNCORE.

Thus, to *tender rent*, is to offer it at the time and place where and when it ought to be paid: which will ſave the condition for that time, though the landlord refuſe to accept it. See ACCEPTANCE.

TENDER, in the ſea language, is a veſſel, attending on ſome other larger, and more conſiderable one. See BOAT, SHALOOP, &c.

TENDINOSUM *Centrum*. See the article CENTRUM.

TENDON, TENDO, in anatomy, that hard, white extreme part of a muſcle, whereby it is faſtened to the bone. See MUSCLE.

Moſt muſcles have, at leaſt, two *tendons*, one at each extreme: that faſtened to the part toward which the motion is to be performed, is called the *head of the muſcle*; and that faſtened to the part drawn toward the other, the *tail of the muſcle*. See HEAD, and TAIL.

The fibres, whereof the *tendons* conſiſt, have been ſuppoſed to be nervous; but they are now found to be no other than productions of the ſame fibres, which make the belly or body of the muſcle. All the difference between them is, that in the belly of the muſcle they are lax, and at a diſtance from each other; whereas in the *tendon*, they are more cloſely and firmly connected. See FIBRE.

Their whiteneſs proceeds wholly from the blood's being excluded, by the tightneſs of their contexture: in effect, there is the ſame difference between them, that there is between a ſkein of thread, and a cord made of the ſame thread.

The fibres of the *tendons* undergo no contraction, or dilatation, as thoſe of the belly of the muſcle do; they act as mere cords, to draw the parts towards each other.

Suture of a TENDON, is a very delicate operation in chirurgery. It had been abandoned a long time, and was not re-eſtabliſhed till the laſt century by J. Bienaiſe. See SUTURE.

TENDON *of Achilles*. See the article ACHILLES.

Mr. Cowper (in the *Philoſophical Tranſactions*) gives us an account of a cure of the *great tendon*, or *tendon* of Achilles, above the heel, after an entire diviſion, by ſtitching.

Puncture of a TENDON. See the article PUNCTURE.

TENEBRÆ, *Darkneſs*, in the Romiſh church, a ſervice performed on the Wedneſday, Thurſday, and Friday before Eaſter, in commemoration of the agony of our Saviour in the garden.

TENEMENT, TENANCY, in law, a houſe or lands, depending on a manour or lordſhip: or a fee, or farm, held of a ſuperior lord, and which he may recall, when the term or condition is expired. See LORD, TENANT, MESSUAGE, &c.

Frank TENEMENT, is any lands, houſe, office, or the like wherein a man has eſtate for life, or in fee. See FRANK, &c.

Baſe TENEMENT, is where a man holds lands, &c. at the will of the lord. See BASE.

Yet Kitcin, Briton, &c. make *frank tenement* and *baſe tenement* oppoſites; on which footing *frank tenement* ſhould be where the tenant is at liberty to quit it when he pleaſes.

TENEMENTARY *Lands*, among our anceſtors, were the outlands of manours, which the Saxon thanes or nobles let out to tenants under arbitrary rents, and ſervices. See TENANT.

TENEMENTIS *Legatis*, in law, a writ which lies in London and other places, where the cuſtom is to deviſe *tenements* by laſt will, as well as perſonal goods and chattels, for the hearing of any cauſe relating thereto.

TENENT. See the articles TENANT, and TENET.

TENENTES *Nativi*. See the article NATIVI.

TENENTIBUS *in aſſiſa non onerandis*, a writ which lies for him to whom a diſſeſſor has made-over land, whereof he diſſeiſſed another; requiring that he be not diſturbed in aſſiſe for the damages awarded, if the diſſeſſor have wherewithal to ſatisfy them.

TENESMUS,* ΤΕΙΝΕΣΜΟΣ, in medicine, a continual painful inclination to go to ſtool; yet without voiding any thing, unleſs, ſometimes, a little purulent, bloody ſlime.

* The word is formed from the Greek, *τεινειν*, *tendere, to ſtretch, bend*, in regard thoſe attacked with this diſeaſe feel a continual tenſion in the fundament.

The cauſe of the *teneſmus* is a ſharp, pungent humour, irritating the inteſtinum rectum, and exciting thoſe troubleſome endeavours to evacuate.—Thoſe affected with the ſtone are alſo ſubject to the *teneſmus*, from the communication, or conſent between the bladder and the rectum.

The cure of a *teneſmus* depends on proper evacuations and aſtringents; the former always preceding the latter; ſuch are bleeding, if plethoric; and gentle cathartics, eſpecially of the powder of rhubarb, &c.—An emetic of the Indian root, *ipecacuanha*, has been found of great ſervice in a long ſtanding *teneſmus*; for the augmenting one evacuation is the leſſening of another, and it becomes ſo much the more ſerviceable, as they happen to be contraries.

The reſtringents are ſuch as are of uſe in other fluxes. See DIARRHÆA, DYSENTERY, &c.

TENET, or TENENT, a particular opinion, dogma, or doctrine, profeſſedly held by ſome divine, philoſopher, &c. See DOGMA, OPINION, &c.

The diſtinguiſhing *tenets* of the ſeveral ſects in religion and philoſophy, ſee under the names of the ſects themſelves. See alſo PHILOSOPHER, SECT, &c.

TENIA. See the article TÆNIA.

TENMENTALE, or TENMANTALE, in our ancient cuſtoms, originally ſignifies the number of ten men; which number, in the time of the Engliſh Saxons, was called a *decennary*; and ten decennaries made what we call a hundred. See FRIBURGH, FRANK-PLEDGE, HUNDRED, &c.

Theſe ten men were bound for each other to preſerve the public peace; and if any of them was found guilty of a breach thereof, the other nine were to make ſatisfaction, or to bring the criminal before the king. See DECENNIER, TITHING, &c.

TENMENTALE was alſo uſed for a duty, or tribute paid to the king, conſiſting of two ſhillings for each plough-land; probably thus called, by reaſon each perſon of the decennary was bound to ſee it paid.

TENNE, TENNY, or TAWNY, in heraldry, a bright colour, made of red and yellow mixed; ſometimes alſo called *bruſk*, and expreſſed in engraving by thwart or diagonal ſtrokes or hatches, beginning from the ſiniſter chief, like purpure, and marked with the letter T. See PURPURE.

In the coats of all below the degree of nobles, it is called *tenny*; but in thoſe of nobles, it is called *hyacinth*; and in princes coats, the *dragon's head*.

TENON, in building, &c. the ſquare end of a piece of wood, or metal, diminiſhed by one third of its thickneſs, to be received into a hole in another piece, called the *mortiſe*, for the jointing or faſtening the two together. See MORTISE.

Among joiners, &c. the *tenon* is made in various forms, ſquare, dove-tailed, for double mortiſes, &c.

Vitruvius calls the *tenons*, *cardines*; dove-tailed *tenons* he calls *ſubſcudes*, or *ſecuriculæ*. See DOVE-*tail*.

TENON-*Saw*. See the article SAW.

TENOR, TENOUR, the purport, or contents of a writing, or inſtrument in law, &c.

Warrants iſſued for the confirmation of ſentences, expreſs, that they ſhall be executed according to their form, and *tenor*.—It was impoſſible to retain ſo long a ſpeech word for word, but the ſubſtance, the *tenor* is this.

TENOR, TENORE, in muſic, the firſt mean or middle part; or that which is the ordinary pitch or tenor of the voice, when not either raiſed to the treble, or lowered to the baſs. See PART, MUSIC, and COUNTER-TENOR.

The *tenor* is frequently marked in thorough baſſes with the letter T.—The *tenor* is a part which almoſt all grown perſons can ſing. But as ſome have a greater compaſs of voice upwards, others downwards, others are confined to a kind of medium, and others can go equally either higher or lower; hence the French muſicians make a variety of *tenors*—as, a *counter tenor*, or *low tenor*; a *mean tenor*, a *natural tenor*, and an *upper tenor*: to which is alſo added, a *re-acting tenor*, *viol tenor*, *violin tenor*, &c.

The Italians uſually diſtinguiſh no more than two kinds of *tenors*; viz. *tenore primo*, or Pº or Iº, which anſwers to our *upper tenor*; and *tenore ſecundo*, or 2º or IIº, which is our *natural tenor*; confounding the *counter tenors*, &c. under the name *baritono*.

TENOR, or TENORISTA, is alſo uſed for a perſon who ſings the *tenor* part in concert—alſo for an inſtrument proper to play it.

TENORE *Indictamenti mittendo*, is a writ whereby the record of an indictment and the proceſs thereupon is called out of another court into the King's-bench.

TENOUR. See the article TENOR.

TENSE, TIME, in grammar, an inflexion of verbs, whereby they are made to ſignify, or diſtinguiſh the circumſtance of time of the thing they affirm, or attribute. See VERB.

The affirmations made by verbs are different as to point of time; ſince we may affirm a thing *is*, or *was*, or *will be*: hence, a neceſſity of a ſet of inflexions, to denote thoſe ſeveral times; which inflexions, our Engliſh grammarians call by a barbarous word *tenſes*, from the French *temps*; moſt other languages call them ſimply *times*.

There are but three ſimple *tenſes*: the *preſent*, as *I love*, *amo*; the *preter*, *preterit*, or *paſt*, as, *I have loved*, *amavi*; and the *future*, as, *I will love*, *amabo*. See PRESENT, &c.

But in regard, in the *preter tenſe* one may either expreſs the thing as juſt done or paſt, or indefinitely and barely that it was done: hence, in moſt languages, ariſe two kinds of *preterits*; the one *definite*, marking the thing to be preciſely done; as, *I have written*, *I have ſaid*: and the other *indefinite*, or *aoriſt*, denoting a thing done indeterminately; as, *I wrote*, *I went*. See PRETER, AORIST, &c.

The *future tenſe* admits of the ſame variety. See FUTURE.

Beſide the three ſimple *tenſes*, others have been invented, called *compound tenſes*; expreſſing the relation of the ſimple ones to each other.—The firſt expreſſes the relation of the *paſt* to the *preſent*, and is called the *preterimperfect tenſe*, becauſe it does not mark the thing ſimply, and properly as done, but as imperfect,

perfect, and preſent with reſpect to another thing paſt: as, *I was at ſupper when he entered*; *Cum intravit, cænabam.* See IMPERFECT.

The ſecond compound *tenſe* marks the time paſt doubly, and is therefore called *pluſquamperfect tenſe*; as, *I had ſupped, cænaveram.*

The third compound *tenſe* denotes the future with reſpect to the paſt; as, *I ſhall have ſupped, cænavero.*

The ſeveral *tenſes* or times, it is to be obſerved, are properly denoted in the Greek and Latin by particular inflexions; in the Engliſh, French, and other modern tongues, the auxiliary verbs *to be* and *to have*, *etre* and *avoir*, are called in.

As to the oriental languages, they have only two ſimple *tenſes*, the *paſt* and *future*, without any diſtinctions of imperfect, more than perfect, *&c.* which renders thoſe languages ſubject to abundance of ambiguities which others are free from.

TENSION, TENSIO, the ſtate of a thing bent, or the effort made to bend it. See DISTENSION.

Animals only ſuſtain and move themſelves by the *tenſion* of their muſcles, and nerves. A chord or ſtring gives an acuter or a deeper ſound, as it is in a greater or leſs degree of *tenſion.* See CHORD, SOUND, *&c.*

TENSOR, in anatomy. See the article EXTENSOR.

TENT,* TABERNACLE, a pavillion, or portable lodge, under which to ſhelter in the open field, from the injuries of the weather. See TABERNACLE.

* The word is formed from the Latin, *tentorium*, of *tendo, I ſtretch*, in regard *tents* are uſually made of canvas ſtretched out, and ſuſtained by poles, with cords and pegs.

Armies encamp under *tents*: moſt of the Tartars and Arabs are wandering people, that lodge under *tents.* See HORD, NOMADES, *&c.*

The Hebrews lodged forty years under *tents* in the deſart; which gave occaſion to the ſcenopegy or feaſt of tabernacles. See SCENOPEGY.

Dark TENT. See the article DARK.

TENT, TURUNDA, in chirurgery, is a roll of lint, made in a particular form, put into wounds whoſe ſuppuration is not perfect, or where there is a quantity of matter contained in the tumour, more than what comes out at the firſt dreſſing, *&c.* See WOUND, *&c.*

Tents are uſed in order to hinder the cloſing too ſoon. But ſeveral chirurgical writers, and particularly the author of the *Hoſpital Surgeon*, gives us numerous inſtances, wherein the uſe, eſpecially of hard *tents*, has proved prejudicial in protracting the cure, bringing on inflammations, ſinus's, mortifications, *&c.* in wounds and ulcers.—To remedy this, he propoſes, that the liniments, *&c.* be made of a liquid conſiſtence, either naturally, or by warming them; and that where *tents* may ſeem indiſpenſably neceſſary, as in large cavities, the orifice may be enlarged, and ſoft doſils put in inſtead of them, which will prevent the miſchiefs commonly attending *tents.* See ULCER.

TENTATIVE, is ſometimes uſed adjectively: thus we ſay, a *tentative method*, meaning a kind of unartful or indirect method which only proceeds by trying.

TENTATIVE is alſo uſed ſubſtantively, for an eſſay, or effort, whereby we try our ſtrength, or ſound an affair, *&c.* to ſee whether or no it will ſucceed.

In the French univerſities, TENTATIVE is the firſt theſis or act which a ſtudent in the theology ſchool holds to ſhew his capacity: if he anſwers well, the degree of bachelor is conferred on him. See ACT, THESIS, DEGREE, BACHELOR, *&c.*

TENTER, TRYER, or PROVER, a machine uſed in the cloth manufactory, to ſtretch out the pieces of cloth, ſtuff, *&c.* or only to make them even, and ſet them ſquare. See CLOTH, *&c.*

It is uſually about four feet and a half high, and for length exceeds that of the longeſt piece of cloth.—It conſiſts of ſeveral long ſquare pieces of wood, placed like thoſe which form the barriers of a manege, ſo, however, as that the lower croſs-piece of wood may be raiſed or lowered, as is found requiſite, to be fixed at any height, by means of pins.—Along the croſs-pieces, both the upper and under one, are hooked nails, called *tenter-hooks*, driven in from ſpace to ſpace.

To put a piece of cloth on the TENTER: while the piece is yet quite wet, one end is faſtened to one of the ends of the *tenter*; then it is pulled by force of arms towards the other end, to bring it to the length required: that other end being faſtened, the upper liſt is hooked on to the upper croſs-piece, and the loweſt liſt to the lower croſs-piece, which is afterwards lowered by force, till the piece have its deſired breadth.—Being thus well ſtretched, both as to length and breadth, they bruſh it with a ſtiff hair-bruſh, and thus let it dry.—Then they take it off; and till they wet it again, it will ſtill retain the width and breadth the *tenter* gave it.

TENTH, *Decima.* See the article TITH.

TENTH *pair of Nerves.* See the article NERVE.

TENURE, TENURA, in law, the manner or condition wherein a tenant holds lands, or tenements of his lord; or the ſervices performed to the lord, in conſideration of the uſe and occupancy of his lands. See TENANT, LORD, *&c.* See alſo NON-*tenure.*

The kinds of ſervice, and conſequently of *tenures*, are almoſt infinite. See SERVICE.

Thoſe for lands held of the king, are either *great*, or *petty ſerjeanty*, in *capite*, *knights-ſervice*, &c. See SERJEANTY, CAPITE, KNIGHTS-SERVICE, *&c.*

Thoſe held of the lords were very various, *baſe*, *frank*, &c. by *homage*, *ſocage*, &c. See BASE, FRANK, *&c.*—The common *tenures* at this day are fee-ſimple, fee-tail, by curteſy, in dower, for life, or for years, and by copy of court-roll. See FEE-TAIL, COURTESY, DOWER, COPYHOLD, *&c.*

Barons by ancient TENURE. See the article BARON.

TEREBINTHINA, in medicine, natural hiſtory, *&c.* See the article TURPENTINE.

TEREBRA. See TREPANUM.

TERES, in anatomy, a name given to two muſcles of the arms, called alſo *rotundi*; diſtinguiſhed by *major*, and *minor.*

TERES, or *rotundus major*, ariſes from the lower angle of the baſis of the ſcapula, and aſcending obliquely upwards, in a round ſmooth body, under the head of the longus, is inſerted with a ſhort flat tendon into the neck of the os humeri.—See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 40.

TERES, or *rotundus minor*, called alſo *tranſverſalis*, is frequently wanting, or at leaſt, ſo confounded with the infraſpinatus, that it is loſt therein. It ariſes from the inferior angle of the ſcapula, and aſcending obliquely in a round fleſhy body, paſſes over the upper head of the longus, and is inſerted by a ſhort flat tendon below the os humeri.

TERES *Pronator Radii.* See the article PRONATOR.

TERGIFŒTOUS *Plants*, ſuch as bear their ſeeds on the backſides of their leaves. See PLANT, and SEED.

Such are the capillaries. See the article CAPILLARY.

TERM, TERMINUS, the extreme of any thing, or that which bounds and limits its extent. See EXTREME.

TERM, in geometry, is ſometimes uſed for a point, ſometimes for a line, *&c.*—A line is the *term* of a ſuperficies: and a ſuperficies, of a ſolid. See POINT, LINE, SURFACE, *&c.*

This is what the ſchools call *terminus quantitatis.*

TERM, in law, ſignifies a boundary or limitation of time, or eſtate.

In this ſenſe we ſay, a leaſe for term of life, for term of years, *&c.* See LEASE, and POST-TERM.

TERMS,* TERMES, TERMINI, in architecture, denote a kind of ſtatues, or columns adorned a-top with the figure of a man's, woman's, or ſatyr's head, as a capital; and the lower part ending in a kind of ſheath, or ſcabbord. See COLUMN, *&c.*

* Some write the word *thermes*, from *hermes*, a name the Greeks gave the god Mercury; whoſe ſtatue, made after this manner, was placed in ſeveral of the croſs-ways in the city of Athens, *&c.* Others bring the etymology of the word from the Roman god *Terminus*, the protector of land-marks, whoſe ſtatue (made without hands or feet, that he might not change his place) was uſed to be planted at the bounds of lands to ſeparate them.

Terms are ſometimes uſed as conſoles, and ſuſtain entablatures; and ſometimes as ſtatues, to adorn gardens. See STATUE.

Of theſe *termini*, the architects make great variety, *viz. angelic*, *ruſtic*, *marine*, *double*, in *buſt*, &c.

Milliary TERMS, *termini milliaries*, among the ancient Greeks, were the heads of certain divinities, placed on ſquare land-marks of ſtone, or on a kind of ſheath, to mark the ſeveral ſtadia, *&c.* in the roads. Theſe are what Plautus calls *lares viales.* See VIALES.

They were uſually dedicated to Mercury, whom the Greeks believed to preſide over the highways.

Some of them were repreſented with four heads; ſuch as we ſtill ſee in Rome, at the end of the Fabrican bridge, which is hence called *ponte de quattro capi.* It is known that Mercury was thus repreſented; and alſo called by the Latins *Mercurius quadrifons*, as being ſuppoſed the firſt who taught men the uſe of letters, muſic, wreſtling, and geometry. See HERMES.

TERMS are alſo uſed for the ſeveral times or ſeaſons of the year, wherein the tribunals, or courts of judicature, are open to all who think fit to complain of wrong, or to ſeek their own by due courſe of law, or action. See COURT, DAY, LAW, FASTUS, *&c.*

In contra-diſtinction to theſe, the reſt of the year is called *vacation.* See VACATION.

Of theſe *terms* there are four in every year, during which time matters of juſtice are diſpatched, *viz.* See NON-TERM.

Hillary Term, which, at London, begins the 23d day of January; or if it be Sunday, the next day after, and ends the 12th of February following.

Eaſter-Term, which begins the Wedneſday fortnight after Eaſter-day, and ends the Monday next after Aſcenſion-day.

Trinity-term, beginning the Friday next after the Trinity-ſunday, and ending the Wedneſday fortnight after.

Michaelmas-Term, which begins the 23d of October, and ends the 28th of November following.

Each of theſe *terms* have alſo their returns. See RETURNS.

Oxford-TERMS. *Hillary* or *Lent-term* begins January 14, and ends the Saturday before Palm-ſunday.—*Eaſter-term* begins the 10th day after Eaſter, and ends the Thurſday before Whit-ſunday.—*Trinity-term* begins the Wedneſday after Trinity-ſunday, and ends after the act, ſooner or later, as the vice-chancellor and convocation pleaſe.—*Michaelmas-term* begins October the 10th, and ends December the 17th.

Cambridge-**TERMS**. *Lent-term* begins January the 13th, and ends the Friday before Palm-ſunday.—*Eaſter-term* begins the Wedneſday after Eaſter-week, and ends the week before Whit-ſunday.—*Trinity-term* begins the Wedneſday after Trinity-ſunday, and ends the Friday after the commencement.—*Michaelmas-term* begins October the 10th, and ends December the 16th.

Scottiſh-**TERMS**. In Scotland, *Candlemas-term* begins January the 23d, and ends February the 12th.—*Whitſuntide-term* begins May the 25th, and ends June the 15th.—*Lammas-term* begins July the 20th, and ends Auguſt the 8th.—*Martinmas-term* begins November the 3d, and ends November the 29th.

Iriſh-**TERMS**. In Ireland the *terms* are the ſame as at London, except *Michaelmas-term*, which begins October the 13th, and adjourns to November the 3d, and thence to the 6th.

TERM, in grammar, denotes ſome word, or expreſſion, in a language. See WORD.

The word *term*, *terminus*, is borrowed metaphorically, by the grammarians and philoſophers, from the meaſurers or ſurveyors of lands: as a field is defined and diſtinguiſhed by its *termini*, or limits, ſo is a thing or matter ſpoken of by the word or *term* it is denoted by. See DEFINITION.

Some of our philoſophers complain loudly of the great uſe, or rather abuſe, of vague and general *terms*, which have no preciſe, definite ſignification.—To diſtinguiſh theſe, F. Malebranche obſerves, that every thing that is, (whether it have actual exiſtence, or not) and of conſequence every thing that is intelligible, is either a being, or a mode and manner of being: where, by being is meant whatever is abſolute, or which may be conceived alone, and without relation to any other thing; and by manner of being, whatever is relative, or which cannot be conceived alone.

Now, there are two kinds of manners of being; the one conſiſting in the relation of the parts of a whole, to ſome part of the ſame whole; the other in the relation of one thing to another: of the firſt kind is the roundneſs of a piece of a wax; and of the ſecond, the motion or ſituation of that ſame wax.

If then, every thing, that is intelligible, be reducible either to beings, or manners of being, it is evident, every *term* which does not ſignify either of thoſe things, ſignifies nothing; and that every *term* which does not ſignify either a being, or a manner of being, is an obſcure and confuſed *term*.

In metaphyſics, the uſe of ſuch *terms* is ſometimes neceſſary and allowable, as in ſpeaking of the divine perfections, *&c.* But in phyſics it is always miſchievous, and yet nothing more common; *e. gr.* when we ſay, that bodies tend to their centre, that they fall by their weight, that they riſe by their levity, that they move by their nature, that they change ſucceſſively their forms, that they act by their virtues, qualities, faculties, *&c.* we uſe *terms* which ſignify nothing; and all theſe propoſitions are abſolutely falſe in the ſenſe moſt philoſophers underſtand them.

There is no centre, in the ſenſe commonly meant; and the *terms*, *weight*, *form*, *nature*, *quality*, and the like, do not awaken any idea either of a being, or manner of being: they are *terms* void of ſenſe, and which perſons of underſtanding ſhould always avoid.

Scientia inſenſati inenarrabilia verba.

TERM, in the arts, or **TERM** *of art*, is a word which, beſides the literal and popular meaning which it has, or may have in common language, bears a further and peculiar meaning in ſome art, or ſcience. See ART.

Or, a *term* is a word which has one or more meanings beſide its grammatical one; or which has a peculiar force or import in the language of ſome particular ſcience, or art.

A word then becomes a *term*, when its idea is rendered more complex, conſiſts of more parts, and includes more ſpecial circumſtances on ſome occaſions than on others.

It is this greater complexneſs, this exceſs of conſtituent parts in the idea, that denominates it a *term* in the general.

Further, as the parts of the idea ſignified by any word are arbitrary, and as one may not only add new parts to thoſe contained in the literal meaning, but alſo ſuper-add others to them, alter them, extend them, and otherwiſe modify them at pleaſure: hence the ſame word becomes a term of this or that art, or both, as the inventors and improvers of thoſe arts have thought fit to adopt it for the common baſis of certain ideas, and to modify and circumſtantiate its meaning to the uſe of their reſpective arts.

See the nature and office of a *term* further illuſtrated in the preface to this work. See alſo the article DEFINITION.

Complex TERMS,	See the articles	COMPLEX.
Equivalent TERMS,		EQUIVALENT.
General TERMS,		GENERAL.
Relative TERMS,		RELATIVE.
Univocal TERMS,		UNIVOCAL.

TERM *in Logic.*—A propoſition is ſaid to conſiſt of two *terms*, *i. e.* two principal and eſſential words, the *ſubject* and the *attribute*. See PROPOSITION.

A ſyllogiſm conſiſts of three *terms*, the *major*, *minor*, and *concluſion*. A ſyllogiſm containing four *terms*, is vicious. See SYLLOGISM.

TERMS *of an Equation*, in algebra, are the ſeveral monomes or members of which it is compoſed, wherein the unknown letter is found, but in different powers and degrees; for if the ſame unknown letter be found in ſeveral members in the ſame degree or power, they all paſs but for one *term*. See EQUATION.

Thus in this equation $aa+ab=R$, the three *terms* are aa, ab, and R: and in this $aa+ab+ac=Rd+dc$, the *terms* are aa, $ab+ac$, and $Rd+dc$, which are but three, becauſe $ab+ac$ having a in the ſame dimenſion in both parts, is taken but for one *term*.

The *firſt term* in any equation, is that where the unknown letter or root hath the higheſt dimenſion:—that term which hath the root in it of one dimenſion or power lower, is called the *ſecond term*; and ſo on.

TERMS *of Proportion*, in mathematics, are ſuch numbers, letters, or quantities as are compared one with another. See PROPORTION.

Thus if $\begin{matrix} 4 : 8 :: 6 : 12 \\ a : b :: c : d \end{matrix}$ then a, b, c, d, or 4, 8, 6, 12, are called the *terms* of the proportion: of which a or 4 is called the firſt *term*, b or 8 the ſecond *term*, &c. See SECOND.

A and *c* are alſo called the *antecedents*, and *b* and *d* the *conſequents*. See ANTECEDENT, and CONSEQUENT.

TERMS, or courſes, in medicine, the menſes, or woman's monthly purgations. See MENSES.

TERMINALIA,* in antiquity, feaſts celebrated by the Romans, in honour of the god Terminus. See FEAST.

* Varro is of opinion this feaſt took its name from its being at the *term* or end of the year: but Feſtus is of a different ſentiment, and derives it from the name of the deity in whoſe honour it was held. See TERMS.

In reality, the *terminalia*, or feaſt of land-marks, was held in honour of Jupiter, conſidered in the capacity of conſervator of land-marks or bounds. Dionyſius Halicarnaſſeus tells us, that it was Numa Pompilius who firſt conſecrated land-marks to Jupiter; and adds, that the ſame prince appointed an anniverſary day, wherein the country people aſſembling together on the bounds of the lands, ſhould offer ſacrifices in honour of the tutelary gods thereof.

The *terminalia* were held on the ſeventh, or, as Struvius will have it, on the tenth of the calends of March. No animal was to be ſacrificed herein, it being deemed unlawful to ſtain the land-marks with blood: they only offered ſacrifices of the firſt-fruits of the earth, and this in the open air, and on the ſpot where the land-marks were.

TERMINANDO *& Audiendo.* See the article AUDIENDO.

TERMINATION, TERMINATIO, in grammar, the ending of a word; or the laſt ſyllable thereof. See WORD, *&c.*

It is the different *terminations* of one and the ſame word on different occaſions, that conſtitute the different caſes, numbers, tenſes and moods, *&c.* See CASE, NUMBER, TENSE, *&c.*

TERMINER, in law. See the article OYER.

TERMINISTS, TERMINISTÆ, a ſect or party among the Calviniſts, whoſe particular tenets are reducible to five points.

1° That there are ſeveral perſons, both in and out of the church, to whom God has fixed a certain *term* before their death, after which he no longer wills their ſalvation, how long ſoever they live afterwards. 2° That God has fixed this fatal *term* of grace by a ſecret decree. 3° That this *term* once elapſed, he makes them no further offer of repentance or ſalvation, but takes away from his word all the power it might have to convert them. 4° That Pharaoh, Saul, Judas, moſt of the Jews, and many of the Gentiles were of this number. 5° That God ſtill bears with ſeveral of theſe ſort of people, and even confers benefits on them after the *term* expired; but that he does not do it with any intention they ſhould be converted. See CALVINISM, *&c.*

All the other proteſtants, and particularly the Lutherans, look on theſe articles with abhorrence, as repugnant to the goodneſs of God, as deſtructive to all Chriſtian virtue, and as contrary to ſcripture, particularly the following texts, Ezek. xviii. 23, 30, 31, 32. xxiii. 11. 1 Tim. iv. 1, 16. 2 Pet. iii. 9. Acts xvii. 30, 31. Mat. xi. 28. Iſa. lxvi. 2. Heb. iii. 7, 13. Rom. ii. 5, *&c.*

TERMINUS, ΤΕΡΜΑ, ſignifies a bound or limit.

TERMINUS *a quo*,* (in metaphyſics) denotes the place, from whence any motion commences; in contra-diſtinction from the other extreme, which is called the *terminus ad quem*.

* The ſchool-men call privation *a terminus a quo*, in ſpeaking of generation, which they conſider as a ſpecies of motion.

Ad **TERMINUM** *qui præteriit.* See AD.

Infra **TERMINUM** *quare ejecit.* See QUARE.

TERNARY *Meaſure.* See the article MEASURE.

TERRA, in geography.	See EARTH.
TERRA, in chymiſtry.	
TERRA, in natural hiſtory.	

TERRA *Damnata*	See	CAPUT MORTUUM & DAMNATA.
TERRA *Lemnia*		LEMNIAN.
TERRA *Japonica*		JAPON *Earth & Catechu.*
TERRA *Sigillata*		SIGILLATA.
TERRA *Merita*		TURMERIC.

TERRA *Petita*. See the article SUMMONS.

TERRA, in our ancient law-books, occurs in the ſenſe of land, or ground, joined with divers additions; as,

Terra Normanorum, the lands of ſuch Norman noblemen as were forfeited to the crown, by the owners taking part with the French king againſt king Henry III.—*Terra fruſca*, ſuch land as has not been lately ploughed.—*Terra gilliflorata*, land held by the tenure of paying a gilliflower yearly. See SERVICE.—*Terra veſtita*, land ſown with corn, and the crop ſtill remaining thereon.—*Terra teſtamentalis*, land held free from feudal ſervices, and deviſable by will.—*Terra culta*, land that is tilled and manured, in contra-diſtinction to *terra inculta*.—*Terra affirmata*, land let out to farm.—*Terra dominica*, or *indominicata*, demain land of a manour. See DEMAIN.—*Terra hydata*, was land ſubject to the payment of hydage. See HIDAGE.—*Terra lucrabilis*, land that may be gained from the ſea, or incloſed out of a waſte or common to particular uſes.—*Terra wainabilis*, tillage land.—*Terra warecta*, fallow land.—*Terra boſcalis*, wood land, &c. See LAND.

TERRA *extendenda*, is a writ directed to the eſcheator, &c. ordering him to inquire and find out the true yearly value of any land, &c. by the oath of twelve men, and certify the extent in Chancery. See EXTENT.

TERRA *Firma*, in geography, is ſometimes uſed for a continent, in contra-diſtinction to iſlands. See CONTINENT.

Thus Aſia, the Indies, and South America, are uſually diſtinguiſhed into *terra firma's* and iſlands. See ISLAND.

TERRA *a terra*.—Galleys and other veſſels are ſaid to go *terra a terra*, when they never go far from the coaſts. See COASTING.

The phraſe is alſo applied in the manage to horſes which neither make curvets nor balotades, but run ſmoothly on the ground on a preſſed gallop, only making little leaps or riſings with the fore feet.

The *terra a terra* is properly a ſeries of very low, eaſy leaps, which a horſe makes forward, bearing ſidewiſe, and working on two treads.—In this motion he lifts both legs at once; and when thoſe are on the point of deſcending, they are accompanied by the hind legs with a ſhort and quick cadence, always bearing and ſtaying on the haunches, ſo that the motions of the hind quarters are very ſhort and quick.

The term is alſo applied by the French to dancers, who cut no capers, nor ſcarce quit the ground.

And hence it is alſo figuratively applied to authors, whoſe ſtyle and diction is low and creeping.

TERRÆ *Ager*	See	AGER.
TERRÆ *Aratrum*		ARATRUM.
TERRÆ *Aratura*		ARATURA.
TERRÆ *Denariatus*		DENARIATUS.
TERRÆ *Legem Amittere*		AMITTERE.
TERRÆ *Lex*		LEX.
TERRÆ *Librata*		LIBRATA.
TERRÆ *Obolata*		OBOLATA.
TERRÆ *Quadrantata*		QUADRANTATA.
TERRÆ *Quadrugata*		QUADRUGATA.
TERRÆ *Trinoda*		TRINODA.
TERRÆ *Uncia*		UNCIA.

TERRÆ-*Filius*, ſon of the earth, a ſtudent in the univerſity of Oxford, formerly appointed in public acts to make jeſting and ſatyrical ſpeeches againſt the members thereof, to tax them with any growing corruptions, &c. See ACT.

TERRACE, or TERRAS, a walk, or bank of earth raiſed in a garden or court, to a due elevation for a proſpect. See WALKS.

The *terrace* is an earth-work uſually lined, and breaſted with a ſtrong wall, in compliance with the natural inequality of the ground.—Sometimes it is made in talus, or aſlope, and covered with turf.

Counter TERRACE, is a *terrace* raiſed over another to join two grounds, or raiſe a parterre.

TERRACE is alſo applied to the roofs of houſes that are flat, and whereon one may walk: as alſo to balconies that project. See ROOF.

The *terrace* is properly the covering of a building which is in plat-form; as that of the periſtyle of the Louvre, or that of the obſervatory, paved with flint and mortar. All the buildings of the oriental nations are covered with *terraces*, to take the freſh air on, and even to lie on. See PLAT-FORM.

TERRACE, or TERRAS, uſed for mortar. See TARRACE.

TERRAGE, TERRAGIUM, anciently ſignified a ſervice, in which a tenant or vaſſal was bound to his lord, to plough and reap the ground for him. See PRECARIÆ.

Others will have it money paid for digging, or breaking the ground in fairs and markets. See PICKAGE.

Quieti ſint de thelonio, pavagio, paſſagio, laſtagio, tallagio, carvagio, priſagio & terragio.

TERRAQUEOUS,* an epithet given to our globe or earth, conſidered as conſiſting of land and water; which together conſtitute one maſs. See GLOBE, and EARTH.

* The word, like the thing, is a compound of *terra* and *aqua*, earth and water.

Some philoſophers, particularly Dr. Burnet, tax the frame and faſhion of the *terraqueous* globe as rude, unartful and diſorderly; and conclude it highly abſurd to ſuppoſe it came thus out of the hands of the Creator, and therefore have recourſe to a deluge to make it thus. See DELUGE.

But others can perceive a world of art and conveniency, even in this apparent diſorder: Mr. Derham particularly obſerves, that the diſtribution of land and water is admirable, the one being laid over the other ſo ſkilfully all the world over, that there is a juſt equipoiſe or balance of the whole globe.—Thus the northern ocean balances the ſouthern, and the American continent is a counterpoiſe to the European, African and Aſiatic. See OCEAN, &c.

And what ſome may object, that the waters occupy too great a part of the globe, which they imagine would be of more uſe were it dry land, he obviates, by ſhewing that this would deprive the world of a due quantity of vapours and rain: for if the cavities which contain the ſea and other waters were deeper, though the quantity of water were the ſame, and only the ſurface leſſer and narrower, the evaporations would be ſo much the leſs, inaſmuch as they are made from the ſurface, and conſequently are in proportion thereto. See VAPOUR, CLOUD, RAIN, &c. See alſo MOUNTAIN, &c.

TERRAR. See the article TERRIER.

TERRAS	See the articles	TERRACE, and PAVEMENT.
Marble TERRAS		MARBLE.

TERRE-PLEIN, in fortification, the top, plat-form, or horizontal ſurface of the rampart whereon the cannon are placed, and the defenders perform their office. See RAMPART.

It is thus called, as lying level, having only a little ſlope outwardly to bear the recoil of the cannon.

It is terminated by the parapet on that ſide towards the campaign, and by the inner talus on the ſide towards the place:—its breadth is from 24 to 30 feet. See PARAPET, &c.

TERRE-TENANT, is he who hath the actual poſſeſſion of the land, otherwiſe called the *occupant*. See TENANT, and OCCUPANT.

Thus a lord of a manour having a freeholder, who letteth out his freehold to another to be occupied: this occupier, who has the actual poſſeſſion, is called the *terre-tenant*.

TERRELLA, ΜΙΚΡΟΓΗ, *little earth*, is a magnet turned of a juſt ſpherical figure, and placed ſo as that its poles, equator, &c. do exactly correſpond to thoſe of the world. See MAGNET.

It was thus firſt called by Gilbert, as being a juſt repreſentation of the great magnetic globe we inhabit. See GLOBE.

Such a *terrella*, if nicely poiſed, and placed in a meridian like a globe, it was ſuppoſed, would be turned round like the earth in 24 hours by the magnetic particles pervading it; but experience has ſhewn this to be a miſtake. See MAGNETISM.

TERRESTRIAL *Birds*	See	BIRDS.
TERRESTRIAL *Globe*		GLOBE.
TERRESTRIAL *Line*		LINE *Terreſtrial.*
TERRESTRIAL *Paradiſe*		PARADISE.
TERRESTRIAL *Roads*		ROAD.

TERRIER, or TERRAR, in our ancient cuſtoms, a collection of acknowledgments of the vaſſals, or tenants of a lordſhip, containing the rents, ſervices, &c. they owe their lord; and ſerving as a title or claim for demanding and executing the payment thereof. See MANOUR, &c.

At preſent, by *terrier* we mean no more than a book or roll, wherein the ſeveral lands, either of a private perſon, or of a town, college, church, &c. are deſcribed.

The *terrier* ſhould contain the number of acres, the ſcite, boundaries, tenants names, &c. of each piece or parcel.

TERRIER alſo denotes the lodge or hole which foxes, badgers, rabbets, &c. dig themſelves under ground, and wherein they ſave themſelves from the purſuit of the hunters.—Hence

TERRIER is alſo uſed for a kind of little hound to hunt thoſe animals, which, like a ferret, creeps into the ground, and by that means affrights and bites them; either tearing them with his teeth, or elſe haling them by force out of their holes. See HOUND.

TERRIS *bonis & catallis rehabendis poſt purgationem*, a writ for a clerk to recover his lands, goods, or chattels formerly ſeized, after having cleared himſelf of a felony, upon ſuſpicion whereof he was convict, and delivered to his ordinary to be purged.

TERRIS *& catallis tentis ultra debitum levatum*, a writ judicial for the reſtoring lands or goods to a debtor, who is diſtrained beyond the quantity of the debt. See DISTRESS.

TERRIS *liberandis*, a writ lying for a man convicted by attaint, to bring the record and proceſs before the king, and take a fine for his impriſonment, and deliver him his lands and tenements again, and releaſe him of the ſtrip and waſte.

TERRITORY, *Diſtrict*, the extent or compaſs of land within the bounds, or belonging to the juriſdiction of any ſtate, city, or other diviſion. See DISTRICT.

It is a maxim, that the church has no *territory*; *i. e.* it has no temporal juriſdiction; ſo that an eccleſiaſtical judge cannot arreſt any body, not even a prieſt.

Much in this ſenſe, Cujas ſays, the church has an auditory, but no *territory*.

TERSION,* Tersio, the act of wiping or rubbing a thing. See Attrition, and Abrasion.

* The word comes of *tero*, *I wear*.

TERTIAN, Tertiana, a fever or ague intermitting every other day; ſo that there are two fits in three days. See Fever, Ague, *&c.*

The method of curing *tertians*, as well as other agues, is by the cortex, either given in ſubſtance or decoction: this laſt is beſt in weak conſtitutions, and where the fits are not ſo regular; but the ſubſtance more to be depended on as to certainty in other caſes. See Ague, *&c.*

TERTIARY *canons*. See the article Canon.

TERTIATE, in gunnery.—To *tertiate* a great gun, is to examine the thickneſs of the metal at the muzzle, whereby to judge of the ſtrength of the piece, and whether it be ſufficiently fortified or not. See Gun, Cannon, Ordnance, *&c.*

This is uſually done with a pair of calliper compaſſes, and if the piece be home-bored, the diameter leſs by the height, divided by 2, is the thickneſs at any place. See Caliber.

TERTII *internodii pollicis extenſor*		Extensor.
Tertio *adjacente propoſitio de*	See	Proposition.
Tertius *Scalenus*		Scalenus.

TERUNCIUS, in antiquity, a very ſmall braſs coin in uſe among the Romans. See Coin.

The inconvenience of ſuch very ſmall pieces being ſoon found, the *teruncius* became diſuſed, but its name was ſtill retained in reckoning; and thus it became a money of account. See Money.

The *teruncius*, at firſt, was a quarter of the *as*, or *libra*; hence, as the *as* contained 12 ounces, the *teruncius* contained three; whence the name, which is formed of the Latin, *tres unciæ*. *Teruncius* was alſo uſed for a quarter of the denarius; ſo that when the denarius was at ten as's, the *teruncius* was worth two and a half; and when the denarius was riſen to 16, the *teruncius* was worth four. See Denarius.

TESSELLATED *pavement*, *pavimentum* Tessellatum, a rich pavement of moſaic work, made of curious ſmall ſquare marbles, bricks or tyles, called *teſſelæ*, from the form of dies. See Mosaic *work*.

Teſſellated pavements were much uſed in the tents of the Roman generals. See Pavement, *&c.*

TESSARA-Costa, in our ancient writers. See the article Quadragesima.

TEST,* or Test *oath*, a form of oath, whereby the doctrine of tranſubſtantiation, the ſacrifice of the Maſs, the invocation of ſaints, *&c.* are abjured. See Oath.

* The word ſignifies *proof* or *trial*, being formed of the Latin, *teſtis*, *witneſs*; this oath being a mark or evidence that the perſon is not a Roman catholic.

The *teſt* oath was firſt introduced by authority of parliament in 1672; and they who refuſed to take it, were excluded the privilege of holding any public offices.

Test, among chymiſts and refiners, the ſame with cuppel, or coppel, an inſtrument uſed in the purifying gold and ſilver. See Coppel.

TESTA *ſepiæ*. See the article Sepium.

TESTACEOUS, in natural hiſtory, an epithet given to a ſpecies of fiſh, which are covered with a ſtrong, thick ſhell; as tortoiſes, oyſters, pearl-fiſh, *&c.* See Fish.

In ſtrictneſs, however, *teſtaceous* is only applied to fiſh whoſe ſtrong and thick ſhells are entire and of a piece: thoſe which are ſoft, thin, and conſiſt of ſeveral pieces jointed, as the lobſter, *&c.* being called *cruſtaceous*. See Shell.

But in medicine, all preparations of ſhells, and ſubſtances of the like kind, are called *teſtaceous powders*.—Such are powders of crabs claws and eyes, harts-horn, pearl, *&c.*

Dr. Quincy, and others, ſuppoſe the virtue of all *teſtaceous* medicines to be alike; that they ſeldom or never enter the lacteals, but that the chief of their action is in the firſt paſſages; in which caſe they are of great uſe in abſorbing acidities. See Absorbent.

Hence they become of uſe in fevers, and eſpecially in rectifying the many diſtempers in children, which generally owe their origin to ſuch acidities. See *Diſeaſes of* Children.

TESTAMENT,* Testamentum, in law, a ſolemn and authentic act, whereby a perſon declares his will, as to the diſpoſal of his eſtate, effects, burial, *&c.* See Will.

* The word is formed from the Latin *teſtamentum*, which the lawyers uſually derive from *teſtatio mentis*.

A *teſtament* has no effect till after death, and is always revocable till then. As *teſtaments* are acts, of all others the moſt ſubject to deceits, ſurpriſe, *&c.* it was neceſſary to uſe all kinds of precautions to prevent the wills of the deceaſed from being eluded, and the weakneſs of dying perſons from being abuſed.

The moſt ancient *teſtaments* among the Romans were made *viva voce*, the teſtator declaring his will in the preſence of ſeven witneſſes: theſe they called *nuncupative teſtaments*; but the danger of truſting the will of the dead to the memory of the living, ſoon aboliſhed them, and all *teſtaments* were ordered to be in writing. See Nuncupative.

The French legiſlators thought holographic teſtaments, *i. e.* teſtaments wrote wholly with the teſtator's hand, an abundant ſecurity; but the Roman law, more ſevere, did not admit of teſtaments without further ſolemnity.

The eaſieſt, and moſt favourable, is the 21ſt law in the *code de teſtamentis*, which permits ſuch as are unwilling to truſt the ſecret of their *teſtaments* to others, to writ it with their own hand, and to cloſe it in the preſence of ſeven witneſſes, declaring to them that it is their *teſtament*, after which it is to be ſigned by all the ſeven witneſſes.

Otherwiſe, to make a ſolemn teſtament, it was required to be atteſted by ſeven witneſſes, and ſealed with their ſeals. See Solemn.

Yet the *military teſtament* was not ſubject to ſo many formalities: the ſoldier was ſuppoſed too much employed in defending the laws, to be ſubject to the trouble of knowing them. His tumultuary profeſſion excuſed him from obſerving all the rules. See Military.

Add, that *teſtaments*, wherein fathers diſpoſed of their eſtates among their children, had particular privileges, and were diſpenſed from moſt of the ordinaty formalities.

Probate of a Testament. See the article Probate.

TESTAMENTARY *adoption*		Adoption.
Testamentary *ſucceſſion*	See	Succession.
Testamentary *tutorage*		Tutorage.

TESTATOR or Testatrix, the perſon who makes his, or her, will and teſtament. See Testament.

M. Gillet ſhews, that a perſon incapable of a legacy, cannot demand any ſum which the *teſtator* in his teſtament declares himſelf indebted to him in; in regard ſuch a declaration of debt is preſumed a fraud, againſt the intention of the law.

TESTA Nevilli, or Testa de Nevil, an ancient record kept by the king's remembrancer in the Exchequer, containing the king's fees throughout the greateſt part of England, with inquiſitions of lands eſcheated, and ſerjeanties.

It was denominated from its compiler, Johan. de Nevil, one of the itinerant juſtices under king Henry III.

TESTATUM, in law, a writ in perſonal actions; where, if the defendant cannot be arreſted on a capias in the county where the action is laid, but is returned *non eſt inventus* by the ſheriff, this writ ſhall be ſent into any other county, where ſuch perſon is thought to be, or to have wherewithal to ſatisfy the demand.

It is called *teſtatum*, becauſe the ſheriff has before teſtified, that the defendant was not to be found in his bailiwick.

TESTE, a term commonly uſed in the cloſe of a writ, where the date is contained, which begins with *teſte meipſo*, if it be an original writ; or if judicial, *teſte Mattheo Hale*, *Mil.* or *Franciſco North*, *Mil.* *&c.* according to the court whence it comes.—In ſome ancient formula's, we read *teſte cuſtode Angliæ*. See Writ.

TESTES, in anatomy, too white, ſoft, oval bodies, ſerving for generation; uſually called, diminutively, *teſticles*. See Testicle.

Testes, of the brain, are two little, round, hard bodies, between the third and fourth ventricle, near the pineal gland. See Brain.

Testes *ſynodales*	See the articles	Synodales.
Testibus *hiis*		Hiis.

TESTICLE,* *Teſtis*, a double part in animals of the male kind, ſerving for the office of generation.—See *Tab. Anat.* (*Splanch.*) *fig.* 1. *lit. w. w.* See alſo Generation.

* They are called *teſticles*, by diminution, of *teſtes*, *witneſſes*; as giving teſtimony of virility: they are what we properly call *genitoreis*, *genetalia*.—The Greeks call them *didymi*, or *twins*.

In man, and moſt animals, the *teſticles* are exterior; in ſome, as fowls, interior. See Genital.—Some men have only one, ordinarily they have two, ſome have naturally had three; nay, anatomiſts aſſure us they have known four.

The *teſticles* are ſoft, white bodies, of an oval figure, and about the ſize of a pigeon's egg: they have been thought to be of a glandulous ſubſtance, and, according to the preſent doctrine of the glands, they may be allowed to be ſo ſtill. See Gland.

They are formed of a convolution of divers kinds of veſſels, particularly the ſpermatic veins and arteries, the latter of which bring the blood whence the ſeed is to be ſecreted in the meanders of the *teſticles*, and the former return it back again after the ſecretion made. See Seed, and Spermatic.

The reſt of the *teſticle* is made up of ſeed-veſſels, which indeed are but one continued ſeries or rope, intricately convoluted and wound up as it were into a bottom, but adhering ſo laxly, that it is eaſily drawn out into length, and in rats ſhaken from its cloſe contexture.—Theſe ſeminal veſicles.terminate in the paraſtatæ. See Parastata.

The *teſticles*, with the paraſtatæ, are ſaid to be incloſed in three proper coats; the firſt the muſculoſa, derived from the cremaſter muſcle; the ſecond the elythroides, or vaginalis, which is a continuation of the external lamina of the peritonæum;

tonæum; the third the albuginea. See each under its proper article, Musculosa, Elythroides, &c.

The common capſula or membrane including both *teſticles*, is the ſcrotum, which ſee deſcribed under the article Scrotum.

For the uſe of the *teſticles*, in preparing and ſecreting the ſeed. See Seed.

TESTIMONIAL, a kind of certificate, ſigned either by the maſter and fellow of the college where a perſon laſt reſided, or by three, at leaſt, reverend divines, who knew him well for three years laſt paſt; giving an account of the virtues, uniformity, and learning of the perſon. See Certificate.

Such a *teſtimonial* is always required before holy orders are conferred, and the biſhop even ordinarily demands one of a prieſt before he admits him to a benefice. See Ordination, &c.

Testimonial is alſo a certificate under the hand of a juſtice of peace, teſtifying the place and time when and where a ſoldier or mariner landed, and the place of his dwelling, &c. whither he is to paſs.

TESTIMONY. See Evidence, and Witness. See alſo Faith, and Belief.

For the credibility of human *teſtimony*, ſee Certitude.

TESTUDO, in natural hiſtory. See Tortoise.

Testudo, in antiquity, was particularly uſed among the poets, &c. for the ancient lyre; by reaſon it was originally made, by its inventor Mercury, of the black or hollow ſhell of a *teſtudo aquatica*, or ſea tortoiſe, which he accidentally found on the banks of the river Nile. See Lyre.

Dr. Molyneux has an expreſs diſcourſe, in the *philoſophical tranſactions*, to ſhew that the tortoiſe-ſhell was the baſis of the ancient lyre, and that the whole inſtrument had thence the denomination *teſtudo*; which account lets ſome light into an obſcure paſſage in Horace, ode 3. lib. 4. miſtaken by all the commentators:

O, teſtudinis aureæ
Dulcem quæ ſtrepitum, Pieri, temperas;
O mutis quoque piſcibus
Donatura cygni, ſi libeat, ſonum.

Testudo, *tortoiſe*, in the military art of the ancients, was a kind of cover or ſcreen which the ſoldiers, *e. gr.* a whole company, made themſelves of their bucklers, by holding them up over their heads, and ſtanding cloſe to each other.

This expedient ſerved to ſhelter them from darts, ſtones, &c. thrown upon them, eſpecially thoſe thrown from above when they went to the aſſault.

Testudo was alſo a kind of large wooden tower which moved on ſeveral wheels, and was covered with bullocks hides flead, ſerving to ſhelter the ſoldiers when they approached the walls to mine them, or to batter them with rams.

It was called *teſtudo*, from the ſtrength of its roof, which covered the workmen as the ſhell does the tortoiſe.

Testudo, in medicine, denotes a ſoft broad tumour, or gathering of impure humours between the ſkull and the ſkin, called alſo *talpa*, as reſembling the ſubterraneous windings of a tortoiſe or mole. See Talpa.

Testudo *veliformis quadrabilis*, a hemiſpherical vault, or ceiling of a church, &c. wherein four windows are ſo contrived, as that the reſt of the vault is quadrable, or may be ſquared. See Vault, Quadrature, &c.

The determining of theſe windows was a problem propoſed to the great mathematicians of Europe, particularly the cultivators of the new calculus differentialis, in the *acta eruditorum Lipſiæ*, by Sig. Viviani, under the fictitious name of A. D. *pio liſci puſillo geometra*, which was the anagram of *poſtremo Galilæi diſcipulo*.

It was ſolved by ſeveral perſons, particularly M. Leibnitz, the very day he ſaw it: and he gave it in the Leipſic acts in an infinity of manners; as alſo did M. Bernoulli, the marquis del Hoſpital, Dr. Wallis, and Dr. Gregory.

TETANUS, ΤΕΤΑΝΟΣ,* in medicine, a kind of tonic ſpaſmus, or convulſion, wherein the fore and hind muſcles of the head are rendered rigid and inflexible; ſo that it can neither bend one way nor the other. See Convulsion.

* The word is formed from the Greek τενειν, *to ſtretch, ſtrain.*

Tetanus, or Tetanos, is alſo uſed, in a more general ſenſe, for an univerſal convulſion or rigidity ſeizing the whole body at once.

In this ſenſe, the *tetanos* is ſub-divided into emproſthotonus and ophiſthotonus. See Emprosthotonos, and Opisthotonos.

TETRACHORD,* Tetrachordon, in the ancient muſic, a concord conſiſting of three degrees, tones, or intervals, or four ſounds or terms; called alſo by the ancients διατεσσαρον, and by the moderns a *fourth*. See Fourth.

* The word is formed of the Greek, τετρα, of τετταρα, *four times*, and χορδη, a *chord*, or *ſtring*.

This interval had the name *tetrachord* given it with reſpect to the lyre, and its chords or ſtrings. See Chord. See alſo Diatessaron.

Ancient authors make frequent mention of the ſynaphe, or conjunction; and diazeuxis, or disjunction of *tetrachords*.—To conceive their meaning, it muſt be obſerved, that two *tetrachords* were ſaid to be *joined*, when the ſame chord was the higheſt of the firſt, or loweſt inſtrument, and the loweſt of the ſecond; as was the caſe in the two *tetrachords* that compoſe the ancient heptachord or ſeventh. See Conjoint.

But when two *tetrachords* had no common chord; but, on the contrary, had each their different ones to begin and end withal, ſo that between the two there were two intervals of a tone, then the *tetrachords* were ſaid to be *disjoined*, which was the caſe in the two *tetrachords* that compoſe the octachord or octave. See Octave.

TETRACTYC *arithmetic*. See the article Arithmetic.

TETRACTYS, in the ancient geometry.—Pythagoric *tetractys* is a point, a line, a ſurface, and a ſolid.

TETRADIAPASON, *quadruple diapaſon*, a muſical chord, otherwiſe called a quadruple eighth, or a nine and twentieth. See Diapason.

TETRADITÆ, Tetradites, in antiquity, a name given to ſeveral different ſects of heretics, out of ſome particular reſpect they bore to the number four, called in Greek τετρα.

Thus the Sabbathians were called *tetraditæ*, from their faſting on Eaſter-day, as on the fourth day, or Wedneſday. See Sabbathian.

The Manichees, and others, who admitted a quaternity inſtead of a trinity in the Godhead, or four perſons in lieu of three, were alſo called *tetraditæ*. See Manichee.

The followers of Petrus Fullenſis bore the ſame appellation of *tetraditæ*, by reaſon of the addition they made to the triſagion, to countenance an error they held, that in our Saviour's paſſion it was not any particular perſon of the Godhead, *e. gr.* the ſon, that ſuffered, but the whole Deity. See Trisagion.

The ancients alſo gave the name *tetraditæ* to children born under the fourth moon, and theſe they believed unhappy.

TETRAEDRON,* or Tetrahedron, in geometry, one of the five regular or platonic bodies, or ſolids, comprehended under four equilateral and equal triangles. See Solid.

The *tetraedron* may be conceived as a triangular pyramid of four equal faces. See Pyramid.—Such is that repreſented (*Tab. Geomet. Fig.* 59.) See Regular *Body*.

It is demonſtrated by mathematicians, that the ſquare of the ſide of a *tetraedron*, is to the ſquare of the diameter of a ſphere wherein it may be inſcribed in a ſubſeſquialteral ratio: whence it follows, that the ſide of a *tetraedron* is to the diameter of a ſphere it is inſcribed in, as $\surd 2$ to the $\surd 3$, conſequently they are incommenſurable.

TETRAGON,* ΤΕΤΡΑΓΩΝΟΣ, in geometry, a quadrangle, or a figure with four angles. See Quadrangle.

* The word is formed from the Greek τετρα, *four*, and γωνια, *angle*.

Thus a ſquare, parallelogram, rhombus, and trapezium, are *tetragonal* figures. See Square, &c.

Tetragon, in aſtrology, denotes an aſpect of two planets with regard to the earth, when they are diſtant from each other a fourth part of a circle, or 90°—as, AD (*Tab. Aſtron. Fig.* 3.)—See Aspect.

The *tetragon* is expreſſed by the character □. See Quadrat.

TETRAGONIAS, a name given to a meteor, whoſe head is of a quadrangular figure, and its tail or train long, thick and uniform; not much different from the trabs or beam. See Meteor.

TETRAGONISM, ΤΕΤΡΑΓΩΝΙΣΜΟΣ, a term which ſome authors uſe to expreſs the quadrature of the circle. See Quadrature.

TETRAGONUS, in anatomy, a muſcle, called alſo *quadratus genæ*. See Quadratus.

TETRAGRAMMATON, ΤΕΤΡΑΓΡΑΜΜΑΤΟΝ, a denomination given by the Greeks to the Hebrew name of God, יהוה, *Jehova*, becauſe conſiſting of four letters. See God.

TETRAMETER,* in the ancient poetry, an Iambic verſe conſiſting of four feet. See Iambic.

* The word is formed from the Greek τετρα, *four*, and μετρον, *meaſure*, *q. d.* four metres.—We meet with none of theſe but in the comic poets, as Terence.

TETRASPASTON,* in mechanics, a machine wherein are four pullies. See Pully.

* The word is formed from the Greek τετρασπαστον. See Polyspaston.

TETRAPETALOUS, in botany, an epithet given to flowers that conſiſt of four ſingle petala or leaves placed around the piſtil. See Petala.

Theſe M. Juſſieu calls *polypetalous* flowers. See Polypetalous.

Mr. Ray, who calls them *tetrapetalous*, makes them conſtitute a diſtinct kind, which he divides into

1° Such as have an uniform *tetrapetalous* flower, and their ſeed-veſſels a little oblongiſh, which he therefore calls *ſiliquoſæ*; as the keiri or leucoium luteum, and the other common leucoium, the dentaria, the leucoium ſiliquoſum, alyſſon, viola lunaris, paronychia, heſperis, alliaria, rapa, napus, ſinapis, rapiſtrum, eruca ſpuria, eryſimum, cardamine, turritis, piloſella ſiliquoſa, and the raphanus ruſticanus and aquaticus.

2° Such as have their veſſel ſhorter, which therefore, for diſtinction ſake, he calls *capſulatæ* and *ſiliculoſæ*; as the myagrum, draha, leucoium ſiliqua ſubrotunda, cochlearia, naſturtium,

tium, lepidium vulgare, thlapſi, braſica marina, glaſtum, eruca marina, &c.

3° Such as have a ſeeming *tetrapetalous* flower, that is, a monopetalous one, divided deeply into four partitions, which he particularly calls *anomalous*; as the papaver, agremony, veronica, tithymallus, plantago, coronopus, pſyllium, lyſimachia ſiliquoſa, alſine ſpuria, &c.

TETRAPHARMACUM,* ΤΕΤΡΑΦΑΡΜΑΚΟΝ, in the general, denotes any remedy conſiſting of four ingredients.

* The word is compounded of τετρα, *four*, and φαρμακον, *drug*, or *remedy*.

TETRAPLA,* in church hiſtory, a bible diſpoſed by Origen under four columns, in each whereof was a different Greek verſion, *viz.* that of Aquila, that of Symmachus, that of the Seventy, and that of Theodotion. See BIBLE.

* The word is formed from the Greek τετραπλος, *quadruplex, four-fold.*

Sixtus of Sienna confounds the *tetrapla* with the hexapla; but the *tetrapla* is a different work, compoſed after the hexapla, in favour of ſuch as could not have the hexapla. See HEXAPLA.

Some authors are of opinion, that the order wherein the four verſions of the *tetrapla* were ranged, was different from that wherein we have rehearſed them; and particularly that the ſeptuagint was in the firſt column: but S. Epiphanius ſays expreſly to the contrary, and places it in the third.—He even gives us Origen's reaſon for putting it there, which was, ſays he, that the beſt verſion might be in the middle, that the others might be the more eaſily confronted therewith, and corrected from it.

Baronius, however, in his annals for the year 231, takes the ſeptuagint to have been in the third place in the hexapla, but the firſt in the *tetrapla*; yet Epiphanius gives it the ſame place in both.

TETRAPTOTE, TETRAPTOTON, in grammar, a name given to ſuch defective nouns as have only four caſes:—ſuch are aſtus, repetundæ, &c. See CASE, APTOTE, &c.

TETRARCH,* TETRARCHA, a prince who holds and governs a fourth part of a kingdom.

* The word is originally Greek τετραρχης, formed of τετρα, *four*, and αρχη, *rule, dominion.*

Such, originally, was the import of the title *tetrarch*; but it was afterwards applied to any petty king, or ſovereign, and became ſynonymous with *ethnarch*, as appears from the following conſideration: 1° That Pliny makes mention of ſix *tetrarchies* within the cities of Decapolis. 2° That Herod's kingdom was only divided into three parts, which yet were called *tetrarchies*, and the ſovereigns thereof, Luke iii. 1. *tetrarchs.* 3° Joſephus, *Antiq. Jud. lib.* 14. *c.* 23. tells us, that after the battle of Philippi, Anthony going into Syria, conſtituted Herod *tetrarch*; and on medals the ſame Herod is called *ethnarch*. See ETHNARCHA.

TETRASTICH, ΤΕΤΡΑΣΤΙΧΟΝ, a ſtanza, epigram, or poem conſiſting of four verſes. See DISTICH.

TETRASTYLE,* in the ancient architecture, a building, and particularly a temple, with four columns in its front. See TEMPLE.

* The word is formed from τετρα, *four*, and στυλος, *column.*

TETRASYLLABICAL, a word conſiſting of four ſyllables. See WORD, and SYLLABLE.

TEUTONIC, ſomething belonging to the *Teutons*, an ancient people of Germany, inhabiting chiefly along the coaſts of the German ocean.

TEUTONIC *language*, is the ancient language of Germany, which is ranked among the mother-tongues. See LANGUAGE, and MOTHER *Tongue*.

The *Teutonic*, now called the *German* or *High-Dutch*, is diſtinguiſhed into *upper* and *lower*.

The *upper* has two notable dialects, *viz.* 1° the Scandian, Daniſh, or perhaps Gothic; to which belong the languages ſpoke in Denmark, Norway, Sweden, and Iceland. 2° The Saxon; to which belong the ſeveral languages of the Engliſh, Scots, Friſian, and thoſe on the north of the Elbe. See ENGLISH, &c.

To the *lower* belong the Low Dutch, Flemiſh, &c. ſpoke through the Netherlands, &c. See FLEMISH.

TEUTONIC *order*, a military-religious order of knights, eſtabliſhed towards the cloſe of the XIIth century; and thus called, becauſe conſiſting principally of Germans, or *Teutons*. See KNIGHT, and ORDER.

The origin, &c. of this order was thus: the Chriſtians under Guy of Luſignan, laying ſiege to Acre, or Acon, a city of Syria, on the borders of the Holy Land; at which ſiege were preſent, Richard king of England, Philip Auguſtus of France, &c. ſome Germans of Bremen and Lubec, touched with compaſſion for the ſick and wounded of the army, who wanted common neceſſaries, ſet on foot a kind of hoſpital under a tent, which they made of a ſhip's ſail; and here betook themſelves to a charitable attendance on the ſick.

This ſtarted a thought of eſtabliſhing a third military order, in imitation of the templars, and the hoſpitalers. See TEMPLAR, and HOSPITALER.

The deſign was approved by the patriarch of Jeruſalem, the archbiſhops and biſhops of the neighbouring places, the king of Jeruſalem, the maſters of the temple and the hoſpital, and the German lords and prelates then in the Holy Land, &c. And by common conſent, Frederic, duke of Suabia, who was then at their head, ſent embaſſadors to his brother Henry, king of the Romans, to ſolicit the pope to confirm the new order.

Calixtus III. who then governed the church, granted it by a bull of the 23d of February, 1192; and the new order was called, *The order of* Teutonic *knights of the houſe of* St. Mary *of* Jeruſalem.

The pope granted them all the privileges of the templars, and the hoſpitalers of St. John; excepting, that they were to be ſubject to the patriarchs, and other prelates; and that they ſhould pay tithe of what they poſſeſſed.

The firſt maſter of the order, Henry Walpot, elected during the time of the ſiege of Acre, after the taking of that city, purchaſed a garden, wherein he built a church and an hoſpital, which was the firſt houſe of the *Teutonic order*. Such is the account given by Peter of Duiſbourg, a prieſt of this order. Jacques de Vitry differs a little herefrom; and relates, that the *Teutonic order* was eſtabliſhed at Jeruſalem before the city of Acre was beſieged.

Theſe two opinions Hartknoch, in his notes on Duiſbourg, reconciles, by ſaying, that the order was firſt inſtituted by a private perſon, a German, at Jeruſalem; that it was confirmed by the pope, the emperor, and the princes, at the ſiege of Acre; and that after the taking that city, it was become ſo conſiderable, that it was known all over the world.

If it be true, that it was a private perſon who firſt ſet on foot the order, and that thoſe people of Bremen and Lubec only joined with them, as ſome authors aſſert, we do not know the preciſe year of its origin.

The order made no great progreſſes under the three firſt grand maſters; but under the fourth, Herman de Salza, it became very powerful; inſomuch, that Conrade, duke of Mazovia and Cujavia, about the year 1230, ſent an embaſſy to him, to ſolicit his friendſhip and aſſiſtance, offering him and his order the provinces of Culmes and Livonia, with all the lands they could recover from the idolatrous Pruſſians, who harraſſed him exceedingly with their continual incurſions, and againſt whom he intended this new militia; his own knights of the order of *Chriſt*, or of Dobrin, inſtituted for the like purpoſe, being found too weak.

De Salza accepted the donation, and Gregory IX. confirmed it; and to aid the knights in reducing the Pruſſians, Innocent IV. publiſhed a croiſade.—With this help, in a year's time, they ſubdued the provinces of Warmia, Natangia, and Barthia; the inhabitants whereof renounced the worſhip of idols; and in the courſe of fifty years more, they reduced all Pruſſia, Livonia, Samogitia, Pomerania, &c.

In 1204, duke Albert had founded the order of ſword-bearers, port-glaives, which now became united to the *Teutonic* knights, and the union was approved by pope Gregory IX. See PORT-GLAIVE.

Waldemar III. king of Denmark, ſold to the order the province of Eſtein, the cities of Nerva and Weſſemberg, and ſome other provinces.

A new union ſome time afterwards occaſioned great diviſions and troubles in the order: it was with the biſhops and canons of Pruſſia and Livonia, who hereupon took the habit of the *Teutonic order*, and ſhared the ſoveraignty with the knights, in their reſpective dioceſes.

The order, thus maſter of all Pruſſia, built the cities of Elbing, Marienbourg, Thorn, Dantzic, Koningſberg, and ſome others: the emperor Frederic II. permitted them to add to the arms of the order, the imperial eagle; and S. Louis, in 1250, allowed them to quarter the flower-de-luce.

After the city Acre had been recovered by the infidels, the grand maſter of the *Teutonic order* removed his ſeat from that city to Marienbourg. As the order grew in power, the knights took more ſtate on them; and at length, inſtead of friars, brothers, as at firſt, would be called *lords*. And though the grand maſter Conrade Zolnera, of Rotenſteine, oppoſed this innovation, his ſucceſſor Conrade Wallerod not only approved it, but even procured himſelf to be treated with honours only rendered to the greateſt princes.

Diviſions being got into the order, the kings of Poland made their advantage of them: the Pruſſians revolted to them; and after ſeveral wars between the knights and the Poles, the former yielded to king Caſimire the upper Pruſſia, and did homage to him for the lower.

Laſtly, at the time of the reformation, Albert, marquis of Brandenbourgh, then grand maſter, becoming Lutheran, renounced the dignity of grand maſter, diſſolved the commanderies, and drove the knights out of Pruſſia.

Moſt of the knights followed his example, and embraced the reformation: the reſt transferred the ſeat of their order to Margentheim, or Mariendal in Franconia, which they ſtill retain.

They there elected Walter of Cromberg their grand maſter, formed a proceſs againſt Albert, and the emperor put him to the ban of the empire. The order, however, could never recover their domains; but are now little more than the ſhadow of what they formerly were, having only three or four commanderies, ſcarce ſufficient for the ordinary ſubſiſtence of the grand maſter and his knights.

The officers of the *Teutonic order*, when in its ſplendour, were the grand maſter, who reſided at Marienbourg; under him were the grand commander; the grand marſhal, who had his reſidence at Koningſberg; the grand hoſpitaler, who reſided at Elbing; the draper, who took care to furniſh the habits; the treaſurer, who lived at the court of the grand maſter; and ſeveral commanders, as thoſe of Thorn, Culme, Brandenbourg, Koningſberg, Elbing, *&c.*

They had alſo their commanders of particular caſtles, and fortreſſes; advocates, proveditors, intendants of mills, proviſions, *&c.*

Waiſſelius in his annals ſays, they had 28 commanders of cities, 46 of caſtles, 81 hoſpitalers, 35 maſters of convents, 40 ſtewards, 37 proveditors, 93 maſters of mills, 700 brothers or knights to take the field, 162 brothers of the choir, or prieſts, 6200 ſervitors or domeſtics, *&c.*

TEXT, a relative term, contra-diſtinguiſhed to *gloſs* or *commentary*; and ſignifying an original diſcourſe, excluſive of any note or interpretation. See NOTE, ANNOTATION, *&c.*

Infinite pains have been taken by the critics, to reſtore, reconcile, ſettle, explain, *&c.* the *text* of the bible, and the claſſics.

Mr. Whiſton accounts for all thoſe miſunderſtandings between the new and old teſtament, particularly as to the propheſies in the old, cited as fulfilled in the new, to the corruption of the *text* of the old teſtament; and to obviate objections made againſt Chriſtianity on that head, has publiſhed an *Eſſay towards reſtoring the true* text *of the Old Teſtament*, &c. See QUOTATION.

This reſtoration he is to effect from the Samaritan pentateuch, the Roman pſalter, the apoſtolical conſtitutions, *&c.* But all our critics take this corruption of the *text* to be imaginary, and look out for other ways of ſolving thoſe difficulties. See PROPHECY.

TEXT is particularly uſed for a certain paſſage of ſcripture choſe by a preacher to be the ſubject of his ſermon. See HOMILY.

Anciently, the lawyers began all their pleadings with like *texts* of ſcripture.

A *text-book*, in ſeveral univerſities, is a claſſic author wrote very wide, by the ſtudents, to give room for an interpretation dictated by the maſter or regent, to be inſerted in the inter-lines. In this ſenſe, the French ſay, proverbially, *Gloſe d'Orleans plus obſcure que le* texte.

The Spaniards give the name *text* to a kind of little poem, or ſet of verſes, placed at the head of a gloſs, and making the ſubject thereof; each verſe being explained, one after another, in the courſe of the gloſs. See GLOSS.

TEXT, in ancient law-authors, is appropriated to the book of the four goſpels, by way of eminence.—This was written in gold letters, and carefully preſerved in the churches.

> *Codex aurato conſeptus grammate ſcriptus,*
> *Auctus evangelicum conſervat corpore* textum.

TEXTUARIES, TEXTUARII, a name given the ſect of the Caraites, among the Jews. See CARAITES.

Hillel ſhone among the traditionaries, and Schammai among the *textuaries*. See TRADITIONARY.

The civil and canon lawyers ſometimes alſo call a book containing the bare text, without any gloſs or commentary, a *textuary*, *textuarium*.

TEXTUS *Roffenſis*, is an ancient manuſcript, containing the rights, cuſtoms, tenures, *&c.* of the church of Rocheſter, granted by the laws of Ethelbert, Hhlothere, Eadred, and Withred, kings of Kent, collected by Ernulf, the venerable biſhop of Rocheſter, about the year 1100. See LAW.

TEXTURE,* TEXTURA, properly denotes the arrangement and coheſion of ſeveral ſlender bodies or threads interwoven, or intangled among each other; as in the webs of ſpiders, or in cloths, ſtuffs, *&c.* See WEB, and WEAVING.

* The word is Latin, formed of *texo*, *I weave*.

TEXTURE is alſo uſed in ſpeaking of any union or coheſion of the conſtituent particles of a concrete body; whether by weaving, hooking, knitting, tying, chaining, indenting, intruding, compreſſing, attracting, or any other way. See COHESION, PARTICLE, BODY, *&c.*

In this ſenſe, we ſay a cloſe, compact *texture*; a lax, porous *texture*; a regular or irregular *texture*, &c. See PORE, RAREFACTION, CONDENSATION, *&c.*

A great deal depends on the *texture* of the component parts of a body; hence moſt of its particular properties, its ſpecific gravity, colour, *&c.* See COLOUR, *&c.*

THABORITES, or TABORITES. See TABORITE.

THACK *Tyles* } See the articles { TYLES.
THAIN, THANUS } { THANE.

THALAMI *nervorum opticorum*, in anatomy, two oblong prominences of the lateral ventricles of the brain; medullary without, but a little cineritious within. See BRAIN.

They are thus called, becauſe the optic nerves riſe out of them. See OPTIC.

THALMUD. See the article TALMUD.

THAME. See the article TEAM.

THANE, or THAIN, THANUS, the name of an ancient dignity among the Engliſh, or Anglo-Saxons. See NOBILITY.

Skene makes *thane* to have been a dignity equal with that of the ſon of an earl: Camden will have it, that *thanes* were only dignified by the offices which they bore.

There were two kinds or orders of *thanes*: the *king's thanes*, and the *ordinary thanes*.—The firſt were thoſe who attended our Engliſh-Saxon kings in their courts, and who held lands immediately of the king: whence, in doomſday-book, they are promiſcuouſly called *thani*, and *ſervientes regis*.

Soon after the conqueſt, the name was diſuſed; and inſtead thereof they were called the *king's barons*, *barones regis*. See BARON.

Their origin is referred to king Canutus, who, taking the chief of the Daniſh nobility, to the number of 3000, for his guard; and arming them with battle-axes and ſabres with gilt handles, called them *thing-lith*, from the two Daniſh words *theing* or *thein*, body of nobility, and *lith*, order of battle.

The ordinary *thanes*, or *thani minores*, were the lords of manours, who had particular juriſdiction within their limits, and over their own tenants. See LORD, and MANOUR.

Theſe two changed their name for that of barons; and hence their courts are called *courts baron* to this day. See COURT, and BARON.

In old authors, charters, *&c.* we alſo meet with THANE, as ſignifying a nobleman; ſometimes a freeman; and ſometimes a magiſtrate.

THANE-*Lands*, were lands granted by charter of the Saxon kings to their *thanes*. See THANE.

THAUMATURGUS,* *worker of miracles*; an appellation which the Romaniſts give to ſeveral of their ſaints, eminent for the number and greatneſs of their miracles. See SAINT, and MIRACLE.

* The word is formed from the Greek, θαυμα, *wonderful thing*, and εργον, *work*.

St. Gregory *Thaumaturgus*, or Gregory of Neocæſarea, was a diſciple of Origen, about the year 223, and afterwards biſhop of Cæſarea in Pontus; and in that capacity aſſiſted at the firſt council of Antioch, and at that of Epheſus againſt Paulus Samoſatenus.—St. Leo of Catanea is alſo called *Leo Thaumaturgus*. He lived in the VIIIth century; and his body is ſtill honoured at Rome in the church of St. Martin de Tours.—St. Francis Paul, and St. Francis Xavier, are the great *thaumaturgi* of theſe laſt ages. See MIRACLE.

THAWING, the reſolution of ice into its former fluid ſtate, by the warmth of the air, *&c.* See ICE, and FREEZING.

THEANDRIC, ΘΕΑΝΔΡΙΚΟΣ, *Dei-virile*; a term ſignifying divine and human under one—formed from Θεος, *God*, and ανηρ, *man*. See DEI-VIRILE.

S. Dionyſius, biſhop of Athens, firſt uſed the word *theandric*, to expreſs a double operation, or two operations united in Jeſus Chriſt; the one divine, the other human.*—The Monophyſites afterwards abuſed it, to ſignify the one only operation which they admitted in Jeſus Chriſt; in whom they believed there was a mixture of the divine and human nature, whence reſulted a third nature, which was a compound of the one and the other, whoſe operations followed the eſſence and qualities of the mixture, and were neither divine nor human; but both at once, or, in one word, *theandric*. See OPERATION, and MONOTHELITE.

* Θεανδρικη ενεργεια, *theandric* or *Dei-virile* operation, in the ſenſe of Dionyſius and Damaſcenus, is thus exemplified by Athanaſius. When Chriſt healed the perſon who was born blind, the ſpittle, he voided, was human, but the opening of the eyes was done by his divine power. And thus, in raiſing Lazarus, he called as man, but awaked him from the dead as God.

The term *theandric*, and the dogma of *theandric* operations, were examined with great care and attention, at the council of Lateran, held in 649; where pope Martin ſolidly refuted the notion of *theandric* operations, and ſhewed, that the ſenſe wherein St. Dionyſius firſt uſed the word, was catholic, and quite remote from that of the Monophyſites and Monothelites. See PERSON, and TRINITY.

THEANTHROPOS,* ΘΕΑΝΘΡΩΠΟΣ, *God-man*; a term ſometimes uſed in the ſchools, to ſignify Jeſus Chriſt, who is God-man, or two natures in one perſon. See PERSON, and TRINITY.

* The word is formed from the Greek, Θεος, *Deus*, and ανθρωπος, *homo*, *man*.

THEATER,* or THEATRE, THEATRUM, among the ancients, a public edifice, for the exhibiting of ſcenic ſpectacles or ſhews to the people. See SPECTACLE, and SCENIC.

* The word is formed from the Greek, θεατρον, *ſpectacle*, *ſhew*, of θεαομαι, *ſpecto*, *video*, *I ſee*.

Under the word *theater* was comprehended, not only the eminence whereon the actors appeared, and the action paſſed; but alſo the whole area, or extent of the place, common to the actors and ſpectators.

In this ſenſe, the *theater* was a building encompaſſed with portico's, and furniſhed with ſeats of ſtone, diſpoſed in ſemicircles, and aſcending gradually over one another; which encompaſſed a ſpace called the *archeſtra*, in the front whereof was the proſcenium, or pulpitum, whereon the actors performed, and which is what we properly call the *theater*, or ſtage. See **Orchestra**, and **Pulpitum**.

On the proſcenium ſtood the ſcena, a large front, adorned with orders of architecture, behind which was the poſtſcenium, or place where the actors made themſelves ready, retired, &c. So that the ſcena, in its full extent, comprehended all the part belonging to the actors. See **Scene**, &c.

In the Greek *theaters*, the orcheſtra made a part of the ſcena; but in the Roman *theaters*, none of the actors ever deſcended into the orcheſtra; which was taken up by the ſeats of the ſenators.

The moſt celebrated *theaters* remaining of antiquity, are the *theater* of Marcellus, and that of Pompey; which are alſo called *amphitheaters*. See **Amphitheater**.

At Athens are ſtill ſeen the remains of the temple of Bacchus, which was the firſt *theater* in the world, and a maſter-piece in architecture.—All *theaters* were conſecrated to Venus and Bacchus.

Theater, among the moderns, more peculiarly denotes the ſtage, or place whereon the drama, or play is exhibited: anſwering to the proſcenium of the ancients. See **Drama**, &c.

In its full latitude, however, the **Theater** includes the whole play-houſe: in which ſenſe, it is a ſpacious room, or hall, part whereof is taken up by the ſcena, which comprehends the ſtage, the decorations, and the machines; and the reſt diſtributed into a ſpace, called the *pit*, or *parterre*, which is covered with ſeats, boxes, &c. and terminated with an elevation of one or two galleries, diſpoſed into benches aſcending over one another. See **Stage**; ſee alſo **Comedy**, **Tragedy**, &c.

Theater is alſo uſed in architecture, chiefly among the Italians, for an aſſemblage of ſeveral buildings, which, by a happy diſpoſition and elevation, repreſents an agreeable ſcene to the eye.

Such as are moſt of the vineyards at Rome; but particularly that of Monte Dragone, at Freſcati; and in France, the new caſtle of St. Germain en Laye.

Anatomical **Theater**, in a ſchool of medicine and chirurgery, is a hall, with ſeveral rows of ſeats, diſpoſed in the circumference of an amphitheater; having a table, bearing on a pivot, in the middle, for the diſſection of bodies.

Such is the anatomical *theater* of the royal garden of plants at Paris, &c.

The **Theater** at Oxford is a beautiful building, erected by archbiſhop Sheldon, for the uſe of ſcholaſtic exerciſes.

THEATINES, an order of nuns, under the direction of the *Theatins*. See **Theatins**.

There are two kinds of *Theatines*, under the title of *ſiſters of the immaculate conception*, who form two different congregations, the one engaged by ſolemn vows, and the other only by ſimple vows.—Their common foundreſs was Urſula Benincaſa.

Thoſe who make the ſimple vows are the moſt ancient, and are called abſolutely *Theatines of the congregation*: they had their riſe at Naples, in 1583.

The others are called *Theatines of the hermitage*: the whole buſineſs of theſe is praying in retirement, and an auſtere ſolitude, to which they engage themſelves by ſolemn vows.

The *Theatines* of the firſt congregation take care of the temporal concerns of theſe laſt. Their houſes ſtand together, and communicate by a large hall. Their foundreſs drew up their conſtitutions, and laid the foundation of their houſe at Naples, but died before it was finiſhed.

Gregory the XVth, who confirmed the new inſtitute under the rule of St. Auguſtin, appointed that they ſhould be under the direction of the *Theatins*. Urban VIII. revoked this article by a brief in 1624, and ſubjected them to the nuncio of Naples; but Clement IX. annulled this brief, and ſubmitted them anew to the *Theatins* by a brief in 1668.

THEATINS, a religious order of regular prieſts; thus called from their firſt ſuperior Don John Pietro Caraffa, archbiſhop of Chieſi, in the kingdom of Naples, which was anciently called *Theate*.

The ſame archbiſhop was afterwards pope, by the name of Paul IV. after having been a companion of Gaëtan, a Venetian gentleman, the firſt founder of this order, at Rome, in 1524.

The *Theatins* were the firſt who aſſumed the title of *regular clercs*. They have not only no lands, or fixed revenues, either in common or in propriety; but they do not even aſk or beg any thing; but wait for what Providence ſhall ſend them for their ſubſiſtance.

They employed themſelves much in foreign miſſions; and in 1627 entered upon Mingrelia, where they have an eſtabliſhment: they have had the like in Tartary, Circaſſia, and Georgia, which they have ſince abandoned, by reaſon of the little fruit they perceived thereof.

Their firſt congregation appeared at Rome in 1524, and was confirmed the ſame year by Clement VII.—Their conſtitutions were drawn up at a general chapter in 1604, and approved by Clement VIII.—They wear the prieſts habit.

THEATRE. See **Theater**, and **Amphitheater**.

THEBAID, **Thebais**, a famous heroic poem of Statius, the ſubject whereof is the civil war of Thebes between the two brothers Eteocles and Polynices; or Thebes taken by Theſeus. See **Epic**, **Heroic**, &c.

Statius was twelve years in compoſing his *Thebaid*, which conſiſts of twelve books: he wrote under Domitian:—He is cenſured by the beſt critics, as Boſſu, &c. for a vicious multiplicity of fables and actions, for too much heat and extravagance, and for going beyond the bounds of probability. See **Fable**, **Polymythy**, and **Probability**.

Several Greek poets had compoſed *Thebaids* before him; the principal were, Antagoras, Antiphanes and Colophon, Menelaus the Ægean, and an anonymous author mentioned by Pauſanias, *lib.* 9.

Ariſtotle, praiſing Homer for the ſimplicity of his fable, oppoſes to him the ignorance of certain poets, who imagined that the unity of fable or action was abundantly provided for by the unity of the hero, and who compoſed *Theſeids*, Herculeids, &c. in each whereof they collected every thing that had ever happened to their principal perſon. See **Hero**, **Action**, &c.

THEFT, *Furtum*, in law, an unlawful, felonious taking away another man's moveable and perſonal goods, againſt the owner's will, with an intent to ſteal them. See **Larceny**.

It is divided into *theft*, or larceny, properly ſo called, and *petit theft*, or petty larceny; the former whereof is of goods above the value of 12*d.* and is deemed felony.—The other, which is of goods under that value, is not felony. See **Petty-Larceny**, **Felony**, &c.

Open *theft* from the perſon, or in preſence of the owner, is properly called *robbery*. See **Robbery**.

THEFTBOTE, the receiving a man's goods again from a thief, or other amends by way of compoſition, and to prevent proſecution, that the felon may eſcape unpuniſhed; the puniſhment whereof is impriſonment, and not loſs of life, or member. See **Theft**.

THEISM. See **Deism**, **Polytheism**, and **Tritheism**.

THEKUPHÆ. See the article **Tekuphæ**.

THELONIUM, **Telonium**, ſignifies toll. See **Toll**.

Breve eſſendi quieti de **Thelonio**, a writ lying for the citizens of a city, or burgeſſes of a town, that have a charter or preſcription to free them from toll; againſt the officers of any town or market, who would conſtrain them to pay it, contrary to the ſaid grant or preſcription.

THEME, **Thema**, a ſubject or topic, to write or compoſe on. See **Subject**, &c.

Theme, among aſtrologers, denotes the figure they conſtruct when they draw the horoſcope; repreſenting the ſtate of the heavens for a certain point, or moment required; *i. e.* the places of the ſtars, and planets, for that moment. See **Horoscope**.

The celeſtial *theme* conſiſts of 12 triangles, incloſed within two ſquares, and called the *twelve houſes*. See **House**.

THENAR, in anatomy, a muſcle, whoſe office is to draw the thumb from the fore finger; whence it is alſo denominated *abductor pollicis manus*.

There is a ſimilar muſcle belonging to the great toe, ſometimes alſo called *thenar*, or *abductor pollicis pedis*. See **Abductor**.

The antagoniſts to theſe are called *antithenars*. See **Antithenar**.

THENOPSYCHITES. See **Thnetopsychites**.

THEOCATAGNOSTÆ, * a ſect of heretics, or rather blaſphemers, who dared to find fault with certain words and actions of God, and to blame many things in the ſcriptures.

* The word is formed from the Greek, Θεος, *God*, and καταγινωσκω, *I judge*, or *condemn*.

Marſhal, in his tables, places theſe heretics in the VIIth century; for what reaſon we know not; Damaſcenus being the only author that mentions them, but without taking any notice of the time of their appearance.

Add to this, that in Damaſcenus's treatiſe of hereſies, we meet with heretics that were not ſo much the authors of ſects ſubſiſting at any certain time, as wicked perſons, ſuch as are found in all times, and all ages.

THEOCRACY, * a ſtate governed by the immediate direction of God alone. See **Government**.

* The word is formed from Θεος, *God*, and κρατος, *power*, *empire*.

According to Joſephus, the ancient Government of the Jews was *theocratic*; God himſelf ordering and directing every thing belonging to the ſoveraign authority. See **Judge**.

This *theocracy* laſted till the time of Saul; when the Iſraelites, weary thereof, deſired they might have a king like other nations: and thenceforward the ſtate became monarchic.

There was alſo a kind of imaginary *theocracy* at Athens: while the ſons of Codrus were diſputing the ſucceſſion, the Athenians, wearied out with the miſeries of an inteſtine war, aboliſhed the royalty, and declared Jupiter the only king of the people of Athens.

THEODOLITE, a mathematical inſtrument, much uſed in ſurveying, for the taking of angles, diſtances, altitudes, &c. See **Angle**, **Surveying**, &c. See alſo **Plotting**.

It is made variouſly; ſeveral perſons having their ſeveral ways of contriving it, each more ſimple and portable, more accurate and expeditious, than others. The following one is not inferior to any we have ſeen: it conſiſts of a braſs circle, about a foot diameter, cut in form of *Fig.* 25. *Tab. Surveying*; having its limb divided into 360 degrees, and each degree ſubdivided either diagonally, or otherwiſe, into minutes.

Underneath, at *c c*, are fixed two little pillars *b b*, (*fig.* 25. *n.* 2.) which ſupport an axis, whereon is fixed a teleſcope, conſiſting of two glaſſes, in a ſquare braſs tube; for the viewing of remote objects.

On the centre of the circle moves the index C, which is a circular plate, having a compaſs in the middle, whoſe meridian line anſwers to the fiducial line *a a*: at *b b* are fixed two pillars to ſupport an axis, which bears a teleſcope like the former, whoſe line of collimation anſwers to the fiducial line *a a*.—At each end of either teleſcope is fixed a plain ſight for the viewing nearer objects. See SIGHT.

The ends of the index *a a* are cut circularly, to fit the diviſions of the limb B; and when that limb is diagonally divided, the fiducial line at one end of the index ſhews the degrees and minutes upon the limb. The whole inſtrument is mounted with a ball and ſocket, upon a three-legged ſtaff.

Moſt *theodolites* have no teleſcopes, but only four plain ſights, two of them faſtened on the limb, and two on the ends of the index.

The uſe of the *theodolite* is abundantly ſhewn in that of the ſemicircle, which is only half a *theodolite*. See SEMICIRCLE.—And in that of the plain-table, which is occaſionally made to be uſed as a *theodolite*. See PLAIN-*Table*.

Note, the index and compaſs of the *theodolite* likewiſe ſerve for a circumferentor, and are uſed as ſuch. See CIRCUMFERENTOR.

THEOGONY,* that branch of the heathen theology which taught the genealogy of their gods. See GOD.

* The word is formed from Θεος, *God*, and γονη, *geniture, ſeed, offſpring*.

Heſiod gives us the ancient *theogony*, in a poem under that title. Among the ancient writers, Dr. Burnet obſerves, *theogony* and coſmogony ſignified the ſame thing. In effect, the generation of the gods of the ancient Perſians, fire, water, and earth, is apparently no other than that of the primary elements. See CHAOS, and CHAOLOGY.

THEOLOGICAL *Criticiſm* } See { CRITICISM.
THEOLOGICAL *Prebend* } { PREBEND.

THEOLOGIUM,* in the ancient theater, was a place, or little ſtage, above that whereon the ordinary actors appeared. See THEATER.

* The word is Latin, formed from Θεος, and λογος, *ſpeech, diſcourſe*.

The *theologium* was the place where the gods appeared.—It alſo included the machines whereon they deſcended, and from which they ſpoke. See MACHINE.

There was a *theologium* required for the repreſentation of the Ajax of Sophocles, the Hippolitus of Euripides, &c. *Scal. Poet. lib.* I. *cap.* I.

THEOLOGY,* *Divinity*; a ſcience which inſtructs us in the knowledge of God, and divine things; or which has God, and the things he has revealed, for its object. See GOD, DIVINE, &c.

* The word is compounded of Θεος, *God*, and λογος, *diſcourſe*.

Theology is a ſcience which ſhews us what we are to believe of God, and the manner wherein he would be ſerved.—It is divided into two branches, *natural*, and *revealed* or *ſupernatural*.

Natural THEOLOGY, is the knowledge we have of God from his works, by the light of nature, and reaſon. See NATURE, and REASON.

Supernatural THEOLOGY, is that which we learn from revelation. See REVELATION.

Poſitive THEOLOGY, is the knowledge of the holy ſcriptures, and of the ſignification thereof, conformably to the opinions of the fathers and councils; without the aſſiſtance of any argumentation. Some will have it, that this ought to be called *expoſitive*, rather than *poſitive*. See POSITIVE.

Moral THEOLOGY, is that which teaches us the divine laws relating to our manners and actions. See MORAL.

Scholaſtic, or School THEOLOGY, is that which proceeds by reaſoning; or that derives the knowledge of ſeveral divine things from certain eſtabliſhed principles of faith. See SCHOLASTIC.

The ancients had a three-fold *theology*; the firſt, μυθικη, *mythic*, fabulous, which flouriſhed among the poets; and was chiefly employed in the theogony, or genealogy of the gods. See FABLE, MYTHOLOGY, THEOGONY.

The ſecond, πολιτικη, *political*, which was that chiefly embraced by the politicians, prieſts, and people, as moſt ſuitable and expedient to the ſafety, quiet, and proſperity of the ſtate.

The third, φυσικη, *natural*, chiefly cultivated by the philoſophers, as moſt agreeable to nature and reaſon.—The phyſical or natural *theology* acknowledged one only ſupreme God; to which it added dæmons, as mediators between him and man. See DÆMON.

Bachelor in THEOLOGY } See the articles { BACHELOR.
Myſtic THEOLOGY } { MYSTIC.

THEOPASCHITES, THEOPASCHITÆ, a ſect of heretics in the Vth century, the followers of Petrus Fullenſis, or Peter the Fuller; whence they are ſometimes alſo denominated *Fulloniani*. See TRISAGION.

Their diſtinguiſhing doctrine was, that the whole trinity ſuffered in the paſſion of Jeſus Chriſt. See PATRIPASSIANS.

This hereſy was embraced by the Eutychian monks of Scythia; who uſing their utmoſt efforts to make it obtain, raiſed great diſorders towards the beginning of the following century.

It was condemned, at its firſt riſe, in the councils of Rome and Conſtantinople, held in 483: it was revived in the IXth century, and again condemned in a council at Rome, held in 862 under pope Nicholas I.

F. le Quien, in his notes on Damaſcenus, ſays, that the ſame error had been taught before Fullenſis, by Apollinarius, whoſe diſciples were the firſt that were called *theopatitæ*, or *theopaſchitæ*. See APOLLINARIAN.

THEORBA,* THIORBA, or TIORBA, a muſical inſtrument, made in form of a large lute; except that it has two necks, or juga, the ſecond and longer whereof ſuſtains the four laſt rows of chords, which are to give the deepeſt ſounds. See LUTE.

* The word is formed from the French, *teorbe*, or *theorbe*, and that from the Italian, *tiorba*, which ſignifies the ſame; and which ſome will have to be the name of the inventor.

The *theorba* is an inſtrument, which for theſe laſt ſixty or ſeventy years, has ſucceeded to the lute, in the playing of thorough-baſſes: it is ſaid to have been invented in France by the ſieur Hotteman, and thence introduced into Italy, &c.

The only difference between the *theorba* and the lute is, that the former has eight baſs or thick ſtrings, twice as long as thoſe of the lute; which exceſs of length renders their ſound ſo exceedingly ſoft, and keeps it up ſo long a time, that it is no wonder many prefer it to the harpſichord itſelf. At leaſt it has this advantage, that it is eaſily removed from place to place, &c.

All its ſtrings are uſually ſingle; though there are ſome who double the baſs-ſtrings with a little octave, or the ſmall ſtrings with an uniſon; in which caſe, bearing more reſemblance to the lute than the common *theorba*, the Italians call it the *arcileuto*, or *arch-lute*. See ARCILEUTO.

THEOREM, in the mathematical method, a propoſition which terminates in theory, and which conſiders the properties of things already made, or done. See THEORY, and PROPOSITION.

Or, a *theorem* is a ſpeculative propoſition, deduced from ſeveral definitions compared together.—Thus, if a triangle be compared with a parallelogram ſtanding on the ſame baſe, and of the ſame altitude, and partly from their immediate definitions, and partly from other of their properties already determined, it is inferred, that the parallelogram is double the triangle; that propoſition is a *theorem*. See DEFINITION, &c.

Theorem ſtands contra-diſtinguiſhed from *problem*. See the article PROBLEM.

There are two things to be chiefly regarded in every *theorem*, *viz.* the propoſition and the demonſtration: in the firſt is expreſſed what agrees to ſome certain thing under certain conditions, and what does not. See PROPOSITION.

In the latter, the reaſons are laid down, by which the underſtanding comes to conceive that it does, or does not agree thereto. See DEMONSTRATION.

Theorems are of various kinds.

Univerſal THEOREM, is that which extends to any quantity without reſtriction, univerſally—as this, that the rectangle of the ſum and difference of any two quantities is equal to the difference of their ſquares.

Particular THEOREM, is that which extends only to a particular quantity—as this: in an equilateral right lined triangle, each of the angles is 60 degrees.

Negative THEOREM, is that which expreſſes the impoſſibility of any aſſertion—as, that the ſum of two biquadrate numbers cannot make a ſquare number.

Local THEOREM, is that which relates to a ſurface—as, that triangles of the ſame baſe and altitude are equal.

Plane THEOREM, is that which either relates to a rectilinear ſurface, or to one terminated by the circumference of a circle—as, that all angles in the ſame ſegment of a circle are equal. See PLANE.

Solid THEOREM, is that which conſiders a ſpace terminated by a ſolid line; that is, by any of the three conic ſections—*e. gr.* this: that if a right line cut two aſymptotic parabola's, its two parts terminated by them ſhall be equal. See SOLID.

Reciprocal THEOREM, is one whoſe converſe is true—as, that if a triangle have two equal ſides, it muſt have two equal angles: the converſe of which is likewiſe true, that if it have two equal angles, it muſt have two equal ſides. See RECIPROCAL.

THEORETIC,* THEORETICAL, or THEORIC, ſomething relating to *theory*, or that terminates in ſpeculation.—In which ſenſe it ſtands oppoſite to *practical*.

* The word is formed from the Greek, θεωρεω, *I ſee, I view, contemplate*.

The ſciences are ordinarily divided into *theoretical*, as theology, philoſophy, &c. and *practical*, as medicine, law, &c. See SCIENCE.

Theoretic, **Theoreticus**, is an appellation peculiarly given to an ancient ſect of phyſicians contra-diſtinguiſhed from the *empirics*. See Physician.

Theoretic phyſicians were ſuch as applied themſelves to a careful ſtudy and conſideration of what relates to health and diſeaſes; the principles of the human body, its ſtructure and parts, with their actions and uſes; whatever befals it either naturally or preternaturally; the differences of diſeaſes, their nature, cauſes, ſigns, indications, &c. the textures, properties, &c. of plants, and other medicines, &c.—In a word, the *theoretic* phyſicians were ſuch as went on the foot of reaſon, in oppoſition to the empirical phyſicians, who went wholly on experience. See Medicine, and Empiric.

Theoretical *Arithmetic* } See { Arithmetic.
Theoretical *Philoſophy* } See { Philosophy.

THEORIC *Money*, in ancient authors, was what was raiſed by way of tax on the people, to defray the expences of theatrical repreſentations, and other ſpectacles. See Spectacle.

There were particular queſtors or treaſurers of the *theoric money*.—By a law of Eubulus, it was made a capital crime to pervert the *theoric money* to any other uſe; even to employ it in the occaſions of war.

THEORICAL *Aſtronomy*, is that part of aſtronomy which conſiders the true ſtructure and diſpoſition of the heavens and heavenly bodies; and accounts for their various phænomena therefrom. See Astronomy.

It is thus called in oppoſition to that part which conſiders their apparent ſtructure, or their diſpoſition as viewed by the eye; which is called *ſpherical aſtronomy*. See Spherical.

The ſeveral parts of *theorical aſtronomy*, ſee under System, Sun, Star, Planet, Earth, Moon, Satellite, Comet, &c.

THEORY, a doctrine which terminates in the ſole ſpeculation, or conſideration of its object, without any view to the practice, or application thereof. See Science.

To be learned in an art, &c. the *theory* ſuffices; to be a maſter of it, both the *theory* and practice are required.—Machines, many times, promiſe well in the *theory*, yet fail in the practice. See Machine.

We ſay, *theory* of the moon, *theory* of the rainbow, of the microſcope, the camera obſcura, the motion of the heart, the operation of purgatives, &c. See Moon, Rainbow, Microscope, Camera, Heart, Purgative, &c.

Theories *of the Planets*, &c. are ſyſtems or hypotheſes, according to which the aſtronomers explain the reaſons of the phænomena or appearances thereof. See Hypothesis, System, Planet, &c.

THEOTOCUS, *Deipara*. See Mother *of God*.

THERAPEUTÆ, ΘΕΡΑΠΕΥΤΑΙ, a Greek term, ſignifying ſervants, more eſpecially thoſe employed in the ſervice of God.

The Greeks gave the appellation *therapeutæ* to ſuch as applied themſelves to a contemplative life, whether it were from the great concern they had for their ſouls, or from the particular mode and manner of their religion; the word θεραπευειν, whence *therapeutæ* ſignifying the care a phyſician takes of his patient, and the ſervice any one renders another.

Philo, in his firſt book of the contemplative life, relates, that there were a people ſpread throughout moſt of the known world, but particularly throughout Egypt, and about Alexandria, who renounced their friends, their goods, &c. and who, after diſcharging themſelves of all temporal concerns, retired into ſolitary places, where they had each their ſeparate manſion, called *ſemneium*, or monaſtery. See Monastery.

He adds, that they there reſigned themſelves wholly to the exerciſes of prayer and contemplation, were continually as in the preſence of God, prayed mornings and evenings, eat nothing till after ſun-ſet, and many of them not above once in three, or even ſix days; nor then any thing but a piece of bread ſeaſoned with ſalt, or, at beſt, with hyſſop.

They carried nothing with them into their ſemneium but the books of Moſes, the prophets, the pſalms, and other like writings, wherein they ſought for myſtical and allegorical meanings, from a perſuaſion that the ſcriptures were only ſhadows or figures, the hidden meanings whereof were to be unfolded. They had alſo ſome books left them by the founders of their ſect.—They met together every ſeventh day in a large ſemneium to confer together, and partake of the myſteries.

There are two points relating to theſe *Therapeutæ* exceedingly controverted among critics, *viz.* 1° whether they were Jews or Chriſtians; and, 2° if they were the latter, whether they were monks or ſeculars?

As to the firſt, Scaliger *de Emend. Temp.* maintains, they were Eſſene Jews; but Valeſius on Euſebius rejects this opinion of Scaliger, 1° becauſe Philo never calls them Eſſenes: 2° becauſe there were no Eſſenes but in the Holy Land; whereas the *Therapeutæ* were ſpread through Greece, and all the barbarous nations: 3° becauſe Joſephus, who gives a very ample account of the Eſſenes, does not ſay one word of the *Therapeutæ*, or the *therapeutic life*. See Essene.

And yet Valeſius allows them to be Jews; and Photius is of his opinion: the chief reaſons Valeſius gives are what Philo ſays, that they read nothing but the law, and the prophets. 2° that they had ſome books of their founders; and how can this quadrate with the Chriſtians, who were then in their firſt riſe? 3° that they only prayed twice a day, whereas the Chriſtians then prayed much oftener. 4° that the Chriſtans had no hymns or pſalms till after the time of Antoninus. Laſtly, that the Chriſtians could not be ſpread over the world.

Neverthele ſs Euſebius, *lib.* II. *Hiſt. Eccleſ. c.* 17. St. Jerom, Sozomen, Nicephorus, Baronius, Petavius, M. Godeau, Montfaucon, &c. maintain the *Therapeutæ* to have been Chriſtians; urging, that nothing can be more conformable to the practices of the church than the account given of them by Philo; that thoſe books of their founders are the goſpels, and other writings of the apoſtles; and that there are indications even of biſhops and other miniſters among them.

But M. Bouhier, preſident of the parliament of Dijon, refutes this opinion; ſuppoſing it inconſiſtent in Philo, a Jew, to write a book expreſly in praiſe of Chriſtians.

Several authors, however, as Caſſian, F. Helyot, &c. maintain, that the *Therapeutæ* were not only Chriſtians, but that they were alſo religious: and, in effect, M. Bouhier allows, that if they were Chriſtians, they muſt be confeſſed to have been monks.—As to his argument, that Philo would never have wrote a panegyric on the Chriſtians; it is anſwered, that they were people of his own nation, Jews, as he himſelf expreſſes it; and that he only looked on them as a ſect of Jews, who, by their extraordinary virtue, did honour to his nation.

But though the Chriſtianity of the *Therapeutæ* appears probable enough; yet their monachiſm is not made out at all. See Monk, &c.

THERAPEUTICE,* **Therapeutics**, that part of medicine which is employed in ſeeking out remedies againſt diſeaſes, and in preſcribing and applying them to effect a cure. See Medicine.

* The word is Greek, θεραπευτικη, formed from θεραπευειν, to *attend*, to *nurſe*, *cure*, &c.

Therapeutice teaches the uſe of diet, pharmacy, chirurgery, and the *methodus medendi*. See Diet, Medicines, Prescription, &c.

Therapeutice is alſo uſed figuratively, in ſpeaking of the mind, and of diſcourſes made to correct the errors and defects thereof.

Such is the *Therapeutice* or *Therapeutics* of Theodoret; being a treatiſe againſt the errors or unwholſome opinions of the Greeks, *i. e.* the heathens.

THERAPHIM, a **Teraphim**, a Hebrew term, which has given great torture to the critics.—We meet with it 13, or 14 times in ſcripture, where it is commonly interpreted *idols*: but the rabbins are not contented to have it ſimply ſignify idols, but will have it denote a peculiar ſort of idols or images for the knowledge of futurity, *i. e.* oracles.

R. David de Pomis obſerves, that they were called *theraphim*, from רפה, *raphah*, to leave, beauſe people quitted every thing to conſult them.—He adds, that the *theraphim* were in human ſhape; and that, when raiſed upright, they ſpoke at certain hours, and under certain conſtellations, by the influence of the celeſtial bodies. This is a rabbinical fable, which he has learned from Abenezra.

Others hold, that the *theraphim* were brazen inſtruments which pointed out the hours and minutes of future events, as directed by the ſtars.—De Pomis corrects Abenezra, ſaying, that the *theraphim* being made under a certain conſtellation, the devil made them ſpeak under the ſame. See Talisman.

R. Eliezer tells us the reaſon why the rabbins will have the *theraphim* to ſpeak, and render oracles: it is, ſays he, becauſe it is written in the prophet Zachary, x. 2. The *theraphim* have ſpoken vain things.

The ſame rabbin adds, that to make the *theraphim*, they killed a firſt-born child, clove his head, and ſeaſoned it with ſalt and oil; that they wrote on a plate of gold the name of ſome impure ſpirit, laid it under the tongue of the dead, placed the head againſt the wall, lighted lamps before it, prayed to it, and it talked with them.

Be this as it will, Vorſtius obſerves, that beſide the paſſage of Zachary juſt quoted, it appears likewiſe from Ezekiel xxi. 22. that the *therapim* were conſulted as oracles.

De Pomis endeavours to ſhew, that the *theraphim*, which Michol put in David's bed, were not of this kind, becauſe they were not in the figure of men; but R. Eliezer is of another ſentiment.

As to the manner of making the *theraphim*, Vorſtius takes it to be a vain tradition of the rabbins, though R. Tanichuma and Jonathan, in his *Targum*, Gen. xxxi. 19. relate it after R. Eliezer.—The chief reaſon of his diſbelief is, that Laban who had not quite loſt all notion of the true God, as appears from Gen. xxxi. 53. could not be guilty of ſo great a cruelty: but Vorſtius does not conſider, that the cuſtom might not be leſs real, for its not having been eſtabliſhed ſo early as Laban; and that the Hebrews ſometimes burnt their children to Moloch.

F. Kircher directs us to ſeek the origin of the *theraphim* in Egypt; adding, that the word is Egyptian.—Spencer, in his diſſertation on the *urim* and *thummim*, maintains the word to be Chaldee, and to ſignify the ſame with *ſeraphim*; the Chaldeans being frequently known to change the ש into ת, that is, ſ into *t*. He adds, that thoſe images were borrowed from the Amorites, Chaldeans, or Syrians; and that the *ſerapis* of the Egyptians is the ſame thing with the *theraphim* of the Chaldeans. See Selden *de diis Syriis*, ſynt. 1. c. 2.

THERIACA, ΘΗΡΙΑΚΑ, Treacle, in medicine, a name given by the ancients to various compoſitions eſteemed good againſt poiſons; but now chiefly reſtrained to what, by way of diſtinction, we call *theriaca andromachi*, or *venice treacle*. See Alexipharmic, Antidote, Counter-poison, &c.

This is a compound of no leſs than 64 drugs, prepared, pulverized and reduced, by means of honey, into a liquid electuary. See Electuary.

The baſis, or foundation of the compoſition, is vipers fleſh. M. Charas has wrote a particular hiſtory of the animals, plants and minerals, which enter the compoſition of this famed remedy.

It is found ſoveraign againſt the bites of venomous beaſts, and in the wind-colic; and is alſo uſed in intermitting fevers, and in caſes requiring perſpiratives and diaphoretics; alſo in continual fevers, eſpecially ſuch as are malignant, and where the pulſe is low and ticking; in the ſmall-pox and meaſles: and, as moſt of the ingredients thereof are very hot, in all diſeaſes, where the natural heat is weak and languid.

Andromachus, Nero's phyſician, paſſes for the inventor of the *theriaca*; at leaſt, it was he gave the firſt deſcription thereof in elegiac verſes: his ſon did the ſame in proſe, and Democrates in iambics.

Anciently, the *treacle* made at Venice had all the vogue: and many ſtill retain the ancient prejudice: but it is now prepared at Montpellier, at Paris, and even at London, with as much advantage as at Venice.

There is another vulgar kind of *theriaca*, called *diateſſaron*, becauſe only conſiſting of four ingredients. See Diatessaron.

Treacle water, and *treacle vinegar* are found good preſervatives againſt putrid air, whether by being only ſmelt at, or by rubbing the wriſts, temples and noſe therewith.

THERMÆ,* ΘΕΡΜΑΙ, in architecture, ancient buildings, furniſhed with baths, eſpecially of the hot kind. See Bath.

* The word is formed from the Greek, θερμος, *hot*.

Among the noble monuments of ancient Rome, are reckoned the *thermæ*, or baths of Diocleſian.

Thermæ, or hot ſprings, it is commonly argued, owe their heat to a colluctation, or efferveſcence of the minerals in them. Though Dr. Woodward aſcribes it to the ſubterraneous heat, or fire, which communicates with them by ſome ſpiracle or canal, whereby a greater quantity of heat is derived thither than to ordinary ſprings. See Mineral, Water, Spring, Heat, &c.

THERMOMETER, Thermometrum, an inſtrument ſhewing, or rather meaſuring, the increaſe and decreaſe of the heat and cold of the air. See Heat, Air, &c.

Thermometer and *thermoſcope* are ordinarily accounted the ſame thing: Wolfius, however, makes a difference; but ſhews withal that what we call *thermometers* are, in reality, no more than *thermoſcopes*. See Thermoscope.

There are various kinds of *thermometers*, the conſtructions, defects, theory, &c. whereof are as follow:

Conſtruction of a Thermometer, *depending on the rarefaction of the air.*—In a tube BC, (*Tab. Pneumatics*, *fig.* 3. *n.* 2.) to which is faſtened a glaſs ball AB, is put a quantity of common water mixed with aqua regia, to prevent its freezing; and the mixture tinged with a ſolution of vitriol to give it a greenneſs. In filling the tube, care is taken that there be ſo much air left in the ball and the tube, as, that when at its greateſt condenſation in the middle of winter, it may juſt fill the ball; and yet in its greateſt rarefaction in ſummer, may not drive all the liquor out of the tube. To the other extreme of the tube is faſtened another glaſs ball CD, open to the air at D: on each ſide the tube is applied the ſcale EF, divided into any number of equal parts.

Now, as the ambient air becomes warmer, the air in the ball and the top of the tube expanding, will drive the liquor into the lower ball; and conſequently its ſurface will deſcend: on the contrary, as the ambient air grows colder, that in the ball becoming condenſed, the liquor will aſcend. See Rarefaction, and Condensation.

Conſtruction of the mercurial Thermometer.—In the ſame manner, and with the ſame caution as before, put a little quantity of mercury, not exceeding the bigneſs of a pea, into a tube BC (*fig.* 4. *n.* 2.) thus bent in wreaths, that, taking up the leſs height, it may be the more manageable, and leſs liable to harm; divide this tube into any number of equal parts to ſerve for a ſcale.

Here the approaches of the mercury towards the ball A will ſhew the increaſes of the degree of heat.—The reaſon is the ſame as in the former.

The defect of both theſe inſtruments conſiſts in this, that they are liable to be acted on by a double cauſe: for, not only a decreaſe of heat, but alſo an increaſe of weight of the atmoſphere, will make the liquor riſe in the one, and the mercury in the other; and, on the contrary, either an increaſe of heat, or decreaſe of weight of the atmoſphere, will make it deſcend. See Barometer.

Conſtruction of the Florentine or common Thermometer.—The academiſts del Cimento, conſidering the inconveniences of the *thermometers* juſt deſcribed, attempted another, that ſhould meaſure heat and cold by the rarefaction and condenſation of ſpirit of wine; though thoſe be vaſtly leſs than of air, and conſequently the alterations in the degree of heat like to be much leſs ſenſible.

The ſtructure of their *thermometer* is this: on ſome little pieces of turmeric is poured a quantity of rectified ſpirit of wine, which hereby receives a red tincture; this done, the ſpirit of wine is filtrated again and again through a brown paper, that the coarſer particles of the root may be ſeparated therefrom. With the ſpirit thus tinged and prepared, they fill a glaſs ball AB (*fig.* 5. *n.* 2.) and a tube BC; and that all the ſpirit may not deſcend in winter into the ball, it is convenient to put the ball into a lump of ſnow, mixed with ſalt: or, if the inſtrument be to be made in ſummer, into ſpring-water impregnated with ſalt-petre, that the condenſed ſpirit may ſhew how far it will retire in the extremeſt cold.

If it riſe to too great a height from the ball, part of it is to be taken out; and that the tube may not be made longer than needs, it is convenient to immerge the ball, filled with its ſpirit, in boiling water, and to mark the furtheſt point to which the ſpirit then riſes.

At this point the tube is to be hermetically ſealed by the flame of a lamp; and at the ſides is to be added a ſcale, as in the former *thermometer*.

Now, ſpirit of wine rarifying and condenſing very conſiderably; as the heat of the ambient air increaſes, the ſpirit will dilate, and conſequently will aſcend in the tube; and as the heat decreaſes, the ſpirit will deſcend: and the degree or quantity of aſcent and deſcent will be ſeen in the ſcale. Yet as the ratio of yeſterday's heat to to-day's is not hereby diſcovered, this inſtrument is not ſtrictly a *thermometer*, no more than the former.

It is to be here obſerved, 1°. that as the natural gravity of the liquor makes it tend downwards, ſo it reſiſts its aſcent out of the ball into the tube; and that the more, as it riſes higher: for which reaſon, it were beſt to have the tube BC horizontal. 2°. Since there muſt of neceſſity be ſome air left in the void part of the tube over the liquor, that air, by its elaſticity, will tend downwards, and of conſequence will reſiſt the riſe of the liquor, and be compreſſed by it as it does riſe: its elaſticity therefore is thus increaſed.

3°. Since it is found from experience, that a leſs degree of heat is communicated more eaſily to the ſpirit of wine in the ball than a greater, the rarefactions of the ſpirit of wine are not proportionable to their producing cauſes; eſpecially ſince a greater degree of heat finds more liquor in the tube than a leſs does, to which, notwithſtanding, the heat may be more eaſily communicated than to that ſtagnating in the ball.

On theſe accounts, the Florentine *thermometer*, though that commonly in uſe, is far from being an accurate meaſure of heat, &c. to which may be added what Dr. Halley obſerves in the *philoſophical tranſactions*, that he has learned from thoſe who have kept ſpirit of wine long, that it loſes part of its expanſive force in courſe of time.

Another great defect of theſe, and other *thermometers*, is, that their degrees are not comparable with each other. They mark, indeed, the different degrees of heat and cold, but each marks only for itſelf, and after its own manner; for that they do not proceed from any point of heat, or cold, that is common to them all. It is with them as with two clocks, which for want of having been firſt ſet to the ſame hour by the ſun, will, indeed, mark that one, two, or more hours are paſſed, but not what hour it is by the day.—Nor can we be aſſured, that when the liquor is riſen a degree in two different *thermometers*, they have both ſuffered the ſame impreſſion of an equal additional heat: ſince the ſpirit of wine may not be the ſame in both, and in proportion as this ſpirit is more or leſs rectified, it will riſe more or leſs high by the ſame heat.

Nor is this all: for in graduating *thermometers* they take equal lengths of the tube for equal aſcents of the ſpirit; whereas, ſuppoſing the diameters of the tube equal throughout, which very rarely happens, there are ſo many irregularities withinſide, that a certain length of tube ſometimes requires double the quantity of liquor to fill it, that the ſame length in another tube of the ſame diameter requires. All which ariſes from the unequal thickneſſes of the parietes of tubes in different places; and from accidental prominences and cavities, always found in the inner ſurfaces of tubes; and eſpecially from their being almoſt always bigger at one end than the other.

Hence it is, that the compariſon of *thermometers* becomes ſo precarious and defective.—Yet the moſt curious and intereſting uſe of *thermometers* is, what ought to ariſe from ſuch compariſon. It is by this we ſhould know the heat or cold of another ſeaſon, of another year, another climate, &c. what is the greateſt degree of heat or cold that men and other animals can ſubſiſt in.

M. de Reaumur has contrived a new *thermometer* for this purpoſe; wherein the inconveniences above recited are remedied. See its deſcription at large in *Mem. de l'Acad. R. des Scien. an.* 1730, p. 645. *hiſt.* p. 15. *item, an.* 1731. p. 354. *hiſt.* p. 7.

Various methods have been propoſed by various authors, for finding a fixed point, or degree of heat and cold, from which to account the other degrees, and adjuſt the ſcale; that ſo obſervations made at the ſame or different times, in different places, may be compared together.

Some note the place the liquor is at in winter, when water begins to freeze; and again, that in ſummer, when butter placed near the ball of the thermometer, melts: the intermediate ſpace they divide into two equal parts, the middle point whereof anſwers, in their graduation, to temperate heat; and each moiety they ſub-divide into ten degrees, adding four other equal degrees on each of the two extremes. But this method ſuppoſes the ſame degree of heat and cold to anſwer to the freezing of all water, and the melting of all butter; as alſo, that all *thermometers* receive the ſame impreſſions from the ſame degree of heat; all which are contrary to experience.

Others adviſe the ball of the *thermometer* to be put in a quantity of ſnow and ſalt, and the point the liquor is at to be noted. Thence the *thermometer* is to be removed into a deep cave, or cellar, where no external air reaches; ſo that the liquor receiving the action of a temperate air, may ſhew the degree of temperate heat. Laſtly, they divide the intermediate ſpace into 15, or more equal parts, which they continue beyond each extreme: but this method is liable to the ſame inconveniences as the former.

Dr. Halley aſſumes that for a fixed degree of heat wherein ſpirit of wine begins to boil; but there is reaſon to ſuſpect this too of being precarious: though after him, M. Amontons retains the degree of heat anſwering to boiling water, for the graduating his mercurial *thermometer*. But as the different ſpecific gravities of water argue a difference of maſs and texture, it is highly probable that heat of all boiling waters is not the ſame; ſo that the point is yet undetermined.

THERMOSCOPE,* an inſtrument ſhewing the changes happening in the air with reſpect to heat and cold. See AIR, WEATHER, *&c.*

* The word *thermoſcope* is generally uſed indifferently with that of *thermometer*. There is ſome difference, however, in the literal import of the two; the firſt ſignifying an inſtrument that ſhews, or exhibits the changes of heat, *&c.* to the eye, formed from θερμη, *heat*, and σκοπεω, *video, I ſee*; and the latter an inſtrument that meaſures thoſe changes, from θερμη, *heat*, and μετρειν, *to meaſure*: on which foundation the thermometer ſhould be a more accurate *thermoſcope*, &c. This difference the excellent Wolfius taking hold of, deſcribes all the thermometers in uſe as *thermoſcopes*; ſhewing that none of them properly meaſure the changes of heat, *&c.* none of them do more than indicate the ſame. Though their different heights yeſterday and to-day ſhew a difference of heat, yet ſince they do not diſcover the ratio of yeſterday's heat to to-day's, they are not ſtrictly thermometers. See THERMOMETER.

In the *Acta erudit. Lipſ.* we have a method of graduating the common thermometers ſo, as that the unequal diviſions thereof ſhall correſpond to equal degrees of heat, whereby the ratio of to-day's heat to yeſterday's will be meaſured, and conſequently the *thermoſcope* be improved into a thermometer.

The method is that of Car. Renaldinus, and is deſcribed by the Leipſic editors thus: take a ſlender tube about four palms long, with a ball faſtened to the ſame; pour into it ſpirit of wine, enough juſt to fill the ball when ſurrounded with ice, and not a drop over. In this ſtate, ſeal the orifice of the tube hermetically, and provide ſix veſſels, each capable of containing a pound of water, and ſomewhat more; and into the firſt pour 11 ounces of cold water, into the ſecond 10 ounces, into the third 9, *&c.* This done, immerge the thermometer in the firſt veſſel, and pour into it one ounce of hot water; obſerving how high the ſpirit riſes in the tube, and noting the point with unity: then remove the barometer into the ſecond veſſel, into which is to be poured two ounces of hot water, and note the place the ſpirit riſes to with 2. By thus proceeding till the whole pound of water is ſpent, the inſtrument will be found divided into 12 parts, denoting ſo many terms or degrees of heat; ſo that at 2, the heat is double to that at 1, at 3 triple, *&c.*

But the method, though plauſible, Wolfius ſhews is deceitful, and is built on falſe ſuppoſitions: for it takes for granted, that we have one degree of heat, by adding one ounce of hot to 11 of cold water; two degrees, by adding two ounces to 10, *&c.* It ſuppoſes that a ſingle degree of heat acts on the ſpirit of wine in the ball with a ſingle force, a double with a double force, *&c.* Laſtly, it ſuppoſes that if the effect be produced in the thermometer by the heat of the ambient air, which is here produced by the hot water, the air has the ſame degree of heat with the water.

But none of theſe ſuppoſitions is true: for, as to the firſt, allowing the heat of the hot water, equally diſtributed through the cold, one degree of heat will then be diſtributed through 11 parts, two through 10, three through 9, *&c.* Taking therefore equal bulks of the water, *e. gr.* a twelfth part of each, the heat will not be double in one, triple in another, quadruple in another, *&c.*

The firſt ſuppoſition therefore is erroneous, and ſo is the ſecond; for neither is the heat of the hot water equably diffuſed throughout the cold, nor does the heat of the hot water act uniformly on the ſpirit of wine, *i. e.* not with the ſame force during all the time of its action.

For the third ſuppoſition, the heat of the ambient air acts not only on the ſpirit of wine in the ball, but alſo on that in the tube; and therefore this as well as that will be changed.

THESEA, or THESÆA, ΘΗΣΕΙΑ, in antiquity, feaſts celebrated by the Athenians, in honour of Theſeus. See FEAST.

In ſpite of the important ſervices that hero had done his country, in delivering it from a ſhameful tribute of ſo many youths of either ſex ſent yearly to be devoured by the Minotaur in Crete (as the fable has it) or ſent as ſlaves to Minos king of Crete, as the hiſtories have it; from which he freed them, by overcoming Taurus, Minos's general: he was baniſhed for ſome time, and retired to Scyro, under the protection of Lycomedes, king of that iſland, who ſlew him out of jealouſy.

The gods revenged this treatment Theſeus received from the Athenians, by afflicting them with a famine, which the oracle aſſured them ſhould not ceaſe till they had avenged his death.—Upon this they ſlew Lycomedes, brought Theſeus's bones to Athens, placed them in a temple erected to him, and appointed *theſea* to be held every eighth day of each month, wherein largeſſes were diſtributed to the people, and the day ſpent by the rich in feaſting and rejoicing.

THESIN,—*Per Arſin &* THESIN. See *Per* ARSIN.

THESIS,* in the ſchools, a general propoſition which a perſon advances, and offers to maintain. See PROPOSITION.—See alſo ECTHESIS, METATHESIS, PARATHESIS, PARENTHESIS, SYNTHESIS, *&c.*

* The word is pure Greek, θεσις, *poſition*; formed from τιθημι, *pono, I put*, or *lay down*.

In the colleges it is frequent to have placards, containing a number of theſe *theſes*.—There are *theſes* in theology, in medicine, in philoſophy, in law, *&c.*—The maintaining a *theſis*, is a great part of the exerciſe a ſtudent is to undergo for a degree. See DEGREE.

THESIS, in logic, *&c.*—Every propoſition may be divided into *theſis*, and hypotheſis; *theſis* contains the thing affirmed or denied, and hypotheſis the conditions of the affirmation or negation. See HYPOTHESIS.

Thus, in Euclid, If a triangle and parallelogram have equal baſes and altitudes, (is the hypotheſis) the firſt is half of the ſecond, the *theſis*.

Arſis and THESIS. See the article ARSIS.

THEURGY,* ΘΕΟΥΡΓΙΑ, a name which the ancients gave to that ſacred part of magic, which we ſometimes call *white magic*, or the *white art*. See MAGIC.

* The word is formed from the Greek Θεος, *God*, and εργον, *work*, *q. d.* the art of doing divine things, or things which God alone can do, or the power of working extraordinary and ſupernatural things by invoking the names of God, ſaints, angels, *&c.*

Accordingly, thoſe who have wrote of magic in the general, divide it into three parts; the firſt whereof is called *theurgy*, as operating by divine or cœleſtial means; the ſecond, *natural magic*, performed by the powers of nature; and the third, *necromancy*, which proceeds by invoking dæmons. See NECROMANCY, *&c.*

THICK *Inteſtines*. See the article INTESTINES.

THIGH, a part of the body of men, quadrupeds, and birds, between the leg and the trunk. See LEGS, *&c.*

The ſeveral parts of the *thigh* have different names: the fore and upper-part is joined to the groin, or *inguen*; the ſide makes the hanch, or hip, *coxa, coxendix*; the upper hind-part the buttock, *clunis*; the lower and hind-part the ham, *poples*, of *poſt* and *plico*, becauſe it bends backwards; and the fore-part the knee, *genu*, of the Geek γονυ, which ſignifies the ſame.

The bone of the *thigh* is the largeſt and ſtrongeſt in the whole human body, as being to bear the whole burthen thereof: whence its name *femur*, of *fero, I bear*. See FEMUR.

THINKING, *Cogitation*, a general name for any act or operation of the mind. See MIND, and THOUGHT.

Chauvin, with the Carteſians, will have *thinking* to conſiſt in a certain native, inherent motion, or agitation of the human mind, whereof itſelf is conſcious.—*Native* and *inherent*, ſince he conceives it no other than the very eſſence of the mind itſelf, or, at leaſt, its principal and fundamental property:—an *agitation*, ſince there is a new modification or change made in the mind, which we ſcarce know how to conceive without motion; add, that the origin and etymology of the word *cogitation*, according to Varro and Feſtus, implies as much; *cogito* being uſed for *coagito*. See THOUGHT.

When the mind turns its view inwards, upon itſelf, the firſt idea that offers, ſays Mr. Locke, is *thinking*; wherein it obſerves a great variety of modifications, and thereof frames to itſelf diſtinct ideas: thus the perception annexed to any impreſſion on the body made by an external object, is called *ſenſation*. See SENSATION.

When an idea recurs without the preſence of the object, it is called *remembrance*. See MEMORY.

When ſought after by the mind, and brought again in view, it is called *recollection*. See RECOLLECTION.

When held there long under attentive conſideration, it is *contemplation*. See CONTEMPLATION.

When ideas float in the mind without regard or reflection, it is called a *revery:* when they are taken expreſs notice of, and, as it were, regiſtered in the memory, it is *attention:* and when the mind fixes its view on any one idea, and conſiders it on all ſides, it is *ſtudy* and *attention*. See ATTENTION, &c.

Theſe are the moſt obvious modes of *thinking*; but there are ſeveral others which we know of; and, doubtleſs, the mind is capable of infinite others, whereof we have no notion at all. See MODE.

The ſchool philoſophers uſually divide *thinking*, with regard to the objects it is employed about, into underſtanding, *intellectio*; and willing, *volitio*. See UNDERSTANDING, and WILL.—And hence, thoſe are ſaid to be the two powers or faculties of the human mind. See POWER, and FACULTY.

Intellectual *thinking* is farther ſubdivided into divers kinds: the firſt, when the mind merely apprehends or takes notice of a thing, called *perception:* the ſecond, when it affirms or denies a thing, called *judgment:* the third, when it gathers or infers a thing from others given, called *reaſoning:* the fourth, when the mind diſpoſes its own thoughts or ideas in order, called *method*. See PERCEPTION, JUDGMENT, REASONING, and METHOD.

Volitive *thinking*, or volition, admits of infinite different modifications, or new determinations. See WILL.

Some authors extend the idea of *thinking* further; and conſider it in God, angels, men, brutes, &c. whence a new diviſion of *thinking* into divine, angelical, human, and animal or ſenſitive. But the two firſt we know little or nothing of. See GOD, and ANGEL.—The third is that we have already been treating of.—As to the laſt, *viz.* animal or ſenſitive thought, it is defined to be an action of the ſoul attending to an external object, effected by means of the animal ſpirits duly agitated in the brain, to excite an idea. See SPIRITS, KNOWLEDGE, THOUGHT, &c.

The Carteſians maintain, that *thinking* is eſſential to the human ſoul; and, conſequently, that there is no time when the ſoul does not *think:* but this doctrine is overturned by Mr. Locke, who ſhews, that in ſleep without dreaming, there is an entire ceſſation of all the modes of *thinking*. See IDEA.

I think, *cogito*, according to des Cartes, is the firſt, and moſt certain of all truths; from which alone we draw this conſequence, *therefore I am*, or exiſt, *ſum*.—One might alſo ſay, *cogito, ergo Deus eſt*; *I think, therefore there is a God*. See EXISTENCE, CARTESIAN, &c.—Logic is defined the art of *thinking* juſtly. See LOGIC.

THIRD, *Tertius*. See NUMBER, and NUMERATION.

THIRD, in muſic, a concord reſulting from a mixture of two ſounds containing an interval of two degrees. See CONCORD.

It is called *third*, as containing three terms, or ſounds between the extremes. See INTERVAL.

The *third*, in Italian *terza*, in French *tierce*, in Latin *tertia*, has no general name in the Greek: it is the firſt of the imperfect concords, *i. e.* of ſuch as admit of majority and minority, without ceaſing to be concords.—And hence it is, that it is diſtinguiſhed into two kinds.

The firſt, which the Italians call *ditono* (from the Greek *ditonos)* or *terza maggiore*, and we *greater third*, is compoſed diatonically of three terms, or ſounds, containing two degrees, or intervals; one whereof, in the ancient ſyſtem, is a greater tone, and the other a leſſer tone: but in the modern temperate ſyſtem they are both equal, as *ut*, *re*, *mi*; or *ut*, *mi*. See DEGREE, TONE, SEMITONE, &c.

Chromatically it is compoſed of four ſemitones; two whereof are greater, and the *third* leſs: it takes its form from the ratio ſeſqui-quarta 4 : 5.

The ſecond *third*, which the Italians call *trihemituono*, or *ſemi-ditono*, or *terza minore*, and we *leſſer third*, is compoſed, like the former, of three ſounds, or terms, and two degrees, or intervals: but theſe degrees, diatonically, are only a greater tone, and a ſemitone.

Chromatically it is compoſed of three tones, two greater, and one leſs; as *re*, *mi*, *fa*; or *re*, *fa*.

It takes its form from the ratio ſeſqui-quinta 5 : 6.

Both theſe *thirds* are of admirable uſe in melody; and make, as it were, the foundation and life of harmony. See CONCORD, MELODY, and HARMONY.

They are uſed agreeably both aſcending and deſcending; and that either running over all the degrees, as *ut*, *re*, *mi*; or *re*, *mi*, *fa*; or ſkipping the middle degree, as *ut*, *mi*; or *re*, *fa*.

But it is to be obſerved, the *greater third* has ſomewhat gay and ſprightly in riſing, and ſomewhat heavy and melancholic in falling: the *leſſer third*, on the contrary, has ſomewhat ſoft and tender in riſing, and ſomewhat briſk in falling.—For the uſe of the *greater* or *leſſer third* in the ſeries of the ſcale; ſee SCALE.

There are two other kinds of *thirds* that are diſſonant and vicious; the firſt only compoſed of two greater ſemitones, and, by conſequence, of a ſemitone leſs than the *leſſer third:* this they call the *defective third*.

The ſecond, on the contrary, has a ſemitone more than the *greater third*; and this they call the *redundant third*.

The *defective third* is very frequent in Italian ſongs, eſpecially thoſe compoſed for inſtruments; but is not to be uſed without neceſſity, and a deal of diſcretion. The *redundant third* is abſolutely forbidden.

THIRD *Borough*, in our ancient law-books, denotes a conſtable. See CONSTABLE.

THIRD *Earing*, in huſbandry, the tilling or ploughing of the ground a *third* time.

THIRD *Eſtate*. See ESTATE, COMMONS, &c.

THIRD *Night-awn-hynd*: by the laws of Edward the Confeſſor, a gueſt who had lain three nights in an inn, was reputed a domeſtic, and his hoſt was anſwerable for what offence he ſhould commit. See HOGENHINE.

For one night he was accounted *uncuth*, for two nights *gueſt*, and the *third*, *awn-hynd*. *Prima nocte incognitus, ſecunda hoſpes, tertia domeſticus cenſetur.*

THIRD *Order*, a ſort of religious order, that obſerves the ſame rule, and the ſame manner of life, in proportion, as ſome other two orders inſtituted before. See ORDER.

The *third orders* are not originally religious orders, but aſſociations of ſecular, and even married perſons, who conform, as far as their condition will allow them, to the deſign, intention, and rules of a religious order which aſſociates and directs them.

The Premonſtrantes, Carmelites, Auguſtines, and Franciſcans, diſpute among themſelves the honour of having firſt introduced *third orders:* but the pretenſions of theſe laſt appear to be the beſt founded.

The firſt contend, that the *third order* of Premonſtrantes began in the life-time of their founder St. Norbert, who died in 1134. See PREMONSTRANTES.

F. Diego de Coria Maldonado, a Spaniſh Carmelite, who has a particular treatiſe on the *third order* of Carmelites, derives them immediately, as well as the Carmelites themſelves, from the prophet Elijah; and among the great men who have made profeſſion of that *third order*, reckons the prophet Obadiah, who lived 800 years before Chriſt; and among the women, our Saviour's great grandmother, under the borrowed name of St. Emerentiena. This Obadiah, he ſays, was controller-general of the houſe of king Ahab, mentioned in the firſt book of Kings, chap. xviii. and diſciple of the prophet Elijah. After ſerving that prince, and his ſucceſſors, he retired to ſerve God, and entered the prophetic order of Elijah, but without quitting his houſe, his wife, or children.

The author adds, that he was not properly of the *third order*, but of the ſecond, which conſiſted of married people, and was called *the order of eunuchs*, under the direction of Elijah. Such, according to him, is the foundation of the *third order* of Carmelites. See CARMELITE.

F. Helyot ſhews, that this *third order* was not begun till the year 1476, when Sixtus IV. gave permiſſion to the prior and provincials of the Carmelites, to give the regular habit and rule of their order, to people of both ſexes, married or unmarried, living at liberty in the world. De Coria reckons St. Louis, king of France, in the *third order* of the Carmelites.

The THIRD *order* of Auguſtins, if we credit F. Bruno, was inſtituted by St. Auguſtin himſelf: but the arguments he produces are ſo frivolous, that F. Helyot obſerves, they are not worth the refuting.

The THIRD *order* of Franciſcans was inſtituted by St. Francis in 1221, in favour of people of both ſexes, who being ſmitten with the preachings of that ſaint, demanded of him an eaſy manner of living a Chriſtian life: upon which he gave them a rule, the conſtitutions whereof are not now extant as wrote by himſelf, but only as reduced and confirmed by pope Nicholas IV. 68 years afterwards.

The firſt order of this ſaint are the monks called *minor friars*, comprehending the cordeliers, capuchins, and recollects; the ſecond comprehends the nuns of St. Clare; and the third, ſeveral perſons of both ſexes, who live at liberty, and theſe are what we call the *third order*. See FRANCISCAN, &c.

Of this order, which was only eſtabliſhed for ſecular perſons, ſeveral of both ſexes, to attain the greater perfection, have ſince commenced religious, and formed various congregations, under various names, as *religious penitents of the third order*, &c.

THIRD *Point*, or TIERCE-*point*, in architecture, the point of ſection in the vertex of an equilateral triangle.

Arches or vaults of the *third point*, called by the Italians *di terzo acuto*, are thoſe conſiſting of two arches of a circle, meeting in an angle a-top. See ARCH.

THIRD *Point*, in perſpective,	See the articles	POINT.
THIRD *Rate*,		RATE.
THIRD *Subſidy-duty*,		DUTY.
Tithe of the THIRD *year*,		TITHE.

THIRDINGS, the third part of the corn or grain growing on the ground at the tenant's death, due to the lord for a heriot, within the manour of Turfat, in Herefordſhire. See HERIOT.

THIRST, a painful ſenſation, occaſioned by a preternatural vellication of the nerves of the throat or fauces, and producing a deſire of drinking. See DRINK.

Rohault accounts for *thirſt* thus: the ſtomach liquor, which ordinarily reſolves into a thick vapour, and aſcends from the ſtomach up into the throat, to moiſten it; being too much warmed and agitated, either from a want of ſome other liquor to temper and dilute it, or from any other cauſe, becoming converted into too thin, ſubtle, and penetrating a vapour, is ſo far from moiſtening and cooling the throat, that, on the contrary, it dries and heats it; and hence that motion in the nerves, the ſenſation whereof we call *thirſt*. See HUNGER.

Thirſt ſometimes alſo ariſes from a mere dryneſs of the part; and ſometimes from ſharp ſalts, more immediately vellicating the fibres of the throat.

There are various kinds of liquors which quench *thirſt*; ſome by tempering the ſtomach liquor; others by diluting, and even diſſolving the ſalt; and others by moiſtening and ſuppling the fibres.—Acids are peculiarly fitted for that end. See ACID.

Thirſt is ſometimes eluded by rolling a leaden bullet or a pebble in the mouth, which occaſions an extraordinary iſſue of ſaliva to moiſten the throat, *&c.* See SALIVA.

Mr. Boyle mentions a man who could eaſily abſtain from drinking for nine days, and yet his diet nothing more liquid than uſual; the ſecretions of urine, ſweat, *&c.* being performed all the while regularly, and in the ſame quantity as uſual.

In dropſical caſes, where there is not a right ſecretion of the urine by the renal glands, and the veſſels and parts of the body are loaded with too great a quantity of ſerous humours, a great moderation in drinking might be attended with good ſucceſs, provided ſome liquor could be found out to allay that uneaſy ſenſation: probably this would be beſt performed by mucilages acidulated with ſpirit of vitriol or ſulphur, or gellies with juice of lemon, *&c.* and that a ſmall quantity of ſuch a compoſition now and then uſed, might be of as much real ſervice in quenching *thirſt*, as draughts of liquor which increaſe the ſymptoms. See DROPSY.

THISTLE, *Carduus*, a name common to divers plants, whoſe flowers conſiſt of ſeveral little, narrow, longiſh leaves, ranged cloſe together into a ſort of head, and whoſe leaves are uſually ſquammoſe and prickly.—The moſt known of theſe plants are the *bleſſed thiſtle*. See CARDUUS *Benedictus*.

Milk THISTLE, or *our Lady's* THISTLE, *Carduus Mariæ*, the decoction whereof is by ſome recommended againſt the dropſy, jaundice, and pains of the kidneys.

Fuller's THISTLE, or *Teazel:* ſee under the article TEAZEL.

Order of the THISTLE, or of St. Andrew, is a military order in Scotland; inſtituted, as ſome ſay, by Hungus, or Hungo, king of the Picts, after a victory obtained over Athelſtan. See KNIGHT.

The legend is, that a croſs of St. Andrew (the patron of that kingdom) appearing to him at the time of the engagement, he bleſſed the happy augury, took the figure thereof into his ſtandard in honour of his protector, and inſtituted an order of knights, whoſe collar is of gold interwoven with *thiſtle* flowers, and ſprigs of rue.

From the collar hangs a medal, on which is the image of St. Andrew with his croſs on his breaſt; with this motto, *Nemo me impune laceſſet*, Nobody ſhall provoke me unpuniſhed.

Others give a different account of its origin, and aſſure us, it was inſtituted after the concluſion of a peace between Charles VII. of France, and the king of Scotland.

The abbot Juſtiniani goes up higher, and will have it to have been inſtituted by Achaius I. king of Scotland, in 809; who, after an alliance made with Charlemaign, took for his device the *thiſtle*, with the words *nemo me impune laceſſet*, which, in effect, is that of the order: he adds, that king James IV. renewed the order, and took St. Andrew for its protector.

The order only conſiſts of twelve knights, beſides the king, who is the chief, or ſoveraign. Their ordinary badge is a green ribbon, to which hangs a *thiſtle* of gold, crowned within a circle of gold, in which is the foreſaid motto.

Our Lady of the THISTLE, was alſo a military order inſtituted in 1370, by Louis II. duke of Bourbon.—It conſiſted of 26 knights, whereof that prince and his ſucceſſors were the chiefs: their badge was a ſky-blue girdle; and, on ſolemn occaſions, a mantle of the ſame colour, with a gold collar, interwoven with flower-de-luces, among which was the word *eſperance*, *hope*, in capitals.

THISTLE-*take*, a cuſtom in the honour of Halton, in the county of Cheſter, whereby, if in driving beaſts over the common, the driver permits them to graze, or take but a *thiſtle*, he ſhall pay a half-penny a beaſt to the lord of the fee.

At Fiſkerton, in Nottinghamſhire, by ancient cuſtom, if a native, or cottager killed a ſwine above a year old, he paid the lord one penny; which was alſo called *thiſtle-take*.

THLIPSIS, ΘΛΙΨΙΣ, is uſed by anatomiſts, for the compreſſion of any veſſel, or aperture, whereby its cavity is leſſened.

THNETOPSYCHITES,* a ſect in the ancient church, who believed the ſoul of man perfectly like that of brutes; and taught that it died with the body. See SOUL.

* The word is compoſed of the Greek θνητος, *mortal*, and ψυχη, *ſoul*.

We meet with no account of theſe heretics any where, but in J. Damaſcenus, *hæreſ.* 90. unleſs they be the ſame with thoſe Euſebius ſpeaks of, *Hiſt. Eccleſ. lib.* 9. *c.* 38. who relates, that in Origen's time there were heretics in Arabia, who taught, that the ſoul of man died with the body; but that it ſhould riſe again with it at the end of the world. He adds, that Origen refuted them in a numerous council, and reclaimed them from their errors.—St. Auguſtin and Iſidore call them Arabian heretics.

Marſhal, in his tables, has disfigured the word, for want of underſtanding it; he writes it *thenopſychites*, inſtead of *thnetopſychites:* he likewiſe places them in the VIth century; on what grounds we cannot imagine.

THOMÆANS, THOMEANS, THOMITES, or *Chriſtians of St.* THOMAS, a people of the Eaſt-Indians, who, according to tradition, received the goſpel from the apoſtle St. Thomas. See CHRISTIAN.

Upon the arrival of the Portugueſe at Calecut, in their firſt voyage to the Indies, they met with ancient Chriſtians, who pretended to be deſcended from thoſe converted by St. Thomas. The *Thomæans* being informed of a new people arrived among them, who bore a particular veneration for the croſs, ſent embaſſadors to them to make an alliance with them, and to ſolicit their aſſiſtance againſt the Gentile princes, by whom they were greatly oppreſſed.

It is certain the *Thomæans* are Indigenæ, or originally of India: they are called *Nazarenes*; but cuſtom has affixed to that name an idea of contempt: their other name *Mappuley*, and, in the plural, *Mappuleymar*, is more honourable.

They form a very conſiderable clan, or caſt; but are always divided with factions, inveterate enmities, *&c.* The clan extends through all the country from Calecut to Travencor; not that all the tract is poſſeſſed wholly by them: ſometimes they have a whole town to themſelves, and ſometimes only a certain quarter in it.

They own themſelves ſtrangers in that country, and their tradition is, that they came thither from the country about the city of Meilapur, or St. Thomas, by reaſon they were perſecuted by the prince thereof. But the time of this tranſmigration nobody knows any thing of; for they keep no monuments.

The *Thomæans* aſcribe their converſion, their diſcipline, *&c.* to St. *Thomas:* their breviary adds, that their apoſtle paſſed thence into China.

We ſhall not here enter into the diſpute, whether the St. Thomas ſo famed in the Indies be the apoſtle, or ſome other ſaint of that name; which latter is the opinion of ſeveral learned men, and particularly of M. Huet.

But the progreſs of the hiſtory of this church is not leſs difficult to trace than its origin: our European books mention the patriarch of Alexandria's ſending biſhops to the Indians, particularly St. Pantænus, St. Frumentius, *&c.* It may be doubted, whether or no it were to theſe Indians that they were ſent: Baronius, indeed, maintains it was; but the Portugueſe author *da Hiſtoria d'Ethiopia*, endeavours to prove it was to Ethiopia theſe ancient miſſionaries went. All we know for certain is, that the *Thomæans*, for ſeveral ages, were furniſhed with biſhops from the ſide of Babylon, or Syria; and there is a kind of patriarch at Babylon who continues to furniſh them.

Whether or no their apoſtle ordained them any biſhops (the order whereof may have been ſince extinct through want of proper ſubjects, as F. Bouchet imagines) is a queſtion: all we can ſay is, that the *Thomæan* church, at the firſt arrival of the Portugueſe, was wholly governed by theſe foreign biſhops.

The language they uſe, *in ſacris*, is the Chaldee, ſome ſay the Syriac: as to their ordinary language, it is the ſame with that of their neighbours.

The Chaldee was doubtleſs brought among them by their biſhops: it is added, that at the time the Eaſt was infected with Neſtorianiſm, Eutychianiſm, *&c.* the biſhops likewiſe carried them thoſe hereſies.

Such a mixture of opinions, with a total interruption of paſtors, ſometimes for ſeveral years together, occaſioned that horrible chaos their religion was in at the arrival of the Portugueſe: for a ſpecimen whereof we ſhall add their manner of celebrating the Euchariſt.

Over the altar was a kind of tribune or gallery; and while the prieſt was ſaying the beginning of the office below, a cake of flower of rice was frying in oil or butter above: when enough, the cake was let down in a baſket upon the altar, where the prieſt conſecrated it. As to the other ſpecies, for wine, they uſed a kind of brandy variouſly prepared in that country. Nor was their ordination much more regular; the archdeacon, who was ſometimes more reſpected than the biſhop himſelf, frequently ordained prieſts.

Their other abuſes were infinite: the Portugueſe, for theſe two laſt centuries, have laboured the reformation of this church; and have employed both the eccleſiaſtic and ſecular power therein: for this end they have called the *Thomæan* biſhops to the councils at Goa, have inſtructed, charged them, *&c.* and have even ſent them for inſtruction to Portugal and Rome: but they were ſtill apt to relapſe at their return; ſo that finding no good was like to be done with them, they reſolved to exclude them once for all, and to appoint an European biſhop in their room. Theſe proceedings have rendered the Portugueſe infinitely odious to the *Thomæans.*

The perſon who contributed moſt to the reform, is Dom Frey Aleixo de Meneſes, archbiſhop of Goa, who governing the Portugueſe Indians for ſome time, in defect of a viceroy, took that occaſion to call a ſynod in the village of Diamper, where abundance of regulations were made, and the *Thomæans* united to the Roman church: he was ſeconded by the Jeſuits.

After the death of the archbiſhop, a great part of the *Thomæan* church relapſed, and thus ſtill continues, partly Roman, partly *Thomæan.*

THOMAS—*Chriſtians of St.* THOMAS, } See { CHRISTIANS.
THOMAS's *Hoſpital,* } See { HOSPITAL.

THOMISM, or THOMAISM, the doctrine of St. Thomas Aquinas, and his followers the *Thomiſts*; chiefly with regard to predeſtination, and grace.

There is ſome doubt what the true, genuine *Thomiſm* is: the Dominicans pretend to hold pure *Thomiſm*; but there are other authors who diſtinguiſh the *Thomiſm* of St. Thomas from that of the Dominicans. See DOMINICANS.

Others again make *Thomiſm* no other than a kind of Janſeniſm diſguiſed; but Janſeniſm we know has been condemned by the pope, which pure *Thomiſm* never was. See JANSENISM.

In effect, the writings of Alvarez and Lemos, who were appointed by their order to lay down and defend before the holy ſee the dogmata of their ſchool, have ſince been reputed the rule of pure *Thomiſm.*

The modern ſchool has abandoned many of the ancient *Thomiſts*, whoſe ſentiments and expreſſions appeared to Alvarez and Lemos too hard; and the new *Thomiſts*, who paſs the bounds marked by theſe two doctors, cannot give their opinions for the ſentiments of the ſchool of St. Thomas, which the pope has forbid being cenſured.

The *Thomiſm* allowed, is that of Alvarez and Lemos: thoſe two authors diſtinguiſh four claſſes of *Thomiſts*; the firſt, which they reject, deſtroys or takes away liberty; the ſecond and third do not differ from Molina. See MOLINISTS.

The laſt, which Alvarez embraces, admits a phyſical premotion, or predetermination, which is a complement of the active power, whereby it paſſes from the firſt act to the ſecond; that is, from complete and next power to action. See PREDETERMINATION.

This premotion they hold is offered in ſufficient grace: ſufficient grace is given to all men; and they have a complete, independent, next power not to act, and even to reject the moſt efficacious grace. See SUFFICIENT, and GRACE.

THOMISTS, a ſect of ſchool divines, who maintain *Thomiſm.* See SCHOOL, and THOMISM.

The avowed antagoniſts of the *Thomiſts* are the Scotiſts. See SCOTIST.

THOMITES. See the article THOMÆANS.

THORACIC, THORACICUS, in anatomy, an epithet given to two branches of the axillary artery, on account of their conveying the blood into ſome parts of the thorax. See THORAX.

The *thoracic* arteries are diſtinguiſhed into *upper* and *lower.*—There are likewiſe *thoracic* veins, an *upper* and *under*, for the reconveyance of the blood from the thorax to the axillary vein. See AXILLARY.

THORACIC *Duct*, *Ductus* THORACICUS, or *Chyliferus*, is a little canal ariſing from, or rather a continuation of, the exit or mouth of the receptaculum chyli. See RECEPTACLE.

It mounts all along the thorax, whence it takes its name, and ends in the left ſubclavian vein. It is ſometimes called *Pecquet's duct*, or *ductus Pecquetianus*, from M. Pecquet, ſuppoſed to be the firſt diſcoverer thereof.

Indeed the *thoracic* duct, Dr. Wharton aſſures us, was obſerved by Barthol. Euſtachio in 1563; but its uſe, and communication with the receptaculum chyli was unknown. And hence it is that Pecquet, a phyſician of Dieppe, is commonly held to have firſt diſcovered it, in 1651; whence its denomination *ductus Pecquetianus:* tho' the deſcription he gives of its inſertion is faulty.—Van Horne confounds it with the receptaculum, or, as he calls it, *ciſterna chyli.*

In its progreſs through the thorax it is furniſhed with a proper integument from the pleura, beſides the membrane it has in common with the receptaculum: at about one third of its way it divaricates, but ſoon unites again.

Dr. Drake obſerves, that it has valves in different places of its tract; Euſtachio ſays glands. Its uſe is to carry the chyle and lympha from the receptaculum into the ſubclavian, by which it is forwarded to the cava, and thence to the heart. See CHYLE.

THORAX, * ΘΩΡΑΞ, in anatomy, that part of the human body which forms the capacity of the breaſt, and wherein are included the heart and lungs.—See *Tab. Anat.* (Oſteol.) *fig.* 3. *n.* 13. 13. *fig.* 7. *n.* 15. 15.—See alſo BODY.

The *thorax* is alſo called the *ſecond* or *middle venter*, and properly the *cheſt.* See VENTER.

It is bounded a-top by the clavicles, and at bottom by the cartilago xiphoides, and the diaphragm.—Its fore-part is called the *ſternum*, or *breaſt-bone*; its ſide-parts, the *coſtæ*, or *ribs*; its hind-parts are the *ſpina dorſi*, and its *vertebræ*, with the *omoplate.* See RIBS, STERNUM, &c.

Beſide the heart and lungs, the *thorax* likewiſe contains the aſcending cava, the aorta, the pulmonary vein and artery, the trachea, œſophagus, &c.

It is lined within-ſide with a membrane called the *pleura*, and divided in the middle by another called the *mediaſtinum.* See PLEURA, and MEDIASTINUM.

THOROUGH-*Baſs*, in muſic, is that which continues quite through the compoſition. See BASS.

THOUGHT, *Sentiment*, a general name for all the ideas conſequent on the operations of the mind, and even for the operations themſelves. See THINKING.

As in the idea of *thought* there is nothing included of what we include in the idea of an extended ſubſtance; and that whatever belongs to body, may be denied to belong to *thought*: we may conclude that *thought* is not a mode of extended ſubſtance, it being the nature of a mode not to be conceived, if the thing whereof it is the mode be denied. Hence we infer, that *thought* not being a mode of extended ſubſtance, muſt be the attribute of ſome other ſubſtance very different. See MODE.

F. Malebranche, with the ſpirit of a Carteſian, denies that a man who thinks ſeriouſly on the matter, can doubt but the eſſence of the mind conſiſts altogether in *thought*, as that of matter does in extenſion; and that according to the various modifications of *thought*, the mind ſometimes wills, ſometimes imagines, &c. as, according to the various modifications of extenſion, matter is ſometimes water, ſometimes wood, fire, &c. By the way, by *thought* he does not mean the particular modifications of the ſoul, *i. e.* ſuch or ſuch a *thought*, but *thought*, or thinking in the general, conſidered as capable of all kinds of modifications or ideas: as by extenſion he does not mean ſuch or ſuch an extenſion, as a ſquare, oval, or the like, but extenſion in the abſtract, conſidered as ſuſceptible of all kinds of modifications or figures.

He adds, that he takes it to be impoſſible to conceive a mind which does not think, though it be eaſy to conceive one which does not feel, or imagine, or will; in like manner as it is impoſſible to conceive a matter which is not extended, though it be eaſy to conceive one that is neither earth, nor metal; nor ſquare, nor round; nor that is even in motion.

Hence it may be concluded, that as it is poſſible there may be matter which is neither earth, nor metal; nor ſquare, nor round; nor even in motion: it is alſo poſſible, that a mind may neither perceive heat nor cold; nor joy nor grief; nor imagine any thing, nor will any thing; ſo that theſe modifications are not eſſential to it. Thinking alone, therefore, is the eſſence of the mind, as extenſion alone is the eſſence of matter. See ESSENCE, EXTENSION, WILL, &c.

But this doctrine no longer paſſes among us. The followers of Sir Iſaac Newton, and the new philoſophy, deny extenſion to be the eſſence of matter (ſee MATTER;) and the followers of Mr. Locke deny *thought* to be the eſſence of the mind. See SOUL.

THOUSAND. See the article NUMERATION.

THOUSAND *years reign.* See the articles MILLENNIUM, and MILLENNARIES.

THRASHING, or THRESHING, in agriculture, the act of beating the corn out of the ears. See CORN.

Thraſhing is performed two ways; or rather there are two ways of ſeparating corn from the ear—the firſt by beating it with a flail, which is properly what we call *thraſhing.*

Some authors will not by any means we ſhould call this by the Roman name *tritura*, or *trituratio*, but *flagellatio*, of *flagellum*, a *ſcourge*, or *flail.*

The other manner, ſtill practiſed in ſeveral countries, as we are informed by Liger, is to make mules or horſes trample on it backwards and forwards.—This is properly what the ancients called *tritura* and *trituratio.*

But they alſo uſed oxen therein; witneſs the Hebrews, who ſometimes yoaked four oxen together for this purpoſe.

Another way was with a kind of ſledge made of boards joined together, and loaden with ſtones or iron, upon which a man was mounted, and the whole drawn over the corn by horſes: this inſtrument was called *traha*, or *tribula.*

It is a rule among huſbandmen, that the ſeaſon for *thraſhing*, is when the corn has ſweated in the heap, or mow.

THRAVE, or THREAVE *of corn*, in moſt parts of England, is twenty-four ſheaves, or four ſhocks of ſix ſheaves to the ſhock—though in ſome counties they only reckon twelve ſhocks to the *thrave.*

King Athelſtan, anno 923, gave by charter to St. John of Beverly, four *thraves* of corn for every plough-land in the eaſt-riding of Yorkſhire.

---

* It has its name from the Greek θορειν, *ſalire, to leap*; by reaſon of the continual throbbing motion of the heart, which is contained therein.—Galen calls it *cithara*, and ſays it contains the parts that excite to love.

Ya ſou threve *be heven king,*
Of ilka plough of eſt-riding.

THREAD, in botany, is underſtood of thoſe threads uſually found in the middle of flowers; as in the lilly, tulip, roſe, *&c.* There are two kinds: thoſe which ſupport apices, are particularly called *ſtamina*; and thoſe which have none ſimply *threads*. See STAMINA.

Gold THREAD,	See the articles	GOLD.
Virgins THREAD,		VIRGIN.
THREADY *Marble*,		MARBLE.

THREAVE. See the article THRAVE.

THREE-*Legged Staff*, an inſtrument conſiſting of three wooden legs, made with joints, ſo as to ſhut all together, and to take off in the middle, for the better carriage; and uſually having on its top a ball and ſocket: its uſe is to ſupport and adjuſt inſtruments for aſtronomy, ſurveying, *&c.* See BALL and SOCKET.

THREE *Chapters*,	See the articles	CHAPTER.
Compaſſes of THREE *Legs*,		COMPASSES.
Ombre by THREE,		OMBRE.
Rule of THREE,		RULE.

THRENGI, or THRENGES, in our ancient cuſtoms, a denomination given to vaſſals, but not of the loweſt degree of thoſe who held lands of the chief lord: otherwiſe called *drengi*, and *drenches*. * See DRENCHES.

* *Quia vero non erant adhuc tempore regis* Willielmi *milites in Anglia, ſed* threnges; *præcipit rex ut de eis milites fierent ad defendendam terram: ſecit autem Lanfrancus* threngos *ſuos milites*, &c. Somn. Gavelk.

The name was impoſed by the conqueror: for when one Edward Sharnbourn of Norfolk, and others, were ejected out of their lands, they complained to the conqueror; inſiſting, that they were always on his ſide, and never oppoſed him; which, upon inquiry, he found to be true; and therefore he commanded that every one ſhould be reſtored to their lands, and for ever after be called *drenches*, or *threnges*. Spelm. du Cang.

THRENODY, THRENODIA, a mournful, or funeral ſong. See FUNERAL.

THRIHING,	See the articles	TRIHING.
THRINIUM-*Gild*,		THRINIUM-*Gild*.

THROAT, the anterior part of an animal between the head and the ſhoulders, wherein is the gullet. See NECK.

Phyſicians include under the word *throat*, all that hollow or cavity which may be ſeen when the mouth is wide open. See ŒSOPHAGUS, and MOUTH.

It is ſometimes alſo called *iſthmus*, by reaſon it is narrow, and bears ſome reſemblance to thoſe ſtreights called by the geographers *iſthmi*. See FAUCES.

THROAT, in architecture, fortification, *&c.* See GORGE, and GULA.

THRONE, ΘΡΟΝΟΣ, a royal ſeat, or chair of ſtate, enriched with ornaments of architecture and ſculpture, made of ſome precious matter, raiſed one or more ſteps, and covered with a kind of canopy.

Such are the *thrones* in the rooms of audience of kings, and other ſoveraigns.

THROW *the Glove*,	See the articles	GLOVES.
THROWED *Silk*,		SILK.

THROWS *of Women*, the pains of child-birth. See DELIVERY, *&c.*

THROWSTER, one who prepares raw ſilk for the weaver; by cleanſing, and twiſting it. See SILK.

THUMMIM, in the ſcripture learning. See URIM and THUMMIM.

THUNDER, a noiſe in the loweſt region of the air, excited by a ſudden kindling of ſulphurous exhalations. See AIR, ATMOSPHERE, EXHALATION, *&c.*

Seneca, Rohault, and other authors, both ancient and modern, account for *thunder*, by ſuppoſing two clouds impending over one another, the upper and rarer whereof becoming condenſed by a freſh acceſſion of air raiſed thither by warmth from the lower parts of the atmoſphere, or driven upon it by the wind; immediately falls forcibly down upon the lower, and denſer cloud: by which fall, the air interpoſed between the two being compreſſed, that next the extremities of the two clouds is ſqueezed out, and leaves room for the extremity of the upper cloud to cloſe tight upon the under: thus a great quantity of air is incloſed, which at length eſcaping through ſome winding irregular vent or paſſage, occaſions that noiſe we call *thunder*. See CLOUD, *&c.*

But this only reaches to the phænomena of *thunder* heard without lightening; and, in effect, we have now a better ſolution: *thunder* is not occaſioned by the falling of clouds, but by the kindling of ſulphurous exhalations, in the ſame manner as the noiſe of aurum fulminans.

"There are ſulphurous exhalations, ſays Sir Iſaac Newton,
"always aſcending into the air when the earth is dry; there
"they ferment with the nitrous acids, and ſometimes taking
"fire, generate *thunder*, lightening, *&c.*

That, beſide the vapours raiſed from water, *&c.* there are alſo exhalations carried off from ſulphur, bitumen, volatile ſalts, *&c.* is paſt all doubt; the vaſt quantity of ſulphurous and bituminous matter all over the ſurface of the earth, and the volatile ſalts of plants and animals, afford ſuch an ample ſtock thereof, that it is no wonder the air ſhould be filled with ſuch particles, raiſed higher or lower, according to their greater or leſs degree of ſubtility and activity; and more copiouſly ſpread in this or that quarter, according to the direction of the winds, *&c.* See SULPHUR.

Now, the effects of *thunder* are ſo like thoſe of fired gunpowder, that Dr. Wallis thinks we need not ſcruple to aſcribe them to the ſame cauſe: but the principal ingredients in gunpowder we know are nitre and ſulphur: charcoal only ſerving to keep the parts ſeparate, for the better kindling. See NITRE, and GUNPOWDER.

Hence, if we conceive in the air a convenient mixture of nitrous and ſulphurous particles, from the ſources above-mentioned; and thoſe, by any cauſe, to be ſet on fire; ſuch exploſion may well follow, and with ſuch noiſe and light the two phænomena of *thunder*, as in the firing of gunpowder: and being once kindled, it will run from place to place, this way or that, as the exhalations happen to lead it; much as is found in a train of gunpowder.

This exploſion, if high in the air, and remote from us, will do no miſchief; but if near us, may deſtroy trees, animals, *&c.* as gunpowder would do in the like circumſtances.

This nearneſs or farneſs may be eſtimated by the interval of time between the flaſh, and the noiſe. Dr. Wallis obſerves, that ordinarily the difference between the two is about ſeven ſeconds; which, at the rate of 1142 feet in a ſecond of time, gives the diſtance about a mile and half: but ſometimes it comes in a ſecond or two, which argues the exploſion very near us, and even among us. And in ſuch caſes, the reverend doctor aſſures us, he has more than once foretold the miſchiefs that befell.

Upon the whole, that there is in lightening a ſulphurous vapour, appears from the ſulphur which attends it, and from the ſultry heat in the air which uſually precedes it; and that there is a nitrous vapour along with it, the ſame author concludes hence, that we know of no other body ſo liable to a ſudden and violent exploſion. And as to the kindling of theſe materials, we know that a mixture of ſulphur and ſteel filings, with a little water, will break forth into actual flame. Nothing therefore is wanting to the exploſion, but ſome chalybeat, or vitriolic vapour; and among the various effluvia from the earth, the doctor does not doubt, but there muſt be ſome of that: but what he leaves as a probability, we can produce a kind of proof of.

In hiſtory we meet with inſtances of its raining iron in Italy, and iron ſtones in Germany: Jul. Scaliger tells us, he had by him a piece of iron rained in Savoy. Cardan reports 1200 ſtones to have fallen from heaven, ſome of them weighing 30, ſome 40, and one an hundred and twenty pound, all very hard, and of the colour of iron.

The matter of fact is ſo well atteſted, that Dr. Liſter, in the *Philoſophical Tranſactions*, builds a whole theory of *thunder* and lightening on it; maintaining, that they both owe their matter to the breath or exhalation of pyrites. See PYRITES.

That rattling in the noiſe of *thunder*, which makes it ſeem as if it paſſed through arches, or were broken variouſly, is doubtleſs owing to the ſound being excited among clouds hanging over one another, and the agitated air paſſing between them.

THUNDER-BOLT.—If what we call *lightening*, act with extraordinary violence, and break or ſhatter any thing, it is called a *thunder-bolt*; which the vulgar, to fit it for ſuch effects, ſuppoſe to be a hard body, and even a ſtone.

But that we need not have recourſe to a hard ſolid body to account for the effects commonly attributed to the *thunder-bolt*, will be evident to any one, who conſiders thoſe of pulvis fulminans, and of gunpowder. See FULMINANS.

The phænomena of the *thunder-bolt* are, that it oftener ſtrikes on high places than on low: that it frequently burns people's cloaths, without touching their bodies: that it ſometimes breaks their bones, without hurting their fleſh, or their cloaths; that it has even melted the ſword without injuring the ſcabbard, *&c.*

The firſt is eaſily accounted for, from the ordinary height of the clouds, out of which the lightening darts: as to the reſt, ſince exhalations may be very different from one another; ſome, *e. gr.* coming neareſt the nature of ſulphur, may only yield a very ſlight lambent flame, which will only affect ſuch things as take fire the ſooneſt; and others, on the contrary, ſo ſubtile and penetrating, as to come near the nature of volatile ſalts or aqua fortis, which ſpare ſoft bodies, and ſpend their whole force on hard ones.

The chevalier de Louville, of the French academy of ſciences, accounts for ſome of the effects of thunder upon a new principle: as to killing of animals, without burning or wounding them, it is naturally enough aſcribed to the ſulphur, which falling near enough the perſon, the fumes thereof ſtop his reſpiration. As to trees, buildings, *&c.* ſplit or beaten down, there muſt be another cauſe. M. de Louville, therefore, ſuppoſes, that when the thunder is ſo high, its flame is diſſipated before it arrive at the earth: and that the air being violently driven along by the impetuous motion of the flame, and of conſequence exceedingly condenſed, becomes as it were a hard body, capable of producing terrible effects.

Places ſtruck with *thunder-bolts*, were held ſacred among the ancients. Nigidius has a curious treatiſe on the *thunder-bolt*.—Marcilius Ficinus, and ſome others, maintain, that coral diſſipates panic fears, and keeps off *thunder-bolts* and hail: Fortunat. Licetus has endeavoured to account for it phyſically. F. le Brun proves very eaſily, that thoſe philoſophers are miſtaken.

On medals, the *thunder-bolt* is ſometimes found to accompany the emperors heads; as that of Auguſtus. In which caſe, it is a mark of ſoveraignty, and of a power equal with the gods. Appian informs us, that the *thunder-bolt* was the principal divinity of Seleucia; adding, that it was adored, even in his time, with various hymns and ceremonies. See GOD.

THUNDERING *Legion*, *Legio Fulminans*, was a legion in the Roman army, conſiſting of Chriſtian ſoldiers, who in the expedition of the emperor Marcus Aurelius againſt the Sarmatæ, Quadi, and Marcomanni, ſaved the whole army, then ready to periſh of thirſt, by procuring, with their prayers, a very plentiful ſhower thereon; and, at the ſame time, a furious hail, mixed with lightening and thunder-bolts, on the enemy. See LEGION.

This is the account commonly given by eccleſiaſtical hiſtorians: and the whole hiſtory is engraven in baſs-relievo's, on the Antonine column. And hence aroſe the denomination *thunderers:* though ſome ſay, that the legion thoſe Chriſtians were of, was called the *thundering legion* before.

THURSDAY, the fifth day of the Chriſtians week, but the ſixth of that of the Jews. See DAY, and WEEK.

Holy THURSDAY, } See { HOLY.
Maunday THURSDAY, } See { MAUNDAY *Thurſday*.

THUS. See the articles INCENSE, and FRANKINCENSE.

THYMUS, ΘΥΜΟΣ, in anatomy, a conglobate gland, ſituated in the upper part of the thorax, under the claviculæ, where the cava and aorta divide into the ſubclavian branches. See GLAND.

The *thymus* is that part which in a breaſt of veal we call the *ſweet-bread*.—This gland is big in infants, but as they grow in age, it becomes leſs; its arteries and veins are branches of the carotides and jugulars. It has nerves from the par vagum, and its lymphatic veſſels diſcharge themſelves into the ductus thoracicus.

The learned Dr. Tyſon ſuppoſes the uſe of this gland to be for a diverticulum to the chyle in the thoracic duct of a fœtus, whoſe ſtomach being always full of the liquor in which it ſwims, muſt keep the thoracic duct diſtended with chyle; becauſe the blood which the fœtus receives from the mother, fills the veins, and hinders the free entrance of the chyle into the ſubclavian veins. See FOETUS.

Mr. Cheſelden obſerves, that where the *thymus* in men is very ſmall, the thyroid glands increaſe proportionably; but in ſuch brutes as have fallen under his obſervation, it is juſt the contrary: from which he is inclined to believe that they belong to the ſame lymphatics, and that either of them increaſing as much as both ought to do, if both increaſed, anſwers the ſame end as if both did; and that the reaſon why the *thymus* increaſes rather than the thyroid glands in brutes, is, becauſe the ſhape of their thorax affords convenient room for it to lodge in; and that in men, the reaſon why the thyroid glands increaſe ſo much, is, becauſe there is no room in that part of the thorax where the *thymus* is ſeated, for a large gland to be lodged.

THYMUS, in medicine, is uſed for a kind of wart, growing on the natural parts, the fundament, and ſeveral other places of the body, with cloven aſperities like thoſe of the herb *thyme*, whence its name. See WART, and WEN.

The ordinary method of curing a *thymus*, is by ligature and deſiccative lotions, or by cauſtics; and if large, by inciſion; taking care firſt to ſecure the greater veſſels by tying them.

THYROARYTÆNOIDEUS, in anatomy, a pair of muſcles, ſituate under the cartilago thyroides; from the fore and back part of which it ariſes with a very broad head, and terminates in the arytænoides, which it conſtringes, and ſhuts the larynx. See ARYTÆNOIDES.

THYROIDEÆ *Glandulæ*, THYROID *Glands*, are two glands of the larynx. See LARYNX.

There are four pretty large glands, which ſerve to moiſten the larynx; two above, and two below.—The two latter are called *thyroideæ*; ſituate at the bottom of the larynx, aſide of the annular cartilage, and of the firſt ring of the trachea; one on each ſide.

They are in form of little pears; their colour a little more reddiſh, their ſubſtance more ſolid, more viſcous, and reſembling more the fleſh of the muſcles, than the other glands.

They receive nerves from the recurrents, arteries from the carotides; veins which paſs to the jugulars, and lymphatics, and diſcharge themſelves into the thoracic duct.

Their uſe is to ſeparate a viſcid moiſture, ſerving to line and lubricate the larynx, to facilitate the motion of its cartilages, to ſoften the acrimony of the ſaliva, and to ſweeten the voice.

THYROIDES,* ΘΥΡΟΕΙΔΗΣ, in anatomy, the firſt and largeſt of the five cartilages of the larynx; called alſo *ſcutiformis*. See SCUTIFORM, CARTILAGE, LARYNX, and HYOTHYROIDES.

* The word is formed from the Greek, θυρεος, *buckler*, and ειδος, *form*.

In the middle is a prominence, called *pomum adami*. The *thyroides* is uſually parted by a line running along its middle; whence ſome make two of it, though in reality it is very rare that it is found double.

It is near a ſquare, and at each angle is a proceſs: the two uppermoſt are the longeſt, and tie it by means of a nervous ligament to the os hyoides: the two lower, and ſhorter, connect it to the ſecond cartilage, called *cricoides*.

THYRSUS, ΘΥΡΣΟΣ, in antiquity, the ſcepter which the ancient poets put in the hand of Bacchus, and wherewith they furniſh the Menades in their Bacchanalia. See BACCHANALIA, *&c.*

The *thyrſus* was originally a lance, or ſpear, wrapt up in vine leaves; wherewith Bacchus is ſaid to have armed himſelf, and his ſoldiers in his Indian wars, to amuſe and deceive the unpractiſed Indians, and make them ſuſpect no hoſtilities.

Hence it was afterwards borne in the feaſts and ſacrifices of that god; and as the ſatyrs, who were Bacchus's ſoldiers, were ſuppoſed to have fought with it, it became a cuſtom to repreſent them therewith. See SATYR, *&c.*

TIARA,* ΤΙΑΡΑ, an ornament or habit, wherewith the ancient Perſians covered their head; and which the Armenians, and kings of Pontus ſtill wear on medals; theſe laſt, becauſe deſcended from the Perſians.

* Latin authors call it indifferently *tiara*, and *cidaris*.

Strabo ſays, the *tiara* was in form of a tower; and the ſcholiaſt on Ariſtophanes's comedy, Αχαρνης, act I. ſcene 2. affirms, that it was adorned with peacock's feathers.—Some moderns, however, fancy the ſcholiaſt is here ſpeaking of the caſk which the ancient Perſians wore in war; rather than the habit which they wore on the head in the city: but they do not ſeem to have conſidered the paſſage in the poet, to which the ſcholiaſt refers: the matter there ſpoken of is peace, and embaſſadors ſent to treat of peace, with habits of pomp and ceremony, Αχθομαι' γω, *&c.* *Theſe embaſſadors, theſe peacocks, all theſe things of pomp and oſtentation, diſpleaſe me.* By *theſe peacocks*, ſays the ſcholiaſt, he means the *tiaræ*, which among the Perſians are ornaments of the head, wherein are peacock's feathers, *&c.*

St. Jerom on Dan. chap. iv. defines the *tiara* a kind of cap, *genus pileoli*, wore by the Perſians and Chaldeans: and in another place, he adds, it is like Ulyſſes's cap.—The ancient ſcholiaſt on Juvenal, deſcribes it as a prieſt's cap, which deſcending over the cheeks, was tied under the chin: which agrees very well with the form of that which we ſee Mithridates wear on medals.—Servius on Virgil, *lib.* 8. *Æneid.* calls the *tiara* a Phrygian cap; and Statius, *Thebaid*, *lib.* 8. gives it the kings of Parthia, who, doubtleſs, borrowed it from the Perſians.—Juſtin attributes the long garment and *tiara* of the Perſians, to Semiramis's diſguiſe; whereby ſhe paſſed for Ninus.

The kings of Perſia alone had the right of wearing the *tiara* ſtraight and erect: the prieſts, and great lords wore it depreſſed, or turned down on the fore-ſide. Xenophon in his *Cyropædia* ſays, that the *tiara* was ſometimes encompaſſed with the diadem, at leaſt in ceremonies; and had frequently the figure of a half moon embroidered on it: others are of opinion, that the diadem was in figure of a moon, and that it was hence the *tiara* was called *lunata:* laſtly, others think that the *tiara* itſelf was ſometimes in form of a half moon.—From what we have ſaid, it appears, that there were different forms of *tiara's*; and, in effect, Paſchalius, *de coronis*, diſtinguiſhes no leſs than five different kinds. See DIADEM.

TIARA is alſo the name of the pope's triple crown; anciently called *regnum*. See CROWN, POPE, *&c.*

The *tiara* and keys are the badges of the papal dignity; the *tiara* of his civil rank, and the keys of his juriſdiction: for as ſoon as the pope is dead, his arms are repreſented with the *tiara* alone, without the keys.

The ancient *tiara* was a round high cap. John XXIII. firſt encompaſſed it with a crown. Boniface VIII. added a ſecond crown; and Benedict XII. a third.

TIBIA, in anatomy, the bony part of the leg, between the knee and the ankle. See FOOT.

The *tibia* conſiſts of two bones, called *fociles*, the one on the inſide the leg, called the *fibula*, or *little focil*. See FIBULA.—The other on the outſide, called by the common name *tibia*, or the *great focil*. See the following article.

TIBIA is, properly, the inner and bigger bone of the leg, called alſo *focile majus*.—See *Tab. Anat.* (Oſteol.) *fig.* 3. *n.* 22, 22. *&* *fig.* 7. *n.* 26, 26. See alſo the article BONE.

The *tibia* is hard and firm, having a pretty large cavity in its middle, to contain the medulla. See MEDULLA.

It is almoſt triangular; its fore, and ſharp edge being called the *ſhin:* in its upper extremity, it has two large ſinus's, tipt with a ſoft and fine cartilage, from its figure, called *cartilago lunata*;

lunata; which runs in between the extremities of the two bones, and grows very thin at its edge; ſerving to facilitate a ſmall ſide-motion in the knee, like that in the articulation of the lower jaw.

The ſinus's receive the two protuberances of the femur, or thigh-bone; and the production which is between the ſinus's of the *tibia*, is received into the ſinus which divides theſe two protuberances of the femur. See FEMUR.

By bending the knee, we bring the leg, in walking, in a ſtrait line forward; which we could not have done without this articulation; but like thoſe who have the misfortune to have a wooden leg, we muſt have brought our foot about in a ſemicircle, in going even upon a plain, but more evidently upon an aſcent.

On the ſide of this upper end, the *tibia* has a ſmall knob, which is received into a ſmall ſinus of the fibula; and on its fore-part, a little below the patella, it has another, into which the tendons of the extenſors of the leg are inſerted. See FIBULA.

Its lower extremity, which is much ſmaller than its upper, has a remarkable proceſs, which forms the inner ankle; and a pretty large ſinus, divided in the middle by a ſmall protuberance: the ſinus receives the convex head of the aſtragalus, and the protuberance is received into the ſinus, in the convex head of the ſame bone.—It has another ſhallow ſinus in the ſide of its lower end, which receives the fibula.

Mr. Cheſelden gives an inſtance of a boy of ſeven years of age, where both the epiphyſes at the upper end of the *tibia*, were ſo far ſeparated, that not more than half each *tibia* was joined to half the epiphyſis; which made his legs wholly uſeleſs.—This had been occaſioned by the nurſe's holding him out to ſtool by the heels and back, when very young; which is among them (as he obſerves) too common a practice.

TIBIÆ *Biceps*. See the article BICEPS.

TIBIALIS, or TIBIÆUS, in anatomy, a name given to two muſcles of the leg; diſtinguiſhed by *anticus*, and *poſticus*.

TIBIALIS *anticus* ſprings from the exterior proceſs of the *tibia*, and becoming gradually broad and fleſhy about the middle of the *tibia*, down the fore-part of which it runs, is contracted again into a ſlender, ſmooth tendon, which paſſes under the ligamentum annulare, and is partly inſerted into the os cuneiforme majus, and partly into the bone of the metatarſus, that ſupports the great toe. Its office is to draw the foot up.—See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 62. *fig.* 2. *n.* 44.

TIBIALIS *poſticus* is derived from both bones of the *tibia*, and from the ligament that binds them together; and runs with a ſmooth, ſtrong tendon through the ſinus on the inner malleolus, under the annular ligament, to the inſide of the os naviculare.—See *Tab. Anat.* (Myol.) *fig.* 1. *n.* 69. *fig.* 2. *n.* 53. *fig.* 7. *n* 43.

Its office is to draw the foot inwards: from the uſe ſailors make of it in ſailing, it is alſo called the *nauticus*.

TICHONIC *Syſtem*, or *Hypotheſis*. See TYCHONIC.

TIDE,* the ſame with time, or ſeaſon. See TIME, &c.

* The word is originally Saxon, *tid*, which ſignifies the ſame.

Shrove-TIDE, } See the articles { SHROVE.
Twelfth-TIDE, } See the articles { TWELFTH.
Whitſun-TIDE, } See the articles { WHITSUN-*Tide*.

TIDES, two periodical motions of the waters of the ſea, called alſo the *flux* and *reflux*, or *ebb* and *flow*. See SEA, FLUX, OCEAN, &c.

When the motion of the water is againſt the wind, it is called a *windward tide*—when wind and *tide* go the ſame way, *leeward tide*—when it runs very ſtrong, it is a *tide-gate*.

To tide it over, or up into any place, is to go in with the *tide*, either ebb or flood, as long as that laſts; then to ſtay at anchor all the time of contrary *tide*; and thus to ſet in again with the return of the next *tide*.

It is ſaid to *flow tide and half tide* when the *tide* runs three hours in the offing longer than it does by the ſhore: but, by *longer*, they do not mean more hours; but, that if it be high water aſhore at 12, it will not be ſo in the offing till three.—If it ebb and flow longer, they ſay it runs *half tide* and *half quarter*.

When the moon is in the firſt and third quarter, *i. e.* when ſhe is new and full, the *tides* are high and ſwift, and called *ſpring tides*—when ſhe is in the ſecond and laſt quarter, the *tides* are lower and ſlower, and called *neap tides*. See SPRING, NEAP, &c. See alſo WINDWARD, &c.

Phænomena of the TIDES.—The ſea is obſerved to flow, for certain hours, from ſouth towards north; in which motion, or flux, which laſts about ſix hours, the ſea gradually ſwells; ſo that entering the mouths of rivers, it drives back the river-waters towards their heads or ſprings. See RIVER, &c.

After a continual flux of ſix hours, the ſea ſeems to reſt for about a quarter of an hour; after which it begins to ebb or retire back again from north to ſouth, for ſix hours more: in which time, the water ſinking, the rivers reſume their natural courſe. After a ſeeming pauſe of a quarter of an hour, the ſea again begins to flow as before, and thus alternately.

Thus does the ſea ebb twice a day, and flow as often; but not in the ſame hours thereof. The period of a flux and reflux is 12 hours 50 minutes; ſo that the *tides* return later and later each day, by 50 minutes, or ¾ of an hour, 5 minutes.

Now, 12 hours 50 minutes is a lunar day; *i. e.* the moon paſſes the earth's meridian later and later each day by 50 minutes. So that the ſea flows as often as the moon paſſes the meridian, both the arch above, and that below the horizon; and ebbs as often as ſhe paſſes the horizon, both the eaſtern and weſtern point thereof. See MOON.

This further agreement we obſerve between the moon and the ſea; that the *tides*, though conſtant, are not equal: but are greateſt, when the moon is in conjunction, or oppoſition to the ſun, and leaſt when in quadrature thereto.

Laſtly, thoſe *tides* are the greateſt, which happen in the new and full moon, at the times of the equinoxes.

Add, that the ſame things are obſerved throughout moſt of the coaſts of Europe; only that the *tides* are ſo much the leſs, and happen the later, as the coaſts are the more northerly.

Theſe phænomena of the *tides* are admirably accounted for, from the principle of gravitation. All we require to their ſolution is, that the earth and moon, and every particle thereof, mutually gravitate towards each other; the reaſonableneſs of which aſſumption, ſee under the article GRAVITATION.

Indeed the ſagacious Kepler, long ago, conjectured this to be the cauſe of the *tides*: "If, ſays he, the earth ceaſed to at-" tract its waters towards itſelf, all the water of the ocean " would riſe and flow into the moon: the ſphere of the " moon's attraction extends to our earth, and draws up the " water." Thus thought Kepler, in his *Introd. ad Theor. Mart.* This ſurmiſe, for it was then no more, is now abundantly verified, in the following theory, deduced by Dr. Halley, from the Newtonian principles.

Theory of the TIDES.—1°. As the ſurface of the earth and ſea is naturally globular; if we ſuppoſe the moon A (*Tab. Geography, fig.* 6.) perpendicularly over ſome part of the ſurface of the ſea, as E; it is evident the water E, which is now neareſt the moon, will gravitate towards it more than any other part of the earth and ſea in the hemiſphere FEH.

The water in E therefore muſt, by this means, be raiſed towards the moon; *i. e.* it will be lighter than uſual, and of conſequence will ſwell in E.

For the ſame reaſon, the water in G being the moſt remote from the moon, will gravitate leſs towards the ſame, than any other part of the earth or ſea in the hemiſphere FGH.

The water here, therefore, muſt approach leſs towards the moon, than any other part of the globe; *i. e.* it muſt be raiſed the contrary way, as being lighter than uſual, and will therefore ſwell in G.

By this means, the ſurface of the ocean muſt neceſſarily form itſelf into a ſpheroidal, or oval figure, whoſe longer diameter is EG; its ſhorter FH. And thus, the moon ſhifting her poſition in her diurnal motion round the earth, this oval of water muſt ſhift with her; by which means are effected thoſe two floods and ebbs, obſervable every 25 hours.

2°. Since, in the conjunctions and oppoſitions of the ſun and moon, the gravitation of the water to the ſun conſpires with its gravitation towards the moon; but in the quadratures, the water raiſed by the ſun is depreſſed by the moon: hence it is that the *tides* are greateſt in the ſyzygies, and leaſt in the quadratures.

In effect, there are two *tides* every natural day, from the action of the ſun, as there are in the lunar day from that of the moon; all governed by the ſame laws: only thoſe cauſed by the ſun are much leſs than thoſe of the moon: becauſe though the ſun be ten thouſand times bigger than both the earth and moon, yet he is at ſo immenſe a diſtance, that the earth's ſemi-diameter bears no proportion thereto.

Hence, the different *tides* depending on the particular actions of the ſun and moon are not diſtinguiſhed, but confounded. The lunar *tide* is ſomewhat changed by the action of the ſun; and this change varies every day, by reaſon of the inequality between the natural and lunar day. See DAY.

3°. Since the greateſt *tides* about the equinoxes (*viz.* thoſe happening in the ſyzygies) ariſe from the ſun and moon being in the equinoctial; and thoſe about the ſolſtices, from the ſun and moon being in the tropics; for this reaſon, thoſe greateſt *tides* about the equinoxes are greater than thoſe about the ſolſtices; ſince the greater the circle is, wherein the waters move, the greater is their agitation, And if the moon ſtood ſtill in the pole, the ſwelling would become immoveable about the pole, and the higher water be fixed therein.

4°. Since the *tides* are ſomewhat changed by the libration of the waters, which uſe to retain a motion impreſſed on them for ſome time; for this reaſon, the higheſt *tides* are not preciſely in the very conjunction and oppoſition of the moon, but two or three *tides* afterwards.

5°. Since the ſun is ſomewhat nearer the earth in winter than in ſummer; hence it is, that the greateſt equinoctial *tides* are obſerved to be a little before the vernal equinox, and a little after the autumnal one.

6°. Since the greateſt of the two *tides* happening in every diurnal revolution of the moon, is that wherein the moon is neareſt the zenith, or nadir: for this reaſon, while the ſun is in the northern ſigns, the greater of the two diurnal *tides* in our climates, is that ariſing from the moon above the horizon;

when the ſun is in the ſouthern ſigns, the greateſt is that ariſing from the moon below the horizon.

7°. Such would the *tides* regularly be, if the earth were covered with ſea very deep; but by reaſon of the ſhoalneſs of ſome places, and the narrowneſs of the ſtraits in others by which the *tides* are propagated, there ariſes a great diverſity in the effect, not to be accounted for, without an exact knowledge of all the circumſtances of the places; as the poſition of the land, and the breadth and depth of the channels, *&c.* For a very ſlow and imperceptible motion of the whole body of water, where it is (for example) two miles deep, will ſuffice to raiſe its ſurface 10 or 12 feet in a *tide's*-time; whereas if the ſame quantity of water were to be conveyed through a channel of 40 fathom deep, it would require a very great ſtream to effect it in ſo large inlets as are the channel of England and the German ocean; whence the *tide* is found to ſet ſtrongeſt in thoſe places where the ſea grows narroweſt, the ſame quantity of water being in that caſe to paſs through a ſmaller paſſage.

This is moſt evident in the ſtraits between Portland and C. de la Hogue in Normandy, where the *tide* runs like a ſluice; and would be yet more between Dover and Calais, if the *tide* coming round the iſland did not check it.

And this force being once impreſſed upon the water, continues to carry it above the level of the ordinary height in the ocean, particularly where the water meets a direct obſtacle, as it does in St. Maloes; and where it enters into a long channel, which running far into the land, grows very ſtrait at its extremity, as it does at the Severn ſea at Chepſtow and Briſtol.

This ſhoalneſs of the ſea, and the intercurrent continents, are the reaſons that in the open ocean high water is not at the time of the moon's appulſe to the meridian, but always ſome hours after it, as it is obſerved upon all the weſtern coaſt of Europe and Africa, from Ireland to the Cape of Good Hope; in all which a ſouth-weſt moon makes high water, and the ſame is reported to hold in the weſt of America.

It would be endleſs to recount all the particular ſolutions, which are eaſy corollaries from this doctrine; as, why the lakes and ſeas, ſuch as the Caſpian ſea, and the Mediterranean ſea, the Black ſea and Baltick, have no ſenſible *tides:* for lakes having no communication with the ocean, can neither increaſe nor diminiſh their water, whereby to riſe and fall; and ſeas that communicate by ſuch narrow inlets, and are of ſo immenſe an extent, cannot in a few hours time receive and empty water enough to raiſe or ſink their ſurface any thing ſenſibly.

To demonſtrate the excellency of this doctrine, the example of the *tides* in the port of Tunking in China, which are ſo extraordinary, and different from all others we have yet heard of, may ſuffice. In this port there is but one flood and ebb in 24 hours, and twice in each month, *viz.* when the moon is near the equinoctial, there is no *tide* at all, but the water is ſtagnant; but with the moon's declination there begins a *tide*, which is greateſt when ſhe is in the tropical ſigns; only with this difference, that when the moon is to the northward of the equinoctial, it flows when ſhe is above the earth, and ebbs when ſhe is under, ſo as to make high water at moon-ſetting, and low water at moon-riſing: but, on the contrary, the moon being to the ſouthward, makes high water at riſing, and low water at ſetting, it ebbing all the time ſhe is above the horizon.

The cauſe of this odd appearance is ſuggeſted by Sir Iſaac Newton to ariſe from the concurrence of two *tides*, the one propagated in ſix hours out of the great South-Sea along the coaſt of China, the other out of the Indian ſea from between the iſlands, in twelve hours, along the coaſt of Malacca and Camboya. The one of theſe *tides* being produced in north latitude, is, as hath been ſaid, greater, when the moon being to the north of the equator, is above the earth, and leſs when ſhe is under the earth. The other of them, which is propagated from the Indian ſea, being raiſed in ſouth latitude, is greater when the moon declining to the ſouth, is above the earth, and leſs when ſhe is under the earth: ſo that of theſe *tides*, alternately greater and leſſer, there come always ſucceſſively two of the greater and two of the leſſer together every day, and the high water falls always between the arrival of the two greater floods, and the low water between the times of the arrival of the two leſſer floods: and the moon coming to the equinoctial, and the alternate floods becoming equal, the *tide* ceaſes, and the water ſtagnates; but when ſhe has paſſed to the other ſide of the equator, thoſe floods which in the former order were the leaſt, now becoming the greateſt, that which before was the time of the high water, now becomes the low water, and the converſe: ſo that the whole appearance of theſe ſtrange *tides* is, without any forcing, naturally deduced from theſe principles, and is a great argument for the certainty of the whole theory.

TIDE-waiters, or Tide-men, certain officers belonging to the cuſtom-houſe, appointed to watch or attend on ſhips coming from abroad, to ſee that nothing be landed till the cuſtoms be paid. See Custom, *&c.*

They are thus called, becauſe they go aboard the ſhips at their arrival in the mouth of the Thames, and come up with the tide.

TIERCE, or Teirce, a meaſure of liquid things, as wine, oil, *&c.* containing the third part of a pipe, or 42 gallons. See Measure, Gallon, *&c.*

Tierce, in muſic. See the article Third.

Tierce, in gaming, a ſequence of three cards of the ſame colour. See Sequence.

Tierce, in fencing. See the article Guard.

Tierce *Order.* See the article Third *Order.*

Tierce *point.* See the article Third *point.*

Tierced, Tiercé, in heraldry, denotes the ſhield to be divided by any of the partition lines, party, coupy, tranchy or tailly, into three equal parts, of different colours or metals. See Quartering.

If the chief and baſe be of the ſame colour when divided by a feſſe, they blazon it by expreſſing the colour, and mentioning the feſſe; otherwiſe, they ſay it is *tiercé in feſs*, and mention each of the colours; or *tiercé in pale*, if ſo divided in pale.

Tiercelet. See the article Tassel.

TIGE, in architecture, a French term for the ſhaft or fuſt of a column, comprehended between the aſtragal and the capital. See Fust, and Column.

TIGHT. See the article Tite.

TILE. See the article Tyle.

TILLER, or Tillar, in huſbandry, a little young tree left to grow till it be fellable. See Timber.

Tiller of a ſhip, is a ſtrong piece of wood faſtened to the rudder; called alſo the helm.—See *Tab. Ship. fig.* 2. *n.* 105. See alſo the article Rudder.

The name is chiefly given to that which ſerves for a helm in a boat, and which in a ſhip would be called the *helm.* See Helm.

TILLING, Tillage, in gardening and agriculture, a moving or ſtirring of the ground with the plough, or ſpade; which being performed on the ſurface, enters to a certain depth, and makes the lower and upper parts change place: by which means the goodneſs of the earth is kept from being ſpent in feeding ill plants. See Ploughing, *&c.*

The rule, as to gardening in general, is, that hot and dry earth ſhould be *tilled* in ſummer, either a little before, or while it rains, or ſoon after; and that neither too often, nor too deep: in hot weather it is not to be performed, unleſs watered ſoon after; but for moiſt, cold and ſtrong earth, it muſt never be *tilled* in time of rain, but rather in the greateſt heats.

As to arable lands, that which is clayey, ſtiff, cold, and moiſt, is generally thrice *tilled*; in ſpring, ſummer, and at ſeed-time for wheat; and four times for barley.

Theſe repeated ploughings or fallowings are very advantageous to the ſoil, both as they deſtroy weeds, and as the ground is hereby laid in ridges, which prevents its being over-drenched in wet ſeaſons, ſaves it much from blights and bleak weather, and makes the land lighter, and fitter for the ſeed to take root in, and to imbibe the nitrous dews and influences of the air, *&c.* See Vegetation.

TILT. See Just, Turnament, Carrousal, Quadril, *&c.*

TILT-Boat, a boat covered with a *tilt*, *i. e.* a cloth, or tarpawling, ſuſtained by bails or hoops over the ſtern, for the ſheltering of paſſengers.—Such is that which carries paſſengers between London and Graveſend. See Boat.

TIMAR, a tract or portion of land which the Grand Signior grants to a perſon on condition of ſerving him in war, on horſeback.

Some define the *timar* a portion of land aſſigned to a ſpahi, or other perſon fit to ſerve on horſeback, to enjoy during life for his ſubſiſtence.

Meninſki deſcribes it as a ſtipend or revenue granted to old ſoldiers who have deſerved well, in lands, and poſſeſſions of caſtles, towns, villages, fields, or in tithes, and other fruits and incomes; ſometimes with the prefecture, juriſdiction, or ſigniory of the ſaid places. See Benefice, *&c.*

The *timar* is a kind of fief granted for life. See Fee.—The whole Ottoman empire is divided into ſangiackies, or banneries, under which all ſuch as hold *timars*, who are called *Timariots*, are bound to liſt themſelves when ſummoned upon any expedition. See Timariot.

Timars may be reſigned as benefices among us, only obtaining the conſent of the beglerbey, or governor of the province.—Indeed, for *timars* of above 20000 aſpers *per annum*, called *zaim*, the grand vizir alone grants diſpenſations.

TIMARIOTS, thoſe who enjoy lands on the footing and tenure of timars. See Timar.

The *timariots* are obliged to ſerve in war perſonally, with as many men and horſes for ſervice as their timar, by the eſtimate made thereof, contains times 2500 aſpers, or about 6 pounds ſterling; and to maintain them conſtantly mounted and armed after their manner, to be ready to march at all hours when commanded, and that on pain of death; nothing, not even ſickneſs itſelf, being allowed to excuſe them.

Beſides this ſervice, they likewiſe pay an acknowledgment of one tenth of their revenue.—If they have any children of age to bear arms, and fit for the ſervice after their deceaſe, or in defect thereof, if they have any relations that have the leaſt intereſt, the timar is uſed to be continued to them on the ſame conditions; otherwiſe it is transferred to others.

If the revenue thus held of the grand ſignior exceed 15000 aſpers, or 36 pounds ſterling, they who hold it are not called *timariots*, but *ſubaſſi*, or *zaims*, and have the adminiſtration of juſtice in the place, under the ſangiac of the province.

The *timariots* have different appointments, from 4 or 5000 aſpers, equal to about 12 pounds ſterling, to 20000 aſpers: but unleſs their *timar* exceed 8000 aſpers, they are never obliged to march, except when the grand ſignior goes to the army in perſon, on which occaſion none are exempted.

The origin of the *timariots* is referred to the firſt ſultans, who being maſters of the fiefs or lands of the empire, erected them into baronies or commanderies, to reward the ſervices of their braveſt ſoldiers; and eſpecially to raiſe and keep on foot a number of troops without diſburſing any money.

But it was Soliman II. that firſt eſtabliſhed the order and diſcipline among theſe barons, or knights of the empire; and by his order it was that the number of horſemen each ſhould maintain was regulated.

This body has always been not only exceedingly powerful, but great and illuſtrious throughout all the empire; but avarice, the ordinary fault of the orientals, has occaſioned their declenſion of late years.

The viceroys and governors of provinces manage their matters ſo at court, that timars, even out of their juriſdiction, are given to their domeſtics, or to ſuch as will give the moſt money for them.

There are two kinds of *timariots*, the one appointed by the Porte, the other by the viceroy of the country; but the revenues of both are leſs than thoſe of the zaims, and their equipage and tents leſs in proportion. See ZAIM.

Thoſe who have their patents from the court, have from 5 or 6000 aſpers, to 19999 aſpers *per annum*; if they have one aſper more, they become zaims. Thoſe who receive their patents from the viceroys, have from 3 to 6000 aſpers *per annum*.

This cavalry is better diſciplined than that properly called the *ſpahis*, though the ſpahis be the neateſt, and briſkeſt. Theſe laſt only fight in plattoons; whereas the zaims and *timariots* are divided into regiments, and commanded by colonels, under the direction of baſhaws.—The baſhaw of Aleppo, when in the army, is colonel general of this militia.

TIMBER, includes all kinds of felled and ſeaſoned woods, uſed in the ſeveral parts of building; as carpentry, joinery, turnery, &c. See WOOD, and BUILDING.

The kinds of TIMBER are numerous: we ſhall only mention ſome of the moſt uſual, from Evelyn's *Sylva*, &c.—as,

1°. *Oak*, the uſes whereof need no enumerating: to endure all ſeaſons and weathers, there is no wood like it; hence its uſe in pales, ſhingles, poſts, rails, boards, &c. For water-works it is ſecond to none; and where it lies expoſed both to air and water, there is none equal to it.

2°. *Elm:* this felled between November and February, is all ſpine or heart, and no ſap, and is of ſingular uſe in places where it is always wet, or dry; its toughneſs likewiſe makes it of uſe to wheel-wrights, mill-wrights, &c. nor muſt it be omitted, that its not being liable to break and fly in chips, makes it fit for dreſſers and planks to chop on.

3°. *Beech:* its chief uſe is in turnery, joinery, upholſtery, and the like, as being of a clean, white, fine grain, not apt to bend, nor ſlit; yet is it ſometimes, eſpecially of late, uſed for building *timber*, and if it lie conſtantly wet, is judged to out-laſt oak.

4°. *Aſh:* its uſe is almoſt univerſal; it is good for building, or other occaſions where it may lie dry; it ſerves the carpenter, cooper, turner, plough-wright, wheel-wright, gardener; as alſo at ſea for oars, hand-ſpikes, &c.

5°. *Fir*, commonly known by the name of *deal*, is of late much uſed in building, eſpecially within doors, for ſtairs, floors, wainſcot, and moſt works of ornament.

6°. *Walnut-tree* is of univerſal uſe, excepting for the outſides of buildings; none better for the joiners uſe, it being of a more curious brown colour than beech, and leſs ſubject to worms.

7°. *Cheſnut-tree*, next to oak, is the *timber* moſt ſought for by joyners and carpenters: it is very laſting.

8°. *Service-tree*, uſed in joinery, as being of a delicate grain, and fit for curioſities: it alſo yields beams of conſiderable bigneſs for building.

9°. *Poplar*, *abel*, and *aſpen*, differing very little from one another, are much uſed of late inſtead of fir: they look as well, and are tougher and harder.

10°. *Alder*, much uſed for ſewers or pipes to convey water: when always wet, it grows hard like a ſtone, but where ſometimes wet and ſometimes dry, it rots preſently.

Felling of TIMBER.—The ſeaſon uſually commences about the end of April, in regard the bark then generally riſes the freelieſt; ſo that where a quantity of *timber* is to be *felled*, the ſtatute requires it to be done then, for the advantage of tanning. See TANNING.

However, the opinions and practices of authors are very different, as to the beſt ſeaſon for felling *timber:* Vitruvius recommends an autumnal fall, others adviſe December and January: Cato was of opinion, that trees ſhould have borne their fruit before felled, at leaſt their fruit ſhould be firſt ripe; which falls in with the ſentiments of Vitruvius.

In effect, though *timber* unbarked be moſt obnoxious to worms, yet we find the wild oak, and many other kinds, if felled too late, when the ſap begins to be proud, to be very ſubject to worms; whereas about mid-winter, it neither caſts, rifts, nor twines. It were happy, therefore, if a method of tanning without bark could be invented, that trees being felled more early, the *timber* might be the better ſeaſoned.

The ancients had a great regard to the age of the moon in the felling their *timber*.—If their rules avail aught, they are theſe: fell *timber* in the wain, or four days after new moon; ſome ſay, let it be the laſt quarter. Pliny orders it to be in the very article of the change, which happening on the laſt day of the winter ſolſtice, the *timber*, ſays he, will be immortal: Columella ſays from the 20th to the 28th day; Cato, four days after the full; Vegetius, from the 15th to the 25th for ſhip *timber*; but never in the increaſe, trees then abounding with moiſture, the only ſource of putrefaction.

Some even have a regard to the temper and time of the day; the wind to be low, neither eaſt nor weſt, neither in froſty, wet, nor dewy weather, and therefore never in the forenoon.

Laſtly, ſome regard is had to the ſpecies: fir is beſt felled when it begins to ſpring, both as it then quits its coat beſt, and as the wood, according to Theophraſtus, is by that means rendered wonderfully durable in water. Elm, ſays Mr. Worlidge, is to be felled between November and January, in which caſe it will be all heart, at leaſt the ſap will be very inconſiderable: this, he adds, is the only ſeaſon for felling aſh.

Some authors add further, that in felling *timber*, care is to be taken, only to cut it into the pith, and ſo to let it ſtand till dry; by which means the moiſture is evacuated in drops, which would otherwiſe occaſion putrefaction.

Seaſoning of TIMBER.—After felling and ſawing it, ſome adviſe it to be laid up very dry in an airy place, yet out of the wind and ſun, at leaſt free from any extremities of either; and that it may not decay, but dry evenly, they order it to be daubed over with cows dung.

It is not to ſtand upright, but to lie all along, one piece over another, only kept apart by ſhort blocks interpoſed, to prevent a certain mouldineſs, which they are apt to contract in ſweating on one another; from which frequently ariſes a kind of fungus, eſpecially if there be any ſappy parts remaining.

Others adviſe boards, planks, &c. to be laid in ſome pool, or running ſtream for a few days, to extract the ſap from them, and afterwards to dry them in the ſun or air. By this means, it is ſaid, they will be prevented from either chapping, caſting or cleaving; but againſt ſhrinking there is no remedy. Mr. Evelyn particularly recommends this method for fir.

Others again are for burying them in the earth, others in wheat, and others for ſcorching and ſeaſoning them in fire, eſpecially piles, poſts, &c. that are to ſtand either in water or earth.

Sir Hugh Platt informs us, that the Venetians burn and ſcorch their *timber* in the flaming fire, continually turning it round with an engine, till it has got a hard, black, cruſty coal upon it.

Preſerving of TIMBER.—When boards, &c. are dried, ſeaſoned, and fixed in their places, care is to be taken to defend and *preſerve* them; to which the ſmearing them with linſeed-oil, tar, or the like oleaginous matter, contributes much.

The Dutch preſerve their gates, port-cullices, draw-bridges, ſluices, &c. by coating them over with a mixture of pitch and tar, whereon they ſtrew ſmall pieces of cockle and other ſhells, beaten almoſt to powder, and mixed with ſea-ſand, which incruſts and arms it wonderfully againſt all aſſaults of wind and weather.

Timber felled before the ſap is perfectly at reſt, is very ſubject to the worms; to prevent or cure which, Mr. Evelyn gives us the following ſecret, as moſt approved. Put common ſulphur in a cucurbit, with as much aqua-fortis, as will cover it three fingers deep; diſtil it to a dryneſs, which is performed by two or three rectifications.

Lay the ſulphur remaining at bottom on a marble, or in a glaſs, and with the oil it diſſolves into, anoint the *timber*. This, he adds, not only infalliby prevents or cures the wormineſs, but preſerves all kinds of woods, and even many other things, as ropes, nets, and maſts, from putrefaction, either in air, water, ſnow, &c.

For ſuch as would go a ſhorter way to work, two or three anointings with linſeed oil may do very well. As to poſts, &c. that are to ſtand in the ground, the burning the outſides to a coal is a great preſervative.

As to the chops or clefts green *timber* is liable to after working, a very great eye-ſore in many fine buildings, they are cloſed by anointing, ſuppling, and ſoaking it with the fat of powdered beef broth, twice or thrice repeated.—Some carpenters uſe greaſe and ſaw-duſt mingled for the ſame purpoſe.—But the former method is excellent, only it is not to be uſed while the *timber* is green.

TIMBER-*trees*, the wood of *timber*, before it be felled, particularly that of oak, &c.

For the raiſing, planting, tranſplanting, pruning, *&c.* of *timber-trees*, ſee NURSERY, PRUNING, TRANSPLANTING, *&c.*

TIMBER-*meaſure.*—*Timber* is uſually meaſured and eſtimated by the load or ton, which is a ſolid meaſure containing 40 feet of round *timber*, or 50 of hewn *timber*. The denomination of *load*, &c. we ſuppoſe ariſes hence, that 40 or 50 ſolid feet of ſuch *timber* weighs about a ton, *i. e.* 20 hundred weight, which is uſually accounted a cart-load.

1°. *For the meaſuring of round timber:* the practice is, to gird the tree about, in the middle of the length; and folding the line twice, to take one length or quarter of the whole, and account that for the true ſide of the ſquare: then for the length, it is counted from the but-end of the tree, ſo far up as the tree will hold *half a foot girt*, as they call it, *i. e.* ſo long as the line, twice folded, is half a foot.

The dimenſions thus taken, the quantity of *timber* is had, either by multiplying the ſide of the ſquare into itſelf, and that product by the length, by the method of croſs-multiplication. See *Croſs* MULTIPLICATION.

Or, more eaſily and ſpeedily on Gunter's line, by extending the compaſſes from 12 to the ſide of the ſquare in inches; for that extent turned twice (the ſame way) from the length in feet, will reach to the content in feet. See GUNTER'S *Scale*.

Or, better ſtill, on Coggeſhal's ſliding-rule, by ſetting 12 on the girt line D, to the length in feet on the line C. Then againſt the ſide of the ſquare, on the girt line D, taken in inches, you have on the line C the content of the *timber* in feet. See Coggeſhal's SLIDING-*Rule*.

Note, 1°. this method of meaſuring round *timber*, though common, is yet erroneous, and the content found hereby, it is demonſtrated, is leſs than the true content or meaſure in the ratio of 11 to 14. How to avoid this error, and meaſure it juſtly, we have ſhewn under the uſe of Coggeſhal's *ſliding-rule*.

2°. If the tree have any great boughs that are *timber*, as the phraſe is, *i. e.* which will hold foot girt, they are commonly meaſured, and added to the reſt: the ſolidity of the whole being thus found, they divide it by 40, which brings it into loads.

3°. In meaſuring round *timber* for ſale, they uſually caſt away an inch out of the ſquare for the bark, if oak; ſo that a tree 10 inches ſquare, they only account as if 9; but for aſh, elm, beech, *&c.* an inch is too much.

4°. *For the meaſuring hewn* or *ſquared timber*; the practice is, to find the middle of the length of the tree, and there to meaſure its breadth, by clapping two rules, or other ſtraight things to the ſides of the tree, and meaſuring the diſtance between them: in the like manner they meaſure the breadth the other way. If the two be found unequal, they add them together, and take half the ſum for the true ſide of the ſquare.

The dimenſions thus taken, the content is found either by croſs-multiplication, Gunter's ſcale, or the ſliding-rule, after the manner already directed.

The content divided by 50, gives the number of loads.

Note, if the *timber* be unequally ſided, this method of meaſuring it is erroneous, always giving the content more than the truth; and the more ſo, as the difference of the ſides is greater; yet cuſtom has authorized it.

To meaſure ſuch *timber* juſtly, a mean proportional ſhould be found between the unequal ſides, and this mean be accounted the ſide of the ſquare.

For the meaſuring of taper timber, and *timber* of other forms, as cubes, priſms, pyramids, *&c.* See the article SLIDING-*Rule*.

Bearing of TIMBER, } See { BEARING.
Caſing of TIMBER *Work*, } { CASING.

TIMBER, or TIMMER *of furs*,* as ermines, martens, ſables, and the like, denotes 40 ſkins.—Of other ſkins, ſix ſcore. *Ruſt.*

TIMBERS *of ermine*, in heraldry, denote the ranks or rows of ermine in noblemens coats. See ERMINE.

TIMBER, in falconry. To *timber*, is to neſtle, or make a neſt, as birds of prey do.

TIMBRE, or TIMMER, in heraldry, denotes the creſt of an armoury, or whatever is placed a-top of the eſcutcheon, to diſtinguiſh the degree of nobility, either eccleſiaſtical or ſecular. See CREST.

Such is the papal tiara, cardinal's hat, the croſs, mitre, coronet, mortier, and particularly the caſks or helmets, which the ancients called more eſpecially *timbres*, from their reſembling a kind of bell without a clapper, which the French call *timbre*, or becauſe they reſounded like thoſe *timbres* when ſtruck. This is the opinion of Loiſeau, who derives the word from the Latin, *tintinnabulum*. See CASK, and HELMET.

TIME, a ſucceſſion of phænomena in the univerſe; or a mode of duration, marked by certain periods and meaſures; chiefly by the motion and revolution of the ſun. See MODE, and DURATION.

The idea of time in the general, Mr. Locke obſerves, we acquire by conſidering any part of infinite duration, as ſet out by periodical meaſures: the idea of any particular *time*, or length of duration, as a day, an hour, *&c.* we acquire firſt by obſerving certain appearances at regular, and, ſeemingly, equi-diſtant periods.

Now, by being able to repeat thoſe lengths or meaſures of *time* as often as we will, we can imagine duration, where nothing really endures or exiſts; and thus we imagine *to-morrow*, *next year*, &c.

Some of the latter ſchool-philoſophers define *time* to be the duration of a thing whoſe exiſtence is neither without beginning nor end: by which *time* is diſtinguiſhed from eternity. See ETERNITY.

Ariſtotle and the peripatetics define it *numerus motus ſecundum prius & poſterius*, or a multitude of tranſient parts of motion, ſucceeding each other, in a continual flux, in the relation of priority and poſterity.

Hence it ſhould follow, that *time* is motion itſelf, or at leaſt the duration of motion, conſidered as having ſeveral parts, ſome whereof are continually ſucceeding to others: but on this principle, *time* or temporal duration would not agree to bodies at reſt, which yet no body will deny to exiſt in *time*, or to endure for a *time*.

To evade this inconvenience, the Epicureans and Corpuſcularians made *time* to be a ſort of flux, different from motion, conſiſting of infinite parts, continually and immediately ſucceeding each other, and this from eternity to eternity; but others directly explode this notion, as eſtabliſhing an eternal being, independent of God. For how ſhould there be a flux before any thing exiſted to flow? and what ſhould that flux be, a ſubſtance or an accident?

Time may be diſtinguiſhed like place, into *abſolute*, and *relative*. See PLACE.

Abſolute TIME, is *time* conſidered in itſelf, and without any relation to bodies, or their motions.—This flows equally, *i. e.* never proceeds either faſter or ſlower, but glides on in a conſtant, equable tenor.

Relative or *apparent* TIME, is the ſenſible meaſure of any duration by means of motion.—For ſince that equable flux of *time* does not affect our ſenſes, nor is any way immediately cognizable thereby, there is a neceſſity for calling in the help of ſome nearly equable motion to a ſenſible meaſure, whereby we may determine its quantity, by the correſpondency of the parts of this with thoſe of that.

Hence, as we judge thoſe *times* to be equal which paſs while a moving body, proceeding with an equable velocity, paſſes over equal ſpaces; ſo we judge thoſe *times* to be equal which flow while the ſun, moon, and other luminaries perform their revolutions, which, to our ſenſes, are equal.

But ſince the flux of *time* cannot be accelerated, nor retarded, whereas all bodies move ſometimes faſter and ſometimes ſlower, and there is, perhaps, no perfectly equable motion in all nature; it appears hence to follow, that abſolute *time* ſhould be ſomething truly and really diſtinct from motion. For let us ſuppoſe the heavens and ſtars to have remained without motion from the very creation: does it hence follow, that the courſe of *time* would have been at a ſtand? or rather, would not the duration of that quieſcent ſtate have been equal to the very *time* now elapſed?

Since abſolute *time* is a quantity uniformly extended, and in its own nature moſt ſimple, it hence comes to be repreſented by mathematicians, to the imagination, under the moſt ſimple, ſenſible magnitudes, and particularly right lines and circles, with which it bears a near analogy, in reſpect of geneſis, ſimiliarity, *&c.*.

It is not, indeed, neceſſary that *time* ſhould be meaſured by motion; any conſtant periodical appearance in ſeemingly equi-diſtant ſpaces, as the freezing of water, the blowing of a plant, *&c.* returning at ſet periods, might do as well. In effect, Mr. Locke mentions an American people, who count their years by the coming and going away of birds. See PERIOD.

Some authors diſtinguiſh *time* into *aſtronomical* and *civil*.

Aſtronomical TIME, is that taken purely from the motion of the heavenly bodies, without any other regard.

Civil TIME, is the former *time* accommodated to civil uſes, and formed and diſtinguiſhed into *years*, *months*, *days*, &c. See DAY, MONTH, WEEK, YEAR, *&c.*

Time makes the ſubject of chronology. See CHRONOLOGY.

TIME, in muſic, is an affection of ſound, whereby we denominate it *long*, or *ſhort*, with regard to its continuance in the ſame degree of tune. See SOUND.

Time and tune are the great properties of ſound, on whoſe difference or proportions muſic depends: each has its ſeveral charms; where the *time* or duration of the notes is equal, the differences of tune alone are capable to entertain us with endleſs pleaſure. See TUNE.

And of the power of *time* alone, *i. e.* of the pleaſures ariſing from the various meaſures of long and ſhort, ſwift and ſlow, we have an inſtance in the drum, which has no difference of notes, as to tune. See DRUM, ACCENT, *&c.*

Time, in muſic, is conſidered either with reſpect to the abſolute duration of the notes, *i. e.* the duration conſidered in every note by itſelf, and meaſured by ſome external motion foreign to the muſic; in reſpect to which the compoſition is ſaid to be *quick*, or *ſlow*: or it is conſidered with reſpect to the relative quantity or proportion of the notes compared with one another. See NOTE.

---

* *Hæc civitas (ſc. Ceſtriæ) nunc reddebat de firma* 45 *libras & tres timbrias pellium Martenarum* L. L. Edw. Conf.

The ſigns or characters by which the *time* of notes is repreſented, are ſhewn under the article CHARACTERS *in muſic*, where the names, proportions, &c. are alſo expreſſed.

A ſemi-breve, for inſtance, is marked to be equal to two minims, a minim to two crotchets, a crotchet to two quavers, and ſo on, ſtill in a duplicate ratio, *i. e.* in the ratio of 2 : 1. Now, where the notes reſpect each other thus, *i. e.* where they are in this ratio, the muſic is ſaid to be in *duple*, i. e. *double*, or *common time*.

When the ſeveral notes are triple of each other, or in the ratio 3 : 1, that is, when the ſemi-breve is equal to three minims, the minim to three crotchets, &c. the muſic is ſaid to be in *triple time*. See TRIPLE.

To render this part as ſimple as poſſible, the proportions already ſtated among the notes are fixed and invariable, and to expreſs the proportion of 3 : 1, a point (.) is added on the right ſide any note, which is deemed equivalent to half of it; and by this means a pointed ſemi-breve, O· becomes equal to three minims, and ſo of the reſt.

From hence ariſe ſeveral other ratios conſtituting new kinds of triple *time*; as 2 : 3 and 3 : 4, &c. but theſe Mr. Malcolm obſerves are of no real ſervice, and are not perceived without a painful attention. For the proportions of the *times* of notes, to afford us pleaſure, muſt be ſuch as are not difficultly perceived; on which account the only ratios fit for muſic, beſides that of equality, are the *double* and *triple*.

Common or *duple* TIME, is of two ſpecies.—The firſt, when every bar or meaſure is equal to a ſemi-breve, or its value in any combination of notes of a leſſer quantity.

The ſecond, where every bar is equal to a minim, or its value in leſſer notes. The movements of this kind of meaſure are various, but there are three common diſtinctions; the firſt *ſlow*, ſignified at the beginning by the mark C; the ſecond *briſk*, ſignified by ¢; the third *very quick*, ſignified by Ↄ.

But what that ſlow, briſk and quick is, is very uncertain, and only to be learned by practice. The neareſt meaſure we know of, is to make a quaver the length of the pulſe of a good watch, then a crotchet will be equal to two pulſes, a minim to four, and the whole meaſure or ſemi-breve to eight. This may be reputed the meaſure of *briſk time*; for the *ſlow*, it is as long again, and the *quick* only half as long.

The whole meaſure then of common *time* is equal to a ſemibreve or a minim; but theſe are variouſly ſub-divided into notes of leſs quantities. See MEASURE.

Now to keep the *time* equal, we make uſe of a motion of the hand or foot, thus: knowing the true *time* of a crotchet, we ſhall ſuppoſe the meaſure or bar actually ſub-divided into four crotchets for the firſt ſpecies of common *time*; then the half meaſure will be two crotchets; therefore, the hand or foot being up, if we put it down with the very beginning of the firſt note or crotchet, and then raiſe it with the third, and then down to begin the next meaſure; this is called *beating of time*.

By practice they get a habit of making this motion very equal, and conſequently of dividing the meaſure or bar into equal parts, up and down; as alſo of taking all the notes in the juſt proportion, ſo as to begin and end them preciſely with the beating. In the meaſure of two crotchets, they beat down the firſt, and the ſecond up.—Some call each half of the meaſure in common *time*, *a time*; and ſo they call this the mode or meaſure of *two times*, or the *dupla* meaſure.

Again, ſome mark the meaſure of two crotchets with a 2 or $\frac{2}{4}$, ſignifying it to be equal to two notes, whereof four make a ſemi-breve; and ſome mark it $\frac{4}{8}$ for quavers.

For triple TIME, ſee the article TRIPLE-*Time*.

TIME *in Fencing*.—There are three kinds of *time*; that of the ſword, that of the foot, and that of the whole body. All the *times* that are perceived out of their meaſure, are only to be conſidered as appeals, or feints, to deceive and amuſe the enemy. See FENCING, GUARD, FEINT, &c.

TIMMER. See the articles TIMBER, and TIMBRE.

TIN, *Stannum*, a whitiſh metal, ſofter than ſilver, yet much harder than lead. See METAL.

The chymiſts, &c. hold *tin* a ſpecies of imperfect metal, generated of two different ſeeds, *viz.* that of ſilver, and that of lead; which renders it a kind of compound of both; and accordingly it is frequently found both in lead and ſilver mines. *Tin*, however, has alſo its proper mines, of which our counties of Cornwall and Devonſhire are an abundant evidence: the greateſt part of the *tin* conſumed in Europe is procured from thence; and Camden even ſuppoſes this abundance of *tin*, in thoſe two provinces, to have given the original denomination *Britain* to the whole country.—In the Syriac language *varatanac* ſignifies *land of tin*; from which Bochart derives the name *Britain*.

The principal characters or properties of *tin*, enumerated by Boerhaave, are, that it is the lighteſt of all metals; very little ductile or elaſtic; the moſt fuſible and volatile of all metals; ſcarce diſſoluble by acids, unleſs the weaker ſorts; and eaſily and intimately miſcible with other metals, the ductility whereof becomes diminiſhed by ſuch mixture.

The ſame author concludes, that ſulphur is a prevailing ingredient in *tin*, and deduces ſeveral of its particular properties therefrom. He adds, that could the metal be perfectly purged of this heterogeneous ſulphur, it is probable it would be found no other than ſilver.

Several authors had before noted a great conformity, in divers particulars, between the two metals; as, that both grow bitter when diſſolved by acids; that when fuſed together, there is ſcarce any ſeparating them again, not even by lead. Add, that Mr. Boyle, and others, give us ſeveral inſtances of ſilver being actually produced in conſiderable quantity from *tin* ore. See SILVER.

Yet ſome naturaliſts judge the analogy greater between *tin* and lead, and contend that *tin* is only lead, under a leſs degree of coction; but if there be ſome marks of agreement between them, there are as many of diſagreement. The calx of lead, for inſtance, eaſily fuſes and vitrifies, but that of *tin* not without the utmoſt difficulty: if *tin* and lead be mixed by a vehement fire, a vehement colluctation enſues, and they both run into a calx: add, that *tin* is eaſily revivified; but lead with great labour. See LEAD.

The method of getting, preparing, &c. the *tin* in the Corniſh mines, much the beſt and moſt conſiderable in the world, is given us in the *Philoſophical Tranſactions*.—The working of the *tin* mines is very hard and difficult, not only by reaſon of the great depth which the veins deſcend to, even as low as 60 fathom; but alſo becauſe the rocks, through which paſſages are frequently to be cut, are often ſo hard, that the workman cannot dig a foot in a week. Nor is the ſoft, ſhaking earth found in the *tin* mines much leſs inconvenient to the workmen, both by reaſon of fœtid, malignant vapours it exhales, and of the currents of water often met withal therein: all theſe diſadvantages render it impracticable for the workmen to hold it above four hours together.

The mineral ſtone or ore being dug and drawn out of the mine, is there broke into pieces with large iron mallets; then brought to a ſtamping-mill, where it is ſtill pounded ſmaller with ſtampers, much like thoſe of paper-mills; and the water paſſing through it waſhes away the earthy parts, leaving the metallic ones behind: the lotion is repeated twice, to make the better ſeparation. See TRAMBLING.

This done, they dry it in a furnace on iron-plates, and grind it very fine in a craſing-mill; then waſh it again, and dry it: in this ſtate, the metallic matter is called *black tin*.

To convert it into *tin*, i. e. into *white tin*, they carry it to a furnace, or blowing-houſe; where, by means of a charcoal fire, kept up by huge bellows worked with water, it is ſmelted; after it has paſſed all theſe preparations, and is become cold, they forge it, which is the laſt thing done to it in the works.

The droſs or ſcoria ſcummed off the *tin* in fuſion, being melted down with freſh ore, runs into metal; and even the *cauſalty*, i. e. the matter waſhed and ſeparated from the metal in the mill, being thrown up in heaps, after reſting ſix or ſeven years, they fetch it over again, and it yields as good *tin* as any of that of Germany.

The workmen diſtinguiſh ſeveral kinds of *tin*; as *moor-tin*, which is the beſt ſort, a fool whereof weighs 80 pounds; and *mine-tin*, which is the next, a fool thereof weighing about 52 or 50 pounds. The *tin* got from the ſoft, gravelly earth, they call *pryan-tin*, to diſtinguiſh it from that got from the ſtones, which is better by almoſt half.—Two pounds of black *tin*, when melted, yield about one of white.

There is a curioſity in theſe Corniſh mines, which the lover of natural hiſtory will be pleaſed to hear; and it is this: that in digging, at the depth of 40 or 50 fathoms, they frequently meet with large trees, ſtill entire. See SUBTERRANEOUS.

Childrey, in his *Natural Hiſtory*, goes back as far as the deluge to place them there; but without having recourſe to ſo great antiquity, they who believe that the mines, when exhauſted of their ore or mineral matter, renew and fill again in courſe of time, will ſoon ſolve the difficulty, by ſuppoſing, that in the firſt working of theſe mines, theſe trees had been let down to ſerve as props and pillars. See DELUGE.

But there are other people will think this renewal of the mines itſelf a difficulty as great as the former. However, what the former author adds, *viz.* that in ſome places in the mines they likewiſe find pick-axes, &c. with wooden ſhafts, as alſo braſs nails, and even a medal of Domitian, ſeems to countenance the opinion. See MINE.

***Method of aſſaying* TIN.**—To find whether *tin* be ſoft and ductile, or harſh and brittle, there are two kinds of aſſays; the firſt, is by putting the *tin* in a mould of caſt-braſs, and there melting it. If the metal be harſh, it will be taken out heavier than before; otherwiſe it will be lighter. The ſecond, is by caſting the melted *tin* into a little mould, made of the thunder-ſtone. This mould has a little canal of moderate length, which conducts the matter into a cavity, capable of containing half a billiard ball: if the *tin* be harſh, it appears whitiſh towards the entry of the mould, otherwiſe it is tinged ſuperficially with a very faint, bluiſh brown.

For the uſe of *tin* in the compoſition of pewter, ſee PEWTER.

The chymiſts call *tin* by the name *Jupiter*: but from what analogy between the metal and the planet, we leave them to explain. See JUPITER.

By the analyſes made of *tin*, they hold it compounded of earth, ſulphur, a metallic ſalt, and mercury.—The chief chymical preparations from it are, *ſalt of tin*, *flower of tin*, and *diaphoretic of tin*.

***Salt of* TIN**, or of *Jupiter*, is *tin* calcined, and diſtilled vinegar poured thereon; from which, by means of fire, and then of a cool place wherein it is put, a very white ſalt is drawn. See SALT.

***Flower of* TIN**, is a kind of white coſmetic, or paint for the complexion; drawn with ſal ammoniac, by means of ſublimation. See FLOWER.

***Diaphoretic of* TIN**, is fine *tin* and regulus of antimony melted, firſt together, and then both with ſalt-petre. Whence, after various lotions, is drawn a powder, held to be ſoveraign againſt divers diſeaſes.

***Ceruſs of* TIN**, is a white powder, procured from *tin*, whereof a *fucus* is made, called *Spaniſh white*.—This ceruſs is not made with vinegar, as that of lead is; but with the urine of a young perſon: the powder is alſo uſed to colour Delft ware.

***Calx of* TIN**, is the metal reduced into powder, either by means of fire, or by being diſſolved in an acid menſtruum, and precipitated with an alkali.

TIN-*Glaſs*, or **TIN *of Glaſs***, is what we properly call *biſmuth*. See BISMUTH.

TINCTORUM *Rubia*. See the article RUBIA.

TINCTURE, TINCTURA, in pharmacy and chymiſtry, a ſeparation of the finer and more volatile parts of a mixed body, made by means of a proper menſtruum diſſolving the ſame. See MENSTRUUM, and DISSOLUTION.

TINCTURE is more particularly uſed for an extract of part of the ſubſtance of a body, eſpecially its virtue and colour, which are hereby communicated to the menſtruum. See EXTRACT, and ESSENCE.

We have cephalic *tinctures*, antiſcorbutic *tinctures*, ſtomachic *tinctures*, anticolic *tinctures*, invigorating *tinctures*, &c. *tinctures* drawn from roſes, from corals, *&c.* See EXTRACTION.

To make a *tincture*, the matter is uſually bruiſed, put in a matraſs, and the menſtruum, which commonly is ſpirit of wine, poured on it, to the height of two or three fingers above it. Then the glaſs is cloſed, and ſet for digeſtion, in a ſand-heat, during five or ſix days, till the ſpirit is well impregnated, and has received a high colour. See DIGESTION.

Thus are *tinctures* of odoriferous vegetables, as cinnamon, *&c.* drawn; and the ſame menſtruum ſerves for thoſe of metals, and minerals.

The *tinctures* of metals, ſo much talked of by the chymiſts and alchymiſts, are not proper *tinctures*; they are only diſſolutions, wherein the metal is divided and attenuated to a greater degree than it is in its natural and ordinary diſſolvent.

If the *tincture* were irreductible; that is, if the metal were diſſolved to ſuch a degree, as that it could not be brought back again into metal; or, which comes to the ſame, if the principles which compoſe it were diſunited, it would be what the chymiſts have ſo long and ſo earneſtly wiſhed for, and ſought with ſuch infinite pains, eſpecially with regard to gold; the irreductible *tincture* whereof is what ſhould be called *aurum potabile*. See GOLD.

But no ſuch *tincture* has ever yet been diſcovered: the potable gold in uſe among us, being only gold extremely divided; and the caſe is the ſame with the *tinctures* of other metals. See METAL, and MINERAL.

The intention of metalline *tinctures* is to rarefy and extend the ſulphur of the metal as much as poſſible, and ſo render the fixed and earthy parts as ſubtile and volatile as may be: if they are deſigned to be of uſe in medicine, ſome harmleſs and agreeable medium is to be uſed. See STEEL.

The alchymiſts give the name *grand mineral tincture* to the philoſophers ſtone; from an opinion, that all required to that operation, is to give the colour or *tincture* of gold to fixed mercury. See PHILOSOPHERS *Stone*.

Marble, alabaſter, and bones, receive *tinctures* from lixiviums, and ſharp juices; and Mr. Boyle thinks there is reaſon to hope the ſame may be done of precious ſtones: rock cryſtal, it is certain, is tinged by ſubterraneous juices; ſo is ſapphire itſelf. See GEM, *&c.*

In the memoirs of the French academy, mention is made of certain liquors, *e. gr.* ſalts drawn from wheat, which will extract *tinctures* even out of ſome precious ſtones. It is added, they are the more capable of producing this effect, as they give a greater degree of redneſs to the ſolution of vitriol.

TINCTURE *of Amber*, } See the articles { AMBER.
TINCTURE *of Caſſia*, } { CASSIA.

TINCTURE is alſo applied by the heralds to the colours uſed in eſcutcheons, or coats of arms; under which may be likewiſe reduced the two metals, *or* and *argent*, becauſe often repreſented by yellow and white. See COLOUR, and METAL.

TINEA, in medicine, a diſeaſe called by the Arab writers *ſahafati*, and in Engliſh uſually a *ſcald-head*; nearly a-kin to achores. See ACHOR.

The *tinea* is a diſeaſe of the leprous kind: authors uſually reckon three ſpecies of it, *viz.* a *dry*, *moiſt*, and *lupinous*; which, in reality, are only ſo many degrees of the ſame diſeaſe. See LEPROSY.

Turner defines the *tinea* an ulcer ariſing in the heads of children, from a vicious, corroſive, or ſaline humour, which preying on the cutaneous glands, in time deſtroys their texture.

It has its name *tinea*, q. d. *moth*, from the ſimilitude it bears to the holes eat by that inſect in paper, *&c.*—In the firſt ſtage it is covered with a white, dry, ſcurfy, or ſquammous matter: in the ſecond, the ſubjacent fleſh appears granulated: and in the third it is ulcerous.

The internal remedies proper for the *tinea* are, mercurials, proper cathartics, and dietetics, or edulcorants; and ſometimes a ſalivation, eſpecially by unction, has been efficacious, after all other methods have proved vain. The externals are fomentations made of roots of oxylapathum, birth-wort, horſe-radiſh, wormwood, *&c.* boiled in water, and ſtrained; to which are added, ſpirits of wine camphorated, *&c.* liniments of hogs lard, white precipitate mercurial ointments, with powdered brimſtone; and ſometimes powder of Roman and white vitriol, red precipitate, *&c.*

TIN-GLASS, *Biſmuth*, a mineral matter, white, ſmooth, and as to appearance, reſembling *tin*; but hard, brittle, and diſpoſed in ſhining ſcales, as if it were pieces of glaſs, whence its name. See BISMUTH.

TINGLING *of the Ear*. See the article TINNITUS.

TINNING, the covering or lining any thing with melted *tin*, or with *tin* reduced to a very thin leaf. See TIN.

Looking-glaſſes are foliated or *tinned* with thin tables of beaten *tin*, the whole bigneſs of the glaſs, applied and faſtened thereto by means of quickſilver. See FOLIATING, and LOOKING-*Glaſs*.

Kettles, ſaucepans, and other kitchen utenſils, are *tinned* with melted *tin*; and locks, bits, ſpurs, *&c.* with leaf-*tin*, by help of fire.

The plumbers uſe to *tin* or whiten their ſheets of lead; in order to which they have a *tinning* ſurface, filled with live coal, at the two ſides whereof two men are placed, who hold up the ſheets over the fire to heat; and the *tin* leaves being laid over them, as faſt as the ſheets grow hot, and the *tin* melts, they ſpread it, and make it take by rubbing it with tow and roſin. See PLOMBERY.

TINNITUS *Auris*, TINGLING *or buzzing of the Ear*, a diſeaſe pretty frequent in the ear, conſiſting in the perception of a ſound which is not, or, at leaſt, is not external.

This perception is occaſioned by the beating of an artery in the ear, by an inflammation, or abſceſs of the tympanum or the labyrinth, by the admiſſion of foreign bodies, by commotions of the cranium, blows on the ears, *&c.*—Extraordinary and irregular motions of the animal ſpirits are alſo found to occaſion the *tinnitus*, as we find in deliriums, phrenſies, vertigoes, *&c.*—The *tingling* of the ear is one of the diagnoſtic ſigns of the plague.

TIPSTAVES, officers appointed by the marſhal of the King's-bench, to attend the judges with a rod or ſtaff tipped with ſilver, and take charge of ſuch priſoners, as are either committed, or turned over at the judge's chambers.

The denomination is alſo ſometimes given to thoſe more frequently called *baſtons*; who are the warden of the Fleet's officers, attending the king's courts with a painted ſtaff, for the taking into cuſtody ſuch perſons as are committed by the court; and to attend ſuch priſoners as go at large by licence. See BASTON.

TIRE, or, as the ſeamen pronounce it, TEER, *of Guns*, is a row of guns placed along a ſhip's ſide, either above, upon deck, or below: the former of which are called the *upper tire*, the latter the *lower tire*. See SHIP.

TITANS, TITANES, ΤΙΤΑΝΕΣ, in the ancient mythology, the ſons of Uranus or Cœlus, and Veſta, *i. e.* of heaven and earth, according to Heſiod and Apollodorus; or which comes to the ſame thing, of Æther and Tellus, according to Hyginus. Apollodorus reckons five *Titans*: Oceanus, Cœus, Hyperion, Crius, and Japetus; all elder brothers of Saturn: Hyginus reckons ſix, all, except Hyperion, different from the former; their names, Briareus, Gyges, Sterope, Atlas, Hyperion, and Cottus; but he ſeems to include the hundred-handed giants in the number, which Apollodorus, and the generality of mythologiſts, diſtinguiſh from the *Titans*.

The tradition is, that Cœlus, by the ſame wife, Veſta, had Briareus, Gyges, and Cottus, the hundred-handed giants, and had chained them up in Tartarus: Veſta, the earth, their mother, reſenting this treatment, raiſed the *Titans* againſt their father, her huſband: all, excepting Oceanus, made war upon him, and dethroned him, ſetting up Saturn in his place.

Saturn, it ſeems, proved no more favourable to them than his father; but continued the giants in their priſon.—Upon this, Jupiter revolted againſt Saturn; ſerving him as he had done Cœlus; and reſcued the three giants: who afterwards proved of great ſervice to him in the war which the *Titans* waged againſt him.

This war laſted ten years: but at length the *Titans* were vanquiſhed; Jupiter remained in peaceable poſſeſſion of heaven, and the *Titans* were buried under huge mountains thrown on their heads.

Hyginus gives another origin of the *Titans:* he derives them from *Titan*, Saturn's eldeſt brother, by Cœlus and Veſta; who, though preſumptive heir of heaven, yet finding his father and mother more inclined for Saturn than for him, ſurrendered to him his right of ſucceſſion, on condition he ſhould not bring up any male child, that the empire of heaven might revert to his own iſſue the *Titans*.

But Jupiter, Neptune, and Pluto having been afterwards ſaved by the artifice of Ops; *Titan*, and his ſons the *Titans*, made war on Saturn, vanquiſhed, and impriſoned him; thus he continued in the power of his enemies, till Jupiter being grown up, made war on the *Titans*, and delivered his father.

F. Pezron, in his antiquity of the Celtæ, makes that people to be the ſame with the *Titans*; and their princes the ſame with the giants in ſcripture.—He adds, that the word *Titan* is perfect Celtic, and derives it from *tit*, earth, and *den* or *ten*, man: and hence it was the Greeks alſo called them very properly γηγενεις, q. d. *terrigenæ*, earth-born.

The word TITAN is alſo uſed by the poets for the ſun—in which caſe it is likewiſe Celtic, though from another root, being formed from *ti*, houſe or habitation, and *tan*, fire.

Heſychius obſerves, that *Titan* is likewiſe uſed for ſodomite.—He adds, that it is one of the names of antichriſt; in which ſenſe it muſt be wrote *Teitan*, in Greek, to contain the numeral letters of 666; which in the apocalypſe xiii. 18. is the number of the beaſt.

TITE, or TIGHT—The ſeamen ſay a ſhip is *tite*, when ſhe is ſo ſtaunch as to let in but very little water.

This is known by the ſmell of the water pumped out; for if ſhe let in but little, it will always ſtink; otherwiſe not.

TITHES, TYTHS, TENTHS, *Decimæ*, or *Dixmes*, the tenth part of all profits or fruits, both predial, perſonal, and mixt; allotted to the clergy for their maintenance. See FRUIT, CLERGY, *&c.*

Of *tithes* there are three kinds, *viz. perſonal*, *predial*, and *mixt*.

Perſonal TITHES, are thoſe due or accruing from the profits of labour, art, trade, navigation, and induſtry of man. See PERSONAL.

Predial TITHES, thoſe which ariſe either from the fruits of the ground; as corn, hay, underwood, flax, hemp, *&c.* or from the fruits of trees; as apples, pears, plumbs, cherries; or from the produce of the garden. See PREDIAL.

Mixt TITHES, are ſuch as ariſe from beaſts, and other animals fed with the fruits of the earth: as cheeſe, milk, wool, lambs, calves, fowls, *&c.* See MIXT.

Predial tithes, again, are either *great* or *ſmall*.

Great TITHES, are thoſe of corn, hay, and wood.

Small TITHES, are thoſe of flax, *&c.* which are *predial*; and thoſe of wool, milk, cheeſe, lambs, ferrets, *&c.* which are *mixt*. See PARSON, RECTOR, *&c.*

The *tithes* of grounds newly broke up and cultivated, are called *decimæ novales*, and always belong to the vicar, as well as the ſmall *tithes*.—The novelty is confined to forty years before the demand. See VICAR.

The cuſtom of giving or paying *tithe* is very ancient: in Gen. xiv. 20. Abraham gives Abimelech the tenth of all the ſpoils he had taken from the four kings he had defeated: in Gen. xxviii. 22. Jacob makes a vow at Bethel, to give the tenth of all the riches he ſhall gather in that ſojourn, to God.

But theſe *tithes* were free and voluntary; and, beſide, differed in divers other reſpects from what was afterwards called *tithe:* what Melchiſedec received, was only the tenth of the ſpoils, not of Abraham's poſſeſſions; and this once, not annually; and beſide, not as maintenance, which Melchiſedech wanted not, but as homage: add, that this was only from one prieſt to another; for Abraham had not only a prieſt in his loins, but was a prieſt himſelf.—And as to Jacob, who was alſo a prieſt, what he did was the effect of a vow, voluntarily taken, to offer the tenth of all he ſhould poſſeſs; not to any other prieſt, but to God himſelf upon an altar.

Tithe was firſt legally enjoined by Moſes, Lev. xxvii. 30. Numb. xviii. 21. Deut. xiv. 21.—That legiſlator obliged the Iſraelites to ſeveral kinds of *tithes*; as, 1°. The firſt *tithe*, מעשר הראשון, which was a *tithe* of all the fruits, given to the Levites: this was not taken till after the oblation called תרומה had been made. See LEVITE.

2°. The *ſecond tithe* was a tenth part of the nine remaining after payment of the firſt *tithe*. This *tithe* was ſet apart in each family; and the maſter of the family was obliged to carry it to Jeruſalem, and to ſpend it there; or, in caſe he could not, he was to redeem it, or convert it into money: in which caſe he was to add a fifth to it, and carry the money to Jeruſalem. The Rabbins ſay, that if he did not redeem it himſelf, that is, if he did not ſubſtitute his own money in lieu of it, but ſold it to another, he was only required to carry the bare price to Jeruſalem, without any addition.

3°. The *tithe of the tithe*, was the tenth part of all the *tithes* that had been given the Levites by the people: for the Levites, after they had got all their *tithes* of the people, divided it into ten parts; and in their turn, gave a *tithe* to the prieſts.

This *tithe* the Rabbins call תרומה מעשר, *oblation of the tithe*, מעשר מין המעשר, *tithe of tithe*, or מעשר קדשים המקדשים, *tithe of things ſanctified*.—And this the Levites were obliged to carry to the temple; the reſt was reſerved for their own ſubſiſtance.

4°. The *tithe of the third year*, was another kind of *tithe*, not much different from the ſecond *tithe*, excepting that it was leſs troubleſome, by reaſon they were not obliged to carry it to Jeruſalem. Every ſeventh year God appointed the ground ſhould lie and reſt, nor ſhould the owners even gather the fruits which it produced ſpontaneouſly: that year, therefore, they paid no *tithe*, but only the ſix preceding ones. See SABBATH.

Now, every third of theſe ſix years, *i. e.* on the third, and the ſixth, they raiſed, as uſually, the firſt *tithe*; and after that a ſecond.—But this ſecond they did not carry to Jeruſalem either in kind or in money; but kept it by them to be ſpent by the Levites, the ſtrangers, the fatherleſs, and the widows of the place, Deut. xiv. 28, 29.

This was alſo called the *tithe of the poor*, and the *third tithe*; and theſe third years it was paid on, were called the *tithe years*.

All theſe *tithes* amounted to above one ſixth of the revenue of each perſon: for if, for inſtance, a maſter of a family reaped 6000 meaſures of wheat, and 100 were firſt taken away for the firſt fruits or oblation, he had only 5960 left: from this 5900, taking away the firſt *tithe* 590, there remained 5310, the tenth whereof is 531; which being taken for the ſecond *tithe*, leaves 4779 for the proprietor; who conſequently has given 1121, *viz.* 121 more than a ſixth of the whole.

Of the 590, which the Levites received for their firſt *tithe*, 59 went to the prieſt for the *tithe of tithes*; ſo that they were left 531 for their own ſubſiſtance, and that of their families.

Theſe matters are all further explained in the Talmud, wherein are two books on *tithes*, alſo in the book of benedictions, ברכות, in the commentaries of Bartenora, Maimonides, R. Schelomoh Jarrhi, in Scaliger, Amama, Selden, Friſchmuth, Quenſted, Varenius, Hottinger, Sigonius, Cunæus, Godwyn, Leidecker, *&c.*

Under the new law, it is not Jeſus Chriſt that eſtabliſhed *tithes*, as it was God himſelf did it under the old law by the miniſtry of Moſes: the chriſtian prieſts, and the miniſters of the altar of the new covenant, lived at firſt, wholly of the alms and oblations of the devout. See ALMS, OBLATIONS, *&c.*

In after times the laity gave a certain portion of their revenues to the clergy, but voluntarily, and not out of any conſtraint or obligation: the firſt inſtances we have of it, are in the IVth and Vth centuries.

This gift was called *tithe*; not that it was really a tenth part of their income, or near ſo much: but only in imitation of the *tithes* of the old law.

In the following age, the prelates in their councils, in concert with the princes, made an expreſs law to the purpoſe; and obliged the laity to give a full tenth part of their revenues, their fruits, *&c.* to the eccleſiaſtics.

This the church enjoyed without diſturbance for two or three centuries; but in the VIIIth century the laity got hold of part of theſe *tithes*, either by their own authority, or by grants and donations of the princes; and appropriated them to their own uſes. See REVENUE.

Some time afterwards they reſtored them, or applied them to the founding of monaſteries or chapters; and the church conſented, at leaſt tacitly, to this reſtitution.

In 1179, the third council of Lateran, held under Alexander III. commanded the laymen to reſtore all the *tithes* they yet held, to the church.

In 1215, the fourth council of Lateran, held under Innocent III. moderated the matter a little; and, without ſaying any thing of the *tithes* which the laity already poſſeſſed, forbad them to appropriate or take any more for the future.

Fra. Paolo, in his treatiſe of beneficiary matters, is of opinion, that the cuſtom of paying *tithes* under the new law began in France; and affirms, that there are no inſtances of it before the VIIIth and IXth centuries: but he muſt be miſtaken; for in the 2d council of Matiſcona, held in 585, it is ſaid expreſly, that the chriſtians had a long time kept inviolate that law of God, whereby *tithe* of all their fruits was enjoined to be given to holy places, *&c.*

In effect, Origen, Hom. XI. on Numb. thinks, that the old laws of Moſes, touching the firſt fruits and *tithes*, both of cattle, and of the fruits of the earth, are not abrogated by the goſpel; but ought to be obſerved on their ancient footing. The Vth canon of the council of Matiſcona, orders *tithe* to be paid to the miniſters of the church according to the law of God, and the immemorial cuſtom of the chriſtians, and that upon penalty of excommunication: which is the firſt penalty we find impoſed on ſuch as would not pay *tithe.*—On which grounds it is that many among the modern clergy hold their *tithes* to be *jure divino.*

Others, on the contrary, plead, that the recompence to be given church miniſters, is differently ordained by God, according to the differences he has put between his two great diſpenſations, the law and the goſpel: under the law he gave them *tithes*; under the goſpel, having left all things in his church to charity and chriſtian freedom, he has given them only what ſhall be given them freely, and in charity. That the law of *tithes* is in force under the goſpel, all the proteſtant divines, except ſome among the Engliſh, deny; for though hire to the labourer be of moral and perpetual right, yet that ſpecial kind of hire, the *tenth*, can be of no right or neceſſity, but to the ſpecial labour for which God ordained it: that ſpecial labour was the levitical and ceremonial ſervice of the tabernacle, Numb. xviii. 21, 31. which was aboliſhed: the right therefore of the ſpecial hire muſt be aboliſhed too.

That *tithes* were ceremonial, is evident from their not being given to the Levites till they had been firſt offered as a heave offering to the Lord, ver. 24, 28.

He, then, who by the law brings *tithes* into the goſpel, brings in likewiſe a ſacrifice, and an altar; without which, *tithes*, by the law, were unſanctified and polluted, ver. 32. And therefore were never thought of in the firſt chriſtian times, till ceremonial altars and oblations had been brought back.

The Jews themſelves, ever ſince their temple was deſtroyed, though they have rabbies and teachers of the law, yet pay no *tithes*, as having no proper Levites to whom, nor altar whereupon, to hallow them; which argues, that the Jews themſelves never looked on *tithes* as moral, but merely ceremonial. Add, that *tithes* were not allowed to the prieſts and Levites merely for their labour in the tabernacle; but in conſideration of this likewiſe, that they were not allowed to have any other part or inheritance in the land, ver. 20, 24. and who, by that means, for a tenth, loſt a twelfth.

In effect, for the firſt three hundred years after Chriſt, no mention is made in all eccleſiaſtical hiſtory of any ſuch thing as *tithes*; though in that time, altars and oblations had been recalled, and the church had miſerably judaiſed in many other things. The churchmen confeſſedly lived all that time on freewill offerings; nor could the defect of paying *tithe* be owing to this, that there were wanting civil magiſtrates to injoin it; ſince chriſtians, having lands, might have given out of them what they pleaſed; and the firſt chriſtian emperors, who did all things by advice of the biſhops, ſupplied what was wanting to the clergy, not out of *tithes*, which were never propoſed, but out of their own imperial revenues.

The firſt authority produced, ſetting aſide the apoſtolical conſtitutions, which few of the patrons of *tithes* will inſiſt on, is a provincial ſynod at Cullen in 356, where *tithes* are voted to be God's rent: but before that time, divers other abuſes and complaints had got ground, as altars, candles at noon, *&c.* And one complaint begot another; as it is certain that *tithes* ſuppoſe altars.

It is alledged, that *tithes* are of early and ſolemn force among us; having been paid by ſtatute ever ſince the Saxon king Athelſtan, *anno* 928: to which it may be anſwered, that Romeſcot, or Peter-pence, had been likewiſe paid to the pope by ſtatute above 200 years longer, *viz.* from the year 725. And by the way it is to be noted, that theſe ancient *tithes* among our anceſtors, kept a nearer analogy to their original in the Moſaic law; for the prieſts had but a third part, the other two thirds being appointed for the poor, and to adorn and repair the churches, as appears from the canons of Ecbert and Elfric.

The cuſtom of paying *tithe*, or of offering a tenth of what a man enjoys, or of what he reaps from it, has not only been practiſed under the old and the new law, but we alſo find ſomething like it among the heathens.

Xenophon, in the 5th book of the expedition of Cyrus, gives us an inſcription upon a column near the temple of Diana, whereby the people were warned to offer the tenth part of their revenues every year to that goddeſs.

The Babylonians and Egyptians gave their kings a tenth of their revenues: ſee Ariſtotle in his *Oeconomics*, *lib.* 2. Diodorus Siculus, *lib.* 5, and Strabo, *lib.* 15.—Afterwards, the Romans exacted of the Sicilians a tenth of the corn they reaped; and Appian tells us, that thoſe who broke up, or tilled any new grounds, were obliged to carry a tenth of their produce to the treaſury.

The Romans offered a tenth of all they took from their enemies, to the gods; whence the name of Jupiter Prædator: The Gauls, in like manner, gave a tenth to their god Mars, as we learn in the commentaries of Cæſar.—And Feſtus *de Verb. ſignif.* aſſures us, that the ancients uſed to give *tithe* of every thing to their gods: *decima quæque veteres diis ſuis offerebant.*

Authors have been ſtrangely perplexed, to find the original of a cuſtom, eſtabliſhed among ſo many people of different manners and religions, to give a *tenth* to their kings, or their miniſters of religion. Grotius takes it to ariſe hence, that the number ten is the moſt known and the moſt common among all nations; by reaſon of the number of fingers, which is ten. On this account he thinks it is, that the commandments of God were reduced to ten, for people to retain them with greater eaſe; that the philoſophers eſtabliſhed ten categories, *&c.*

Impropriated and appropriated **TITHES**, called alſo *infeodated tithes*, are thoſe alienated to ſome temporal or eccleſiaſtical lord, united to their fee, and poſſeſſed as ſecular goods. See IMPROPRIATION.

By the council of Lateran, held under Alexander III. in 1179, the alienation or infeodation of *tithes* is prohibited for the future: whence all infeodations made ſince that time are generally held by the canoniſts, illegal.

Some attribute the original of theſe impropriated *tithes* to Charles Martel; and hold him damned for firſt giving the revenues of benefices to ſecular nobles: but Baronius will have this a fable, and refers their origin to the wars in the Holy Land; which is alſo the opinion of Paſquier.

The tribute, it ſeems, which the Romans impoſed on all the provinces of their empire, was a tenth part of all the fruits: hence ſeveral authors obſerve, that the Franks having conquered the Gauls, and finding the impoſition eſtabliſhed, they kept it on foot, and gave thoſe *tithes* in fee to their ſoldiers; and this, ſay they, was the origin of infeoffed, or impropriated or appropriated *tithes.* See FEE, and BENEFICE.

But the truth is, they are not ſo ancient; nor do we find any mention of them before the reign of Hugh Capet; even the very council of Clermont, held in 1097, as hot as it was in the intereſts of the church, does not ſay one word of them; which yet would undoubtedly have made loud complaints of ſuch an uſurpation, had it been then known.

Rate-**TITHE**. See the article RATE-*Tithe*.

TITHING, *Decenna*, or *Decury*; a number or company of ten men, with their families; knit together in a kind of ſociety, and all bound to the king, for the peaceable behaviour of each other. See FRIBURGH, FRANK-PLEDGE, and TRIHING.

In theſe companies there was one chief perſon, who from his office was called *teothingman*; and at this day in the weſt *tithingman*, though now no more than a conſtable; the old cuſtom of tenmentales, or *tithings*, being long ſince diſuſed. See HEAD-BOROW, DECENNIER, TENMENTALE, *&c.*

TITILLATION, TITILLATIO, the act of *Tickling*, i.e. exciting a ſort of pleaſurable idea, by a gentle application of ſome ſoft body, upon a nervous part; and which uſually tends to produce laughter. See LAUGHTER.

TITLE, TITULUS, an inſcription put over any thing, to make it known. See INSCRIPTION.

The word is more particularly uſed for the inſcription in the firſt page of a book, expreſſing the ſubject thereof, the author's name, *&c.* See BOOK.

What tortures abundance of authors, is to find ſpecious *titles* for their books: a *title* ſhould be ſimple, and yet clear: theſe are the two genuine characters of this kind of compoſition. Aſſuming *titles* are a prepoſſeſſion againſt the author.

The French are much addicted to fanfaronnades in their *titiles*; witneſs that of M. le Pays, *Amitiez*, *Amours*, *Amourettes*; or that improvement hereon, *Fleurs*, *Fleurons*, *Fleurettes*, &c.

TITLE, TITULUS, in the civil and canon law, denotes a chapter or diviſion of a book. See CHAPTER, *&c.*

A *title* is ſubdivided into paragraphs, *&c.* See PARAGRAPH, *&c.*—Each of the 50 books of the digeſt conſiſts of a number of *titles*; ſome of more, others of leſs. See DIGEST.

TITLE is alſo an appellation of dignity, diſtinction, or preeminence; given to perſons poſſeſſed of the ſame. See NOBILITY, *&c.*

The *titles* of order or dignity, Loyſeau obſerves, ſhould always come immediately after the name, and before the *titles* of office. See NAME.

The king of Spain has a whole page of *titles*, to expreſs the ſeveral kingdoms, and ſigniories he is maſter of. The king of England takes the *title* of *king of Great Britain, France, and Ireland:* the king of France, the *title* of *king of France and Navarre:* the king of Sweden entitles himſelf *king of the Swedes and Goths:* the king of Denmark, *king of Denmark and Norway:* the king of Sardinia, among his *titles*, takes that of *king of Cyprus and Jeruſalem:* the duke of Lorrain, the *title* of *king of Jeruſalem, Sicily*, &c. See KING, *&c.*

The cardinals take *titles* from the names of ſome churches in Rome: as, of St. Cecilia, St. Sabina, *&c.* and they are called cardinals of the *title of St. Cecilia*, &c. See CARDINAL.

The emperor can confer the *title* of prince, or count of the empire; but the right of ſuffrage in aſſemblies of the empire depends on the conſent of the eſtates. See ELECTOR, and EMPIRE.

The Romans gave their Scipio's the *titles* of Africanus, Aſiaticus, *&c.* and to others, they gave the *titles* of Macedonicus, Numidicus, Creticus, Parthicus, Dacicus, *&c.* in memory of the victories obtained over the people ſo called.—The king of Spain, after the like manner, gives honourable *titles* to his cities, in recompence for their ſervices, or their fidelity.

TITLE is alſo a certain quality aſcribed by way of reſpect to certain princes, *&c.* See QUALITY.

The pope has the *title* of *holineſs*; a cardinal prince of the blood, that of *royal highneſs*, or *moſt ſerene highneſs*, according to his nearneſs to the throne; other cardinal princes, *moſt eminent highneſs*; an archbiſhop, *grace* and *moſt reverend*; a biſhop, *right reverend*; abbots, prieſts, religious, *&c. reverend.* See HOLINESS, EMINENCE, GRACE, REVEREND, *&c.* See alſo POPE, CARDINAL, *&c.*

As to ſecular powers, to the emperor is given the *title* of *imperial majeſty*; to kings, *majeſty*; to the king of France, *moſt chriſtian majeſty*; to the king of Spain, *catholic majeſty*; to the king of England that of *defender of the faith*; to the Turk, *grand ſignior*, and *highneſs*; to the prince of Wales, *royal highneſs*; to the dauphin of France, *ſerene highneſs*; to electors, *electoral highneſs*; to the grand duke, *moſt ſerene highneſs*; to the other princes of Italy and Germany, *highneſs*; to the doge of Venice, *moſt ſerene prince*; to the republic or ſenate of Venice, *ſignory*; to the grand maſter of Malta, *eminence*; to nuncio's and ambaſſadors of crowned heads, *excellency.* See EMPEROR, KING, PRINCE, DUKE, *&c.* See alſo HIGHNESS, SERENITY, EMINENCE, EXCELLENCY, *&c.*

The emperor of China, among his *titles*, takes that of *tien ſu*, ſon of heaven. The Orientals, it is obſerved, are exceedingly fond of *titles*: the ſimple governor of Schiras, for inſtance, after a pompous enumeration of qualities, lordſhips, *&c.* adds the *titles* of *flower of curteſy*, *nutmeg of conſolation*, and *roſe of delight.*

TITLE, in law, denotes a right which a perſon has to the poſſeſſion of any thing. See RIGHT, and POSSESSION.

It is alſo an authentic inſtrument, whereby a man can prove and make appear his right. See MUNIMENT, DOCUMENT, INSTRUMENT, *&c.*

A preſcription of twenty years, with a *title*, is good, and of thirty without a *title.* See PRESCRIPTION.

There muſt be at leaſt a colourable *title* to come into poſſeſſion of a benefice, otherwiſe the perſon is deemed an intruder. See BENEFICE.

TITLE, in the canon law, is that by virtue whereof a beneficiary holds a benefice:—ſuch is the collation of an ordinary, or a proviſion in the court of Rome founded on a reſignation, permutation, or other legal cauſe. See BENEFICE.

The *title* of a benefice, or beneficiary, is either a true, or a colourable one.—A true or valid *title*, is that which gives a right to the benefice: ſuch is that received from a collator who has a right to confer the benefice on a perſon capable thereof, the uſual ſolemnities being obſerved. See COLLATION, *&c.*

Colourable *title* is a ſeeming one; *i. e.* ſuch a one as appears valid, and is not.—Such would that be founded on the collation of a biſhop, in caſe the benefice in queſtion were not in his collation.

By the canons, a colourable *title*, though falſe, produces two very conſiderable effects. 1. That after peaceable poſſeſſion for three years, the incumbent may defend himſelf by the rule *de triennali poſſeſſione*, againſt ſuch as would diſpute the benefice with him. 2°. That in caſe he be proſecuted within three years, and obliged to ſurrender the benefice, he ſhall not be obliged to reſtore the produce of it.

TITLE * is alſo uſed in ſeveral ancient ſynods and councils, for the church to which a prieſt was ordained, and where he was conſtantly to reſide.

* *Nullus in preſbyterum, nullus in diaconum, niſi ad certum* titulum *ordinetur, Concil Londin. Ann.* 1125.
